Subject PV Final Draft for Review by Advisory and Standards Boards

Karen,

Attached is the Final Draft of our report on Provisional Voting for review by the Advisory Board and the Standards Board. I understand from our conversation earlier today that it will be reviewed by the Commissioners at their meeting next week, and, if approved by them, distributed to the boards in advance of their meetings on May 23 and 24. This report will form the basis of our PowerPoint briefing for the boards at those meetings. I will not have hard copies of those PowerPoint presentations for distribution to the boards until the day of the meeting.

We intend to have the Final Draft Voter ID Report to you in time for review by the Commissioners at their second meeting next week.

Thanks for your guidance.

Tom O'Neill

Best Practices to Improve Provisional Voting

CONTENTS

FINAL DRAFT

For Review by the Standards Board and Board of Advisors

The Research Team

This research report on Provisional Voting in the 2004 election is part of a broader analysis that also includes a study of Voter Identification Requirements, a report on which is forthcoming. Conducting the work was a consortium of The Eagleton Institute of Politics of Rutgers, The State University of New Jersey, and The Moritz College of Law of The Ohio State University.

The Eagleton Institute explores state and national politics through research, education, and public service, linking the study of politics with its day-to-day practice. It focuses attention on how contemporary political systems work, how they change, and how they might work better. Eagleton regularly undertakes projects to enhance political understanding and involvement, often in collaboration with government agencies, the media, non-profit groups, and other academic institutions.

The Moritz College of Law has served the citizens of Ohio and the nation since its establishment in 1891.It has played a leading role in the legal profession through countless contributions made by graduates and faculty. Its contributions to election law have become well known through its Election Law @ Moritz website. *Election Law @ Moritz* illuminates public_understanding of election law and its role in our nation's democracy.

The Peer Review Group improved the quality of our work by critiquing drafts of our analysis, conclusions and recommendations. While the Group as a whole and the comments of its members individually contributed generously to the research effort, any errors of fact or weaknesses in inference are the responsibility of the Eagleton-Moritz research team. The members of the Peer Review Group do not necessarily share the views reflected in the policy recommendations of the report.

EXECUTIVE SUMMARY

Background and Methodology

This report to the United States Election Assistance Commission (EAC) presents recommendations for best practices to improve the process of provisional voting. It is based on research conducted by the Eagleton Institute of Politics at Rutgers, the State University of New Jersey, and the Moritz College of Law at Ohio State University under contract to the EAC, dated May 24, 2005.

The Help America Vote Act of 2002 (HAVA, (Public Law 107-252) authorizes the EAC (SEC. 241, 42 USC 15381) to conduct periodic studies of election administration issues. The purpose of these studies is to promote methods for voting and administering elections, including provisional voting, that are convenient, accessible and easy to use; that yield accurate, secure and expeditious voting systems; that afford each registered and eligible voter an equal opportunity to vote and to have that vote counted; and that are efficient. Section 302(a) of HAVA required states to establish provisional balloting procedures by January 2004.[1] The process HAVA outlined left considerable room for variation among the states, arguably including such critical questions as who qualifies as a registered voter eligible to cast a provisional ballot that will be counted and in what jurisdiction (precinct or larger unit) the ballot must be cast in order to be counted.[2]

The general requirement for provisional voting is that, if a registered voter appears at a polling place to vote in an election for Federal office, but either the potential voter's name does not appear on the official list of eligible voters for the polling place, or an election official asserts that the individual is not eligible to vote, that potential voter must be permitted to cast a provisional ballot. In some states, those who should receive a provisional ballot include, in the words of the EAC's Election Day Survey, "first-time voters who registered by mail without identification and cannot provide identification, as required under HAVA. . ." [3] HAVA also provides that those who vote pursuant to a court order keeping the polls open after the established closing hour shall vote by provisional ballot. Election administrators are required by HAVA to notify individuals of their opportunity to cast a provisional ballot.

---

[1] The Election Center's National Task Force Report on Election Reform in July 2001 had described provisional ballots as providing "voters whose registration status cannot be determined at the polls or verified at the election office the opportunity to vote. The validity of these ballots is determined later, thus ensuring that no eligible voter is turned away and those truly ineligible will not have their ballots counted." It recommended "in the absence of election day registration or other solutions to address registration questions, provisional ballots must be adopted by all jurisdictions. " See www.electioncenter.org .

[2] The 2004 election saw at least a dozen suits filed on the issue of whether votes cast in the wrong precinct but the correct county should be counted. One federal circuit court decided the issue in *Sandusky County Democratic Party v. Blackwell, 387 F.3d565* (6th Cir. 2004), which held that votes cast outside the correct precinct did not have to be counted. The court relied on the presumption that Congress must be clear in order to alter the state-federal balance; thus Congress, the court concluded would have been clearer had it intended to eliminate state control over polling location (387 F.3d at 578). An alternative argument, that HAVA's definition of "jurisdiction" incorporates the broader definition in the National Voting Rights Act, however, has not been settled by a higher court. But for now states do seem to have discretion in how they define "jurisdiction" for the purpose of counting a provisional ballot.

[3] The definition of who was entitled to a provisional ballot could differ significantly among the states. In California, for example, the Secretary of State directed counties to provide voters with the option of voting on a provisional paper ballot if they felt uncomfortable casting votes on the paperless e-voting machines. "I don't want a voter to not vote on Election Day because the only option before them is a touch-screen voting machine. I want that voter to have the confidence that he or she can vote on paper and have the confidence that their vote was cast as marked," Secretary Shelley said. See http://wired.com/news/evote/0,2645,63298,00.html . (Our analysis revealed no differences in the use of provisional ballots in the counties with these paperless e-voting machines.) In Ohio, long lines at some polling places resulted in legal action directing that voters waiting in line be given provisional ballots to enable them to vote before the polls closed. (Columbus Dispatch, November 3, 2004 .)

Our research began in late May 2005. It focused on six key questions raised by the EAC.

1. How did the states prepare for the onset of the HAVA provisional ballot requirement?
2. How did this vary between states that had previously had some form of provisional ballot and those that did not?
3. How did litigation affect implementation?
4. How effective was provisional voting in enfranchising qualified voters?
5. Did state and local processes provide for consistent counting of provisional ballots?
6. Did local election officials have a clear understanding of how to implement provisional voting?

To answer those questions, we:

1. Surveyed 400 local (mostly county) election officials to learn their views about the administration of provisional voting and to gain insights into their experience in the 2004 election.
2. Reviewed the EAC's Election Day Survey, news and other published reports in all 50 states to understand the local background of provisional voting and develop leads for detailed analysis.[4]
3. Analyzed statistically provisional voting data from the 2004 election to determine associations between the use of provisional voting and such variables as states' experience with provisional voting, use of statewide registration databases, counting out-of-precinct ballots, and use of different approached to voter identification.
4. Collected and reviewed the provisional voting statutes and regulations in all 50 states.
5. Analyzed litigation affecting provisional voting or growing out of disputes over provisional voting in all states.

Our research is intended to provide EAC with a strategy to engage the states in a continuing effort to strengthen the provisional voting process and increase the consistency with which provisional voting is administered, particularly within a state. As EAC and the states move forward to assess and adopt the recommendations made here, provisional voting merits continuing observation and research. The situation is fluid. As states, particularly those states that did not offer a provisional ballot before 2004, gain greater experience with the process and as statewide voter databases are adopted, the provisional voting process will demand further, research-based refinement.

KEY FINDINGS

Variation among the states

In the 2004 election, nationwide about 1.9 million votes, or 1.6% of turnout, were cast as provisional ballots. More than 1.2 million, or just over 63%, were counted. Provisional ballots accounted for a little more than 1% of the final vote tally. These totals obscure the wide variation in provisional voting among the states.[5]

---

[4] Attachment 1 provides detailed information on how this study classifies the states according to the characteristics of their provisional voting procedures. It also describes how the data used in the statistical analysis may differ from the data in the Election Day Survey, which became available as our research was concluding.

[5] HAVA allows the states considerable latitude in how to implement provisional voting, including deciding who beyond the required categories of voters should receive provisional ballots and how to determine which provisional ballots should be counted.

- Six states accounted for two-thirds of all the provisional ballots cast.[6]
- The percentage of provisional ballots in the total vote varied by a factor of 1,000 -- from a high of 7% in Alaska to Vermont's 0.006%.
- The portion of provisional ballots cast that were counted ranged from 96% in Alaska to 6% in Delaware.
- States with voter registration databases counted, on average, 20% of the provisional ballots cast.
- States without databases counted ballots at more than twice that rate: 44%.[7]
- States that provided more time to evaluate provisional ballots counted a greater proportion of those ballots. Those that provided less than one week counted an average of 35.4% of their ballots, while states that permitted more than 2 weeks, counted 60.8%.

An important source of variation among states was a state's previous experience with provisional voting. The share of provisional ballots in the total vote was six times greater in states that had used provisional ballots before than in states where the provisional ballot was new. In the 25 states that had some experience with provisional voting before HAVA, a higher portion of the total vote was cast as provisional ballots and a greater percentage of the provisional ballots cast were counted than in the 18 new to provisional balloting.[8]

Variation within states

Within states, too, there was little consistency among different jurisdictions. Of the 20 states for which we have county-level provisional ballot data, the rate of counting provisional ballots varied by as much as 90% to 100% among counties in the same state. This suggests that additional factors (including the training of election judges or poll workers) beyond statewide factors, such as experience or the existence of voter registration databases, also influence the use of provisional ballots.

- In Ohio some counties counted provisional ballots not cast in the assigned precinct even though the state's policy was to count only those ballots cast in the correct precinct.
- Some counties in Washington tracked down voters who would otherwise have had their provisional ballots rejected because they had failed to complete part of their registration form, gave them the chance to correct those omissions, and then counted the provisional ballot.

Resources available to administer provisional voting varied considerably among and within states. Differences in demographics and resources result in different experiences with provisional voting. For example, the Election Day Survey found that staffing problems appeared to be particularly acute for jurisdictions in the lowest income and education categories. Small, rural jurisdictions and large, urban jurisdictions tended to report higher rates of an inadequate number of poll workers within polling places or precincts.

- Jurisdictions with lower education and income tend to report more inactive voter registrations, lower turnout, and more provisional ballots cast.

---

[6] California, New York, Ohio, Arizona, Washington, and North Carolina. The appearance of Arizona, Washington and North Carolina on this list shows that the number of provisional ballots cast depends on factors other than the size of the population.

[7] As the Carter-Baker Commission report put it, "provisional ballots were needed half as often in states with unified databases as in states without." Report on the Commission on Federal Election Reform, "Building Confidence in U. S. Elections," September 2005, p. 16.

[8] See the appendix for our classification of "old" and "new" states and explanation of why the total is less than 50.

- Jurisdictions with higher levels of income and education reported higher average numbers of poll workers per polling place or precinct and reported lower rates of staffing problems per precinct.

In precincts located in districts where many voters live in poverty and have low levels of income and education, the voting process, in general, may be managed poorly. Provisional ballots cannot be expected to work much better. In these areas, the focus should be on broader measures to improve the overall functionality of struggling voting districts, although improving the management of provisional balloting may help at the margin.

The lessons of litigation

Successful legal challenges highlight areas where provisional voting procedures were wanting. A flurry of litigation occurred around the country in October 2004 concerning the so-called "wrong precinct issue" – whether provisional ballots cast by voters in a precinct other than their designated one would be counted for statewide races. Most courts, including the U.S. Court of Appeals for the Sixth Circuit (the only federal appeals court to rule on the issue), rejected the contention that HAVA requires the counting of these wrong-precinct provisional ballots. This litigation was significant nonetheless.

- First, the Sixth Circuit decision established the precedent that voters have the right to sue in federal court to remedy violations of HAVA.
- Second --and significantly-- the litigation clarified the right of voters to receive provisional ballots, even though the election officials were certain they would not be counted. The decision also defined an ancillary right –the right to be directed to the correct precinct. There voters could cast a regular ballot that would be counted. If they insisted on casting a provisional ballot in the wrong precinct, they would be on notice that it would be a symbolic gesture only.
- Third, these lawsuits prompted election officials to take better care in instructing precinct officials on how to notify voters about the need to go to the correct precinct in order to cast a countable ballot.

States move to improve their processes

Shortly after the 2004 election, several states came to the conclusion that the administration of their provisional voting procedures needed to be improved, and they amended their statutes. The new legislation highlights areas of particular concern to states about their provisional voting process.

- Florida, Indiana, Virginia, and Washington have clarified or extended the timeline to evaluate the ballots.
- Colorado, New Mexico, North Carolina, and Washington have passed legislation focused on improving the efficacy and consistency of the voting and counting process.
- Colorado, Arkansas, and North Dakota took up the issue of counting provisional ballots cast in the wrong precinct.

The wide variation in the implementation of provisional voting among and within states suggests that EAC can help states strengthen their processes. Research-based recommendations for best, or at least better, practices that draw on the experience gained in the 2004 election can be useful in states' efforts to achieve greater consistency in the administration of provisional voting. The important effect of experience on the administration of the provisional ballot process indicates that the states have much they can learn from each other.

SUMMARY OF RECOMMENDATIONS FOR BEST PRACTICES

State efforts to improve the provisional voting process have been underway since the 2004 election. By recommending best practices, the EAC will offer informed advice while respecting diversity among the states.

Take a quality-improvement approach

Defining what constitutes a successful provisional voting system is difficult. Defining quality requires a broad perspective about how well the system works, how open it is to error recognition and correction, and how well provisional voting processes are connected to the registration and voter identification regimes. A first step is for states to recognize that improving quality begins with seeing the provisional voting process as a system and taking a systems approach to regular evaluation through standardized metrics with explicit goals for performance. EAC can facilitate action by the states by recommending as a best practice that:

- Each state collect data systematically on the provisional voting process to permit evaluation of its voting system and assess changes from one election to the next. The data collected should include: provisional votes cast and counted by county; reasons why provisional ballots were not counted, measures of variance among jurisdictions, and time required to evaluate ballots by jurisdiction

Emphasize the importance of clarity

Above all else, the EAC should emphasize the importance of clarity in the rules by which each state governs provisional voting. As state legislators and election officials prepare for the 2006 election, answers to the questions listed in the recommendation section of this report could be helpful. Among those questions are:

- Does the provisional voting system distribute, collect, record, and tally provisional ballots with sufficient accuracy to be seen as procedurally legitimate by both supporters and opponents of the winning candidate?
- Do the procedural requirements of the system permit cost-efficient operation?
- How great is the variation in the use of provisional voting in counties or equivalent levels of voting jurisdiction within the state? Is the variation great enough to cause concern that the system may not be administered uniformly across the state?

Court decisions suggest areas for action

The court decisions following the 2004 election also suggest procedures for states to incorporate into their procedures for provisional voting. EAC should recommend to the states that they:

- Promulgate clear standards for evaluating provisional ballots, and provide training for the officials who will apply those standards.
- Provide effective materials to be used by local jurisdictions in training poll workers on such procedures as how to locate polling places for potential voters who show up at the wrong place.
- Make clear that the only permissible requirement to obtain a provisional ballot is an affirmation that the voter is registered in the jurisdiction and eligible to vote in an election for federal office. Poll workers need appropriate training to understand their duty to give such voters a provisional ballot.

Assess each stage of the provisional voting process

Beyond the procedures suggested by court decisions, states should assess each stage of the provisional voting process. They can begin by assessing the utility and clarity of the information for voters on their websites and by considering what information might be added to sample ballots mailed to voters before elections. The better voters understand their rights and obligations, the easier the system will be to manage, and the more legitimate the appearance of the process.

Avoiding error at the polling place will allow more voters to cast a regular ballot and all others who request it to cast a provisional ballot. Our recommendations for best practices to avoid error at the polling place include:

- The layout and staffing of the multi-precinct polling place is important. States should ensure that training materials distributed to every jurisdiction make poll workers familiar with the options available to voters.
- The provisional ballot should be of a design or color sufficiently different from a regular ballot to avoid confusion over counting and include take-away information for the voter on the steps in the ballot evaluation process.
- Because provisional ballots offer a fail-safe, supplies of the ballots at each polling place should be sufficient for all the potential voters likely to need them. Best practice would be for states should provide guidelines (as do Connecticut and Delaware) to estimate the supply of provisional ballots needed at each polling place.

The clarity of criteria for evaluating voter eligibility is critical to a sound process for deciding which of the cast provisional ballots should be counted.

- .State statutes or regulations should define a reasonable period for voters who lack the HAVA-specified ID or other information bearing on their eligibility to provide it in order to facilitate the state's ability to verify that the person casting the provisional ballot is the same one who registered. At least 11 states allow voters to provide ID or other information one to 13 days after voting. Kansas allows voters to proffer their ID by electronic means or by mail, as well as in person.
- More provisional voters have their ballots counted in those states that count ballots cast outside the correct precinct. While HAVA arguably leaves this decision up to the states, pointing out the effect of the narrower definition on the portion of ballots counted could be useful to the states in deciding this question. States should be aware, however, of the additional burden placed on the ballot-evaluation process when out-of-precinct ballots are considered. And tradeoffs are involved if out-of-precinct voters are unable to vote for the local offices that might appear on the ballot in their district of residence.
- If a state does require voters to appear at their assigned precinct, where the same polling site serves more than one precinct, a voter's provisional ballot should count so long as the voter cast that ballot at the correct polling site even if at the wrong precinct within that location. While the best practice might be for poll workers to direct the voter to correct precinct poll workers' advice is not always correct, and the voter should be protect against ministerial error.
- Officials should follow a written procedure, and perhaps a checklist, to identify the reason why a provisional ballot is rejected. Colorado's election rules offer particularly clear guidance to the official evaluating a provisional ballot.

In verifying provisional ballots, the time by which election officials must make their eligibility determinations is particularly important in presidential elections because of the need to certify electors to the Electoral College. Our research did not identify an optimum division of the five weeks available.

- The best practice here is for states to consider the issue and make a careful decision about how to complete all steps in the evaluation of ballots and challenges to those determinations within the five weeks available.

After the election, timely information to voters about the disposition of their provisional ballot can enable voters to determine if they are registered for future elections and, if not, what they need to do to become registered.

- Best practice for the states is to establish mechanisms to ensure that voters casting provisional ballots are informed whether they are now registered for future elections and, if not, what they need to do to become registered.

Final observation

The detailed examination of each stage in the provisional voting process can lay the foundation each state needs to improve its system. Efforts to improve provisional voting may be most effective as part of a broader effort by state and local election officials to strengthen their systems. Collecting and analyzing data about those systems will enable states to identify which aspects of the registration and electoral system are most important in shunting voters into the provisional ballot process. Responsible officials can then look to their registration system, identification requirements or poll worker training as ways to reduce the need for voters to cast their ballots provisionally.

Provisional Voting in 2004

In the 2004 election, nationwide about 1.9 million votes, or 1.6% of turnout, were cast as provisional ballots. More than 1.2 million or just over 63% were counted. Provisional ballots accounted for a little more than 1% of the final vote tally.

These totals obscure the wide variation in provisional voting among the states.[9] Six states accounted for two-thirds of all the provisional ballots cast.[10] State by state, the percentage of provisional ballots in the total vote varied by a factor of 1,000 -- from a high of 7% in Alaska to Vermont's 0.006%. The portion of provisional ballots cast that were actually counted also displayed wide variation, ranging from 96% in Alaska to 6% in Delaware. States with voter registration databases counted, on average, 20% of the provisional ballots cast. Those without databases counted provisional ballots at more than twice that rate, 44%.

An important source of variation was a state's previous experience with provisional voting. The share of provisional ballots in the total vote was six times greater in states that had used provisional ballots before than in states where the provisional ballot was new. In the 25 states that had some experience with provisional voting before HAVA, a higher portion of the total vote was cast as provisional ballots and a greater percentage of the provisional ballots cast were counted than in the 18 new to provisional balloting.[11]

- The percentage of the total vote cast as provisional ballots averaged more than 2% in the 25 experienced states. This was 4 times the rate in states new to provisional voting, which averaged 0.47%. [12]
- The experienced states counted an average of 58% of the provisional ballots cast, nearly double the proportion in the new states, which counted just 33% of cast provisional ballots.
- The combined effect of these two differences was significant. In experienced states 1.53% of the total vote came from counted provisional ballots. In new states, provisional ballots accounted for only 0.23% of the total vote.

Those voting with provisional ballots in experienced states had their ballots counted more frequently than those in the new states. This experience effect is evidence that there is room for improvement in provisional balloting procedures, especially in those states new to the process.[13] That conclusion gains support from the perspectives of the local election officials revealed in the survey conducted as a part of this research. Local (mostly county level) election officials from "experienced" states were more likely to:

---

[9] HAVA allows the states considerable latitude in how to implement provisional voting, including deciding who beyond the required categories of voters should receive provisional ballots and how to determine which provisional ballots should be counted.

[10] California, New York, Ohio, Arizona, Washington, and North Carolina. The appearance of Arizona, Washington and North Carolina on this list shows that the number of provisional ballots cast depends on factors other than the size of the population.

[11] See the appendix for our classification of "old" and "new" states and explanation of why the total is less than 50.

[12] To compensate for the wide differences in vote turnout among the 50 states the average figures here are calculated as the mean of the percent cast or counted rather than from the raw numbers of ballots cast or counted.

[13] Managing the provisional voting process can strain the capacity election administrators. For example, Detroit, counted 123 of the 1,350 provisional ballots cast there in 2004. A recent study concluded that Detroit's " 6-day time limit to process provisional ballots was very challenging and unrealistic. To overcome this challenge, *the entire department's employees were mobilized to process provisional ballots."* (emphasis added.) GAO Report-05-997, "Views of Selected Local Officials on Managing Voter Registration and Ensuring Citizens Can Vote," September 2005.

- Be prepared to direct voters to their correct precincts with maps;
- Regard provisional voting as easy to implement;
- Report that provisional voting sped up and improved polling place operations
- Conclude that the provisional voting process helped officials maintain accurate registration databases.

Officials from "new" states, on the other hand, were more likely to agree with the statement that provisional voting created unnecessary problems for election officials and poll workers.

If experience with provisional voting does turn out to be a key variable in performance, that is good news. As states gain experience with provisional ballots their management of the process could become more consistent and more effective over subsequent elections. Further information from the EAC on best practices and the need for more consistent management of the election process could sharpen the lessons learned by experience. The EAC can facilitate the exchange of experience among the states and can offer all states information on more effective administration of provisional voting.

Concluding optimistically that experience will make all the difference, however, may be unwarranted. Only if the performance of the "new" states was the result of administrative problems stemming from inexperience will improvement be automatic as election officials move along the learning curve. Two other possibilities exist. Our current understanding of how provisional voting worked in 2004 is not sufficient to determine unambiguously which view is correct.

1. "New" states may have a political culture different from "old" states. That is, underlying features of the "new" states political system may be the reason they had not adopted some form of provisional voting before HAVA. The "new" states may strike a different balance among the competing objectives of ballot access, ballot security and practical administration. They may ascribe more responsibility to the individual voter to take such actions as registering early, finding out where the right precinct is, or re-registering after changing address. They may value keeping control at the local level, rather than ceding authority to state or federal directives. The training they offer poll workers about provisional ballots may not be as frequent or effective as in other states. If the inconsistent performance in the "new" states arises out of this kind of political culture, improving effectiveness in the use of the provisional ballots -- as measured by intrastate consistency in administration--- will be harder and take longer to achieve.[14]
2. "Old" states may devote fewer resources to updating their registration files or databases because they consider provisional ballots as a reasonable fail safe way for voters with registration problems a way to cast a ballot. The adoption of statewide voter registration databases in compliance with HAVA therefore may reduce the variation in the use of provisional ballots among the states.

Other influences decreasing consistency among the states include:

---

[14] Despite differing political cultures among states and the latitude HAVA provides states, the statute does, indeed impose some degree of uniformity on issues that Congress thought essential. For example, before HAVA, took effect, "no state gave the voter the right to find out the status of their ballot after the election. " Now all offer that opportunity. See Bali and Silver, "The Impact of Politics, Race and Fiscal Strains on State Electoral Reforms after Election 2000," manuscript, Department of Political Science, Michigan State University. Resisting HAVA's mandates through foot-dragging lacks any legitimate foundation in law or policy.

- The more rigorous the verification requirements, the smaller the percentage of provisional ballots that were counted. Some states verified provisional ballots by comparing the voter's signature to a sample, some matched such identifying data as address, birth date, or social security number, others required voters who lacked ID at the polling place to return later with the ID to evaluate the provisional ballot, ans some required provisional voters to execute an affidavit. [15]
    - In the 4 states that simply matched signatures, nearly 3.5% of the total turnout consisted of provisional ballots, and just under three-fourths of those ballots (73%) were counted.
    - In the 14 states that required voters to provide such additional information as address or date of birth just over 1.5% of the total turnout consisted of provisional ballots, and 55% of those ballots were counted.
    - In the 14 states that required an affidavit (attesting, for example, that the voter was legally registered and eligible to vote in the jurisdiction) just over one-half of a percent (0.6%) of turnout came from provisional ballots, and less than one-third of those (30%) were counted. (But note that HAVA requires all voters to certify that they are eligible and registered in order to cast a provisional ballot, which is functionally an affidavit. The 14 states described here used an explicit affidavit form.)
    - In the 10 states that required voters to return later with identifying documents just under 1.5% of the total turnout came from provisional ballots, and more than half (52%) of these were counted. Voters apparently found this requirement less onerous than the affidavit, even though it required a separate trip to a government office

- Voter registration databases provided information that reduced the number of provisional ballots counted.[16] In states using provisional voting for the first time, states with registered-voter databases counted only 20% of the ballots that were cast. States without such databases counted more than double that rate (44%). As HAVA's requirement for adoption of statewide databases spreads across the country, this variation among states is likely to narrow. Real-time access to a continually updated, statewide list of registered voters should reduce the number of provisional ballots used and reduce the percentage counted since most of those who receive them will be less likely to be actually registered in the state.

- States that counted out-of-precinct ballots counted 56% of the provisional ballots cast. States that counted ballots cast only in the proper precinct counted an average of 42% of provisional ballots. [17]

---

[15] See Table 2 in Appendix 2 for information on the verification method used in each state.

[16] The Election Day Survey found that states using statewide voter registration databases reported a lower incidence of casting provisional ballots than states without voter registration databases, suggesting that better administration of voter registration rolls might be associated with fewer instances where voters would be required to cast a provisional ballot due to a problem with their voter registration.

[17] The Election Day Survey concluded that : "Jurisdictions with jurisdiction-wide provisional ballot acceptance reported higher rates of provisional ballots cast, 2.09 percent of registration or 4.67 percent of ballots cast in polling places, than those with in-precinct-only acceptance, 0.72 and 1.18 percent, respectively. Predictably, those jurisdictions with more permissive jurisdiction-wide acceptance reported higher rates of counting provisional ballots, 71.50 percent, than other jurisdictions, 52.50 percent."

  - In experienced states, the disparity was even more pronounced: 52% of provisional ballots cast were counted in states requiring in-district ballots, while 70% were counted in those allowing out-of-precinct ballots.
  - If all states had counted out-of-precinct ballots, perhaps 290,000 more provisional ballots would have been counted across the country.[18]

- States that provide a longer the time to evaluate provisional ballots counted a higher proportion of those ballots. [19]
  - Fourteen states permitted less than one week to evaluate provisional ballots, 15 states permitted between one and two weeks, and 14 states permitted greater than two weeks[20].
  - Those states that permitted less than one week counted an average of 35.4% of their ballots.
  - States that permitted between one and two weeks counted 47.1%.
  - States that permitted more than 2 weeks, counted 60.8% of the provisional ballots cast[21].
  - The effect of allowing more time for evaluation is felt most strongly in states where more than 1% of the overall turnout was of provisional ballots. In states where provisional ballots were used most heavily, those that permitted less than one week to evaluate ballots counted 58.6% while those that permitted one to two weeks counted 65.0% of ballots, and those states that permitted greater than three weeks verified the highest proportion of provisional ballots, at 73.8%.

Variation Within States

Not only was there little consistency among states in the use of provisional ballots, there was also little consistency within states. This was true in both new and old states. Of the 20 states for which we have county-level provisional ballot data, the rate of counting provisional ballots varied by as much as 90% to 100% among counties in the same state. This suggests that additional factors beyond statewide factors, such as verification requirements or the time provided for ballot evaluation, also influence the provisional voting process. Reacting to the lack of consistency within states, the Carter-Baker Commission) recommended that "states, not counties or municipalities, should establish uniform procedures for the verification and counting of provisional ballots, and that procedure should be applied uniformly throughout the state."[22]

Election Line reported that:

---

[18] This estimate is a rough approximation. States that recognize out-of-precinct ballots counted, on average, 56% of the provisional votes cast. Applying that ratio to the 1.9 million provisional ballots cast nationwide would result in 1.1 million provisional ballots that would have been counted if all states accepted out-of-precinct votes. States that did not recognize out-of-precinct ballots counted 42% of the provisional ballots cast, or about 813,000 ballots, for a difference of about 290,000 votes.

[19] See Appendix __, Relationship Between Time Allotted to Verify Provisional Ballots and the Level of Ballots that are Verified, David Andersen, The Eaglteton Institute of Politics

[20] Many thanks to Ben Shepler, of the Moritz College of Law, for assembling complete data on the time requirements states permitted for the counting of provisional ballots.

[21] 43 states are included in this analysis, including Washington D.C. The 7 election-day registration states are omitted, as is Mississippi, which never provided data on provisional ballots. North Carolina is also omitted from the regressions, as it does not have a statewide policy on how it verifies provisional ballots.

[22] Recommendation 2.3.2 of the Report of the Commission on Federal Election Reform, "Building Confidence in U.S. Elections," September 2005, p.16. The report also observed that, ". . .different procedures for counting provisional ballots within and between states led to legal challenges and political protests. Had the margin of victory for the presidential contest been narrower, the lengthy dispute that followed the 2000 election could have been repeated."

- In Ohio some counties counted provisional ballots not cast in the assigned precinct even though the state's policy was to count only those ballots cast in the correct precinct.
- Some counties in Washington tracked down voters who would otherwise have had their provisional ballots rejected because they had failed to complete part of their registration form, gave them the chance to correct those omissions, and then counted the provisional ballot. This would probably not have come to light except for the sharp examination caused by the very close election for governor.

Resources available to administer provisional voting varied considerably among and within states. The result is that differences in demographics and resources result in different experiences with provisional voting. For example, the Election Day Survey found that:

- Jurisdictions with lower education and income tend to report more inactive voter registrations, lower turnout, and more provisional ballots cast.

- Jurisdictions with higher levels of income and education reported higher average numbers of poll workers per polling place or precinct and reported lower rates of staffing problems per precinct.

- Staffing problems appeared to be particularly acute for jurisdictions in the lowest income and education categories. Small, rural jurisdictions and large, urban jurisdictions tended to report higher rates of an inadequate number of poll workers within polling places or precincts.

- Predominantly non-Hispanic, Black jurisdictions reported a greater percentage of polling places or precincts with an inadequate number of poll workers. Predominantly non-Hispanic, Native American jurisdictions reported the second highest percentage of staffing problems.

The conclusions to be drawn from these findings are clear. In voting districts with lower education levels, poverty, and inadequately staffed polling places, the voting process is unlikely to function well. More people will end up casting provisional ballots. That makes the provisional voting process especially important in such districts. But if jurisdictions struggle with regular voting, how well are they likely to do with the more complicated provisional balloting process? In precincts were the voting process, in general, is managed poorly, provisional ballots cannot be expected to work much better. In these areas, the focus should be on broader measures to improve the overall functionality of struggling voting districts, although improving the management of provisional balloting may help at the margin.

Effectiveness of Provisional Voting

The certainty of our conclusions about the effectiveness of provisional voting is limited because of the complexity of the problem and a lack of important information. An ideal assessment of how well provisional ballots worked in 2004 would require knowing the decisions of local officials in 200,000 precincts on how to inform voters about provisional voting; their performance in providing a provisional ballot to those qualified to receive one, and their decisions whether to count a provisional ballot. Information needed about the eligibility or registration status of provisional voters is also not available.

We see no automatic correlation between the quality of a state's voting system and either the number of provisional ballots cast or counted. Low numbers could reflect accurate statewide voting data and good voter education. Or they could suggest that provisional ballots were not made easily available. High numbers could be seen as signifying an effective provisional voting system or a weak registration process. But we do know that in 2004 provisional ballots allowed 1.2 million citizens to vote, citizens who would otherwise have been turned away from the polls.

Since we do not know the total number of registered voters who might have voted but could not makes a precise, quantitative estimate of the effectiveness of provisional voting impossible. The Cal Tech – MIT Voting Technology Project, however, estimated that 4 – 6 million votes were lost in the 2000 presidential election for the reasons shown in Table 1 below. The estimate is an approximation, but it may provide data good enough for a general assessment of the size of the pool of potential voters who might have been helped by the provisional ballot process.

Estimates of Votes Lost In 2000 Presidential Election

Votes Lost (Millions)	*Cause*
1.5 – 2	Faulty equipment and confusing ballots
1.5 – 3	Registration mix-ups
<1	Polling place operations
?	Absentee ballot administration

Table 1 Cal Tech – MIT Voting Technology Project Estimates
4 – 6 million votes are lost in presidential elections due to the causes shown in the table. Registration mix-ups (e.g., name not on list) and polling place operations (e.g., directed to wrong precinct) are the causes most likely to be remedied by provisional voting.

The table shows that the universe of voters who could be helped by provisional voting might be 2.5 – 3 million voters. In 2004, about 1.2 million provisional voters were counted. A rough estimate, then, of the effectiveness of provisional voting in 2004, then, might be 40% to 50% (ballots counted/votes lost)[23]. Whatever the precise figure, it seems reasonable to conclude that there is considerable room for improvement in the administration of provisional voting.

Legislative Response

Indeed, several states[24] came to the conclusion that the administration of their provisional voting procedures needed to be improved and amended their statutes after the 2004 election. State legislation adopted since the election points to particular areas of concern.

---

[23] Another interpretation of the data should be considered. The Census Bureau's Current Population Survey (CPS) developed the category of "registration mix-ups" to assess the states' registration systems. After each election the CPS asks people if they were registered and if they voted. The CPS gives breakdowns of reasons why people did not vote. Survey responders tend to deflect blame when answering questions about voting. In the narrow context of provisional ballots, 'registration problems' would cover only voters who went to the polls where the determination that they were not registered was wrong or they were registered, but in the wrong precinct. If they were in the wrong precinct, provisional voting can help them in only 17 states. In 2004, only 6.8% of those not voting and registered blamed registration problems, while 6.9% reported so in 2000.

[24] Twelve states made statutory or regulatory changes: Arizona, Arkansas, Colorado, Florida, Georgia, Indiana, Louisiana, Montana, New Mexico, North Carolina, Virginia and Wyoming. See Table 4 in Appendix 2.

Not enough time to examine and count the provisional ballots. Florida, Indiana, Virginia, and Washington all have clarified or extended the timeline to evaluate the ballots. But taking more time can prove a problem, particularly in presidential elections with the looming deadline to certify the vote for the Electoral College.[25]

Lack of uniform rules for counting ballots and effective training of the election officials in interpreting and applying those rules to determine the validity of ballots. Colorado, New Mexico, North Carolina, and Washington have all passed legislation focused on improving the efficacy and consistency of the voting and counting process.

Litigation

Successful legal challenges to the process highlight areas where provisional voting procedures were wanting. A flurry of litigation occurred around the country in October 2004 concerning the so-called "wrong precinct issue" – whether provisional ballots cast by voters in a precinct other than their designated one would be counted for statewide races. These lawsuits were largely unsuccessful in their stated goal: most courts, including the U.S. Court of Appeals for the Sixth Circuit (the only federal appeals court to rule on the issue), rejected the contention that HAVA requires the counting of these wrong-precinct provisional ballots.

This litigation was significant nonetheless.

- First, the Sixth Circuit decision established the precedent that voters have the right to sue in federal court to remedy violations of HAVA.
- Second --and significantly-- the litigation clarified the right of voters to receive provisional ballots, even though the election officials were certain they would not be counted. The decision also defined an ancillary right –the right to be directed to the correct precinct. There voters could cast a regular ballot that would be counted. If they insisted on casting a provisional ballot in the wrong precinct, they would be on notice that it would be a symbolic gesture only.
- Third, these lawsuits prompted election officials to take better care in instructing precinct officials on how to notify voters about the need to go to the correct precinct in order to cast a countable ballot – although the litigation regrettably came too late to be truly effective in this regard. In many states, on Election Day 2004, the procedures in place for notifying voters about where to go were less than ideal, reflecting less-than-ideal procedures for training poll workers on this point.

There was also pre-election litigation over the question whether voters who had requested an absentee ballot were entitled to cast a provisional ballot. In both cases (one in Colorado and one, decided on Election Day, in Ohio), the federal courts ruled that HAVA requires that these voters receive a provisional ballot. Afterwards, it is for state officials under state law to

---

[25] The resources available to evaluate and count provisional ballots within a tight schedule may not be easily available. The General Accounting Office reports that Detroit, where 1,350 provisional ballots were cast and 123 counted, found the 6-day time frame for processing provisional ballots "very challenging and unrealistic. To overcome this challenge, the *entire department's employees were mobilized to process provisional ballots.*" The report also found that in Los Angeles County, "staff had to prepare duplicate ballots to remove ineligible or invalid contests when voters cast their ballots at the wrong precinct. To overcome this challenge, staffing was increased to prepare the duplicate ballots." In a close, contested election, "duplicate" ballots would doubtless receive long and careful scrutiny." See Appendix 7, GAO, "Views of Selected Local Election Officials on Managing Voter Registration and Ensuring Eligible Citizens Can Vote," September 2005. (GAO Report-05-997)

determine whether these provisional ballots will be counted, in part by determining if these provisional voters already had voted an absentee ballot (in which case one ballot should be ruled ineligible, in order to avoid double voting). These decisions confirm the basic premise that provisional ballots should be available whenever voters believe they are entitled to them, so that their preferences can be recorded, with a subsequent determination whether these preferences count as valid votes.

RECOMMENDATIONS

Because every provisional ballot counted represents a voter who, if the system had worked perfectly, should have voted by regular ballot, the advent of statewide registration databases is likely to reduce the use provisional ballots. The one area in which such databases may not make a difference is for those who voted by provisional ballot because they did not bring required identification documents to the polling place. The statewide voter registration database will facilitate verifying that ballot, but the voter will still have vote provisionally. Beyond that exception, even with statewide registries in every state, provisional voting will remain an important failsafe, and voters should have confidence that the failsafe will operate correctly.

The wide variation in the implementation of provisional voting among and particularly within states suggests that EAC can help states strengthen their processes. Research-based recommendations for best, or at least better, practices based on the experience gained in the 2004 election can be useful in states' efforts to achieve greater consistency in the administration of provisional voting.

Recommendations for Best Practices

Recent legislative activity shows that state efforts to improve the provisional voting process are underway. Those states, as well as others that have not yet begun to correct shortcomings that became apparent in 2004, can benefit from considering the best practices described here. By recommending best practices, the EAC will offer informed advice while respecting diversity among the states. One way to strengthen the recommendations and build a constituency for them would be for EAC to ask its advisory committee members to recommend as best practices procedures that have worked in their states.

Self-evaluation of Provisional Voting –4 Key Questions

The first need to achieve greater consistency within each state is to think about provisional voting systematically. As legislators, election officials, and citizens in the states prepare for the 2006 election, they should ask themselves these questions about their provisional voting systems.

1. Does the provisional voting system distribute, collect, record, and tally provisional ballots with sufficient accuracy to be seen as procedurally legitimate by both supporters and opponents of the winning candidate? Does the tally include all votes cast by properly registered voters who correctly completed the steps required?

2. Is the provisional voting system sufficiently robust to perform well under the pressure of a close election when ballot evaluation will be under scrutiny and litigation looms?

3. Do the procedural requirements of the system permit cost-efficient operation? Are the administrative demands of the system reasonably related to the staff and other resource requirements available?

4. How great is the variation in the use of provisional voting in counties or equivalent levels of voting jurisdiction within the state? Is the variation great enough to cause concern that the system may not be administered uniformly across the state?

If the answers to these questions leave room for doubt about the effectiveness of the system or some of its parts, the EAC's recommendation of best practices should provide the starting point for a state's effort to improve its provisional voting system.

Best Practices For Each Step In The Process

We examined each step of the provisional voting process to identify specific areas where the states should focus their attention to reduce the inconsistencies noted in our analysis. We offer recommendations in each area appropriate to the responsibilities that HAVA assigns the EAC for the proper functioning of the provisional voting process.

The Importance of Clarity

The EAC should emphasize above all else the importance of clarity in the rules governing every stage of provisional voting. As the Century Foundation's recent report observed, "Close elections increasingly may be settled in part by the evaluating and counting of provisional ballots. . . To avoid post election disputes over provisional ballots—disputes that will diminish public confidence in the accuracy and legitimacy of the result– well in advance of the election, states should establish, announce, and publicize clear statewide standards for every aspect of the provisional ballot process, from who is entitled to receive a provisional ballot to which ones are counted."[26]

Litigation surrounding the 2004 election resulted in decisions that, if reflected in state statutes or regulations and disseminated in effective training for poll workers, can increase the clarity of provisional ballot procedures, increase predictability, and bolster confidence in the system. By taking the following steps, states can incorporate those court rulings into their procedures.

- Promulgate, ideally by legislation, clear standards for evaluating provisional ballots, and provide training for the officials who will apply those standards. For example, in Washington State, the court determined that an election official's failure in evaluating ballots to do a complete check against all signature records is an error serious enough to warrant recanvassing.[27] Clear direction by regulation or statute on what records to use in evaluating ballots could have saved precious time and effort and increased the reliability of the provisional voting system.

- States should provide poll workers standard information resources for the training of poll workers by local jurisdictions. Training materials might include, for example, maps or databases with instruction on how to locate polling places for potential voters who show up at the wrong place. Usable and useful information in the hands of poll workers can protect voters from being penalized by ministerial errors at the polling place.[28]

[26] The Century Foundation, Balancing Access and Integrity, Report of the Working Group on State Implementation of Election Reforms, July 2005.

[27] See *Washington State Republican Party v. King County Division of Records*, 103 P3d 725, 727-728 (Wash. 2004)

[28] See *Panio v. Sunderland* 824 N.E.2d 488, 490 (NY, 2005) See also Order, *Hawkins v. Blunt*, No.04-4177-CV-C-RED (W.D. Mo. October 12, 2004). While rejecting the notion that all ballots cast in the wrong precinct should be counted, the court ruled that provisional votes cast in the wrong precinct should be thrown out provided that the voter had been directed to the correct precinct. This meant that provisional votes cast in the wrong precinct (and even the

- State training materials provided to local jurisdictions should make clear that the only permissible requirement to obtain a provisional ballot is an affirmation that the voter is registered in the jurisdiction and eligible to vote in an election for federal office. [29] Recent legislation in Arizona indicates that recommendations should emphasize HAVA's requirement that persons appearing at the polling place claiming to be registered voters cannot be denied a ballot because they do not have identification with them. Poll workers may need appropriate training to understand their duty to give such voters a provisional ballot. [30]

A. Registration and Pre-Election Information for Voters

Providing crisp, clear information to voters before the election is important to the success of the provisional voting process. The better voters understand their rights and obligations, the easier the system will be to manage, and the more legitimate the appearance of the process. States can begin by assessing the utility and clarity of the information for voters on their websites and by considering what information might be added to sample ballots mailed to voters before elections. Best practices in this area would include:

1. If states require identification at the time of registration, the kind of IDs required should be stated precisely and clearly and be publicly and widely available in a form that all voters can understand. For example, "You must bring your driver's license. If you don't have a driver's license, then you must bring an ID card with your photograph on it and this ID card must be issued by a government agency. " [31]

2. The process to re-enfranchise felons should be clear and straightforward. To avoid litigation over the registration status of felons, best practice should be defined as making re-enfranchisement automatic, or no more burdensome than the process required for any new registrant.[32]

3. State or county websites for voters should offer full, clear information on boundaries of precincts, location of polling places, requirements for identification, and other necessary guidance that will facilitate registration and the casting of a regular ballot. An 800 number should also be provided. Models are available: the statewide databases in Florida and Michigan provide voters with provisional voting information, registration verification and precinct location information.

B. At the Polling Place

---

wrong polling place) would count if there were no evidence that the voter had been directed to a different polling place. The court placed a duty upon election officials to make sure the voters were in the correct locations. Note that this question would not arise in a state that counted ballots cast in the wrong polling place but within the correct county.

[29] *Sandusky County Democratic Party v. Blackwell,* 387 F.3d 565, 774 (6th Cir. 2004)

[30] *The Florida Democratic Party v. Hood*, 342 F. Supp. 2d 1073, 1075-76 (N.D. Fla. 2004). The court explained that provisional voting is designed to correct the situation that occurs when election officials do not have perfect knowledge and when they make incorrect determinations about eligibility (the "fail-safe" notion). Denying voters provisional ballots because of on-the-spot determinations directly contradicts this idea. Even before the cited decision, the Florida Secretary of State's office had determined that any voter who makes the declaration required by federal law is entitled to vote a provisional ballot, even if the voter is in the wrong precinct.

[31] Websites in 29 states describe, with varying degrees of specificity, the identification voters may need. In 18 states voters can learn something about the precinct in which they should vote. And in 6 states (California, District of Columbia, Kentucky, Michigan, North Carolina, and South Carolina) they can verify their registration on the website.

[32] The Century Foundation, op. cit.

Avoiding error at the polling place will allow more voters to cast a regular ballot and all others who request it to cast a provisional ballot.

1. The layout and staffing of the polling place, particularly the multi-precinct polling place is important. Greeters, maps, and prominently posted voter information about provisional ballots, ID requirements, and related topics can help the potential voters cast their ballot in the right place. States should require poll workers to be familiar with the options and provide the resources needed for them to achieve the knowledge needed to be helpful and effective. Colorado has clear regulations on polling place requirements, including HAVA information and voting demonstration display.[33] Many states require training of poll workers. In some states that requirement is recent: after the 2004 election, New Mexico adopted a requirement for poll workers to attend an "election school." [34] A state statutory requirement for training could facilitate uniform instruction of poll workers in those states that do not already provide it.

2. The provisional ballot should be of a design or color sufficiently different from a regular ballot to avoid confusion over counting, as occurred in Washington State. The ballot might include a tear-off leaflet with information for voters such as: "Reasons Why Your Provisional Ballot Might Not Be Counted" on one side and "What to Do if My Provisional Ballot Is Not Counted" on the other.

3. Because provisional ballots offer a fail-safe, supplies of the ballots at each polling place should be sufficient for all the potential voters likely to need them. In 2004, some polling places ran out of ballots, with unknown effects on the opportunity to vote. In Middlesex County, New Jersey, for example, on Election Day the Superior Court ordered the county clerk to assure that sufficient provisional ballots were available at several heavily used polling places, and it authorized the clerk "in the event additional provisional ballots are required . . .to photocopy official provisional ballots." [35] At least two states, Connecticut and Delaware, provide guidelines to local election officials on how to estimate the demand for provisional ballots. Connecticut sets the number at 1% of the voters in the district, Delaware at 6%.[36] States that do not offer a practical method to guide the supply of provisional ballots at polling places should consider doing so. The guideline should take into account both the number of voters in the district and the number of provisional ballots actually cast in recent elections.

4. To achieve the procedural clarity needed to forestall disputes, states should establish a clear chain of custody for the handling of provisional ballots from production through distribution, collection and, finally, evaluation. A number of states have clear procedures for at least parts of this chain of custody. All states should examine their chain-of-custody requirements for clarity. Illinois includes the potentially beneficial requirement that ballots be transported by bi-partisan teams, which offers the potential to avoid some charges of election fraud.

[36] Connecticut: "Equal to or not less than 1% of the number of electors who are eligible to vote in any given district, or such other number as the municipal clerk and the registrars agree is sufficient to protect voting rights. Conn. Gen. Stat. Ann. § 9-232j.Delaware: Each County Department of Elections Office is required to provide to each election district a number of provisional ballots equal to 6% of registered voters in that district, with a minimum allocation of 15 ballots. Additional supplies to be delivered when the supply becomes "very low." Del.Code Ann. Tit 15 § 4948(e).

C. Evaluating Voter Eligibility and Counting Provisional Ballots

The clarity of criteria for evaluating voter eligibility is critical to a sound process for deciding which of the cast provisional ballots should be counted. Public recognition of the validity of those criteria is important to establishing the legitimacy of the system as a whole. The experience in 2004 in North Carolina, Washington, and Ohio underlines the importance of clear criteria. As the Century Foundation report put it, "Whatever procedures the states choose [to determine if a provisional ballot should be counted], the paramount consideration—as with all others concerning provisional voting—is that they be clear and thus not susceptible to post-election manipulation and litigation."[37] Nonetheless, the *Panio v. Sutherland*[38] decision in New York shows the difficulty of defining the range of administrative errors from which the provisional voters should be held harmless. Even when the standard is "clerical error" judges can differ over what that means exactly. Possibly a state law might be able to clarify a definition by giving examples of clerical errors, but even then the definition is unlikely to be perfect.

1. State statutes or regulations should define a reasonable period for voters who lack the HAVA-specified ID or other information bearing on their eligibility to provide it in order to facilitate the state's ability to verify that the person casting the provisional ballot is the same one who registered. While there may be a concern to ensure that the individual who returns with the ID may not be the same individual who cast the provisional ballot, the spirit of HAVA demands that the opportunity to prove identity be provided after Election Day. A signature match can go far in establishing that the individual who voted and the individual returning later with identification is, in fact, the same person. Encouraging a voter who lacks ID on Election Day to return later to help the verification process by providing proper identification will strengthen the system and increase public confidence in the electoral process. Our data indicate that some voters would prefer to return with ID rather than to sign an affidavit, perhaps because of uncertainty about the legal process involved in the affidavit. At least 11 states allow voters to provide ID or other information one to 13 days after voting. Of particular interest is Kansas, which allows voters to proffer their ID by electronic means or by mail, as well as in person.[39]

2. More provisional ballots are counted in those states that verify ballots cast outside the correct precinct. [40] While HAVA arguably leaves this decision up to the states, pointing out the effect of the narrower definition on the portion of ballots counted could be useful to the states in deciding this question. States should be aware, however, of the

[39] In Kansas, the voter can provide ID to a County Election Officer any time before the County Board of Canvassers meets to count provisional ballots. KS. ST. 25-1122(d). ID can be presented in person, OR via mail or electronic means. *Id.* The Board must meet either on the Friday or Monday following a Tuesday election. *Id.* at 25-3104. Deadlines in other states are: Alabama -- 5:00 P.M. on the Monday following the election AL ST § 17-10A-2(c)_(1) Florida: until 5:00 P.M. on the third day following the election . Fla. Stat. Ann. § 101.048 (adopted after the 2004 election);Georgia—no later than 2 days after the election. GA ST § 21-2-417; 419. Illinois- 2 days to submit additional information 10 Ill. Comp. Stat. Ann. 5/18A-15(d); Indiana— in 2004 the deadline was the close of the polls IN. ST. §. 3-11.7-5-2(a). The time period was extended to 13 days by the adoption of Indiana Code 3-11-8, Section 25, Subsection (l); Maryland—until the meeting of the Election Board; MD ELEC LAW § 11-303. New Jersey— until the close of business on the second day after the election 19:53C-3(i). Nevada— until 5:00 P.M. on the Friday following the election NV ST 293.3085; New Mexico—until 7:00 P.M. on Election Day NM ADC 1.10.22 (8) (H).

[40] See Andersen, op. cit, pgs. 23 – 24 for an analysis of the significant effect of counting out-of-precinct ballots. The Election Day Survey found that, "Most notably, jurisdictions that permitted jurisdiction-wide acceptance of provisional ballots reported higher rates of provisional ballots being cast, but also reported a much higher incidence of provisional ballots being counted, than other jurisdictions."

additional burden placed on the ballot-evaluation process when out-of-precinct ballots are considered. And tradeoffs are involved if out-of-precinct voters are unable to vote for the local offices that might appear on the ballot in their district of residence. One option for states is to involve the voters in the decision by pointing out that voters who cast their provisional ballots in the wrong precinct may not be able to participate in the local election. The voter could then decide to go to the correct precinct or vote provisionally for the higher offices at the top of the ticket only.

3. Alternatively, if a state chooses to require voters to appear at their assigned precinct, where the same polling site serves more than one precinct, a voter's provisional ballot should count so long as the voter cast that ballot at the correct polling site even if at the wrong precinct within that location. [41] Ideally the voter could be directed to the correct machine, but poll worker advice will not always be correct. One way to assess the balance of issues here is to consider that, If a voter in a multi-precinct polling place is sent to the wrong machine, the error is probably the poll worker's, and the voter should not be penalized.

4. Officials should follow a written procedure, and perhaps a checklist, to identify the reason why a provisional ballot is rejected (e.g., check the applicable box "unregistered voter"; "lack of signature match" "wrong precinct," etc.) Those forms should be disclosed publicly when completed. Colorado's election rules offer particularly clear guidance to the official evaluating a provisional ballot.[42]

Colorado Rejection Codes (Any ballot given a rejection code shall not be counted):

RFS	(Rejection federal or state) No federal or state candidates or issues to duplicate.
RNS	(Rejection not signed) Provisional Ballot Affidavit not signed.
RIN	(Rejection incomplete information provided) Required information is incomplete and the designated election official is unable to confirm voter's eligibility.
RNR	(Rejection not registered) Voter did not register by the voter registration deadline or by emergency registration, Colorado voter registration record was not found, or voter was previously cancelled and has not been reinstated pursuant to 1-2-605(10). C.R.S.
REE	(Rejection envelope empty) Provisional ballot envelope is empty.
RAB	(Rejection voter voted absentee) Designated election official has confirmed that voter voted an absentee ballot.
REV	(Rejection based on ballot cast in early voting) Voter voted early.
RIP	(Rejection based on incorrect party) Incorrect Party in Primary Election.
RFE	(Rejection felon not eligible to vote) Individual was convicted of a felony and is either serving a sentence of confinement or detention or is on parole.
RWC	(Rejection elector not registered in county or State of Colorado) Non-county or non-state resident; therefore voter not eligible to vote in the county where the provisional ballot was voted.
RID	(Rejection first time voter has not supplied identification upon registration or thereafter prior to and during time voter voted) First Time Voter who

---

[41] Chances are administrative error accounts for the voter being directed to the wrong precinct under these circumstances.

[42] 8 CCR 1505-1, at 26.5.4, adopted august 4, 2005. See also 1-2-509(3) C.R.S.

registered by mail or through a voter registration drive, is tagged as id deficient, and did not provide id at the time of voting.

RRD (Rejection registration deficient) Voter had deficient or incomplete registration and required information was not provided prior to or at the time of filling in the provisional ballot envelope. Voter's eligibility cannot be established.

D. Verification of Provisional Ballots

1. States that use the information on the provisional ballot to permit voters who have changed their addresses to update their registrations should adopt clear procedures on that process and specify how the new information will be communicated between different Boards of Elections

2. In verifying provisional ballots, the time by which election officials must make their eligibility determinations is particularly important in presidential elections because of the need to certify electors to the Electoral College. States should consider in particular how to divide the time allowed them by the safe-harbor provisions that apply in presidential elections to the certification to the Electoral College. Some part of this five-week period will be consumed by the eligibility evaluation, but states should take care to provide a sufficient period of time as well for challenges. If a state consumes 21 days following the election in the eligibility evaluations, only two weeks will remain for legal challenges to be concluded. Is that sufficient? Or should the state provide the resources needed to complete the eligibility determinations in 10 days or two weeks, leaving three weeks or more for legal challenges in a close election? Our research did not identify an optimum division of the five weeks available. The prudent course here would be to encourage states to consider the issue and then make a careful decision about how to complete all steps in the evaluation of ballots and challenges to those determinations within the five weeks available.

E. Post-election Information for Voters

Timely information to voters about the disposition of their provisional ballot will provide helpful feedback and more important enable voters to determine if they are registered for future elections and, if not, what they need to do to become registered.

1. Establish mechanisms to ensure that voters casting provisional ballots are informed whether they are now registered for future elections and, if not, what they need to do to become registered.

F. State Laws Governing Litigation over Provisional Voting

1. Establish special, streamlined litigation procedures for Election Day complaints that individuals are being denied the right to cast a provisional ballot

Broader Considerations

G. Integrity and the Appearance of Integrity

1. State laws or regulations providing for non-partisan or bi-partisan bodies to make a public determination of the validity of provisional ballots would increase confidence in the system.

2. To improve transparency, state laws or regulations should require the purging process for registration to be public and with an opportunity for voters to correct an erroneous determination that they should be purged.

3. State laws or regulation should require the evaluation process for provisional ballots to be public, while protecting the names of those who voted provisionally.

H. Continuous Assessment of the Provisional Ballot -- Process and Performance

Defining what makes for a successful provisional voting system is difficult. The most successful system is probably not the one with the most provisional votes cast (that could indicate problems with the registration system). Nor is the system with the greatest number counted or with the fewest counted necessarily superior because the evaluation process could be flawed.

Defining quality requires a broad perspective about how well the system works, how open it is to error recognition and correction, and how well provisional voting processes are connected to the registration and voter identification regimes. The EAC should consider engaging one of the national quality organizations or processes, such as Six Sigma[43] or the Baldridge Quality process [44] to evaluate the provisional ballot process. Pending such a review, the EAC can recommend that states take the following actions.

1. Recognize that the first step to improving quality is to see the provisional voting process as a system and take a systems approach to regular evaluation through standardized metrics with explicit goals for performance.
2. States should begin by collecting data systematically on the provisional voting process so that they can evaluate their voting system and assess changes from one election to the next. The effort should start in the 2006 election, and the data collected should include:
    -- Provisional votes cast and counted by jurisdiction, say counties, with details on why the voter had to vote provisionally (lack of ID, not on list, challenged at polling place, issued absentee ballot, etc) and number of ballots actually counted in each category.
    -- Reasons why provisional ballots were not counted, using categories such as those that have been adopted by Colorado, described earlier in this report.
    -- Measures of variance among jurisdictions.
    -- Number of poll workers trained in administration of provisional voting by polling place
    -- Number of jurisdictions posting information on provisional voting in the polling place
    -- Time required to evaluate ballots by jurisdiction

---

[43] Six Sigma is a measure of quality that strives for near perfection. Six Sigma is a disciplined, data-driven approach and methodology for eliminating defects (driving towards six standard deviations between the mean and the nearest specification limit) in any process -- from manufacturing to transactional and from product to service.

[44] The Baldrige Criteria for Performance Excellence provide a systems perspective for understanding performance management. They reflect validated, leading-edge management practices against which any organization can measure itself. With their acceptance nationally and internationally as the model for performance excellence, the Criteria represent a common language for communication among organizations for sharing best practices. The Criteria are also the basis for the Malcolm Baldrige National Quality Award process.

Improving understanding of the provisional voting process through analysis of detailed information will enable state and local election officials to strengthen their systems. By collecting and analyzing this data states can identify which aspects of the registration and electoral system are most important in shunting voters into the provisional ballot process. Responsible officials can then look to their registration system, identification requirements or poll worker training as a way to reduce the need for voters to cast their ballots provisionally.

ATTACHMENT 1 – Data Sources for Classification of the States

Our research on provisional voting divided the various states into several categories to allow an assessment of how different factors may have influenced the process of casting and counting provisional ballots. This analysis was conducted before the release of the Election Day Study, and the categories we used may differ in some respects from its work. The variables used to analyze a state's use of provisional ballots:

1. New vs. Old (states that used a provisional ballot before the 2004 election)
2. Use of a statewide database of registered voters vs. no use of a statewide database
3. Counting out-of-precinct ballots vs. not counting out-of-precinct ballots
4. Voter identification requirements
5. Method used to verify provisional ballots
6. Levels of provisional ballots cast and counted

We first assigned states within these categories based on classifications done by Electionline.org in its studies. The Electionline data was the only published information available at the time of our research. We reviewed the Electionline data carefully, and, in select cases, updated it with new, detailed information that had become available after its publication. The changes we made are explained below.

--Idaho, Maine, Minnesota, New Hampshire, Wisconsin and Wyoming were excluded from our analysis. They have election-day registration systems, and did not need to use HAVA-compliant provisional ballots.

--North Dakota does not register voters, so it also was excluded from HAVA requirements and did not use provisional voting.

--Mississippi has not reported its provisional voting results and could not be included in our analysis, though it was compliant in 2004.

--Pennsylvania did not report its totals for the Election Day Study, but we obtained information on Pennsylvania and included it in our analysis.

New vs. Old States

We classified states as "new" or "old" based on the 2001 Electionline study of provisional voting,[45] but condensed its classifications into a single dichotomous variable, new/old with all other cases excluded. The Electionline study divided states into five categories of their use of provisional ballots in the 2000 election:

1. Use of provisional ballots (P)
2. Limited use of provisional ballots (LP)
3. Affidavit ballots (A)
4. No system in place (N)
5. Unnecessary/Not Applicable (U/NA)

We included in the list of "Old States" all states listed as using provisional ballots, limited use of provisional ballots or affidavit ballots. States in all three categories would have been familiar with key aspects of provisional voting.. States that had no provisional voting system in place for the 2002 election, and were HAVA compliant in 2004, were listed as "new" states, as 2004 would have been the first year in which they would be offering the option of provisional voting. States that were listed as unnecessary or not applicable were excluded from this study, as they

---

[45] This study can be found at: http://electionline.org/Portals/1/Publications/Provisional%20Voting.pdf.

were exempt from the HAVA regulations in 2004 because they either allowed same-day registration or did not register voters.

Rhode Island is the only state categorized as an old state by Electionline that we moved into the list of new states. Electionline's map shows Rhode Island as a state that used provisional voting in 2000, but in the state description, it is listed as having no system in place. We learned from the Rhode Island Board of Elections that the state had previously permitted potential voters to sign an affidavit if they did not appear on a precinct's list of registered voters, but felt they were registered to vote. Based on the signed affidavit, the election official would then contact a county official to see if the voter was on a more complete registration list. If the voter's name was on the complete list, that voter was permitted to cast a regular ballot. As this process did not grant the voter a provisional ballot, but served as a different type of administrative failsafe, we concluded that Rhode Island's first use of provisional voting was in 2004 and, therefore, classified the state as "new" to the system of provisional balloting.

Statewide List of Registered Voters

The Electionline preview of the 2004 Election[46] was the starting point for compiling a list of states that had a statewide database of registered voters. That study listed 34 States that did not have their statewide database systems complete, and 16 that did, including the District of Columbia. North Dakota does not register voters, so does not need to compile such a database. Electionline's criterion for concluding that a state had a statewide list was that the state have participation from all jurisdictions in a statewide system. We added Oklahoma to the list of states with statewide databases because we found it had met the Electionline criteria by the 2004 election, albeit too late for inclusion in the Electionline survey.

Out-of-Precinct Ballots

We based our classification of states that allow the counting of ballots cast outside the correct precinct on the data in the 2004 Electionline preview of the 2004 election[2]. States that evaluated ballots cast in a precinct where the voter was not registered were categorized as "out-of-precinct." States that invalidated such ballots were categorized as "In-precinct only."

[47] In Illinois, it is not clear that all counties followed this procedure. Some counties may not have counted out-of-precinct ballots.

Verification Method

We identified four different ways states assessed provisional ballots to determine if they should be counted: signature match, match voter data, signed affidavits, and bringing back identification later. We gathered information about these verification techniques by checking state websites and consulting journalistic accounts. We consulted state legislation to provide further information where needed.

Table 3

* North Carolina lacked clear standards to evaluate provisional ballots and is excluded from this analysis.

Data Collection

To assemble our data for analysis, we began by using the data on provisional votes cast and counted reported by Electionline. To increase the accuracy of this data, we surveyed each state's election websites for updated data, and for reported numbers on the county level. We then sent emails to 49 (we excluded Alaska, see below) states and the District of Columbia, requesting updated data on the number of provisional votes cast and counted by county. We received information from 25 states by our cut-off date of August 25, 2005.

Table 4

West Virginia	
26 States	**25 States**

---

[48] Alaska was not contacted via email, as the state does not have voting districts comparable to counties in other states and could not be matched with comparable census data.

[49] Maryland reported provisional ballots that were counted per county, but not number cast.

[50] Nebraska reported an incomplete list of provisional ballots cast and counted by county, but designated counties by number, rather than by name.

Data Differences

The data used in this study differ from the data reported in the Election Day Study for 19 states. The Election Day Study was not completed until well after our statistical analysis of provisional voting was finished. Where there are differences, they are typically very small, usually fewer than 100 votes either cast or counted. Of the 9 states that have differences of more than 100 votes cast or counted, 7 have reported their numbers directly to us and can be considered updated data that EDS had not obtained. For one of those states, New Mexico, EDS had incomplete data, and for another, Pennsylvania, EDS had no data at all. The data that we have collected reflects updated numbers from the states that have changed following recounts and litigation that altered how ballots were evaluated.

Table 5
Data Differences with the Election Day Study

State	EDS Numbers Cast/Counted	Our Numbers Cast/Counted	Differences	Updated Info from State?[51]
Alabama	6,478/1,865	6560/1836	82/29	No

Subject RE: Voter ID Paper --Final Draft

Karen,

Glad the paper arrived. Sorry it was a bit later than promised, but we reworked the statistical analysis on the basis of some insightful suggestions by the Peer Review Group. . .that took a few extra days (and nights). Looking back at my email to you, I realize the full statistical analysis was not attached as it should have been. It is appendix to the paper that will be of interest to those who want the details of our methodology. It is attached to this email.

I will be away, without access to email, until late Monday afternoon, but if you need to, you can reach me by cell phone at 908-794-1030.

Tom O'Neill

Analysis of Effects of Voter Identification Requirements on Turnout

Tim Vercellotti
Eagleton Institute of Politics
Rutgers University

Introduction

A key area of disagreement in the policy debate over voter identification requirements concerns how such requirements affect voter turnout. Opponents of voter identification laws argue that they constitute an institutional barrier to voting, particularly among the poor, African-Americans, Hispanics, the elderly and people with disabilities (Baxter and Galloway 2005, Electionline.org 2002, Jacobs 2005, Young 2006). This argument holds that voter identification requirements create an extra demand on voters, and thus may discourage some of them from participating in elections. Further, critics argue that requiring voters to produce some form of government-issued photo identification on Election Day is more demanding than requiring, for example, that they state their names at the polling place because of the various steps needed to procure a photo identification card. Supporters of voter identification requirements, on the other hand, argue that the requirements are necessary to combat voter fraud, safeguard the integrity of the electoral process, and engender faith in the electoral process among citizens (Young 2006).

This report examines the potential variation in turnout rates based on the type of voter identification requirement in place in each state on Election Day 2004. It draws on two sets of data – aggregate turnout data at the county level for each state, as compiled by the Eagleton Institute of Politics, and individual-level survey data included in the November 2004 Current Population Survey conducted by the U.S. Census Bureau. Classification of voter identification requirements comes from a review of state statutes conducted by the Moritz College of Law at the Ohio State University.

Types of voter identification requirements

Each state is classified as having one of five types of identification requirements in place on Election Day 2004. Upon arrival at polling places, voters had to either: state their names (nine states); sign their names (13 states and the District of Columbia); match their signature to a signature on file with the local election board (eight states); provide a form of identification that did not necessarily include a photo (15 states); or provide a photo identification (five states).[1] It was then possible to code the states according to these requirements, and test the assumption that voter identification requirements would pose an increasingly demanding requirement in this order: stating one's name, signing one's name, matching one's signature to a signature on file, providing a form of identification, and providing a form of photo identification.

But election laws in numerous states offer exceptions to these requirements if individuals lack the necessary form of identification. Laws in those states set a minimum standard that a voter must meet in order to vote using a regular ballot (as opposed to a provisional ballot). Thus

---

[1] Oregon conducts elections entirely by mail. Voters sign their mail-in ballots, and election officials match the signatures to signatures on file. For the purposes of this analysis, Oregon is classified as a state that requires a signature match.

it is also possible to categorize states based on the minimum requirement for voting with a regular ballot. In 2004 the categories were somewhat different compared to the maximum requirement, in that none of the states required photo identification as a minimum standard for voting with a regular ballot. Four states, however, required voters to swear an affidavit as to their identity (Florida, Indiana, Louisiana, and North Dakota). The five categories for minimum requirements were: state name (12 states), sign name (14 states and the District of Columbia), match one's signature to a signature on file (six states), provide a non-photo identification (14 states), or swear an affidavit (four states). This analysis treats the array of minimum identification requirements also in terms of increasing demand on the voter: state name, sign name, match signature, provide non-photo identification, and, given the potential legal consequences for providing false information, swearing an affidavit.

Analysis of aggregate data

If one treats maximum voter identification requirements as an ordinal variable, with photo identification as the most demanding requirement, one finds some statistical support for the premise that as the level of required proof increases, turnout declines. Averaging across counties in each state, statewide turnout is negatively correlated with voter identification requirements ($r = -.21$, $p < .0001$). In considering the array of minimum requirements, with affidavit as the most demanding requirement, voter identification also is negatively correlated with turnout ($r = -.16$, $p < .0001$). Breaking down the turnout rates by type of requirement reveals in greater detail the relationship between voter identification requirements and voter turnout.

[Table 1 here]

Differences in voter turnout at the state level in 2004 varied based on voter identification requirements.[2] Taking into account the maximum requirements, an average of 63.1 percent of the voting age population turned out in states that required voters to state their names, compared to 57.3 percent in states that required photo identification. A similar trend emerged when considering minimum requirements. Sixty-one percent of the voting age population turned out in states requiring voters to state their names, compared to 58.7 percent in states that required an affidavit from voters. While the trend is not perfectly linear, there is a general movement toward lower turnout as requirements tend toward requiring greater levels of proof.

Voter identification requirements alone, however, do not determine voter turnout. Multivariate models that take into account other predictors of turnout can place the effects of voter identification in a more accurate context. I estimated the effects of voter identification requirements in multivariate models that also took into account the electoral context in 2004 and demographic characteristics of the population in each county. To capture electoral context I included whether the county was in a presidential battleground state (any state in which the

---

[2] Voter turnout is defined here as the percentage of the adult voting-age population that voted in November 2004, based on county vote totals reported by the states and U.S. Census population projections for the counties from 2003. McDonald and Popkin (2001) contend that using the voting-age population to calculate turnout understates turnout for a number of reasons. They point out that voting-age population estimates include adults who are ineligible to vote (such as convicted felons), and the estimates overlook eligible citizens living overseas. While estimates of the voting-eligible population are available at the state level, I was unable to find such estimates for individual counties, which provide the unit of analysis for the aggregate data analyzed here.

margin of victory for the winning candidate was five percent or less), and whether the county was in a state with a competitive race for governor and/or the U.S. Senate (also using the threshold of a margin of victory of five percent or less). Drawing from U.S. Census projections for 2003, I included the percentage of the voting-age population in each county that was Hispanic or African-American to control for ethnicity and race. I controlled for age using the 2003 Census projection for the percentage of county residents age 65 and older, and I controlled for socioeconomic status by including the percentage of individuals who fell below the poverty line in each county in the 2000 Census.

I estimated a series of random intercept models to account for the likelihood that data from counties were correlated within each state (for further explanation of random intercept and other multilevel models, see Bryk and Raudenbush 1992, Luke 2004, Singer 1998).[3] The dependent variable in each model was voter turnout at the county level, with turnout calculated as the percentage of the voting-age population that voted in the 2004 election.

[Table 2 here]

Turning first to an analysis using the maximum identification requirements, those requirements had a small and negative effect on turnout in 2004 controlling for electoral context and demographic factors. Both contextual factors (whether the county was in a state that was a battleground state and whether that state had a competitive race for governor and/or U.S. Senate) increased voter turnout. As the percentage of senior citizens in the county increased, so did turnout. The percentage of African-Americans in the county had no effect, but the percentage of Hispanic adults exerted a negative effect on voter turnout, as did the percentage of individuals living below the poverty line.

I then sought to test the hypothesis that voter identification requirements dampen turnout among minorities and the poor, a claim voiced by some critics of the requirements. To test this idea I incorporated a series of interactions between the maximum voter identification requirements and the percentage of African-Americans, Hispanics, and poor individuals in the counties. The interaction involving African-Americans was not significant, but those involving Hispanics and poor individuals were significant.[4] Thus voter identification requirements have a greater effect for Hispanics and those living below the poverty line. A chi-square test of the difference in the deviance for each model (represented by -2 log likelihood in Table 2), shows that the model with interactions provides a better fit to the data ($p = 0.0003$).

I also estimated the effects of the minimum voter identification requirements holding constant the effects of electoral context and the demographic variables.

---

[3] The data analyses provided evidence that there was, indeed, a clustering of data within each state. The intraclass correlation, bounded by 0 and 1, measures the variation between the states. A random intercept model using only the intercept as a predictor generated an intraclass correlation of .40, indicating considerable variation between the states.

[4] The interactions are labeled in Tables 2 and 3 as VID*African-American, VID*Hispanic, and VID*Poverty. To calculate the effects of voter identification requirements for a specific group, one must add the estimates for voter identification, the group, and the interaction. Doing so for Hispanic adults results in an estimate of -0.36 [-0.04 (voter id) - 0.38 (Hispanic) + 0.06 (voter id X Hispanic)].

[Table 3 here]

The effects of the minimum requirements are not statistically significant (p = 0.15). The battleground state variable continues to exert a positive influence on turnout, while the presence of a competitive race for governor and/or U.S. Senate has no statistically significant effect. As in the maximum identification requirements models, as the percentage of the population that is Hispanic or poor increases, turnout declines. As the percentage of elderly increases, so does turnout. The proportion of African-Americans in the population does not affect turnout. Adding interactive effects to the model results in a statistically significant and negative effect of minimum voter identification requirements on turnout. But one must interpret this estimate with caution. A chi-square test for the difference in fit between the two models shows no significant difference (p = 0.08), and thus no improvement to the fit when adding the interactions between voter identification requirements and the percentages of the county that is Hispanic or lives below the poverty line.

Analysis of the aggregate data at the county level generates some support for the hypothesis that as the burden of voter identification requirements increases, turnout declines, at least in the case of the maximum requirements. This is particularly so for counties with concentrations of Hispanic residents or individuals who live below the poverty line. But aggregate data cannot fully capture the individual demographic factors that may figure into the decision to turn out to vote. For example, previous research has found that education is a powerful determinant of turnout (Wolfinger and Rosenstone 1980, but see also Nagler 1991). Married individuals also are more likely to vote than those who are not married (Alvarez and Ansolabehere 2002; Alvarez, Nagler and Wilson 2004; Fisher, Kenny, and Morton 1993). To fully explore the effects of voter identification requirements on turnout, it is important to examine individual-level data as well.

Individual-level analysis

Individual-level turnout data exists in the November 2004 Current Population Survey conducted by the U.S. Census Bureau. The Census Bureau conducts the CPS monthly to measure unemployment and other workforce data, but the bureau adds a battery of voter participation questions to the November survey in even-numbered years to coincide with either a presidential or midterm-Congressional election.

One of the advantages of the CPS is the sheer size of the sample. The survey's Voting and Registration Supplement consisted of interviews, either by telephone or in person, with 96,452 respondents.[5] The large sample size permits analyses of smaller groups, such as Black or Hispanic voters or voters with less than a high school education. The analyses reported here are based on reports from self-described registered voters. I omitted those who said they were not registered to vote. I also excluded those who said they cast absentee ballots because the

---

[5] It is important to note that the Census Bureau allows respondents to answer on behalf of themselves and others in the household during the interview. While proxy reporting of voter turnout raises the possibility of inaccurate reports concerning whether another member of the household voted, follow-up interviews with those for whom a proxy report had been given in the November 1984 CPS showed 99 percent agreement between the proxy report and the information given by the follow-up respondent (U.S. Census Bureau 1990).

identification requirements for absentee ballots may differ from those required when one votes in person. In addition, I eliminated from the sample respondents who said they were not U.S. citizens.

It is important to note here that the voter turnout rate for the CPS sample is much higher than the turnout rates presented in the aggregate data analysis. The U.S. Census Bureau reported that 89 percent of registered voters in the CPS sample said they voted (U.S. Census Bureau 2005). Turnout among the voting-age population was 58 percent in 2004, according to the aggregate data analysis. The difference is a result of several factors. One factor consists of the different denominators in calculating the turnout rate – registered voters versus the much larger voting-age population. Also, previous research has shown that, generally speaking, some survey respondents overstate their incidence of voting. Researchers speculate that over-reports may be due to the social desirability that accompanies saying one has done his or her civic duty, or a reluctance to appear outside the mainstream of American political culture (U.S. Census Bureau 1990). It is also possible that voting is an indication of a level of civic engagement that predisposes voters to agree to complete surveys at a higher rate than non-voters (Flanigan and Zingale 2002). Hence the voter turnout rates reported in the CPS tend to be much higher than the actual turnout rate for the nation (Flanigan and Zingale 2002). Even with this caveat, however, the CPS serves as a widely accepted source of data on voting behavior.

The dependent variable in these analyses is whether a respondent said he or she voted in the November 2004 election. In addition to the voter identification requirements, the models include two other state-level factors that might have influenced turnout in 2004: whether the state was considered a battleground state in the presidential election, and whether there was a competitive gubernatorial and/or U.S. Senate race in the state (see Alvarez and Ansolabehere 2002, Alvarez et al. 2004, and Kenny et al. 1993 for similar approaches). As in the aggregate analysis, the threshold that determined whether the state was a battleground state or had a competitive statewide race was a margin of victory of five percent or less. At the individual level, I controlled for gender, age in years, education, household income, and dummy variables representing whether a voter was Black/non-Hispanic, Hispanic, or another non-white race (with white/non-Hispanic voters as the omitted category for reference purposes). Drawing on previous research on voting behavior, I also controlled for whether an individual was employed, or at least a member of the workforce (as opposed to being a full-time student, a homemaker, or retired). Both employment and workforce membership have been shown to be positive predictors of turnout (see Mitchell and Wlezien 1995). Marital status, whether one is a native-born citizen and residential mobility also have emerged as significant predictors of turnout (Alvarez and Ansolabehere 2002, Alvarez et al. 2004, Kenney et al. 1993, Wolfinger and Rosenstone 1980). I included in the model variables for whether a respondent was married (coded 1 if yes, 0 otherwise), and whether one was a native-born citizen (coded 1 if yes, 0 otherwise). I measured residential mobility by coding for whether the respondent had moved to a new address in the six months prior to the interview (coded 1 if yes, 0 otherwise).

Results

The dependent variable is whether a respondent said he or she voted in the November 2004 election (coded 1 for yes, 0 for no). I estimated models using probit analysis, and estimated robust standard errors to control for correlated error terms for observations from within the same state.

[Table 4 here]

The two models in Table 4 use either the maximum or minimum voter identification requirements in each state. The two models generate virtually identical results. Voter identification requirements exert a statistically significant, negative effect on whether survey respondents said they had voted in 2004. Of the other state factors, only the competitiveness of the presidential race had a significant effect on turnout. In terms of demographic influences, African-American voters were more likely than white voters to say they had cast a ballot, while those of other non-white races were less likely than white voters to say they had turned out. Hispanic voters were not statistically different from white voters in terms of reported turnout. Consistent with previous research, age, education, income, and marital status all were positive predictors of voting. Women also were more likely to say they voted than men. Those who had moved within six months before the interview were less likely to say they had voted.

While the probit models provide statistical support for the influence of voter identification requirements and other variables on turnout, probit coefficients do not lend themselves to intuitive interpretation. Another common approach in studies of election requirements is to examine how the predicted probability of voter turnout would vary as election requirements vary. I used the probit coefficients to calculate the predicted probability of voting at each level of voter identification requirements while holding all other independent variables in the models at their means.[7] I calculated the probabilities taking into account both maximum and minimum requirements, with photo identification serving as the most demanding of the maximum requirements and affidavits as the most demanding minimum requirement.

[Table 5 here]

Allowing the voter identification requirement to vary while holding constant all other variables in the model showed that the predicted probability of turnout ranged from 91.2 percent if all voters had to state their names to 88.7 percent if all voters had to provide photo identification under the maximum requirements. In other words, the probability of voting dropped with each level of voter identification requirement, with a total drop of 2.5 percent across the five types of identification. When taking into account the minimum requirement for identification, the probability showed a similar decline, with a slightly larger total drop of 3.3 percent.

Among the key variables of interest in the debate over voter identification requirements are race, age, income, and education. Given the large sample size (54,973 registered voters), it was possible to break the sample into sub-samples along those demographic lines to explore

---

[7] In the case of dichotomous independent variables, holding them at their mean amounted to holding them at the percentage of the sample that was coded 1 for the variable (Long 1997).

variation in predicted probability by group. I disaggregated the sample by the variable of interest (such as race, for example), omitting that variable while I re-ran the probit model with the remaining predictors of voter turnout, including the voter identification requirements.[8] If the analysis showed that the voter identification requirements had a statistically significant effect on turnout, I used the probit coefficients from the model to calculate the predicted probability of voting for each group across the five requirements while holding the other variables in the model constant.

[Table 6 here]

Both the maximum and minimum identification requirements had negative and statistically significant effects for white voters. Allowing the requirements to vary from stating one's name to providing photo identification or an affidavit showed drops of 2.5 percent and 3.3 percent respectively in the predicted probability of voting. The identification requirements had no effect on the probability of African-Americans voting, but the minimum identification requirements had a comparatively sizable effect on voter turnout among Hispanics. The predicted probability of Hispanics voting ranged from 87 percent if stating one's name would be the required form of identification to 77.3 percent if a voter would have to provide an affidavit in order to vote, a difference of 9.7 percent.

The effects of voter identification requirements also varied by age, with the greatest variation occurring among voters ages 18 to 24.

[Table 7 here]

Voters in that age group had a predicted probability of 83.9 percent if the maximum requirement would be to state one's name, and the probability drops 8.9 percentage points if voters would have to provide photo identification. The range was from 83.1 percent to 75.4 percent under the minimum requirements. The gap in probability narrowed in older age groups (4.8 percent for the maximum requirements and 5.8 percent for the minimum requirements for those ages 25 to 44; 1.8 percent for the minimum requirements for those ages 45 to 64, and 2.4 percent for the minimum requirements for those ages 65 and older).

Variation also emerged along the lines of income, with the effects of voter identification requirements varying to a greater extent for voters in households below the poverty line compared to those living above the poverty line.[9]

[Table 8 here]

While the maximum set of requirements did not have a statistically significant effect for voters living below the poverty line, the minimum set of requirements had a significant and negative effect. The probability of voting was .784 for poor voters if they would have to identify

---

[8] See Nagler 1991 for a similar approach in analyzing the effects of registration closing dates broken down by education levels.

[9] I coded respondents as being above or below the U.S. Census Bureau's 2004 poverty line based on respondents' reported annual household income and size of the household.

themselves by giving their name, and the probability declined to .731 if they would have to provide an affidavit attesting to their identity. Both the maximum and minimum sets of requirements had a significant and negative effect on voters living above the poverty line, but the difference in probability across the effects was narrower (2.3 percent for the maximum requirements and 3.1 percent for the minimum requirements).

The effects of voter identification requirements varied across education levels as well, with those lowest in education demonstrating the widest variation in probabilities as identification requirements ranged from least to most demanding.

[Table 9 here]

Registered voters who had less than a high school education had a 77.5 percent probability of voting if the maximum requirement would be stating one's name, and a 70.8 percent probability if they would have to provide photo identification under the maximum requirement, a difference of 6.7 percent. The difference from the lowest to the highest requirement among the minimum requirements was 7.4 percent. The difference in probabilities ranged from 3.3 percent for the maximum requirements to 4.5 percent for the minimum requirements for voters with a high school diploma. The range of effects of voter identification requirements was smaller among those with higher levels of education (and non-existent for one category – voters with some college education).

Discussion and conclusion

The results presented here provide evidence that as the level of demand associated with voter identification requirements increases, voter turnout declines. This point emerged from both the aggregate data and the individual-level data, although not always for both the maximum and minimum sets of requirements. The overall effect for all registered voters was fairly small, but even a slight decline in turnout has the potential to alter the outcome of a close election.

The effects of voter identification requirements were more pronounced for specific subgroups. Hispanic voters and the poor appear to be less likely to vote if the level of required identification becomes more demanding, according to both the aggregate and the individual-level data. In the individual-level data, for Hispanic voters, the probability of voting dropped by 9.7 percent across the various levels of minimum identification requirements. Survey respondents living in poor households would be 5.3 percent less likely to vote as the requirements vary from stating one's name to attesting to one's identity in an affidavit.

Effects of voter requirements also varied with education. Registered voters who had not graduated from high school would be 6.7 percent less likely to vote if the maximum requirement is photo identification as opposed to stating one's name. When considering the minimum requirements, those with less than a high school education would be 7.4 percent less likely to say they voted if the requirement was an affidavit as opposed to stating one's name. Age was also a key factor, with voters ages 18 to 24 being 7.7 percent to 8.9 percent less likely to vote as the requirements ranged from stating one's name to providing a photo identification or affidavit.

Two concerns aired by critics of voter identification requirements were not borne out by the results. African-American voters did not appear to be affected by voter identification requirements, according to both the aggregate data and individual-level data analyses. Also, the elderly, while they would be slightly less likely to vote as requirements range from least to most demanding, would not necessarily be affected in the dramatic manner predicted by some opposed to photo identification requirements in particular.

In examining the effects of voter identification requirements on turnout, there is still much to learn. The data examined in this project could not capture the dynamics of how identification requirements might lower turnout. If these requirements dampen turnout, is it because individuals are aware of the requirements and stay away from the polls because they cannot or do not want to meet the requirements?[10] Or, do the requirements result in some voters being turned away when they cannot meet the requirements on Election Day? The CPS data do not include measures that can answer these questions, pointing up the need for collection of additional data. Knowing more about the "on the ground" experiences of voters concerning identification requirements could guide policy-makers at the state and local level in determining whether and at what point in the electoral cycle a concerted public information campaign might be most effective in helping voters to meet identification requirements. Such knowledge also could help in designing training for poll workers to handle questions about, and potential disputes over, voter identification requirements.

---

[10] The individual-level data offer some insight here. If advance knowledge of the voter identification requirements were to dampen turnout, it is reasonable to expect that advance knowledge of those requirements also could discourage some individuals from registering to vote. I ran the same probit models using voter registration as the dependent variable (coded 1 if the respondent said he or she was registered, and 0 if the respondent was not registered). Neither the maximum nor minimum array of voter identification requirements had a statistically significant effect on the probability that a survey respondent was registered to vote.

Figures represent the predicted probability of registered voters saying they voted as the identification requirement varies from the lowest to the highest point in the scale, with all other variables held constant. Maximum and minimum voter identification requirements were not a significant predictor of voting for those with some college education.

Subject Voter ID Paper --Final Draft

Karen,

Attached is the final draft of the Voter ID paper, with recommendations for the EAC to consider promulgating as best practices. Two appendices are included as part of the draft and a third, the statistical analysis of the effects of different voter ID requirements on turnout, is attached separately to this email.

We look forward to discussing this final draft with you and with the commissioners on April 3. I'll be preparing a Powerpoint presentation for that meeting. Any guidance you can give me later this month on particular questions that briefing should address would be appreciated.

The Moritz-Eagleton team will be meeting next Tuesday at 9:30 a.m.. If you have preliminary comments you would like us to consider, that meeting would be a most convenient occasion to discuss them.

Tom O'Neill

REPORT AND RECOMMENDATIONS TO THE EAC VOTER IDENTIFICATION ISSUES

1. Introduction and Report Background

This report to the United States Election Assistance Commission (EAC) presents recommendations for best practices to improve implementation of the requirements for voters to show identification pursuant to [statute or regulation citation] It is based on research conducted by the Eagleton Institute of Politics at Rutgers, the State University of New Jersey, and the Moritz College of Law at Ohio State University under contract to the EAC, dated May 24, 2005. The research included a review and legal analysis of state statutes, regulations and litigation concerning voter identification and provisional voting, a sample survey of local election officials, and a statistical analysis of the effects of various requirements for voter identification on turnout in the 2004 election. This report is a companion to a report on Provisional Voting submitted to the EAC on November 28, 2005 under the same contract.

The Help America Vote Act of 2002 (HAVA) (Public Law 107-252) authorizes the EAC (SEC. 241, 42 USC 15381) to conduct periodic studies of election administration issues. The purpose of these studies is to promote methods for voting and administering elections, including provisional voting, that are convenient, accessible and easy to use; that yield accurate, secure and expeditious voting systems; that afford each registered and eligible voter an equal opportunity to vote and to have that vote counted; and that are efficient.

2. Voter Identification –Background and Approach of the Study

Voters may have to identify themselves twice in the electoral process: when registering to vote and then when casting a ballot. The burden of providing required ID documents on the voter may be greater at the polls on Election Day than at the time of registration. The burden of checking ID, even as simple as a signature match, can be much greater on election workers at the polls than on those registering voters. Poll workers may be faced with long lines and limited time. This analysis focuses on ID requirements on Election Day, but with an appreciation that the ID requirements at time of registration and on Election Day are inter-related. [1] The emphasis here is on Voter ID on Election Day and afterwards as election judges evaluate provisional

---

[1] As the Carter-Baker Commission noted, photographic ID requirements for in-person voting do little to address the problem of fraudulent registration by mail, especially in states that do not require third-party organizations that register voters to verify identification. Commission on Federal Election Reform, pp 46-47.

ballots. This is the critical period for the electoral system, the time when ballot access and ballot security are in the most sensitive balance.

This analysis takes a view of voter ID issues broader than the rather narrow identification requirements in HAVA. Much of the national ferment over voter ID goes beyond HAVA to require more rigorous documentation of identity for all would-be voters, not just those casting a ballot for the first time who had not registered in person. The controversy in the states over voter ID stems from the HAVA requirements, goes beyond those requirements, and sets the context for the analysis here.[2]

Identification is often described as the critical step in protecting the integrity of the ballot, the process that ensures that the potential voter is eligible and permitted to cast a ballot and one ballot only. In fact, ensuring ballot integrity requires a perspective that takes in the entire voting process. Protecting the integrity of the ballot requires more than preventing the ineligible from voting. It also should ensure that all those who are eligible and want to vote can cast a ballot that counts, and that they can effectively cast a ballot for the candidate of their choice. The protection effort must take into account all forms of voting, including absentee ballots, and embrace each step in the process. A voting system that establishes onerous requirements for voters to identify themselves may prevent the ineligible from voting, but it may also prevent the eligible from casting a ballot. If the ID requirements of a ballot protection system block ineligible voters from the polls at the cost of preventing eligible voters who cannot obtain or forget to bring to the polls the required forms of identification, the integrity of the ballot may not have been improved; the harm may be as great as the benefit.

Assessing the effectiveness of voter ID as a way to protect the integrity of the ballot should logically include an estimate of the nature and frequency of vote fraud. This analysis does not include consideration of the incidence of vote fraud, the forms that it takes, nor the possible effectiveness of various voter ID regimes to counter attempts at vote fraud. The EAC has commissioned a separate study of vote fraud and instructed us not to address that issue in this research.

---

[2] Harvard Law Review 119:1127. "Legislators hoping to stiffen their state antifraud laws have taken their cue from identification provisions buried in HAVA. . . . HAVA makes explicit that it shall not 'be construed to prevent a State from establishing election technology and administration requirements that are more strict than' HAVA itself provides. The states have accepted the invitation. "

Nonetheless, a broad view of ballot integrity is needed to appreciate the background and context of this narrower study. We explore the inter-relationships between Voter ID requirements and Provisional Voting and estimate the effects of various voter id requirements on turnout and on the casting of provisional ballots.

Voters lacking required ID, or who have ID that does not reflect their current address, may be able to vote only by casting a provisional ballot.[3] To the extent that stricter voter ID requirements divert more voters to the provisional ballot, voter ID requirements can put stress on the already pressured management of the polling place. Administering provisional ballots is more expensive than the normal ballot. Scrutiny of ID can create lines at the polling places, lines made longer as voters are diverted to the provisional voting line. Each of these potential consequences of more elaborate voter identification processes can increase the chance of litigation. Long lines will, at best, discourage voters and at worst make voting seem a hassle that will keep more citizens from the polls. A review of voter identification practices should keep in mind that America's problem may well be that too many people do not vote rather than that a few people may vote more than once.

An evaluation of the effect of different Voter ID regimes will be more effective if based on clear standards --legal, equitable, practical. The standards suggested here can best be described as the set of questions to be asked about Voter ID requirements. We suggest 7 questions that try to measure the most important dimensions of the problem.

- Is the Voter ID system designed on the basis of valid and reliable, empirical studies of the incidence of the sorts of vote fraud it is designed to prevent?
- How effective is the ID requirement in increasing the security of the ballot? How well can it be coordinated with a statewide voter database?[4]
- How practical is the requirement? Can it be administered smoothly by the staff and budget likely to be made available? How much additional training of polling place workers might be required? Is it simple enough or can it be defined with sufficient clarity

---

[3] For example, the Florida voter ID law adopted after the 2004 election and pre-cleared by the Department of Justice, permits voters who cannot meet the ID requirements to sign an affidavit on the envelope of a provisional ballot, which will be counted if the signature matches that on the voter's registration form.

[4] See the final section of this report for a brief overview of possible effects of a statewide voter database on voter identification issues.

that poll workers throughout the state can administer it uniformly and with a minimum of local interpretation made on the fly under the pressure of Election Day?[5]

- How cost-effective is the system? Does it increase the security of the ballot at an affordable cost, measured in both monetary and other costs? To improve understanding of the non-monetary component of the costs, conducting a voter impact study might be appropriate. The voter impact study would examine, before the adoption of the regulation, the cost of compliance by the voter (such as the cost in time and money of acquiring a photo ID card), any offsetting benefits to voters, and the possible disparate effects of the regulation on various groups of voters.
- If a side effect of the Voter ID regulation is likely to reduce turnout, generally or among particular groups, is it possible to take other steps to ameliorate the adverse consequences?[6]
- Does it comply with the letter and spirit of Voting Rights Act?
- The seventh question is more difficult to measure than those described in the 6 questions outlined above. The Voter ID requirements should have a neutral result on the composition of the qualified electorate. That is, those requirements should not be designed to reduce the turnout of particular groups of voters who may have a propensity to support one party over another. Whatever the requirement may be, all citizens should be able to comply with it easily and at no or minimal cost.

Summary of findings and conclusions

Voter turnout at the state level in 2004 declined where voter identification requirements were more demanding. While the trend is not perfectly linear, the data show a general movement toward lower turnout as requirements tend toward requiring greater levels of proof. An average of 63.1 percent of the voting age population turned out in states that required voters to state their names, compared to 57.3 percent in states that required photo identification. Including other factors beyond voter id requirements diminishes the influence of voter ID on turnout. But the analysis still offers some support for the hypothesis that as the burden of voter identification

---

[5] In New York, in 2004, disparities in training and voting information were made all too apparent in a study finding elections officials had wildly varying interpretations of what the state's voter identification requirement was. Tova Wang, "Warning Bell in Ohio," December 5, 2005. Website, the Foundation for National Progress.

[6] For example, the Carter-Baker Commission accompanied its recommendation for a national voter ID card with a recommendations for an affirmative effort by the states to reach out and register the unregistered, to use the new Voter ID regime as a means to enroll more voters.

requirements increases, turnout declines. The effect is particularly noticeable in counties with concentrations of Hispanic residents or of people living below the poverty line.

Evidence on the incidence of vote fraud, especially on the kind of vote fraud that could be reduced by requiring more rigorous voter identification is not sufficient to evaluate the tradeoffs between ensuring ballot access and ensuring ballot integrity. The lack of full understanding of the dynamics of voter ID requirements on political participation can be remedied by requiring the collection and reporting of data on the reasons potential voters are required to cast a provisional ballot and the reasons for rejecting provisional ballots. Also useful would be the results of exit polling of voters on their experiences in meeting voter ID requirements and on what type of ballot they cast.[7] And, of course, more information is needed on the incidence and varieties of vote fraud, but that inquiry is outside the scope of this report.

Recommendations for consideration and action by the EAC

The EAC should consider the following actions to improve understanding of the relationship between voter ID requirements, broadly defined, and the two important goals of ensuring ballot access and ensuring ballot integrity.

- Encourage or sponsor further research to clarify the connection between Voter ID requirements and the number of potential voters actually able to cast a ballot.
- Recommend as a best practice that before states adopt a change described as increasing ballot security, states should publish an analysis of the number of eligible, potential voters that the new requirement may keep away from the polls or be permitted to cast only a provisional ballot as well as an estimate of the number of ineligible voters who will be prevented from voting.
- Encourage or require the states in the 2006 election and beyond, to collect and report reliable, credible information on the relationship between ballot access and ballot security. The data should be analyzed to provide a sound estimate of the incidence of the kinds of vote fraud that more stringent ID requirements may prevent and should describe the dynamics of voter ID in preserving the security of the ballot?

---

[7] Arizona held its first election with new, stricter ID requirements on March 14, 2006. In at least one county (Maricopa) election officials handed a survey to voters that asked if they knew about the voter identification law and if they did, how they found out about it. Edythe Jensen, "New Voter ID Law Goes Smoothly in Chandler," *Arizona Republic*, March 15, 2006. More surveys of this kind can illuminate the dynamics of voter ID and voting in ways not possible with the current lack of information on this subject.

  - Useful information could be supplied by exit polling. It would identify those who had cast a provisional ballot and ask why they were unable to cast a regular ballot. Answers would illuminate the frequency with which ID issues divert voters into the provisional ballot line.
  - Polling to ask voters what they know about the voter id requirements would also provide useful context for evaluating the effect of various voter id requirements on electoral participation.
- Encourage states to examine the time period allowed for voters who cast a provisional ballot because they lacked required ID to return with their identification. In eleven states, voters who had to cast a provisional ballot because they lacked the ID required for a regular ballot were permitted to return later with their ID. Their provision of this ID is the critical step in evaluating the ballots. The length of the period in which the voter may return with ID is important. In setting the time period for return, which now varies among the states from the same day to about two weeks, states should consider three criteria: the convenience of the voter, the total time allowed to evaluate ballots[8], and the safe harbor provision in presidential elections.

---

[8] Our research on provisional voting reveals that states that provide more than week to evaluate provisional ballots end up counting substantially more of those ballots than states that provide less than a week.

3. Voter ID and Turnout

As of the 2004 election, the states and the District of Columbia could be divided into 5 different Voter ID regimes. These are shown in Table 1, *Voter ID Requirements.* Nine states required that voters give their names; 14 that they sign their names; 8 match the signature to a sample in the registration book; 15 require some form of ID (ranging from a utility bill to a government-issued photo ID), and 5 states in 2004 required a photo ID, although in all those states voters without that credential could cast a regular ballot after signing an affidavit concerning their identity and eligibility.

TABLE 1 -- Voter ID Requirements

State	Forms of ID Required 2004	Current ID Requirement for First-Time Voters	Current ID Requirements for All Other Voters	Verification Method for Provisional Ballots

^In Florida and Louisiana, states that required a photo id in 2004, voters without that credential could sign an affidavit concerning their identity and eligibility and cast a regular ballot.

^^In these states in 2004, voters lacking a photo ID could vote by providing other ID.

*Arizona voters who lack a photo ID may present 2 forms of ID with no photograph, such as 2 utility bills.

**State only requires ID for first-time voters who register by mail without providing ID. They accept all forms of ID listed in the statute.

***Georgia is currently enjoined from implementing this law, returning them for the time being to their 2004 requirement of provide ID.

****Pennsylvania requires ID of all first-time voters, whether they registered by mail or in-person.

*****Tennessee voters must provide signature and address. In counties without computerized lists, the signature is compare to the registration card. In counties with computerized lists, the signature is compared to a signature on ID presented with registration.

******Texas voters must present a current registration certificate. Those without a certificate can vote provisionally after completing an affidavit.

In 9 states, voters were required merely to state their names so that poll workers could locate them in the registration book. In 14 states, voters signed their names. In 8 states, voters' signatures were matched with a specimen signature. In 15 states voters had to show some form of ID, not necessarily an official picture ID. And in 5 states, voters were required to show an official photo ID, although in 2004 voters who lacked a picture ID could execute an affidavit and vote a regular ballot.

This neat assignment of each state to one of a few categories may fail to reflect actual practice at a polling place. Like any system run by fallible people it is subject to wide variation in practice. Voters may be confronted with demands for identification at variance with state statutes or legislation. Other voters may be waved through the process without a look at any document, no matter what the regulations may say. Under the press of long lines and unfamiliar requirements, there is, in short, no sure way to report the wide variety of conditions voters may encounter.

It is not practical to attempt to capture the wide variety of how voter ID requirements may be actually implemented across the nation's tens of thousands of polling places. Recognizing that means that the analysis of the effect of state requirements on county-level turnout must be viewed with some caution.

Effect of Voter ID requirements on Turnout

Summary of Findings and Conclusions

We categorized each state according to its voter ID requirements in 2004, as shown in Table 1 and analyzed turnout data for each county according to the voter identification requirements of its state. We also assessed self-reported turnout by the sample interviewed in the November 2004 Current Population Survey of the Census Bureau. [9]

Voter turnout at the state level in 2004 varied based on voter identification requirements. An average of 63.1 percent of the voting age population turned out in states that required voters to state their names, compared to 57.3 percent in states that required photo identification. Other factors, of course, also influence turnout. Taking those other factors into account in the county-level analysis makes the effect of the voter ID requirement less dramatic. But the analysis still offers some support for the hypothesis that as the burden of voter identification requirements increases, turnout declines. The effect is particularly noticeable in counties with concentrations of Hispanic residents or of people living below the poverty line.

The individual-level analysis, based on the CPS, produced a similar result. Voter identification requirements exert a statistically significant, negative effect on whether survey respondents said they had voted in 2004. The probability that a respondent to the survey voted dropped with each

---

[9] See Appendix ___ for the full report on voter ID and turnout.

level of voter identification requirement, with a total drop of 2.5 percent across the five types of identification.

Future policy decisions should consider the tradeoffs between the incidence of vote fraud that can be prevented by stricter voter ID requirements and the number of eligible voters who will be kept from the polls by those stricter ID requirements. Continuing research is needed to provide the information to inform this calculation of benefits and costs.

Methods and Findings

We classified each state as having one of five types of identification requirements in place on Election Day 2004. Upon arrival at polling places, voters had to either: state their names (9 states); sign their names (13 states and the District of Columbia); match their signature to a signature on file with the local election board (8 states); provide a form of identification that did not necessarily include a photo (15 states); or provide a photo identification (5 states). We then tested the assumption that voter identification requirements would prove to be increasingly demanding on the voter, with providing photo ID the most rigorous. a form of identification, and providing a form of photo identification.

The analysis recognized that election laws in numerous states offer exceptions to these requirements if a prospective voter lacked the ID. Laws in those states set a minimum standard that a voter must meet in order to vote using a regular ballot. We therefore also categorized states based on the minimum requirement for voting with a regular ballot. None of the states required photo identification as a minimum standard for voting with a regular ballot. Four states, however, required voters to swear an affidavit as to their identity (Florida, Indiana, Louisiana, and North Dakota). The five categories for minimum requirements were: state name (12 states), sign name (14 states and the District of Columbia), match one's signature to a signature on file (six states), provide a non-photo identification (14 states), or swear an affidavit (four states). This analysis treats the array of minimum identification requirements also in terms of increasing demand on the voter: state name, sign name, match signature, provide non-photo identification, and, given the potential legal consequences for providing false information, swearing an affidavit.

Voter turnout at the state level in 2004 declined as voter identification requirements became more demanding, as shown in Table 2. While the trend is not perfectly linear, there is a general movement toward lower turnout as requirements tend toward requiring greater levels of proof. Using the maximum requirements as the independent variable, an average of 63.1 percent of the voting age population turned out in states that required voters to state their names, compared to 57.3 percent in states that required photo identification. A similar trend emerged when using the minimum requirements as the independent variable. Sixty-one percent of the voting age population turned out in states requiring voters to state their names, compared to 58.7 percent in states that required an affidavit from voters.

Table 2 – Variation in 2004 State Turnout Based on Voter Identification Requirements

Maximum Requirement		Minimum Requirement	
Voter Identification Required in the States	Mean Voter Turnout for States in that Category	Voter Identification Required in the States	Mean Voter Turnout for States in that Category
State Name	**63.1 %**	State Name	**61.3 %**
Sign Name	**58.6 %**	Sign Name	**60.4 %**
Match Signature	**62.1 %**	Match Signature	**59.2 %**
Provide Non-Photo ID	**57.8 %**	Provide Non-Photo ID	**57.6 %**
Provide Photo ID	**57.3 %**	Swear Affidavit	**58.7 %**
Average Turnout (All States)	**59.6 %**		

Voter identification requirements alone do not determine voter turnout. Other influences – demographic or political-- also affect voter participation. Multivariate models that take into account other predictors an place the effects of voter identification in a more accurate context. To consider that broader context, our multivariate analysis included whether the county was in a presidential battleground state or a state with a competitive race for governor or the U.S. Senate. Demographic variables included the percentage of the voting-age population in each county that was Hispanic or African-American, the percentage of county residents age 65 and older, and the percentage of the county population living below the poverty line. The dependent variable in each model was voter turnout at the county level, with turnout calculated as the percentage of the voting-age population that voted in the 2004 election.

The aggregate analysis for the maximum identification requirements revealed a small and negative effect on turnout in 2004 controlling for electoral context and demographic factors. If the state was a battleground for president, governor or senate voter turnout increased. As the percentage of senior citizens in the county increased, so did turnout. The percentage of African-

Americans in the county had no effect, but the percentage of Hispanic adults reduced voter turnout, as did the percentage of individuals living below the poverty line.

In general, analysis of the aggregate data at the county level provides some support for the hypothesis that as the burden of voter identification requirements increases, turnout declines, at least in the case of the maximum requirements. This is particularly so for counties with concentrations of Hispanic residents or individuals who live below the poverty line.

Information collected for the Census Bureau Current Population Survey in November 2004 makes it possible to examine the influence of voter ID requirements at the individual level. Self-identified registered voters reported their experience at the polls in the survey. (Note that the voter turnout rate for the CPS sample, an average of 89%, is much higher than the turnout rates presented in the aggregate data analysis, which average 58%. The difference is a result of several factors, including different denominators in calculating the turnout rate – self-reported registered voters in the CPS versus the much larger voting-age population for the aggregate data. Also some survey respondents overstate their incidence of voting.) Nevertheless, the CPS serves as a widely accepted source of data on voting behavior.

The dependent variable in the individual analyses is whether respondents said they voted in the 2004 election. As in the aggregate analysis the contextual variables consist of whether the state was a battleground state or had competitive state-level races. The analysis also controlled for gender, age in years, education, household income, race or ethnicity, and employment status, marital status, and residential mobility.

The analysis revealed that voter identification requirements exerted a statistically significant, negative effect on whether survey respondents said they had voted in 2004. Of the other state factors, only the competitiveness of the presidential race had a significant effect on turnout. In terms of demographic influences, consistent with previous research, age, education, income, and marital status all were positive predictors of voting. Women also were more likely to say they voted than men. Those who had moved within six months before the interview were less likely to say they had voted.

Allowing the voter identification requirement to vary while holding constant all other variables in the model showed that the predicted probability of turnout ranged from 91.2 percent if all voters had to state their names to 88.7 percent if all voters had to provide photo identification. (Note

that these turnout figures are higher than actual because of the factors involved in the CPS's self-reported survey, but that the difference in effect is reasonably related to the results obtained in the aggregate analysis.) In other words, the probability of voting dropped with each level of the maximum voter identification requirement, with a total drop of 2.5 percent across the five types of identification. When taking into account the minimum requirement for identification, the probability showed a similar decline, with a slightly larger total drop of 3.3 percent.

Both the maximum and minimum identification requirements had negative and statistically significant effects for white voters. Allowing the requirements to vary from stating one's name to providing photo identification or an affidavit showed drops of 2.5 percent and 3.3 percent respectively in the predicted probability of voting. The identification requirements had no effect on the probability of African-Americans voting, but the minimum identification requirements had a comparatively sizable effect on voter turnout among Hispanics. The predicted probability of Hispanics voting ranged from 87 percent if stating one's name would be the required form of identification to 77.3 percent if a voter would have to provide an affidavit in order to vote, a difference of 9.7 percent. Variation also emerged along the lines of income, with the effects of voter identification requirements varying to a greater extent for voters in households below the poverty line compared to those living above the poverty line.

Registered voters who had less than a high school education had a 77.5 percent probability of voting if the maximum requirement would be stating one's name, and a 70.8 percent probability if they would have to provide photo identification under the maximum requirement, a difference of 6.7 percent. The range of effects of voter identification requirements was smaller among those with higher levels of education (and non-existent for one category – voters with some college education).

Discussion and Conclusions of the Analysis

The results presented here give evidence that tougher voter identification requirements are associated with a decline in voter participation. The overall effect for all registered voters was fairly small, but even a slight decline in turnout has the potential to alter the outcome of a close election. The decline is apparent in both the aggregate data and the individual-level data, although not always for both the maximum and minimum sets of requirements.

- Hispanic voters and the poor appear to be less likely to vote if the level of required identification becomes more demanding, according to both the aggregate and the individual-level data. In the individual-level data, for Hispanic voters, the probability of voting dropped by 9.7 percent across the various levels of minimum identification requirements. Survey respondents living in poor households would be 5.3 percent less likely to vote as the requirements vary from stating one's name to attesting to one's identity in an affidavit.

- Self-reported registered voters who had not graduated from high school would be 6.7 percent less likely to vote if the maximum requirement is photo identification as opposed to stating one's name. When considering the minimum requirements, those with less than a high school education would be 7.4 percent less likely to say they voted if the requirement was an affidavit as opposed to stating one's name.

- Age was also a key factor, with voters ages 18 to 24 being 7.7 percent to 8.9 percent less likely to vote as the requirements ranged from stating one's name to providing a photo identification or affidavit.

- Two concerns aired by critics of voter identification requirements were not borne out by the results. African-American voters did not appear to be affected by voter identification requirements, according to both the aggregate data and individual-level data analyses. Also, the elderly, while they would be slightly less likely to vote as requirements range from least to most demanding, would not necessarily be affected in the dramatic manner predicted by some opposed to photo identification requirements in particular.

The data examined in this analysis could not capture the dynamics of how identification requirements might lower turnout. Do these requirements dampen turnout because individuals are aware of the requirements and stay away from the polls because they cannot or do not want to meet the requirements? Or, do the requirements result in some voters being turned away when they cannot meet the requirements on Election Day? The CPS data do not include measures that can answer these questions, pointing up the need for collection of additional data. Knowing more about the "on the ground" experiences of voters concerning identification requirements could guide policy-makers at the state and local level in determining whether and at what point in the electoral cycle a concerted public information campaign might be most

effective in helping voters to meet identification requirements. Such knowledge also could help in designing training for poll workers to handle questions about, and potential disputes over, voter identification requirements.

4. Litigation over Voter ID Requirements

There have been a handful of cases challenging identification requirements in court in recent years. In general, requirements that voters provide some identifying documentation have been upheld, where photo ID is *not* the only acceptable form. Whether or not laws requiring photo ID will be upheld is more doubtful. To date, only one court has considered a law requiring voters to show photo ID (*Common Cause v. Billups*), and that court concluded that this requirement is likely unconstitutional. Cases challenging the mandatory disclosure of voters' Social Security numbers on privacy grounds have yielded mixed results.

Non-photo identification. For the most part, courts have looked favorably on cases challenging requirements that voters present some form of identifying documents if the photo identification is the only form accepted. In *Colorado Common Cause v. Davidson,* No. 04CV7709, 2004 WL 2360485, at *1 (Colo. Dist. Ct. Oct. 18, 2004), plaintiffs challenged a law requiring <u>all</u> in-person voters to show identification (not just first-time registrants). The court upheld this requirement against a constitutional challenge. Similarly, in *League of Women Voters v. Blackwell,* 340 F. Supp. 2d 823 (N.D. Ohio 2004), the court rejected a challenge to an Ohio directive requiring first-time voters who registered by mail to provide one of the HAVA-permitted forms of identification, in order to have their provisional ballots counted. Specifically, the directive provided that their provisional ballots would be counted if the voter (a) orally recited his driver's license number or the last four digits of his social security number or (b) returned to the polling place before it closed with some acceptable identification (including reciting those identification numbers). *Id.* This was found to be consistent with HAVA.

Photo ID. Since the 2004 election, two states have adopted laws requiring photo identification in order to have one's vote counted, without an affidavit exception: Georgia and Indiana. Both these requirements were enacted in 2005 and both have been challenged in court. The Georgia law required voters attempting to cast a ballot in person present a valid form of photographic identification. O.C.G.A. § 21-2-417. On October 18, 2005, the District Court granted the Plaintiff's motion for a preliminary injunction, enjoining the application of the new identification requirements on constitutional grounds. In granting the injunction, the court held that plaintiffs' claims under both the Fourteenth Amendment (equal protection) and Twenty-Fourth Amendment (poll tax) had a substantial likelihood of succeeding on the merits at trial (*Common Cause v. Billups,*

Prelim. Inj. 96, 104). In January 2006, Georgia enacted a modified version of its photo ID law, which the court has not yet ruled on. In the other state that has enacted a photo ID requirement without an affidavit exception (Indiana), legal challenges have also been filed. (*Indiana Democratic Party v. Rokita* and *Crawford v. Marion County Election Board*). Cross-motions for summary judgment are currently pending. Another case of significance, for purposes of photo ID requirements, is *American Civil Liberties Union of Minnesota v. Kiffmeyer,* No. 04-CV-4653, 2004 WL 2428690, at *1 (D. Minn. Oct. 28, 2004). In that case, the court enjoined a Minnesota law that allowed the use of tribal photo ID cards, only for an Indian who lived on the reservation. 2004 WL 2428690, at *1. The Court found no rational basis for distinguishing based on whether or not the cardholder lives on the reservation. *Id.* at *1, 3. The court's decision in this case indicates that courts are likely to look strictly on photo ID requirements.

Privacy. In *Greidinger v. Davis,* 988 F.2d 1344 (4th Cir. 1993), the court struck down on due process grounds a Virginia law requiring disclosure of voters' social security numbers for voter registration. The social security numbers recorded in voter registration lists had been disclosed to the public and political parties that had requested the lists. The court found that the requirement to give the social security number effectively conditioned rights on the consent to an invasion of privacy. It concluded that this public disclosure of the social security numbers was not necessary to achieve the government's interest in preventing fraud. On the other hand, in *McKay v. Thompson,* 226 F.3d 752 (6th Cir. 2000), the court rejected privacy challenges based on both the Constitution and federal statutes, to a Tennessee law requiring social security numbers for voter registration since 1972. 226 F.3d at 755. Second, the NVRA only permits requiring the minimum amount of information necessary to prevent duplicate voter registration and to determine eligibility. The distinction appears to be between the use of Social Security numbers for internal purposes only, which was deemed permissible, and the disclosure of those numbers to the public which was not.

These decisions suggest that the courts will look strictly at requirements that voters produce a photo ID in order to cast a regular ballot. The courts have used a balancing test to weigh the legitimate interest in preventing election fraud against the citizen's right to privacy (protecting social security numbers from public disclosure, for example) and the reasonableness of requirements for identity documents. To provide both the clarity and certainty in administration of elections needed to forestall destabilizing challenges to outcomes, these early decisions

suggest that best practice may be to conform to the NVRA's limitation on requirements for voter identification to the minimum needed to prevent duplicate registration and ensure eligibility.

5. Developments since 2004

Since the passage of HAVA, with its limited requirements for voter identification, and following the 2004 election, debate over voter ID has taken place in state legislatures across the country. That debate has not been characterized by solid information on the consequences of tightening requirements for voters to identify themselves before being permitted to cast a regular, rather than a provisional, ballot.

Better information might improve the quality of the debate. Answers to the following key questions are not available in a form that might satisfy those on both sides of the argument.

- What is the overall incidence of vote fraud?
- How does fraud take place in the various stage of the process: registration, voting at the polls, absentee voting, or ballot counting?
- What contribution can tighter requirements for voter ID make to reducing vote fraud?
- What would be the other consequences of increasingly demanding requirements for voters to identify themselves? This is the question addressed, within the limits of the available data, in the analysis in this report.

This information would allow a more informed judgment to be brought to bear in the states as they consider the tradeoffs among the competing goals of ballot integrity, ballot access, and administrative efficiency. The Carter-Baker Commission recognized the tradeoffs when it tied recommendation for national ID to an affirmative effort by government to identify unregistered voters and make it easy for them to register.

State Voter Databases and Voter ID

With the implementation of the HAVA Computerized Statewide Voter Registration List, an application for voter registration for an election for Federal office may not be accepted or processed unless the application includes a driver's license number or last four digits of the Social Security number on the voter registration form. This information can be used to verify the identity of the registrant through interfacing with lists maintained by the Motor Vehicle office and Social Security office. If registrants do not have either a driver's license or Social Security number, the State will assign a unique identifier number to that person.

HAVA does not require that the states notify registrants to remedy any failure to provide either of these numbers or to confirm that they have provided a verifiable number. Verification at the time of registration could forestall difficulties at the polling place. HAVA is silent on how the ID might be required at the polling place for new voters whose driving license or Social Security number could not be verified. Errors in recording those numbers are sure to occur.

Some states are wrestling now with these unresolved issues. In New Jersey, for example, pending legislation require that voters must be able to confirm their registration through a secure access to the SVRL. It also requires voters to present ID at the polls in order to cast a regular ballot if the numbers recorded on the registration have not been verified (or if no verifiable number appears on the registration). It recognizes the HAVA requirement that if the number provided by the voter has not been verified and if the voter does not present ID at the polls, that voter may cast a provisional ballot. The bill does not specify they have to provide ID within 48 hours in order for their vote to count, as is the case with first-time mail-in registrants.

As some states gain experience in this area, the EAC would perform a useful service by making timely recommendations of best practices for all states to consider.

6. Conclusions

The form of Voter ID required of voters affects turnout. Lack of ID can keep voters from the polls. Or, when they go to the polls, it is reasonable to conclude that stricter Voter ID requirements will divert more voters into the line for provisional ballots. (This conclusion is a conjecture because we lack good data on why voters must cast their ballots provisionally.) The result can be longer lines at the polls and confusion, without a clear demonstration that the security of the ballot is correspondingly increased. [10] The dynamics of Voter ID requirements – how the more rigorous Voter ID requirements—affect the decision by potential voters to go or stay away from the polls are not well understood. This lack of understanding should be recognized in the policy process. The debate over voter ID in the states would be improved by additional research sponsored by the EAC. That research might address that, so far as may be

---

[10] In this connection, the Brennan Center's response to the Carter-Baker Commission report observes that, "while it might be true that in a close election "a small amount of fraud could make the margin of difference," it is equally true that the rejection of a much larger number of eligible voters could make a much bigger difference in the outcome." The exclusion of voters through restrictive ID requirements could affect election outcomes as much as fraud by voters at the polls. *Response to the Report of the 2005 Commission on Federal Election Reform*, The Brennan Center for Justice at NYU School of Law and Spencer Overton, On Behalf Of The National Network on State Election Reform, September 19, 2005

necessary to reduce vote fraud, could identify methods to eliminate the need for voters to bring specific identity documents with them to the polls while assuring that each voter who casts a ballot is eligible and votes only once. One way to break the connection between the benefits of photo ID and the need for the voter to bring identification to the polling place, as recommended by our colleague Edward Foley: keep the information to verify a voter's identity in the records at the polling place. Other approaches could be developed. [11]

---

[11] "A potential solution to this problem is to break the connection with the photo requirement and the obligation to produce identification at the polls. Eligible citizens could be required to provide a photograph at the time they *register* to vote, and poll workers would match this photograph with the image of the person standing in front of them. Given the availability of digital photography, the photos of registered voters could be stored in electronic poll books and easily "pulled up" with a click of a computer mouse when voters sign in to vote. These electronic photos should satisfy the anti-fraud concerns of conservatives as much as printed photos that citizens would be required to bring to the polls. . . Of course, to satisfy the concerns of liberals, a requirement to provide a digital photograph at time of registration would have to address the cost and accessibility issues identified earlier. "

b. Analysis of Effects of Voter ID Requirements on Turnout (attached as a separate document)
c. Indexed database of major articles on Voter ID Requirements and related topics (included with this draft)
d. Compendium of states' legislation, procedures, and litigation

APPENDIX –Court Decisions and Literature on Voter Identification and Related Issues

Court Decisions

Summary of Relevant Cases:

Challenges Prevailed:

American Civil Liberties Union of Minnesota v. Kiffmeyer, 2004

- Action for temporary restraining order – granted
- Statute: allowed use of tribal identification cards w/ name, address & photo as a valid identification to register to vote only if the voter lives on the reservation to "complete" a mail-in application (which only affected about 600 voters w/ incomplete applications)
- Claim -14th Amendment EPC: likely to prevail, no rational basis for a distinction between Indians residing on reservations and those not
- Statute: may use certain forms of photo identification lacking address together with a utility bill but not tribal identification cards
- Claim -14th Amendment EPC: likely to prevail

Greidinger v. Davis, 1993

- Statute: mandated disclosure of SS # as a precondition to voter registration (rationale was voter identification, but the numbers were rarely used to verify identity & were disclosed in voter lists to both political parties and the public upon request)
- Claims:
    - 14th Amendment EPC: no classification (applied strict scrutiny)
    - Substantive due process: law invalid; found that the statute conditioned the fundamental right to vote on the consent to an invasion of privacy; this was found to be a substantial burden (applied strict scrutiny)
        - Compelling interests: preventing voter fraud (deemed compelling)
        - Necessary: fails, preventing voter fraud when allowing names for inspection could be achieved by supplying addresses and DOBs or use of voter registration numbers
        - HOWEVER: Court also made it clear that if the registration scheme kept the SS# for internal use only – it would be valid

Challenges Rejected:

League of Women Voters v. Blackwell, 2004.

- Sec. of State Directive: provisional ballots issued if first-time voter, who registered by mail and did not provide ID, cannot produce proper ID at the polls AND that the provisional ballot will only be counted if the voter returns to the poll before it closes w/ ID or can recite SS# or DL#
- Claims – Supremacy Clause & HAVA: ruled that HAVA did not specify how the first-time voters' identifications should be verified and this method was not unreasonable or too burdensome

Colorado Common Clause v. Davidson, 2004

- Statute: required all voters to show ID (most types permitted) before voting
- Claims:
    - HAVA: ruled that HAVA did not preempt more strict state laws & allowed States to be more strict as long as consistent with the purpose of HAVA (both HAVA & CO provisions' purposes were to prevent voter fraud)
    - Substantive due process and equal protection
        - No improper discrimination

  - Preventing voter fraud is a compelling interest since it is irreversible once vote is cast
  - Only marginally more intrusive than HAVA, many types of identification permitted – thus, valid

McKay v. Thompson, 2000

- Statute: mandated disclosure of SS # as a precondition to voter registration
- Claims:
  - Privacy Act, Section 7: ruled that Tennessee voter system exempt from Privacy Act because it is pre-75
  - NVRA, permitting only min. amt. of info. necessary to prevent duplicate registration and determine eligibility: ruled that NVRA does not specifically forbid the use of SS#s & the Privacy Act specifically permits them pre-75
  - Substantive due process: ruled that internal use of SS# not a burden
  - Free Exercise, based on Bible's supposed prohibition on use of universal identifiers: ruled that law is generally applicable and thus valid
  - P&I, Article IV: does not protect in-state citizens
  - P&I, 14th Amend.: no protection for privilege where Congress authorized its infringement

Kemp v. Tucker, 1975

- Statute: required name, occupation, address, sex, race, height, hair color, eye color, and date of birth be listed on voter registration card for identification purposes
- Claims:
  - VRA: ruled that race was not made a "qualification" for voting
  - 15th Amendment: ruled that it did not abridge right to vote on account of race because rejection of application was due to failure to provide information, not race; race only one factor in identification
  - 14th Amendment EPC: ruled there was no distinction among voters

Perez v. Rhiddlehoover, 1966

- Statute: date of birth, place of birth, mother's first or maiden name, color of eyes, sex, race, occupation, and whether owner, tenant or boarder must appear on the registration for identification
- Claims:
  - VRA: ruled that it was not a "test or device" because it applied equally
  - 15th Amendment: same reasons

Cases in Which the Plaintiffs Have Prevailed in Challenging the Statute Requiring Voter Identification:

***American Civil Liberties Union of Minnesota v. Kiffmeyer*, No. 04-CV-4653, 2004 WL 2428690, at *1 (D. Minn. Oct. 28, 2004).**

This was an action just before the November 2004 election for a temporary restraining order, which was granted. The ACLU challenged a Minnesota law allowing the use of tribal identification cards with the name, address, and photograph as a valid identification (equal to a driver's license) for use in "completing" an incomplete mail-in voter registration only if the Indian lives on the reservation. 2004 WL 2428690, at *1. The Court ruled that this distinction would likely violate the Equal Protection Clause because there was no rational basis for differentiating

between the validity of the identification based on whether or not the cardholder lives on the reservation. *Id.* at *1, 3.

Secondly, the ACLU challenged a second statute which allowed the use of certain photo identification lacking the voter's address to be used together with a utility bill or bank statement as valid identification for registration. *Id.* at *3. The statute did not, however, permit using a tribal identification for this same purpose. *Id.* The Court ruled that this likely violated the equal protection clause as well. *Id.*

***Greidinger v. Davis*, 988 F.2d 1344 (4th Cir. 1993).**

This case challenged a Virginia law requiring the social security number for voter registration, which the State subsequently disclosed to the public and political parties upon request in voter registration lists, which included the social security numbers. Failure to provide the social security number resulted in the denial of the registration application. The law was challenged under the Equal Protection Clause and under substantive due process. The Court quickly rejected the equal protection challenge because the law made no classification. 988 F.2d at 1350.

The law was invalidated under substantive due process. *Id.* at 1355. The Court found that the statutory scheme conditioned the fundamental right to vote on the consent to an invasion of privacy, based on concerns of identity theft. *Id.* at 1353-54. The Court found this to be a substantial burden on the right to vote. *Id.* at 1354. The Court recognized that the government's interest in preventing voter fraud was compelling. *Id.* However, the Court found that disclosure of the information to the public and political parties was not necessary to achieve that interest. *Id.* Disclosure of addresses or dates of birth would be sufficient to aid the public in distinguishing between two voters with the same name. *Id.* at 1355. The Court did state that required disclosure of the social security number for internal use only would be valid. *Id.* at 1354 n.10.

Cases in Which the Statute or Practice of Voter Identification Has Been Upheld:

***League of Women Voters v. Blackwell,* 340 F. Supp. 2d 823 (N.D. Ohio 2004).**

The League of Women Voters challenged the Secretary of State's directive that provisional ballots should be issued to all first-time voters who registered by mail without providing identification who cannot show proper identification at the polls. 340 F. Supp. 2d at 828. The Directive also stated that the provisional ballots would only be counted if the voter orally recited his driver's license number or the last four digits of his social security number or returned to the polling place before it closed with some acceptable identification, including reciting those identification numbers. *Id.* The Court stated that HAVA only requires verification of eligibility of first time voters registering by mail; it does not say how that should be done. *Id.* at 831. The Court found the burden on the right to vote to be slight. *Id.* The Directive was found valid under HAVA and the Supremacy Clause because the number of uncounted votes would be small, the requirement was reasonable, and there was adequate notice of the requirement on the registration forms. *Id.* at 829-30.

***Colorado Common Cause v. Davidson,* No. 04CV7709, 2004 WL 2360485, at *1 (Colo. Dist. Ct. Oct. 18, 2004).**

In this case, the validity of three Colorado statutory provisions was challenged. The laws (1) required <u>all</u> in-person voters to show identification (not just first-time registrants); (2) provided that votes cast in the wrong precinct would not be counted; and (3) provided that

provisional ballots would not be counted if the voter applied for an absentee ballot. 2004 WL 2360485, at *1. The plaintiffs also challenged the provisions under HAVA. The identification provision allowed nearly all forms of acceptable identification under HAVA. *Id.* at *6.

The challenge to the identification requirement failed under both challenges. The Court interpreted HAVA as not intended to preempt state laws and as permitting states to be more strict than, but not inconsistent with, HAVA. *Id.* at *10. The Court felt that the purpose of both laws was the same, to reduce voter fraud, and thus, both laws could coexist. As to the Constitutional claim, both equal protection and substantive due process, the Court felt that preventing voter fraud, which is impossible to remedy once a vote is cast, is a compelling interest, and the Court also felt that a voter identification requirement for all voters, with many types of acceptable identification, was only marginally more intrusive than HAVA. *Id.* at 12. The Court also found no improper discrimination between voters. *Id.* Thus, the provision was upheld.

***McKay v. Thompson*, 226 F.3d 752 (6th Cir. 2000).**

The Sixth Circuit ruled that the Privacy Act, the National Voter Registration Act, Substantive Due Process, the Privileges and Immunities Clauses (Fourteenth Amendment & Article IV), and the First Amendment right to free exercise do not prohibit requiring disclosure of social security numbers as a precondition to voter registration.

The Privacy Act, Section 7, mandates that it is unlawful for a government to deny a right or privilege because of a citizen's refusal to disclose his social security number, unless the disclosure was required for a system established prior to 1975. 226 F.3d at 755 (citing Privacy Act of 1974, Pub. L. No. 93-579 (1974)). Since Tennessee required social security numbers for voter registration since 1972, his challenge was rejected. 226 F.3d at 755. Second, the NVRA only permits requiring the minimum amount of information necessary to prevent duplicate voter registration and to determine eligibility. *Id.* at 755-56 (citing 42 U.S.C. §1973gg-3(c)(2)(B)). The Court rejected this challenge because the NVRA does not specifically forbid the use of social security numbers, and the Privacy Act, a more specific statute, grandfathered their use if prior to 1975. 226 F.3d at 756.

Finally, the plaintiff's constitutional claims were all rejected. His substantive due process claim was rejected because internal receipt and use of social security numbers does not burden the fundamental right to vote. *Id.* The free exercise challenge, based on the Bible's supposed prohibition of universal identifiers, was rejected because the law was generally applicable and not directed at particular religious practices. *Id.* The Privileges and Immunities Clause claim was rejected because the Clause does not apply to citizens of the state. *Id.* The Fourteenth Amendment Privileges and Immunities claim, based on the right to vote as unique to U.S. citizenship, was rejected because the Clause provides no protection where Congress has authorized the infringement. *Id.*

***Kemp v. Tucker*, 396 F. Supp. 737 (M.D. Pa. 1975), *aff'd*, 423 U.S. 803.**

A statute was upheld, which required name, occupation, address, sex, race, height, hair color, eye color, and date of birth to be recorded on the voter registration card and allowed registration officials to reject an incomplete application. 396 F. Supp. at 738. Claims were alleged under the Fourteenth Amendment's Equal Protection Clause, the Fifteenth Amendment, and the Voting Rights Act.

As to the Fourteenth and Fifteenth Amendment claims, the Court reasoned that preventing voter fraud is a compelling goal, and identification provisions are "an essential means of achieving the goal." *Id.* at 739. The Court also rejected the equal protection claim because the statutes did not create a distinction at all. *Id.* at 740 n.3. Since race is just one of

several characteristics required, the Court found that it was intended for preventing voter fraud, not some other motive. *Id.* at 740. As to the VRA, the Court rejected the claim that it added race as a qualification for voting as frivolous. *Id.* As to a Fifteenth Amendment claim that it abridged the right to vote on account of race, the Court also made a distinction between rejecting a voter application because of race and rejecting an application because of failure to answer all relevant questions to assist in preventing voter fraud. *Id.* The statute was upheld.

***Perez v. Rhiddlehoover*, 186 So. 2d 686 (La. Ct. App. 1966).**

A voter registration requirement was challenged and upheld. The statute stated that date of birth, place of birth, mother's first or maiden name, color of eyes, sex, race, occupation, and whether owner, tenant or boarder must appear on the registration. 186 So.2d at 690. This information was required for identification of voters, especially when voters had the same name, to prevent duplicate voting. It was challenged under the Voting Rights Act of 1965 Section 4(a) which prohibits denying the right to vote for failure to comply with a "test or device." The Court felt that this requirement was not a test or device for discrimination because it applied equally. *Id.* at 691. The Court also determined that it was not in conflict with the Fifteenth Amendment either. *Id.*

***Friendly House, et al. v. Janet Napolitano et al.*, CV 04-649 TUC DCB**

On November 30, 2004, the Mexican American Legal Defense and Educational Fund (MALDEF) filed suit seeking to halt the implementation of Proposition 200. . Proposition 200 created a number of legal requirements to ensure that public benefits are not available to illegal immigrants. In particular, Proposition 200 requires that a person attempting to register to vote provide one of six specific forms of proof of United States citizenship. Compl. 12-13. Also, any person attempting to vote must present either one form of photo identification or two forms of non-photo identification. *Id.* at 13.

The lawsuit alleges two violations that directly relate to the voting identification restrictions. First, the lawsuit alleges a violation of the Twenty-Fourth and Fourteenth amendments in that a voter must pay a poll tax by spending money to purchase the required identification. *Id.* at 20. Second, the lawsuit alleges violation of the Voting Rights Act. *Id.* at 21. The lawsuit was recently dismissed by the 9th Circuit Court of Appeals for a lack of standing. The Circuit Court found that there was no injury-in-fact, meaning that once an injury occurs the suit will likely be refiled. Additionally, it should be noted that the voter identification issue is only a part of the lawsuit, and much of the focus has been on other aspects of Proposition 200.

Current Litigation Concerning Voter ID Issues[12]

Litigation is filled with uncertainty. Litigation stemming from newly passed voter identification requirements will continue into the foreseeable future. Lawsuits are currently pending over voter identification requirements in Georgia and Indiana. Other states, such as Ohio, are considering new identification requirements that could lead to further litigation. The Georgia lawsuit has already succeeded in getting a preliminary injunction against the law in question, which will likely galvanize interested parties in other states to pursue similar litigation. Of course, if the injunction is eventually overturned at the appellate level it could have a similar chilling affect on future litigation.

This summary major litigation pending in Georgia and Indiana includes a brief assessment of the likelihood of success:

---

[12] As of January 2, 2006

Georgia (*Common Cause/Georgia v. Billups*):

On September 19, 2005, Common Cause of Georgia, in conjunction with several other non-profit organizations, filed suit in Federal District Court against the Georgia Secretary of State and other election officials, challenging the constitutionality of Georgia's new voter identification requirements. The new law requires all voters attempting to cast a ballot in person to present a valid form of photographic identification. O.C.G.A. § 21-2-417. A voter that is unable to provide proper identification is given a provisional ballot. However, that provisional ballot will be counted only if the voter is able to subsequently present valid identification within two days of the election. *Id.*

The lawsuit alleges five separate violations of state and federal law. First, the complaint alleges that the identification requirements infringe on the right to vote guaranteed in the Georgia constitution (Compl. 32)[13]. In addition, the Plaintiffs claim violations of the Federal Civil Rights Act and Voting Rights Act. (Compl. 36,38). Finally, the lawsuit alleges violations of the Fourteenth and Twenty-Fourth amendments to the U.S. Constitution. The complaint claims that the ID requirements constitute an "undue burden" on the right to vote, in violation of the Equal Protection Clause of the Fourteenth Amendment (Compl. 34). The ID requirement does not apply to most absentee voters, and thus the requirement is also over-broad and not narrowly tailored to address the stated purpose of preventing voter fraud (Compl. 34). The complaint further alleges that the cost of obtaining a photo ID constitutes a poll tax, in violation of the Twenty-Fourth Amendment, and that the cost is also a violation of the Fourteenth Amendment because it applies to voters who choose to vote in person, and not to those who vote absentee (Compl. 34,35).

On October 18, 2005, the District Court granted the Plaintiff's motion for a preliminary injunction, enjoining the application of the new identification requirements. In granting the injunction, the court held that both federal constitutional claims had a substantial likelihood of succeeding on the merits at trial (Prelim. Inj. 96, 104). The court also held that, while the two federal statutory claims were plausible, they both lacked sufficient evidence at the time to have a substantial likelihood of success. (Prelim. Inj. 109,111,116). Finally, the court held that the Georgia constitutional claim would be barred by the Eleventh Amendment to the U.S. Constitution. (Prelim. Inj. 77).

The Defendants appealed the motion for preliminary injunction to the Eleventh Circuit, and oral argument is scheduled for March 1, 2006. In addition, some news reports have claimed that the Georgia legislature is considering re-visiting the ID requirements in light of the on-going litigation.[14] As for the merits, in granting the preliminary injunction the District Court has already signaled its belief that the federal constitutional claims are likely meritorious. The Eleventh Circuit may have a different view, but for now the case looks to have a reasonable chance of success.

Indiana (*Indiana Democratic Party v. Rokita* and *Crawford v. Marion County Election Board*):

The Indiana lawsuit is similar to its Georgia counterpart in content, though not in status. In Indiana separate lawsuits, now joined, were filed by the state Democratic Party and the

---

[13] Litigation documents are available at the Election Law @ Moritz website. http://moritzlaw.osu.edu/electionlaw/litigation/index.php

[14] GA Legislature May Revisit Voter ID Law, State Net Capitol Journal, Dec. 19, 2005.

Indiana Civil Liberties Union (ICLU). The Democratic Party's lawsuit is directed against the Indiana Secretary of State, while the ICLU's lawsuit involves the Marion County Board of Elections and the State of Indiana. Like Georgia, Indiana law also requires citizens voting in person to present some form of official photo identification. IC § 3-11-8-25.1. Voters unable to present identification are given a provisional ballot, which is counted if they are able to provide the required identification by Noon on the second Monday following the election. IC § 3-11.7-5-1. Unlike Georgia, Indiana provides state issued identification at no charge. However, there are costs involved in the process, including transportation to the Bureau of Motor Vehicles, and payment for documents such as birth certificates, which are needed to obtain the ID. (Second Am. Compl. 6).

The Democratic Party's complaint raises Fourteenth Amendment claims similar to those in the Georgia lawsuit, including concerns about substantially burdening the right to vote, the enactment of a de-facto poll tax from the costs indirectly associated with obtaining ID, and the lack of applicability to voters who cast an absentee ballot. (Second Am. Compl. 6-9). In addition, the complaint alleges that the substantial burden placed on the right to vote violates the First Amendment protection of expressive or symbolic speech, as well as the freedom of association as applied to Democratic primary elections. (Second Am. Compl. 9-10). Finally, the complaint alleges violations of the Voting Rights Act, National Voter Registration Act, and the Help America Vote Act (Second Am. Compl. 10-11). The ICLU's complaint alleges many of the same violations, but also includes claims of a violation of Indiana's constitutional guarantee of a free and equal election system. (Compl. 15)

The case is currently in the pre-trial phase, with both sides awaiting decisions on their respective motions for summary judgment.[15] The likelihood of success is bolstered by the fact that the Fourteenth amendment constitutional claims have already been found persuasive by at least one other Federal District Court. However, the Indiana law is notably different than its Georgia counterpart in that it provides free identification. While the plaintiffs make a solid argument that related costs still amount to a poll-tax, it is possible that the court could distinguish on this matter.

Unlike the Georgia case, the Indiana lawsuit also claims a violation of the Help America Vote Act. Although the claim is not completely clear, it seems as though the Plaintiffs are arguing that the Indiana statute requires more stringent identification than what is required by HAVA. 42 U.S.C. § 15483(b)(1)-(2). While this is true, it is unclear how this violates the statute. HAVA merely states that certain voters unable to produce HAVA required identification be given a provisional ballot. *Id.* Indiana law meets this requirement. IC § 3-11-8-25.1. Although Indiana law requires more stringent identification for counting the provisional ballot, HAVA leaves theses decisions to state law. 42 U.S.C. § 15482(a).

---

[15] According to an AP article, the Plaintiffs filed some type of brief on December 21—however it is not yet up on the Moritz website and I am unsure how to access it otherwise.

Deliberative Process Privilege

Report to the
U. S. Election Assistance Commission
On
Best Practices to Improve Provisional Voting
Pursuant to the
HELP AMERICA VOTE ACT OF 2002
Public Law 107-252

November 23, 2005

Submitted by

The Eagleton Institute of Politics, Rutgers, The State University of New Jersey

The Moritz College of Law, The Ohio State University

FINAL DRAFT
11/23/2005

Report to the U. S. Election Assistance Commission

Best Practices to Improve Provisional Voting

CONTENTS

Executive Summary

Please provide an Executive Summary to provide background and summarize the key recommendations.

Background of the Research

This report to the United States Election Assistance Commission (EAC) presents recommendations for best practices to improve the process of provisional voting. It is based on research conducted by the Eagleton Institute of Politics at Rutgers, the State University of New Jersey, and the Moritz College of Law at Ohio State University under contract to the EAC, dated May 24, 2005. The research included a review and legal analysis of state statutes, regulations and litigation concerning provisional voting, a sample survey of local election officials, and a statistical analysis of provisional voting in the 2004 election. Also consulted as a basis for these recommendations were other studies, notably the EAC's Election Day Survey.[1] (Recommended as Research Methodology description)

The Help America Vote Act of 2002 (HAVA) (Public Law 107-252) authorizes the EAC (SEC. 241, 42 USC 15381) to conduct periodic studies of election administration issues. The purpose of these studies is to promote methods for voting and administering elections, including provisional voting, that are convenient, accessible and easy to use; that yield accurate, secure and expeditious voting systems; that afford each registered and eligible voter an equal opportunity to vote and to have that vote counted; and that are efficient.

Section 302(a) of HAVA requires states to establish the process of provisional balloting by January 2004.[2] The process HAVA outlined leaves considerable room for variation among the states, arguably including such critical questions as who qualifies as a registered voters eligible to cast a provisional ballot that will be counted and, arguably, in what jurisdiction (precinct or larger unit) that where the ballot must be cast in order to be counted.[3]

The general requirement is that, if a registered voter appears at a polling place to vote in an election for Federal office, but the potential voter's name does not appear on the official list of eligible voters for the polling place, or if an election official asserts that the individual is not eligible to vote, that potential voter be permitted to cast a provisional ballot. In some states, those who should receive a provisional ballot include, in the words of the Election Day Survey, first-time voters who cannot provide identification, as required under HAVA, and voters who were

---

[1] Appendix 1 provides detailed information on how this study classifies the states according to the characteristics of their provisional voting procedures and describes how the data used in the statistical analysis may differ from the data in the Election Day Survey, which became available as our research was concluding.

[2] The Election Center's National Task Force Report on Election Reform in July 2001 had described provisional ballots as providing "voters whose registration status cannot be determined at the polls or verified at the election office the opportunity to vote. The validity of these ballots is determined later, thus ensuring that no eligible voter is turned away and those truly ineligible will not have their ballots counted." It recommended "in the absence of election day registration or other solutions to address registration questions, provisional ballots must be adopted by all jurisdictions." See www.electioncenter.org .

[3] The 2004 election saw at least a dozen suits filed on the issue of whether votes cast in the wrong precinct but the correct county should be counted. One federal circuit court decided the issue in *Sandusky County Democratic Party v. Blackwell, 387 F.3d565* (6th Cir. 2004), which held that votes cast outside the correct precinct did not have to be counted. The court relied on the presumption that Congress must be clear in order to alter the state-federal balance; thus Congress, the court concluded would have been clearer had it intended to eliminate state control over polling location (387 F.3d at 578). An alternative argument, that HAVA's definition of "jurisdiction" incorporates the broader definition in the National Voting Rights Act, however, has not been settled by a higher court. But for now states do seem to have discretion in how they define "jurisdiction" for the purpose of counting a provisional ballot.

challenged at the poll.[4] HAVA also provides that those who vote pursuant to a court order keeping the polls open after the established closing hour shall vote by provisional ballot. HAVA also requires election administrators to notify individuals of their opportunity to cast a provisional ballot.

Provisional Ballots in the 2004 Election

In the 2004 election, nationwide about 1.9 million votes, or 1.6% of turnout, were cast as provisional ballots. More than 1.2 million, or just over 63% were counted. Provisional ballots accounted for a little more than 1% of the final vote tally.[5] (This number does not match the EAC 2004 Election Day Survey. 64.5% counted)

These totals obscure the tremendous variation in provisional voting among the states. HAVA allows the states considerable latitude in how to implement provisional voting, including deciding who beyond the required categories of voters should receive provisional ballots and how to determine which provisional ballots should be counted. Six states accounted for two-thirds of all the provisional ballots cast.[6] State by state, the percentage of provisional ballots in the total vote varied by a factor of 1,000, from a high of 7% in Alaska's to Vermont's .006%. The portion of provisional ballots cast that were actually counted also displayed wide variation, ranging from 96% in Alaska to 6% in Delaware. States with voter registration databases counted, on average, 20% of the provisional ballots cast. Those without databases counted ballots at more than twice that rate: 44%. (Or, as the Carter-Baker Commission report put it, "provisional ballots were needed half as often in states with unified databases as in states without."[7])

The wide variations in the use of provisional ballots argue for the promulgation of best practices that states can use to determine how to make procedures clearer to both officials and voters could improve the implementation of provisional voting across the country. (Is this a best practices recommendation?)

One important source of variation among states was a state's previous experience with provisional voting. The share of provisional ballots in the total vote was six times greater in states that had used provisional ballots before than in states where the provisional ballot was new. In the 25 states that had some experience with provisional voting before HAVA, a higher portion of the total vote was cast as provisional ballots and a greater percentage of the provisional ballots cast were counted than in the 18 new to provisional balloting.[8]

---

[4] The definition of who was entitled to a provisional ballot could differ significantly among the states. In California, for example, the Secretary of State directed counties to provide voters with the option of voting on a provisional paper ballot if they felt uncomfortable casting votes on the paperless e-voting machines. "I don't want a voter to not vote on Election Day because the only option before them is a touch-screen voting machine. I want that voter to have the confidence that he or she can vote on paper and have the confidence that their vote was cast as marked," Secretary Shelley said. See http://wired.com/news/evote/0,2645,63298,00.html . (Our analysis revealed no differences in the use of provisional ballots in the counties with these paperless e-voting machines.) In Ohio, long lines at some polling places resulted in legal action directing that voters waiting in line be given provisional ballots to enable them to vote before the polls closed. (Columbus Dispatch, November 3, 2004 .)

[5] These figures differ slightly from those in the Election Day Survey. Data used for this study include complete voting data for New Mexico, for which the Election Day Survey had only partial data, and vote totals for Pennsylvania, which was not included in the provisional voting analysis in the Election Day Survey. See the appendix to this report for a full explanation of the differences in data between this research and the Election Day Survey.

[6] California, New York, Ohio, Arizona, Washington, and North Carolina. The appearance of Arizona, Washington and North Carolina on this list shows that the number of provisional ballots cast depends on factors other than the size of the population.

[7] Report on the Commission on Federal Election Reform, "Building Confidence in U. S. Elections," September 2005, p. 16.

[8] See the appendix for our classification of "old" and "new" states and explanation of why the total is less than 50.

- The percentage of the total vote cast as provisional ballots averaged more than 2% (2.17%) in the 25 experienced states. This was 4 times the rate in states new to provisional voting, which averaged 0.47%.
- The experienced states counted an average of 58% of the provisional ballots cast, nearly double the proportion in the new states, which counted just 33% of cast provisional ballots. (The average of provisional ballots cast was 64.5% counted. A third category had to account for a significant amount over 64.5%. What was that category?)
- Perhaps another reason provisional ballots must be cast in the correct precinct in order to be counted is that local races are also important and that allowing provisional ballots to be counted by voters who cast them outside of the precinct and only counting the ballots for the upper ballot races for outside of the precinct can disenfranchise voters from participating in local races. This argument has been used by many legislatures and in court castes to require that provisional ballots must be cast in the correct precinct in order to be counted.
- The combined effect of these two differences was significant. In experienced states 1.53% of the total vote came from counted provisional ballots. In new states, provisional ballots accounted for only 0.23% of the total vote.

Formatted: Bullets and Numbering

Those voting with provisional ballots in experienced states were enfranchised more frequently than those in the new states, another indication that there is room for improvement in provisional balloting procedures.[9] That conclusion gains support from the perspectives of the local election officials revealed in the survey conducted as a part of this research. Local (mostly county level) election officials from "experienced" states were more likely to:

- Be prepared to direct voters to their correct precincts with maps;
- Regard provisional voting as easy to implement;
- Report that provisional voting sped up and improved polling place operations
- Conclude that the provisional voting process helped officials maintain accurate registration databases.

Officials from "new" states, on the other hand, were more likely to agree with the statement that provisional voting created unnecessary problems for election officials and poll workers.

If experience with provisional voting does turn out to be a key variable in performance, that is good news. As states gain experience with provisional ballots their management of the process could become more consistent and more effective over subsequent elections. Further information from the EAC on best practices and the need for more consistent management of the election process could sharpen the lessons learned by experience. The EAC should consider providing all states with information on more effective administration of provisional voting. EAC could also consider convening a national meeting for state and county election officials to share experiences and best practices from their own jurisdictions.

Deleted: the

But the optimistic conclusion that experience will make all the difference may be unwarranted. Only if the performance of the "new" states was the result of administrative problems stemming from inexperience will improvement be automatic as election officials move along the learning

---

[9] Managing the provisional voting process can strain the capacity election administrators. For example, Detroit, counted 123 of the 1,350 provisional ballots cast there in 2004. A recent study concluded that Detroit's " 6-day time frame for processing the provisional ballots was very challenging and unrealistic. To overcome this challenge, *the entire department's employees were mobilized to process provisional ballots.*" (emphasis added.) GAO Report-05-997, "Views of Selected Local Officials on Managing Voter Registration and Ensuring Citizens Can Vote," September 2005.

curve. Two other possibilities exist. Current understanding of the provisional voting processes in use in 2004 is not sufficient to determine unambiguously which view is correct.

1. "New" states may have a political culture different from "old" states. That is, underlying features of the "new" states political system may be the reason they had not adopted some form of provisional voting before HAVA. The "new" states may strike a different balance among the competing objectives of ballot access, ballot security and practical administration. They may ascribe more responsibility to the individual voter to take such actions as registering early, finding out where the right precinct is, or re-registering after changing address. They may value keeping control at the local level, rather than ceding authority to state or federal directives. If the inconsistent performance in the "new" states arises out of this kind of political culture, improving effectiveness in the use of the provisional ballots -- as measured by intrastate consistency in administration— will be harder and take longer to achieve.[10] This ballot should mention something about election judges and their training.

Formatted: Outline numbered + Level: 1 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: 0.25" + Tab after: 0.5" + Indent at: 0.5", Tabs: -0.33", List tab + Not at 0.25"

2. "Old" states may devote fewer resources to updating their registration files or databases because they are comfortable with provisional ballots as a fail safe way for voters with registration problems a way to cast a ballot. (wording too strong) The adoption of statewide voter registration databases in compliance with HAVA therefore may reduce the variation in the use of provisional ballots among the states.

Formatted: Highlight

Other influences decreasing consistency among the states include:

- The more rigorous the verification requirements of the voter's identity and registration status, the smaller the percentage of provisional ballots that were counted. Some states merely require a voter's signature, some match signatures, some require identity documents, others require an affidavit, and a few require photo identification. [11]
    - In the 4 states that simply matched signatures, nearly 3.5% of the total turnout consisted of provisional ballots, and just under three-fourths of those ballots (73%) were counted.
    - In the 14 states that required voters to provide such additional information as address or date of birth just over 1.5% of the total turnout consisted of provisional ballots, and 55% of those ballots were counted.
    - In the 14 states that required an affidavit (attesting, for example, that the voter was legally registered and eligible to vote in the jurisdiction) just over one-half of a percent (0.6%) of turnout came from provisional ballots, and less than one-third of those (30%) were counted. (But note that HAVA requires all voters to certify that they are eligible and registered in order to cast a provisional ballot, which is functionally an affidavit. The 14 states described here used an explicit affidavit form.)
    - In the 10 states that required voters to return later with identifying documents just under 1.5% of the total turnout came from provisional ballots, and more than half

---

[10] Despite differing political cultures among states and the latitude HAVA provides states, the statute does, indeed impose some degree of uniformity on issues that Congress thought essential. For example, before HAVA, took effect, "no state gave the voter the right to find out the status of their ballot after the election. " Now all offer that opportunity. See Bali and Silver, "The Impact of Politics, Race and Fiscal Strains on State Electoral Reforms after Election 2000," manuscript, Department of Political Science, Michigan State University. Resisting HAVA's mandates through foot-dragging lacks any legitimate foundation in law or policy.

[11] See Table 2 in Appendix 2 for information on the verification method used in each state.

(52%) of these were counted. Voters apparently found this requirement less onerous than the affidavit, even though it required a separate trip to a government office. (the voter was registered, than the ballot counted, the voter did not have to present identification).

This section needs a mention of the VR databases

Formatted: Highlight

Formatted: Bullets and Numbering

- Voter registration databases provided information that reduced the number of provisional ballots counted.[12] In states using provisional voting for the first time, states with registered-voter databases counted only 20% of the ballots that were cast. States without such databases counted more than double that rate (44%). As HAVA's requirement for adoption of statewide databases spreads across the country, this variation among states is likely to narrow. Real-time access to a continually updated, statewide list of registered voters should reduce the number of provisional ballots used and reduce the percentage counted since most of those who receive them will be less likely to be actually registered in the state.

Formatted: Bulleted + Level: 1 + Aligned at: 0.25" + Tab after: 0.5" + Indent at: 0.5", Tabs: 0.21", List tab + Not at 0.25" + 0.5"

- States that counted out-of-precinct ballots counted 56% of the provisional ballots cast. States that counted ballots cast only in the proper precinct counted an average of 42% of provisional ballots. [13]
    - In experienced states, the disparity was even more pronounced, 52% of provisional ballots cast were counted in states requiring in-district ballots, while 70% were counted in those allowing out-of-precinct ballots.
    - If all states had counted out-of-precinct ballots, perhaps 290,000 more voters would have been enfranchised across the country.[14]

Deleted: :

Variation With-in States

Not only was there little consistency among states in the use of provisional ballots, there was also little consistency within states. This was true in both new and old states. Of the 20 states for which we have county-level provisional ballot data, the rate of counting provisional ballots varied by as much as 90% to 100% among counties in the same state. This suggests that additional factors outside of the statewide factors analyzed here also influence the use of provisional ballots. Perhaps it is the judges training or it is, in part, because of different laws. [15]

Formatted: Highlight

Formatted: Highlight

---

[12] The Election Day Survey found that states using statewide voter registration databases reported a lower incidence of casting provisional ballots than states without voter registration databases, suggesting that better administration of voter registration rolls might be associated with fewer instances where voters would be required to cast a provisional ballot due to a problem with their voter registration.

[13] The Election Day Survey concluded that : "Jurisdictions with jurisdiction-wide provisional ballot acceptance reported higher rates of provisional ballots cast, 2.09 percent of registration or 4.67 percent of ballots cast in polling places, than those with in-precinct-only acceptance, 0.72 and 1.18 percent, respectively. Predictably, those jurisdictions with more permissive jurisdiction-wide acceptance reported higher rates of counting provisional ballots, 71.50 percent, than other jurisdictions, 52.50 percent."

[14] This estimate is a rough approximation. States that recognize out-of-precinct ballots counted, on average, 56% of the provisional votes cast. Applying that ratio to the 1.9 million provisional ballots cast nationwide would result in 1.1 million provisional ballots that would have been counted if all states accepted out-of-precinct votes. States that did not recognize out-of-precinct ballots counted 42% of the provisional ballots cast, or about 813,000 ballots, for a difference of about 290,000 votes.

[15] For example, The Election Day Survey also found that "the reported rate of provisional ballots cast increases with population size, from 0.10 percent for voter registration in jurisdictions under 1,000 voting age population (VAP), to 2.51 percent in jurisdictions over one million VAP. It also calculated that, "The highest reported rate of counting provisional ballots was also among predominantly Hispanic jurisdictions, 79.30 percent, followed by predominantly

Reacting to the lack of consistency within states, (not the Carter-Baker Commission) recommended that "states, not counties or municipalities, should establish uniform procedures for the verification and counting of provisional ballots, and that procedure should be applied uniformly throughout the state."[16]

Election Line reported that:

- In Ohio some counties counted provisional ballots not cast in the assigned precinct even though the state's policy was to count only those ballots cast in the correct precinct.
- Some counties in Washington tracked down voters who would otherwise have had their provisional ballots rejected because they had failed to complete part of their registration form, gave them the chance to correct those omissions, and then counted the provisional ballot. This would probably not have come to light except for the sharp examination caused by the very close election for governor.

Resources available to administer provisional voting varied considerably among and within states. The result is that differences in demographics and resources result in different experiences with provisional voting. For example, the Election Day Survey found that:

- Jurisdictions with lower education and income tend to report more inactive voter registrations, lower turnout, and more provisional ballots cast.

- Jurisdictions with higher levels of income and education reported higher average numbers of poll workers per polling place or precinct and reported lower rates of staffing problems per precinct.

- Staffing problems appeared to be particularly acute for jurisdictions in the lowest income and education categories. Small, rural jurisdictions and large, urban jurisdictions tended to report higher rates of an inadequate number of poll workers within polling places or precincts.

- Predominantly non-Hispanic, Black jurisdictions reported a greater percentage of polling places or precincts with an inadequate number of poll workers. Predominantly non-Hispanic, Native American jurisdictions reported the second highest percentage of staffing problems.

The conclusions to be drawn from these findings are clear. In voting districts with lower education levels, poverty, high mobility, (no previous mention of this factor. What research exists to back up naming high mobility as a factor?) and inadequately staffed polling places, the voting process is unlikely to function well. More people will end up casting provisional ballots. That makes the provisional voting process especially important. But if jurisdictions struggle with regular voting, how well are they likely to do with the more complicated provisional balloting process? In precincts were the voting process, in general, is managed poorly, provisional ballots cannot be expected to work much better. In these areas, the focus should be on broader

---

non-Hispanic White areas, 62.60 percent; predominantly non-Hispanic Black communities, 58.60 percent; and predominantly non-Hispanic Native American jurisdictions, 48.70 percent.

[16] Report of the Commission on Federal Election Reform, "Building Confidence in U.S. Elections," September 2005, p.16. The report observed that, ". . .different procedures for counting provisional ballots within and between states led to legal challenges and political protests. Had the margin of victory for the presidential contest been narrower, the lengthy dispute that followed the 2000 election could have been repeated."

measures to improve the overall functionality of struggling voting districts, although improving the management of provisional balloting may help at the margin.

Effectiveness of Provisional Voting

The certainty of our conclusions about the effectiveness of provisional voting is limited because of a fundamental challenge of methodology (what is meant by this statement) and the lack of important information. An ideal assessment of how well provisional ballots served the needs of voters and the public interest requires knowing the decisions of local officials in 200,000 precincts on how to inform voters about provisional voting; their performance in providing a provisional ballot to those qualified to receive one, and their decisions whether to count a provisional ballot. And information needed about the eligibility or registration status of provisional voters is also not available. (Are polling places posting their provisional voting signs? Are election judges doing their jobs?)

We see no automatic correlation between the quality of a state's voting system and either the number of provisional ballots cast or counted. Low numbers could reflect an accurate statewide voting data and good voter education. Or they could suggest that provisional ballots were not made easily available. High numbers could be seen as signifying an effective provisional voting system or a weak registration process. But we do know that in 2004 provisional ballots enfranchised 1.2 million citizens, who would otherwise have been turned away from the polls.

Not knowing the total number of registered voters who might have voted but could not makes a precise, quantitative estimate of the effectiveness of provisional voting impossible. The Cal Tech – MIT Voting Technology Project, however, estimated that 4 – 6 million votes were lost in the 2000 presidential election for the reasons shown in Table 1 below. The estimate is an approximation, but it may provide data good enough for a general assessment of the size of the pool of potential voters who might have been helped by the provisional ballot process.

Estimates of Votes Lost In 2000 Presidential Election

Votes Lost (Millions)	***Cause***
1.5 – 2	Faulty equipment and confusing ballots
1.5 – 3	Registration mix-ups
<1	Polling place operations
?	Absentee ballot administration

Table 1 Cal Tech – MIT Voting Technology Project Estimates
4 – 6 million votes are lost in presidential elections due to the causes shown in the table. Registration mix-ups (e.g., name not on list) and polling place operations (e.g., directed to wrong precinct) are the causes most likely to be remedied by provisional voting.

The table shows that the universe of voters who could be helped by provisional voting might be 2.5 – 3 million voters. A rough estimate of the effectiveness of provisional voting in 2004, then,

might be 40% to 50% (ballots counted/votes lost)[*]. (this is unclear. What is trying to be said? Is a comparison of the # of provisional ballots actually counted to the MIT estimate of lost ballots in 2000 being made? If so, would the MIT survey be influenced by the implementation of statewide voter registration databases or other interim measures that would improve the quality of voter registration lists?) Whatever the precise figure, it seems reasonable to conclude that there is considerable room for improvement in the administration of provisional voting.

Legislative Response

Indeed, several states[17] came to the conclusion that the administration of their provisional voting procedures needed to be improved and amended their statutes after the 2004 election. State legislation adopted since the election points to particular areas of concern.

> Not enough time to examine and count the provisional ballots. Florida, Indiana, Virginia, and Washington all have clarified or extended the timeline to evaluate the ballots. But taking more time can prove a problem, particularly in presidential elections with the looming deadline to certify the vote for the Electoral College.[18]
>
> Lack of uniform rules for counting ballots and effective training of the election officials in interpreting and applying those rules to determine the validity of ballots. Colorado, New Mexico, North Carolina, and Washington have all passed legislation focused on improving the efficacy and consistency of the voting and counting process.
>
> The issue of counting provisional ballots cast in the wrong precinct was addressed by Colorado, Arkansas, and North Dakota. How was it addressed?

Litigation

Successful legal challenges to the process highlight areas where provisional voting procedures were wanting. A flurry of litigation occurred around the country in October 2004 concerning the so-called "wrong precinct issue" – whether provisional ballots cast by voters in a precinct other than their designated one would be counted for statewide races. These lawsuits were largely unsuccessful in their stated goal: most courts, including the U.S. Court of Appeals for the Sixth Circuit (the only federal appeals court to rule on the issue), rejected the contention that HAVA requires the counting of these wrong-precinct provisional ballots.

---

[*] Another interpretation of the data should be considered. The Census Bureau's Current Population Survey (CPS) developed the category of"registration mix-ups" to assess the states' registration systems after each election when it asks people if they were registered and if they voted. The CPS gives breakdowns of reasons why people did not vote. Survey responders tend to deflect blame when answering questions about voting. In the narrow context of provisional ballots, 'registration problems' would cover only voters who went to the polls where the determination that they were not registered was wrong or were registered, but in the wrong precinct. If they were in the wrong precinct, provisional voting can help them in only 17 states. In 2004, only 6.8% of those not voting and registered blamed registration problems, while 6.9% reported so in 2000.

[17] Twelve states made statutory or regulatory changes: Arizona, Arkansas, Colorado, Florida, Georgia, Indiana, Louisiana, Montana, New Mexico, North Carolina, Virginia and Wyoming. See Table 4 in Appendix 2.

[18] The resources available to evaluate and count provisional ballots within a tight schedule may not be easily available. The General Accounting Office reports that Detroit, where 1,350 provisional ballots were cast and 123 counted, found the 6-day time frame for processing provisional ballots "very challenging and unrealistic. To overcome this challenge, the *entire department's employees were mobilized to process provisional ballots*." The report also found that in Los Angeles County, "staff had to prepare duplicate ballots to remove ineligible or invalid contests when voters cast their ballots at the wrong precinct. To overcome this challenge, staffing was increased to prepare the duplicate ballots." In a close, contested election, "duplicate" ballots would doubtless receive long and careful scrutiny." See Appendix 7, GAO, "Views of Selected Local Election Officials on Managing Voter Registration and Ensuring Eligible Citizens Can Vote," September 2005. (GAO Report-05-997)

This litigation was significant nonetheless.

- First, the Sixth Circuit decision established the precedent that voters have the right to sue in federal court to remedy violations of HAVA.

- Second --and significantly-- the litigation clarified the right of voters to receive provisional ballots, even though the election officials were certain they would not be counted. The decision also defined an ancillary right –the right to be directed to the correct precinct. There voters could cast a regular ballot that would be counted. If they insisted on casting a provisional ballot in the wrong precinct, they would be on notice that it would be a symbolic gesture only.

- Third, these lawsuits prompted election officials to take better care in instructing precinct officials on how to notify voters about the need to go to the correct precinct in order to cast a countable ballot – although the litigation regrettably came too late to be truly effective in this regard. In many states, on Election Day 2004, the procedures in place for notifying voters about where to go were less than ideal, reflecting less-than-ideal procedures for training poll workers on this point.

There was also pre-election litigation over the question whether voters who had requested an absentee ballot were entitled to cast a provisional ballot. In both cases (one in Colorado and one, decided on Election Day, in Ohio), the federal courts ruled that HAVA requires that these voters receive a provisional ballot. Afterwards, it is for state officials under state law to determine whether these provisional ballots will be counted, in part by determining if these provisional voters already had voted an absentee ballot (in which case one ballot should be ruled ineligible, in order to avoid double voting). These decisions confirm the basic premise that provisional ballots should be available whenever voters believe they are entitled to them, so that their preferences can be recorded, with a subsequent determination whether these preferences count as valid votes.

Need for Promulgation of Best Practices
Because every provisional ballot counted represents a voter who, if the system had worked really well, should have voted by regular ballot, the advent of statewide registration databases is likely to reduce the use provisional ballots. The one area in which such databases may not make a difference is for those who voted by provisional ballot because they did not bring required identification documents to the polling place. This is false. If they are registered (the voter registration database is checked as required by HAVA or restricted by state requirement) the provisional counts. Beyond that exception, even with statewide registries in every state, provisional voting will remain an important failsafe, and voters should have confidence that the failsafe will operate correctly.

The wide variation in the implementation of provisional voting among and within states suggests that EAC can help states strengthen their processes. Research-based recommendations for best, or at least better, practices based on the experience gained in the 2004 election can be useful in states' efforts to achieve greater consistency in the administration of provisional voting.

Recommendations for Best Practices
Recent legislative activity shows that state efforts to improve the provisional voting process are underway. Those states, as well as others that have not yet begun to correct shortcomings that became apparent in 2004, can benefit from considering the best practices described here. By recommending best practices, the EAC will offer informed advice while respecting diversity

among the states. One way to strengthen the recommendations and build a constituency for them would be for EAC to ask its advisory committee members to recommend as best practices procedures that have worked in their states.

Self-evaluation of Provisional Voting –4 Key Questions (Best practice suggestion?)
The first recommendation is not for a specific procedure, but rather for a way of thinking about provisional voting. As legislators and election officials in the states prepare for the 2006 election, they should ask themselves these questions about their provisional voting systems.

1. Does the provisional voting system distribute, collect, record, and tally provisional ballots with sufficient accuracy to be seen as procedurally legitimate by both supporters and opponents of the winning candidate? Does the tally include all votes cast by properly registered voters who correctly completed the steps required?
2. Is the system sufficiently robust (what system – the voting system or the procedures for provisional voting?) to perform well under the pressure of a close election when ballot evaluation will be under scrutiny and with litigation looming?
3. Do the procedural requirements of the system permit cost-efficient operation? Are the administrative demands of the system reasonably related to the staff and other resource requirements available?
4. How great is the variation in the use of provisional voting in counties or equivalent levels of voting jurisdiction within the state? Is the variation great enough to cause concern that the system may not be administered uniformly across the state?

If the answers to these questions leave room for doubt about the effectiveness of the system or some of its parts, the EAC's recommendation of best practices should provide the starting point for a state's effort to improve its provisional voting system.

Best Practices For Each Step In The Process
We examined each step of the provisional voting process to identify specific areas where the states should focus their attention, and we offer recommendations in each area appropriate to the responsibilities that HAVA assigns the EAC for the proper functioning of the provisional voting process. (State how were these particular best practices chosen or arrived at?)

The Importance of Clarity

The EAC should emphasize above all else the importance of clarity in the rules governing every stage of provisional voting. As the Century Foundation's recent report observed, "Close elections increasingly may be settled in part by the evaluating and counting of provisional ballots. . . To avoid post election disputes over provisional ballots—disputes that will diminish public confidence in the accuracy and legitimacy of the result– well in advance of the election, states should establish, announce, and publicize clear statewide standards for every aspect of

the provisional ballot process, from who is entitled to receive a provisional ballot to which ones are counted."[19]

Litigation surrounding the 2004 election resulted in decisions that, if reflected in state statutes or regulations and disseminated in effective training for poll workers, can increase the clarity of provisional ballot procedures, increase predictability, and bolster confidence in the system. By taking the following steps, states can incorporate those court rulings into their procedures.

- Promulgate, ideally by legislation, clear standards for evaluating provisional ballots, and provide training for the officials who will apply those standards. For example, in Washington State, the court determined that an election official's failure in evaluating ballots to do a complete check against all signature records is an error serious enough to warrant recanvassing.[20] Clear direction by regulation or statute on what records to use in evaluating ballots could have saved precious time and effort and increased the reliability of the provisional voting system.

- States should provide poll workers the training and information resources they need, as for example, how to locate polling places for potential voters who show up at the wrong place. Usable and useful information in the hands of poll workers can protect voters from being penalized by ministerial errors at the polling place.[21] (does this mean that the state should provide poll workers training? Most provided by local election jurisdictions. Is the recommendation to deviate from current practice?)

- States should make clear that the only permissible requirement to obtain a provisional ballot is an affirmation that the voter is registered in the jurisdiction and eligible to vote in an election for federal office. [22] Recent legislation in Arizona indicates that HAVA's recommendations should emphasize HAVA's requirement that persons appearing at the polling place claiming to be registered voters cannot be denied a ballot because they do not have identification with them. Poll workers need appropriate training to understand their duty to give such voters a provisional ballot. [23]

A. Registration and Pre-Election Information for Voters

Providing crisp, clear information to voters before the election is important to the success of the provisional voting process. The better voters understand their rights and obligations, the easier the system will be to manage, and the more legitimate the appearance of the process. States

---

[19] The Century Foundation, Balancing Access and Integrity, Report of the Working Group on State Implementation of Election Reforms, July 2005.

[20] See *Washington State Republican Party v. King County Division of Records*, 103 P3d 725, 727-728 (Wash. 2004)

[21] See *Panio v. Sunderland* 824 N.E.2d 488, 490 (NY, 2005) See also Order, *Hawkins v. Blunt*, No.04-4177-CV-C-RED (W.D. Mo. October 12, 2004). While rejecting the notion that all ballots cast in the wrong precinct should be counted, the court ruled that provisional votes cast in the wrong precinct should be thrown out provided that the voter had been directed to the correct precinct. This meant that provisional votes cast in the wrong precinct (and even the wrong polling place) would count if there were no evidence that the voter had been directed to a different polling place. The court placed a duty upon election officials to make sure the voters were in the correct locations. Note that this question would not arise in a state that counted ballots cast in the wrong polling place but within the correct county.

[22] *Sandusky County Democratic Party v. Blackwell*, 387 F.3d 565, 774 (6th Cir. 2004)

[23] *The Florida Democratic Party v. Hood*, 342 F. Supp. 2d 1073, 1075-76 (N.D. Fla. 2004). The court explained that provisional voting is designed to correct the situation that occurs when election officials do not have perfect knowledge and when they make incorrect determinations about eligibility (the "fail-safe" notion). Denying voters provisional ballots because of on-the-spot determinations directly contradicts this idea. Even before the cited decision, the Florida Secretary of State's office had determined that any voter who makes the declaration required by federal law is entitled to vote a provisional ballot, even if the voter is in the wrong precinct.

can begin by assessing the utility and clarity of the information for voters on their websites and by considering what information might be added to sample ballots mailed to voters before elections. Best practices in this area would include:

1. If states require identification at the time of registration, the kind of IDs required should be stated precisely and clearly and be publicly and widely available in a form that all voters can understand. For example, "You must bring your driver's license. If you don't have a driver's license, then you must bring an ID card with your photograph on it and this ID card must be issued by a government agency. " [24]

2. The process to re-enfranchise felons should be clear and straightforward. To avoid litigation over the registration status of felons, best practice should be defined as making re-enfranchisement automatic, or no more burdensome than the process required for any new registrant.[25]

3. A state website for voters should offer full, clear information on boundaries of precincts, location of polling places, requirements for identification, and other necessary guidance that will facilitate registration and the casting of a regular ballot. An 800 number should also be provided. Models are available: the statewide databases in Florida and Michigan provide voters with provisional voting information, registration verification and precinct location information. Why not recommend local websites to do the same as state sites?

B. At the Polling Place

Avoiding error at the polling place will allow more voters to cast a regular ballot and all others who request it to cast a provisional ballot.

1. The layout and staffing of the polling place, particularly the multi-precinct polling place is important. Greeters, maps, and prominently posted voter information about provisional ballots, ID requirements, and related topics can help the potential voters cast their ballot in the right place. States should require poll workers to be familiar with the options and provide the resources needed for them to achieve the knowledge needed to be helpful and effective. It's the law. Do they understand that all have to do this? Colorado has clear regulations on polling place requirements, including HAVA information and voting demonstration display.[26] After the 2004 election, New Mexico adopted a requirement for poll workers to attend an "election school." [27] Most states require this. It is not new. In fact, Florida's statutory training provisions are among the highest in the nation. Such statutory direction could help other states ensure uniform instruction of poll workers.

2. The provisional ballot should be of a design or color sufficiently different from a regular ballot to avoid confusion over counting, as occurred in Washington State. The ballot might include a tear-off leaflet with information for voters such as: "Reasons Why Your Provisional Ballot Might Not Be Counted" on one side and "What to Do if My Provisional Ballot Is Not Counted" on the other.

---

[24] Websites in 29 states describe, with varying degrees of specificity, the identification voters may need. In 18 states voters can learn something about the precinct in which they should vote. And in 6 states (California, District of Columbia, Kentucky, Michigan, North Carolina, and South Carolina) they can verify their registration on the website.

[25] The Century Foundation, op. cit.

[26] 8 Colo. Code Regs. § 1505-1, Rule 7.1.

[27] 2005 N.M. Laws 270 page no. 4-5.

3. Because provisional ballots offer a fail-safe, supplies of the ballots at each polling place should be sufficient for all the potential voters likely to need them. In 2004, some polling places ran out of ballots, with unknown effects on the opportunity to vote. In Middlesex County, New Jersey, for example, on Election Day the Superior Court ordered the county clerk to assure that sufficient provisional ballots were available at several heavily used polling places, and it authorized the clerk "in the event additional provisional ballots are required . . .to photocopy official provisional ballots." [28] At least two states, Connecticut and Delaware, provide guidelines to local election officials on how to estimate the demand for provisional ballots. States that do not offer a practical method to guide the supply of provisional ballots at polling places should consider doing so. The guideline should take into account both the number of voters in the district and the number of provisional ballots actually cast in recent elections. Connecticut sets the number at 1% of the voters in the district, Delaware at 6%.[29]

4. To achieve the procedural clarity needed to forestall disputes, states should establish a clear chain of custody for the handling of provisional ballots from_production through distribution, collection and, finally, evaluation. A number of states have clear procedures for at least parts of this chain of custody._Illinois includes the potentially beneficial requirement that ballots be transported by bi-partisan teams, which offers the potential to avoid some charges of election fraud.[30] Seems like most states require training; do they have data on that? Florida's statutory training provisions among the strongest in the nation.

C. Evaluating Voter Eligibility and Counting Provisional Ballots

The clarity of criteria for evaluating voter eligibility is critical to a sound process for deciding which of the cast provisional ballots_should be counted. The recognition of the validity of those criteria is important to establishing the legitimacy of the system as a whole. The experience in 2004 in North Carolina, Washington, and Ohio underline the importance of clear criteria. As the Century Foundation report put it, "Whatever procedures the states choose [to determine if a provisional ballot should be counted], the paramount consideration—as with all others concerning provisional voting—is that they be clear and thus not susceptible to post-election manipulation and litigation."[31] Nonetheless, the *Panio v. Sutherland*[32] decision in New York shows the difficulty of defining the range of administrative errors from which the provisional voters should be held harmless. Even when the standard is "clerical error" judges can differ over what that means exactly. Possibly a state law might be able to clarify a definition by giving examples of clerical errors, but even then the definition is unlikely to be perfect.

1. State statutes or regulations should define a reasonable period for voters who lack the HAVA-specified ID or other information bearing on their eligibility to provide it in order to facilitate the state's ability to verify that the person casting the provisional ballot is the

---

[28] Voting Order, November 2, 2004, Superior Court of New Jersey, Law Division, Middlesex County.

[29] Connecticut: "Equal to or not less than 1% of the number of electors who are eligible to vote in any given district, or such other number as the municipal clerk and the registrars agree is sufficient to protect voting rights. Conn. Gen. Stat. Ann. § 9-232j.Delaware: Each County Department of Elections Office is required to provide to each election district a number of provisional ballots equal to 6% of registered voters in that district, with a minimum allocation of 15 ballots. Additional supplies to be delivered when the supply becomes "very low." Del.Code Ann. Tit 15 § 4948(e).

[30] 10 Ill. Comp. Stat. Ann. 5/18A-10(b)._Indiana requires that the precinct election board give the ballots to the Inspector, who takes the ballots to Circuit Court Clerk. Ind. Code Ann. Sec. 3-11.7-2-4

[31] The Century Foundation, op. cit.

[32] 4 N.Y.3d 123, 824 N.E.2d 488 (N.Y. 2005) and Memorandum (LaPlante—Foley) Provisional Ballot Cases by State, July 19, 2005.

same one who registered. While there may be a concern to ensure that the individual who returns with the ID may not be the same individual who cast the provisional ballot, the spirit of HAVA demands that the opportunity to prove identity be provided after Election Day. A signature match can go far in establishing that the individual who voted and the individual returning later with identification is, in fact, the same person. Encouraging a voter who lacks ID on Election Day to return later to help the verification process by providing proper identification will strengthen the system and increase public confidence in the electoral process. Our data indicate that some voters would prefer to return with ID rather than to sign an affidavit, perhaps because of uncertainty about the legal process involved in the affidavit. At least 11 states allow voters to provide ID or other information one to 13 days after voting. Of particular interest is Kansas, which allows voters to proffer their ID by electronic means or by mail, as well as in person.[33]

2. More provisional voters are enfranchised in those states that count ballots cast outside the correct precinct. [34] The best practice may be to count provisional ballots even if they are cast in the wrong precinct. While HAVA arguably leaves this decision up to the states, pointing out the effect of the narrower definition on the portion of ballots counted could be useful to the states in deciding this question. States should be aware, however, of the additional burden placed on the ballot-evaluation process when out-of-precinct ballots are considered. See the experience in Los Angeles County with the difficulties in evaluating out-of-precinct ballots described earlier in this report. EAC Chairman: does not agree w/ this recommendation. It does not take into account for local offices that would not be voted upon w/ such practices. Voters would then not be directed or go to their correct polling place to cast a ballot.

3. Alternatively, if a state chooses to require voters to appear at their assigned precinct, where the same polling site serves more than one precinct, a voter's provisional ballot should count so long as the voter cast that ballot correct polling site even if at the wrong precinct within that location. [35] Can the best practice be to send voter to correct precinct – if its in the same building as suggested in this recommendation. Why disenfranchise voter from voting on a local race?

4. Officials should follow a written procedure, and perhaps a checklist, to identify the reason why a provisional ballot is rejected (e.g., check the applicable box "unregistered voter"; "lack of signature match" "wrong precinct," etc.) Those forms should be disclosed

---

[33] In Kansas, the voter can provide ID to a County Election Officer any time before the County Board of Canvassers meets to count provisional ballots. KS. ST. 25-1122(d). ID can be presented in person, OR via mail or electronic means. *Id.* The Board must meet either on the Friday or Monday following a Tuesday election. *Id.* at 25-3104. Deadlines in other states are: Alabama – 5:00 P.M. on the Monday following the election AL ST § 17-10A-2(c)_(1) Florida: until 5:00 P.M. on the third day following the election . Fla. Stat. Ann. § 101.048 (adopted after the 2004 election);Georgia—no later than 2 days after the election. GA ST § 21-2-417; 419. Illinois- 2 days to submit additional information 10 Ill. Comp. Stat. Ann. 5/18A-15(d); Indiana— in 2004 the deadline was the close of the polls IN. ST. §. 3-11.7-5-2(a). The time period was extended to 13 days by the adoption of Indiana Code 3-11-8, Section 25, Subsection (l); Maryland—until the meeting of the Election Board; MD ELEC LAW § 11-303. New Jersey— until the close of business on the second day after the election 19:53C-3(i). Nevada— until 5:00 P.M. on the Friday following the election NV ST 293.3085; New Mexico—until 7:00 P.M. on Election Day NM ADC 1.10.22 (8) (H).

[34] See Andersen, op. cit, pgs. 23 – 24 for an analysis of the significant effect of counting out-of-precinct ballots. The Election Day Survey found that, "Most notably, jurisdictions that permitted jurisdiction-wide acceptance of provisional ballots reported higher rates of provisional ballots being cast, but also reported a much higher incidence of provisional ballots being counted, than other jurisdictions."

[35] Chances are administrative error accounts for the voter being directed to the wrong precinct under these circumstances.

publicly when completed. Colorado's election rules offer particularly clear guidance to the official evaluating a provisional ballot.[36]

Colorado Rejection Codes (Any ballot given a rejection code shall not be counted):

RFS	(Rejection federal or state) No federal or state candidates or issues to duplicate.
RNS	(Rejection not signed) Provisional Ballot Affidavit not signed.
RIN	(Rejection incomplete information provided) Required information is incomplete and the designated election official is unable to confirm voter's eligibility.
RNR	(Rejection not registered) Voter did not register by the voter registration deadline or by emergency registration, Colorado voter registration record was not found, or voter was previously cancelled and has not been reinstated pursuant to 1-2-605(10). C.R.S.
REE	(Rejection envelope empty) Provisional ballot envelope is empty.
RAB	(Rejection voter voted absentee) Designated election official has confirmed that voter voted an absentee ballot.
REV	(Rejection based on ballot cast in early voting) Voter voted early.
RIP	(Rejection based on incorrect party) Incorrect Party in Primary Election.
RFE	(Rejection felon not eligible to vote) Individual was convicted of a felony and is either serving a sentence of confinement or detention or is on parole.
RWC	(Rejection elector not registered in county or State of Colorado) Non-county or non-state resident; therefore voter not eligible to vote in the county where the provisional ballot was voted.
RID	(Rejection first time voter has not supplied identification upon registration or thereafter prior to and during time voter voted) First Time Voter who registered by mail or through a voter registration drive, is tagged as id deficient, and did not provide id at the time of voting.
RRD	(Rejection registration deficient) Voter had deficient or incomplete registration and required information was not provided prior to or at the time of filling in the provisional ballot envelope. Voter's eligibility cannot be established.

D. Verification of Provisional Ballots

1. States that use the information on the provisional ballot to permit voters who have changed their addresses to update their registrations should adopt clear procedures on that process and specify how the new information will be communicated between different Boards of Elections

2. The time by which election officials must complete their eligibility evaluations is critical, particularly in presidential elections. States should consider in particular how to divide the time allowed them by the safe-harbor provisions that apply in presidential elections to the certification to the Electoral College. Some part of this five-week period will be consumed by the eligibility evaluation, but states should take care to provide a sufficient period of time as well for challenges. If a state consumes 21 days following the election in the eligibility evaluations, only two weeks will remain for legal challenges to be concluded. Is that sufficient? Or should the state provide the resources needed to

---

[36] 8 ccr 1505-1, at 26.5.4, adopted august 4, 2005. See also 1-2-509(3) C.R.S.

complete the eligibility determinations in 10 days or two weeks, leaving three weeks or more for legal challenges in a close election? Our research did not identify an optimum division of the five weeks available. The best practice here is for states to consider the issue and make a careful decision about how to complete all steps in the evaluation of ballots and challenges to those determinations within the five weeks available. Why is it suggested that completing eligibility evaluations are more critical in presidential elections? What about gubernatorial elections?

E. Post-election Information for Voters

Timely information to voters about the disposition of their provisional ballot will provide helpful feedback and more important enable voters to determine if they are registered for future elections and, if not, what they need to do to become registered.

1. Establish mechanisms to ensure that voters casting provisional ballots are informed whether they are now registered for future elections and, if not, what they need to do to become registered.

F. State Laws Governing Litigation over Provisional Voting

1. Establish special, streamlined litigation procedures for Election Day complaints that individuals are being denied the right to cast a provisional ballot

Broader Considerations

G. Integrity and the Appearance of Integrity

1. State laws or regulations providing for non or bi-partisan bodies to make a public determination of the validity of provisional ballots would increase confidence in the system.

2. To improve transparency, state laws or regulations should require the purging process for registration to be public and with an opportunity for voters to correct an erroneous determination that they should be purged.

3. State laws or regulation should require the evaluation process for provisional ballots to be public. The process *not* the names since by law they cannot be revealed.

H. Continuous Assessment of the Provisional Ballot -- Process and Performance

Defining what constitutes a successful provisional voting system is difficult. As noted earlier, the most successful system is probably not the one with the most provisional votes cast (that could indicate problems with the registration system). Nor is the system with the greatest number counted or with the fewest counted necessarily superior because the evaluation process could be flawed.

Defining quality requires a broad perspective about how well the system works, how open it is to error recognition and correction, and how well provisional voting processes are connected to the registration and voter identification regimes. The EAC should consider engaging one of the national quality organizations (what is meant by national quality organizations? Examples?) to evaluate the provisional ballot process within the broader context of the electoral system.

Pending such a review, the EAC can recommend that states take the following actions.

1. Recognize that the first step to improving quality is to see the provisional voting process as a system and take a systems approach to regular evaluation through standardized metrics with explicit goals for performance.

2. States should begin by collecting data systematically on the provisional voting process so that they can evaluate their voting system and assess changes from one election to the next. The effort should start in the 2006 election, and the data collected should include:
   - Provisional votes cast and counted by jurisdiction, say counties, with details on why the voter had to vote provisionally (lack of ID, not on list, challenged at polling place, issued absentee ballot, etc) and number of ballots actually counted in each category.
   - Reasons why provisional ballots were not counted, using categories such as those that have been adopted by Colorado, described earlier in this report.
   - Measures of variance among jurisdictions.
   - Number of poll workers trained in administration of provisional voting by polling place
   - Number of jurisdictions posting information on provisional voting in the polling place
   - Time required to evaluate ballots by jurisdiction

Improving understanding of the provisional voting process through analysis of detailed information will enable state and local election officials to strengthen their systems. By collecting and analyzing this data states can identify which aspects of the registration and electoral system are most important in shunting voters into the provisional ballot process. Responsible officials can then look to their registration system, identification requirements or poll worker training as a way to reduce the need for voters to cast their ballots provisionally.

Conclusion – Research-based, continuing improvements for provisional voting are needed (This section should be the first part of the document)

The recommendations above are based on research that began in late May 2005. Our research focused on six key questions raised by the EAC. The answers to those questions provided the foundation for our policy recommendation. Those questions are:

1. How did the states prepare for the onset of the HAVA provisional ballot requirement?
2. How did this vary between states that had previously had some form of provisional ballot and those that did not?
3. How did litigation affect implementation?
4. How effective was provisional voting in enfranchising qualified voters?
5. Did state and local processes provide for consistent counting of provisional ballots?
6. Did local election officials have a clear understanding of how to implement provisional voting?

(Should this section be put under a Research Methodology section at the beginning?)

To answer those questions, the Eagleton-Moritz team undertook the following research efforts:

1. Survey of 400 local (mostly county) election officials to learn their views about the administration of provisional voting and to gain insights into their experience in the 2004 election.
2. Review of news and other published reports in all 50 states to understand the local background of provisional voting and develop leads for detailed analysis.

3. Statistical analysis of provisional voting to determine associations between the use of provisional voting and such variables as states' experience with provisional voting, use of statewide registration databases, counting out-of-precinct ballots, and use of different approached to voter identification
4. Collection and review of the provisional voting statutes and regulations in all 50 states.
5. Analysis of litigation affecting provisional voting or growing out of disputes over provisional voting in all states.

Our research-based recommendations provide EAC with a strategy to engage the states in a continuing effort to strengthen the provisional voting process and increase the consistency with which provisional voting is administered, particularly within a state. As EAC and the states moved forward to assess and adopt the recommendations made here, provisional voting merits continuing observation and research. The situation is fluid. As states, particularly states that did not offer a provisional ballot before 2004, gain greater experience with the process and as statewide voter databases are adopted, the provisional voting process will demand further, research-based refinement.

ATTACHMENT 1 – Characteristics of the Provisional Voting Process Classification of the States

Our research on provisional voting divided the various states into several categories to allow an assessment of how different factors may have influenced the process of casting and counting provisional ballots. This analysis was conducted before the release of the Election Day Study, and the categories we used may differ in some respects from its work. The variables used to analyze a state's use of provisional ballots:

Deleted: categories analyzed here ar

Deleted: e

1. New vs. Old (states that used a provisional ballot before the 2004 election)
2. Use of a statewide database of registered voters vs. no use of a statewide database
3. Counting out-of-precinct ballots vs. not counting out-of-precinct ballots
4. Voter identification requirements
5. Method used to verify provisional ballots
6. Levels of provisional ballots cast and counted

We first assigned states within these categories based on classifications done by Electionline.org in its studies. The Electionline data was the only published information available at the time of our research. We reviewed the Electionline data carefully, and, in select cases, updated it with new, detailed information that had become available after its publication. The changes we made are explained below.

Please note that:

--Idaho, Maine, Minnesota, New Hampshire, Wisconsin and Wyoming were excluded from our analysis. They have election-day registration systems, and did not need to use HAVA-compliant provisional ballots.

--North Dakota does not register voters, so it also was excluded from HAVA requirements and did not use provisional voting.

--Mississippi has not reported its provisional voting results and could not be included in our analysis, though it was compliant in 2004.

--Pennsylvania did not report its totals for the Election Day Study, but we obtained information on Pennsylvania and did include it in our analysis.

New vs. Old States

We classified states as “new” or “old” based on the 2001 Electionline study of provisional voting[37] and condensing its classifications into a single dichotomous variable, new/old with all other cases excluded. The Electionline study divided states into five categories of their use of provisional ballots in the 2000 election:

1. Use of provisional ballots (P)
2. Limited use of provisional ballots (LP)
3. Affidavit ballots (A)
4. No system in place (N)
5. Unnecessary/Not Applicable (U/NA)

We collapsed all of the states listed as using provisional ballots, limited use of provisional ballots or affidavit ballots as “old” states, because the states in all three categories would have been familiar with key aspects of provisional voting.. States that had no provisional voting system in place for the 2002 election, and were HAVA compliant in 2004, were listed as “new” states, as 2004 would have been the first year in which they would be offering the option of provisional voting. States that were listed as unnecessary or not applicable were excluded from this study, as they were exempt from the HAVA regulations in 2004 because they either allowed same-day registration or did not register voters.

Rhode Island is the only state categorized as an old state by Electionline that we moved into the list of new states. Electionline’s map shows Rhode Island as a state that used provisional voting in 2000, but in the state description, it is listed as having no system in place. We learned from the Rhode Island Board of Elections that the state had previously permitted potential voters to sign an affidavit if they did not appear on a precinct’s list of registered voters, but felt they were registered to vote. Based on the signed affidavit, the election official would then contact a county official to see if the voter was on a more complete registration list. If the voter’s name was on the complete list, that voter was permitted to cast a regular ballot. As this process did not grant the voter a provisional ballot, but served as a different type of administrative failsafe, we concluded that Rhode Island’s first use of provisional voting was in 2004 and, therefore, classified the state as “new” to the system of provisional balloting.

---

Statewide List of Registered Voters

The Electionline preview of the 2004 Election[38] was the starting point for compiling a list of states that had a statewide database of registered voters. That study listed 34 States that did not have their statewide database systems complete, and 16 that did, including the District of Columbia. North Dakota does not register voters, so does not need to compile such a database. Electionline's criterion for concluding that a state had a statewide list was that the state have participation from all jurisdictions in a statewide system. We added Oklahoma to the list of states with statewide databases because we found they had met the Electionline criteria by the 2004 election, albeit too late for inclusion in the Electionline survey.

---

[38] "Election Preview 2004: What's changed, What Hasn't and Why". This study can be found at: http://electionline.org/Portals/1/Publications/Election.preview.2004.report.final.update.pdf

Table 2 (This table is no longer germane.)

CATEGORIZATION OF STATES -- Statewide Registration Database

Had Database 2004	No Database A-N	No Database N-W	HAVA Exempt or NA
Alaska	Alabama	Ohio	Iowa
Arizona	Arkansas	Oregon	Maine
Connecticut	California	Pennsylvania	Mississippi
Delaware	Colorado	Rhode Island	Minnesota
District of Columbia	Florida	Tennessee	New Hampshire
Georgia	Idaho	Texas	North Dakota

New Mexico	Montana		
Oklahoma	Nebraska		
South Carolina	Nevada		
South Dakota	New Jersey		
West Virginia	New York		
	North Carolina		
16	27		8

Minnesota has a statewide database but was excluded from the analysis because it did not offer provisional ballots and was exempt from the HAVA requirements.

Out-of-Precinct Ballots

We based our classification of states that allow the counting of ballots cast outside the correct precinct on the data in the 2004 Electionline preview of the 2004 election[2]. States that evaluated ballots cast in a precinct where the voter was not registered were categorized as "out-of-precinct." States that invalidated such ballots were categorized as "In-precinct only."

Table 3
CATEGORIZATION OF STATES – Counting Out-Of-Precinct Ballots

Out-of-Precinct	In-Precinct Only	HAVA EXEMPT OR NA
Alaska	Alabama	Idaho
Arkansas	Arizona	Maine

Voter Identification

We relied on Electionline studies, including the Voter Identification study[39] and the 2004 Election Preview, to classify the states on their requirements for voter identification. Each state's categorization is taken directly from the Electionline studies except Hawaii.[40] The five

---

[39] This study can be found at: http://electionline.org/Portals/1/Publications/Voter%20Identification.pdf

[40] In 2004, ElelctionLine listed Hawaii as requiring identification. Our review of statutes revealed that Hawaii could require photo ID. Since that is the most rigorous form of identification that may be required of voters, we classified Hawaii under this category.

different, and increasingly rigorous, categories are: Give Name (8 states), Sign Name (14 states), Match Signature (8 states), Provide ID (15 states), and Photo ID (5 states).

Table 4

CATEGORIZATION OF STATES – Forms of Identification Required

States in italics are exempt from HAVA or did not report Provisional Ballot data and are not included in the analysis.

Give Name	**Sign Name**	**Match Signature**	**Provide ID**	**Photo ID**
Maine	California	Illinois	Alabama	Florida
Massachusetts	DC	Nevada	Alaska	Hawaii
New Hampshire	*Idaho*	New Jersey	Arizona	Louisiana
North Carolina	Indiana	New York	Arkansas	South Carolina
Rhode Island	Iowa	Ohio	Colorado	South Dakota
Utah	Kansas	Oregon	Connecticut	
Vermont	Maryland	Pennsylvania	Delaware	
Wisconsin	Michigan	West Virginia	Georgia	
Wyoming	Minnesota		Kentucky	
	Mississippi		Missouri	
	Nebraska		Montana	
	New Mexico		*North Dakota*	
	Oklahoma		Tennessee	
	Washington		Texas	
			Virginia	
9	14	8	15	5

South Dakota complicates the effort to assign each state to a category. It permits voters to sign an affidavit that would allow them to vote without presenting photo ID. While Hawaii did not normally require photo ID, its statutes gave challenged voters the opportunity to respond by producing a photo ID.

Verification Method

We identified four different ways states assessed provisional ballots to determine if they should be counted: signature match, match voter data, signed affidavits, and bringing back identification later. We gathered information about these verification techniques by checking state websites and consulting journalistic accounts. We consulted state legislation to provide further information where needed.

Table 5

CATEGORIZATION OF STATES – Ballot Evaluation Methods

States in italics are exempt from HAVA or did not report Provisional Ballot data and are not included in the analysis. No states have been italicized. Is this correct?

Signature Match	**Data Match**	**Affidavit**	**Return with ID**	**NA**
Alaska	Alabama	Connecticut	Indiana	Idaho

	Pennsylvania	New York	Utah	
	Rhode Island	South Dakota		
	S. Carolina	Tennessee		
	Washington	Vermont		
	West Virginia	Virginia		
4	14	14	10	9

Data Collection

To assemble our data for analysis, we began by using the data on provisional votes cast and counted reported by Electionline. To increase the accuracy of this data, we surveyed each state's election websites for updated data, and for reported numbers on the county level. We then sent emails to 49 (we excluded Alaska, see below) states and the District of Columbia, requesting updated data on the number of provisional votes cast and counted by county. We received information from 25 states by our cut-off date of August 25, 2005.

---

* North Carolina lacked clear standards to evaluate provisional ballots and is excluded from this analysis.

Table 6
Updated information by State

Received Updated Data	Did Not Receive Updated Data
California	Alabama
District of Columbia	Alaska[41]
Florida	Arizona
Hawaii	Arkansas
Indiana	Colorado
Iowa	Connecticut
Kansas	Delaware
Louisiana	Georgia
Maryland[42]	Idaho
Missouri	Illinois
Montana	Kentucky
Nebraska[43]	Maine

Pennsylvania	North Carolina
Rhode Island	North Dakota
South Dakota	South Carolina
Tennessee	Utah
Texas	Vermont
Virginia	Wisconsin
Washington	Wyoming
West Virginia	
26 States	**25 States**

---

[41] Alaska was not contacted via email, as the state does not have voting districts comparable to counties in other states and could not be matched with comparable census data.
[42] Maryland reported provisional ballots that were counted per county, but not number cast.
[43] Nebraska reported an incomplete list of provisional ballots cast and counted by county, but designated counties by number, rather than by name.

Data Differences

The data used in this study differs from the data reported in the Election Day Study for 19 states. The Election Day Study was not completed until well after our statistical analysis of provisional voting was finished, on the schedule laid out in our work plan. Where there are differences, they are typically very small, usually fewer than 100 votes either cast or counted. Of the 9 states that have differences of more than 100 votes cast or counted, 7 have reported their numbers directly to us and can be considered updated data that EDS had not obtained. For one of those states, New Mexico, EDS had incomplete data, and for another, Pennsylvania, EDS had no data at all. The data that we have collected reflects updated numbers from the states that have changed following recounts and litigation that altered how ballots were evaluated.
Please explain the 0/8022 discrepancy under North Carolina "differences" since you indicate the info was not updated from the database.

State	**EDS Numbers Cast/Counted**	**Our Numbers Cast/Counted**	**Differences**	**Updated Info from State?**
Alabama	6,478/1,865	6560/1836	82/29	No

When did Eagleton get the information for Missouri. Missouri enacted provisional voting in 2002 and it is likely it was in place for the November 2002 election Pre-HAVA.

Eagleton's PV, LPV, EDR notations are confusing. In the instance of Colorado, the LPV designation (in the PV Status row - HAVA column is incorrect.) In Colorado the voter did not have to vote in the precinct.

Table 2 -- Characteristics of State Provisional Voting Systems

States	Was there a Statewide DB in 2004?	Are Outside Precincts Counted in Presidential Elections?	Verification Method	What is the time line for counting PV ballots?	Is this Review process open?

Eagleton Institute of Politics, Rutgers The State University of New Jersey
US Election Assistance Commission Project Budget (3/22/05)

Description	**Budget**	
Personnel		
Eagleton faculty/senior staff	35,000	Mandel, Weingart, Reed, Linky (various percentages)
Eagleton staff: logistics/administrative/clerical	15,000	(various percentages)
Fringe (32.5%)	16,250	
	66,250	
Hourly Personnel		
Research Coordinator	21,250	1250 hours at $17 per hour
Logistics/Admin Coordinator	12,325	725 hours at $17 per hour
Research assistants	7,200	300 hours at $12 per hour for two researchers
Fringe on Hourly (9%)	3,670	
	44,445	
Subtotal Personnel Expenses	**$110,695**	
Honoraria		
Honoraria for Peer Review Group	**10,000**	10 at $1,000
Public Hearings (3 in 3 cities)		
Public Hearings	75,000	3 hearings at $25K per EAC figures
2 Hearings in DC- train, ground, lodging, meals*	3,480	attended by 3 staff
1 Hearings in St. Louis- air, ground, lodging, meals**	2,640	attended by 3 staff
	81,120	
Briefings/Meetings with EAC		
Train, ground, lodging, meals***	**5,200**	5 briefings in DC, attended by 2 staff
General Operations		
Office supplies, software, telephone, copying, postage	10,000	
Desktop computers, laptop, printer	10,000	
	20,000	
Subcontract		
Project Director- O'Neill	**79,500**	80% time April – Aug., 60% Sept. – Oct.
Ohio State University- Legal Analysis	**84,744**	Partner institution, Moritz College of Law, OSU
Subtotal Non Personnel Expenses	**$280,564**	
Subtotal All Direct Cost	**391,259**	
Modified Total Direct Cost $277,015****		
F&A on Modified Total Direct Cost (55.5%)	153,743	Rutgers University federally approved rate.
TOTAL Project Budget	**$545,002**	
Optional Surveys		
State Election Officials	15,000	Eagleton
Young Voters	25,000	Eagleton
Provisional Voting, 1st state	116,000	OSU Political Science
Provisional Voting, 1st additional state	75,000	OSU Political Science
Provisional Voting, 2nd additional state	60,000	OSU Political Science
Total Optional Surveys (no F&A)	**$291,000**	

* Travel and lodging to two hearings in DC includes $260 for train fare to DC, $200 for hotel/lodging, and $60 per day for two days for meals= $580 per person per trip for three people.

** Travel and lodging to one hearing in St. Louis includes $500 airfare to St. Louis, 2 nights hotel/lodging at $100, and $60 per day for three days for meals= $880 per person for three people.

*** Travel and lodging to five Briefings/Meetings with EAC includes $260 for train fare to DC, $200 for hotel/lodging, and $60 for meals= $520 per person per trip for two people.

**** Modified total direct cost is equivalent to total direct cost except for two items - F&A included only on first $25K of subcontract with Project Director ($79,500) and first $25K of subcontract with OSU ($84,744).

Subject FYI-Eagleton

Turns out that Eagleton was doing a brief conference call with their project staff this afternoon and they asked me to participate briefly. Looked for you guys and you were in the Commissioner Retreat. Basically shared some very general thoughts with them and framed it as a series of questions/issues that might arise when they make their presentations next week.

Spoke of the CVAP vs. VAP issue, exit polls and CPS data versus using our Election Day survey and speaking with Election Officials about these topics. Also framed the issue of possible bias in their report by suggesting that they start out explaining how and why they have arrived at their statement about voter Id (burdensome, onerous, etc). Also suggested framing this by speaking of African American and elderly voter ID attitudes that appear to contrast with attitudes expressed by Hispanic voters. Did also ask about why they didn't look at Asian voters and if they included the March 15 2006 Census Bureau report in their analysis.

They took these comments under advisement and will be ready to address these and other topics at Monday's meetings.

Subject No Cost Extension Request

Karen - I am attaching a spreadsheet providing the information you have requested (Attachment 1), but I want to highlight a few points which may not be immediately self-evident.

First, the original budget (Attachment 2) we submitted to the EAC, dated March 22^nd , did not itemize personnel expenses by each person. In addition, when we actually began work two months after submitting that budget, we decided to reallocate more time to people within Eagleton and hire fewer outside hourlies.

Second, in the figures I sent you in late December we tried to account for all the expenses and projections but overlooked a few things including neglecting to include the honoraria for our peer review team. Hence, the figures we're now sending are different than what I sent in December.

Lastly, we originally discussed a no-cost extension through February, but since we don't yet have the EAC comments on our draft Provisional Voting material nor an estimate of when they are likely to be ready, I think it is prudent to extend the no-cost extension through March 31^st . We would still like to conclude by the end of February, but if you can approve the extension for another month we could avoid going through this process again if everything is not complete six weeks from now.

It is my understanding that Rutgers will soon be sending our December invoice. At this time, I would also like to request that we combine January and February an invoice the EAC once for that time period.

As you can see, we are currently projecting an ending balance of approximately $10,000. If additional expenses are incurred beyond what is currently projected, we're confident they will not exceed the original budget of $560,002.

Thanks and I look forward to hearing from you.

EAGLETON INSTITUTE OF POLITICS

Request to the U.S. Election Assistance Commission for a No-Cost Extension and Reallocation of Funds

November 30, 2005

Why we need a no -cost extension

The original work schedule called for EAC to publish in mid-October voluntary guidance and/or recommended best practices for provisional voting based on our research. In making that time estimate, we did not provide sufficient time for the EAC to review and consider the draft reports that would form the basis for that publication. The draft was complete in August, but the EAC's schedule did not permit us to brief the commissioners and staff until early September. We did not receive EAC comments until October, making it impossible to complete the work on the original schedule. Taking account of those comments and guidance from EAC required several weeks. The EAC did not receive our final draft report and recommendations for best practices until late November. We are now awaiting the EAC's comments on that final draft, which we have been told to expect in January.

The additional time required to complete the work on provisional voting has delayed the completion of our analysis of Voter Identification issues. The draft report on that topic will be submitted to the EAC in mid January.

Because the EAC has decided to issue recommendations for best practices on these topics, rather than voluntary guidance, we will finish the work within two months of the original completion date since the adoption process will be shorter. Note that meeting this schedule is dependent on the time needed by the EAC to review our work.

This extension will entail additional personnel time but, since no public hearings on "best practices" are required, if the EAC does not object, funds originally allocated for the hearings would be available for transfer to support the additional staff and consultant time necessary to complete the work.

When will work be completed and funds fully expended?

As shown on the attached schedule, work on this contract will be completed in three phases. The EAC will receive our final report and recommendations for best practices in provisional voting during the week of January 23, 2006 (assuming that we receive the EAC's comments on the draft report submitted on November 28 by January 9).

We will submit our draft report, alternative approaches, and compendium of statutes, regulations, and litigation on Voter Identification Issues during the week of January 16, 2006. If the EAC is able to return comments to us no later than the week of January 30, we will have submit the final report and recommendations for best practices on Voter Identification to the EAC during the week of February 13.

The total project budget is $560,002. As of October 31st, the EAC has been invoiced for $259,081.79; the balance remaining is $399,920.21. We anticipate that the project will be complete and the balance of funds fully expended by February 28, 2006. The final invoice for the contract will be submitted to the EAC within 75 days of the close of the project.

REVISED SCHEDULE FOR
November 2005 – February 2006
November 10, 2005
Assumes no guidance document, only analysis and recommended best practices

DATE	Project Management	Provisional Voting	Voter ID
Week of 10/31		Review draft report to EAC (Team) Submit comments on report (Team)	Voter ID Research to TV
Week of 11/7	Status reports to JD for October tasks (all)	Redraft report (TON) Review and approve report (Team) Final draft report (TON)	Research continues (TV)
Week of 11/14	Submit monthly progress report (JD)	Submit report to Project Team for comments (TON)	Research continues (TV)

Week of 11/21		Project team comments received Submit report to EAC for review and to PRG for information (TON, JW)	Complete data collection for Voter ID analysis. (TV)
Week of 11/28		EAC review	Draft report on Voter ID analysis (TV)
Week of 12/5	Status reports to JD for November tasks (all)	EAC review	Internal review (PT)
Week of 12/12	Submit monthly progress report (JD)	EAC review	Revise draft (TV) Draft alternatives (TON) Review and comment on alternatives (PT)
Week of 12/19		EAC review	Complete draft report and alternatives (TV, TON)
Week of 12/26		EAC review	Review draft report and alternatives (PT)

Week of 1/2/06	Status reports to JD for December tasks (all)	EAC review	Report and alternatives to PRG for review
Week of 1/9/06		Receive comments from EAC and revise report as needed	PRG meets and comments Revise (TV & TON)
Week of 1/16/06	Submit monthly progress report (JD)	Project team reviews and approves revised report	Submit draft report, alternatives and compendium to EAC EAC reviews
Week of 1/23/06		Finalize analysis and best practices and submit to EAC for publication and further action as	EAC review continues
Week of 1/30/06		[redacted]	Comments from EAC Revise (TV & TON)

Week of 2/6/06	Status reports to JD for January tasks (all)		Review and approve revised report and recommendations for best practices (PT)
Week of 2/13/06	Submit monthly progress report (JD)		Submit report and best practices to EAC for publication and further action as appropriate
Week of 2/20/06	FINAL status reports to JD for all tasks (all) Final project and fiscal report to EAC PROJECT ENDS		[redacted]

Subject Voter ID Report and Appendices

Karen,

Attached is the final draft report on our Voter ID analysis, revised to incorporate the comments made by the EAC at and after our meeting in Washington and the new statistical analysis performed by Tim Vercellotti, which I sent you last Friday. Included in the attached file are about 60 pages of appendices. You may or may not want to distribute all the appendices to the reviewers who will take part in Thursday's conference call. They might find Appendix A useful; it provides a detailed summary of the actual statutory language on Voter ID in each of the states. The other appendices, which are called for as deliverables in the contract, provide worthwhile information for the record, but are not likely to offer material for the reviewers to focus on.

When it comes time to distribute this material to the advisory boards before our meeting with them in May, once again you may want to exercise judgment about how much of it is likely to prove of interest to them.

We look forward to Thursday's teleconference.

Tom O'Neill

VoterIDReport0508.doc

REVISED FINAL DRAFT
05/08/06

REPORT AND RECOMMENDATIONS TO THE EAC VOTER IDENTIFICATION ISSUES

Report Background

This report to the United States Election Assistance Commission (EAC) analyzes the effects of voter identification requirements on turnout in the 2004 election and makes recommendations for best practices to evaluate proposals for voter ID requirements. It is based on research conducted by the Eagleton Institute of Politics at Rutgers, the State University of New Jersey, and the Moritz College of Law at Ohio State University under a contract to the EAC, dated May 24, 2005. The research included a review and legal analysis of state statutes, regulations and litigation concerning voter identification and provisional voting, and a statistical analysis of the effects of various requirements for voter identification on turnout in the 2004 election. This report is a companion to a draft report on Provisional Voting submitted to the EAC on November 28, 2005 under the same contract.

The Help America Vote Act of 2002 (HAVA) (Public Law 107-252) authorizes the EAC (Sec. 241, 42 USC 15381) to conduct periodic studies of election administration issues. The purpose of these studies is to promote methods for voting and administering elections, including provisional voting, that are convenient, accessible and easy to use; that yield accurate, secure and expeditious voting systems; that afford each registered and eligible voter an equal opportunity to vote and to have that vote counted; and that are efficient.

EXECUTIVE SUMMARY AND RECOMMENDATIONS

Methods

To explore the effects of voter ID requirements on electoral participation in 2004, as measured by turnout, we gathered information on the requirements in effect in the 50 states and the District of Columbia in that year. We assigned each state to one of five categories based on its ID requirements. They are progressively more rigorous based on the demands they make on voters.[1] The categories range from "Stating Name" which we judge to be somewhat less demanding than "Signing Name." "Signature Match" requires poll workers to examine the signature and compare it to a sample, which is slightly more demanding that the voter simply signing. "Present ID" requires voters to offer some documentary evidence of their identity,

---

[1] Even the most relaxed provisions for identification at the polls –anything stricter than the honor system used in North Dakota—will impose some burden on particular voters. Harvard Law Review 119:1146

ranging from a utility bill to a passport. It is more demanding than the previous three categories because it requires that the voter remember to bring this documentation to the polls. (Even a simple ID, such as a utility bill, may not be available to some renters or, say, those in group housing.) We regard a government "Photo ID" as the most rigorous requirement. Such identity documents may not be uniformly and conveniently available to all voters.

To examine the potential variation on turnout rates associated with each type of voter ID requirements in effect on Election Day 2004, we drew on two sets of data. These were, first, aggregate turnout data at the county level for each state and, second, the reports of individual voters collected in the November 2004 Current Population Survey by the U. S. Census Bureau. Using two different data sets makes it possible to check the validity of one analysis against the other. It also provides insights not possible using only one of the data sets. The aggregate analysis cannot provide valid estimates on the effects of different ID requirements on particular demographic groups (e.g., the old, the young, African-Americans, the poor, or high school graduates). The Current Population Survey data does permit that kind of analysis, although it has the disadvantage of relying on self-reports by respondents about their registration status and experience in the polling place.

To understand legal issues that have been raised in recent litigation over voter ID requirements, we collected and analyzed the few major cases that have been decided on this issue. The decisions so far suggest the constitutional and other constraints on voter ID requirements.

Findings

Our analysis of data from the 2004 election indicates that the form of identification required of voters affects turnout. Lack of ID can keep voters from the polls or prevent them from casting a regular ballot if they go to the polling place.[2] This finding emerged from both the analysis of aggregate, county-level data and the individual-level data of the Current Population Survey. The overall effect for all registered voters was fairly small, but statistically significant.

Voter turnout in 2004 was lower in states where voter identification requirements were more demanding. The data show a general movement toward lower turnout as voters are required to present levels of proof of their identify.

---

[2] It also seems reasonable to conclude that in states that require an identity document to vote, more voters –those lacking the required ID—will cast provisional ballots. This conclusion is a conjecture because we lack precise information on why voters must cast their ballots provisionally.

The aggregate data show that 60.9 percent of the estimated citizen voting age population turned out in 2004. An average of 64.6 percent turned out in states that required voters to state their names, compared to 58.1 percent in states that required photo identification, a reduction of 6.5 percentage points. That figure, however, probably overstates the effect of voter ID requirements since the inclusion of other factors in the analysis diminishes the extent of influence of voter ID on turnout. After taking account of other factors, the analysis supports the hypothesis that as voter identification requirements increases, turnout declines.

The effects were more pronounced for some specific subgroups. Hispanic voters, the poor and those who did not graduate from high school appear to be less likely to vote as the identification requirement becomes more demanding. The analysis for some other demographic groups illustrate the range of effects predicted for more rigorous voter ID requirements:

Race or Ethnicity

- In the individual-level data for Hispanic voters, the probability of voting dropped by 9.7 percent across the various levels of identification requirements.
- More rigorous ID requirements did not have a statistically significant effect when looking at all African-Americans, but
- African-American voters from households below the poverty line were 7.5 percent less likely to vote as the ID requirements varied from stating one's name to providing photo identification.

Income

- Citizens from poor households were 5.3 percent less likely to vote as the requirements varied from stating one's name to attesting to one's identity in an affidavit.

Education

- Registered voters who had not graduated from high school were 6.7 percent less likely to say they voted as the requirements ranged from stating one's name to providing photo identification.

Age

- Age was also a key factor, with voters ages 18 to 24 being 7.7 percent to 8.9 percent less likely to vote as the requirements ranged from stating one's name to providing a photo identification or affidavit.
- Turnout by young (18-24) African-American voters in states that required a government-issued photo ID was about 10% less likely to vote than in states where they had only to state their name.
- The elderly, while they would be slightly less likely to vote as the requirements changed from stating name to providing photo ID, would not necessarily be affected in the dramatic manner predicted by opponents of photo identification requirements.

Our analysis of litigation suggests that the courts will look strictly at requirements that voters produce a photo ID in order to cast a regular ballot. The courts have used a balancing test to weigh the legitimate interest in preventing election fraud against the citizen's right to privacy (protecting social security numbers from public disclosure, for example) and the reasonableness of requirements for identity documents. To provide both the clarity and certainty in administration of elections needed to forestall destabilizing challenges to outcomes, best practice for the states may be to limit requirements for voter identification to the minimum needed to prevent duplicate registration and ensure eligibility.

Evidence on the incidence of vote fraud, especially on the kind of vote fraud that could be reduced by requiring more rigorous voter identification is not now sufficient to evaluate the tradeoffs between ensuring ballot access and ensuring ballot integrity.[3] Assessing the effectiveness of voter ID as a way to protect the integrity of the ballot should logically include an estimate of the nature and frequency of vote fraud. This research does not include consideration of vote fraud nor the possible effectiveness of various voter ID regimes to counter attempts at vote fraud. As a result, our analysis of the effects of voter ID requirements on turnout cannot take into account how many potential voters who did not turn out under comparatively stricter voter ID requirements might have been ineligible or eligible to vote.

The current lack of understanding of precisely how voter ID requirements affect turnout can be remedied by requiring the collection and reporting of data on the reasons potential voters are required to cast a provisional ballot and the reasons for rejecting provisional ballots during the

---

[3] The EAC has contracted with other researchers to study vote fraud issues.

2006 and subsequent elections. Also useful would be the results of surveys of voters on their experiences in meeting voter ID requirements and on what type of ballot they cast.[4] And, of course, more information is needed on the incidence and varieties of vote fraud, but that inquiry is outside the scope of this report.

A voting system that requires voters to produce an identify document or documents may indeed prevent the ineligible from voting. It may also prevent eligible voters from casting a ballot. If the ID requirement of a ballot protection system blocks ineligible voters from the polls at the cost of preventing eligible voters who lack the required forms of identification, the integrity of the ballot may not have been improved; the harm may be as great as the benefit.

Recommendations for consideration and action by the EAC

The dynamics of Voter ID requirements –how more rigorous voter ID requirements affect the decision by potential voters to go or stay away from the polls-- are not well understood. This lack of understanding should be recognized in the policy process in the states. The debate over voter ID in the states would be improved by additional research sponsored by the EAC.

The EAC should consider the following actions to improve understanding of the relationship between voter ID requirements and the two important goals of ensuring ballot access and ensuring ballot integrity.

1. Encourage or sponsor further research to clarify the connection between Voter ID requirements and the number of potential voters actually able to cast a ballot.
2. Recommend as a best practice the publication of a "Voting Impact Statement" by states as they assess their voter ID requirements to protect the integrity of the ballot. The analysis will help ensure that efforts to increase ballot security have a neutral effect on electoral participation by eligible voters. The Voter Impact Statement would estimate the number and demographics of 1) eligible, potential voters that may be kept from the polls or permitted to cast a provisional ballot by a stricter ID requirement; and 2) and assess the number of ineligible voters who will be prevented from voting by the stricter ID requirements.

---

[4] Arizona held its first election with its new, stricter ID requirements on March 14, 2006. In at least one county (Maricopa) election officials handed a survey to voters that asked if they knew about the voter identification law and if they did, how they found out about it. Edythe Jensen, "New Voter ID Law Goes Smoothly in Chandler," *Arizona Republic*, March 15, 2006. More surveys of this kind can illuminate the dynamics of voter ID and voting in ways that are not possible now because of insufficient data.

3. Encourage or require the states in the 2006 election and beyond, to collect and report reliable, credible information on the relationship between ballot access and ballot security. EAC should publish an analysis of this information to provide a sound factual basis for the states to consider as they estimate the incidence of the kinds of vote fraud that more stringent ID requirements may prevent. The analysis should describe the dynamics of the voter ID process in preserving the security of the ballot. EAC can also use this information to encourage the states to assess the effectiveness of programs to ensure that all eligible voters have required ID and are permitted to vote in future elections.
    I. Useful information could be supplied by state-sponsored surveys of voters by local election officials. It would make clear why those who cast a provisional ballot were found ineligible to cast a regular ballot. The answers would illuminate the frequency with which ID issues divert voters into the provisional ballot line.
    II. Surveys to ask voters what they know about the voter id requirements would also provide useful context for evaluating the effect of various voter ID requirements on electoral participation.
    III. Spot checks by state election officials on how the identification process works at polling places could provide information on how closely actual practice tracks statutory or regulatory requirements. Such reports should be available to the public.
4. Encourage states to examine the time period allowed for voters who cast a provisional ballot because they lacked required ID to return with their identification. In eleven states, voters who had to cast a provisional ballot because they lacked the ID required for a regular ballot were permitted to return later with their ID. Their provision of this ID is the critical step in evaluating the ballots. The length of the period in which the voter may return with ID is important. In setting the time period for return, which now varies among the states from the same day to about two weeks, states should consider three factors: the convenience of the voter, the total time allowed to evaluate ballots[5], and the safe harbor provision in presidential elections.
5. Recommendations to the states from EAC should reflect current judicial trends. Requirements that voters provide some identifying documentation have been upheld, where photo ID is *not* the only acceptable form. Whether laws requiring photo ID will be upheld is

---

[5] Our research on provisional voting reveals that states that provide more than a week to evaluate provisional ballots end up counting substantially more of those ballots than states that provide less than a week.

more doubtful. To date, only one court has considered a law requiring voters to show photo ID (*Common Cause v. Billups*), and that court concluded that this requirement is likely unconstitutional.

SUMMARY OF RESEARCH

Background and Approach of the Study

Establishing the eligibility of a person to vote has long been part of the electoral process. Voters may have to identify themselves twice in the electoral process: when registering to vote and then when casting a ballot. The pressures felt by the voter arising from the need to check ID, even so simple a check as a signature match, can be greater at the polls on Election Day than at the time of registration. Poll workers may feel under pressure when faced with long lines and limited time.

This analysis focuses on ID requirements on Election Day, but with an appreciation that the ID requirements at time of registration and on Election Day are inter-related. [6] The emphasis in this report is on Voter ID requirements on Election Day and afterwards as election judges evaluate provisional ballots. This is the critical period for the electoral system, the time when ballot access and ballot security are in the most sensitive balance.

The report looks broadly at voter ID issues and goes beyond the rather narrow identification requirements in HAVA. Much of the current debate in state legislatures over voter ID ranges beyond HAVA to require more rigorous documentation of identity for all would-be voters, not just those who had not registered in person and are casting a ballot for the first time. Current controversies in the states over voter ID seems to have been sparked in part by the HAVA requirements, but goes beyond those requirements, and sets the context for the analysis here.[7]

We recognize that the previously technical, rather dull subject of voter ID requirements has become fiercely partisan and divisive in many states. The polarization of the debate has raised the stakes over this issue, making dispassionate analysis both more valuable and more rare.[8]

---

[6] As the Carter-Baker Commission noted, photo ID requirements for in-person voting do little to address the problem of fraudulent registration by mail, especially in states that do not require third-party organizations that register voters to verify ID. Commission on Federal Election Reform, pp 46-47.

[7] Harvard Law Review 119:1127: "Legislators hoping to stiffen their state antifraud laws have taken their cue from identification provisions buried in HAVA."

[8] "Of the various electoral procedure laws passed in the fifty states since the 2000 and 2004 presidential elections and those still being debated in state legislatures and local media, few arouse more potent partisan feelings than voter identification laws." *Harvard Law Review* 119:1144. John Fund's 2004 book, *Stealing Elections: How Voter Fraud Threaten Our Democracy*, cites (pages 16 – 17) a Rasmussen Research poll that asked respondents if they were more concerned with voting by ineligible participants or with disenfranchisement of eligible voters. Sixty-two percent of Kerry supporters, but only 18 percent of Bush supporters, worried more about *disenfranchisement*; 58 percent of Bush supporters, but only 19 percent of Kerry supporters were more concerned with *voter fraud*.

Voter ID is often described as the critical step in protecting the integrity of the ballot, the process to ensure that the potential voter is eligible and , if eligible, is permitted to cast one ballot and one ballot only. Truly protecting the integrity of the ballot, however, requires a perspective that takes in the entire voting process. It demands more than preventing the ineligible from voting, and should also ensure that all those who are eligible and want to vote can cast a ballot that counts. The protection effort must embrace all forms of voting, including absentee ballots, and consider each step in the process from registration through vote counting.

A voting system that requires voters to produce an identity document or documents may prevent the ineligible from voting. It may also prevent the eligible from casting a ballot. If the ID requirements block ineligible voters from the polls at the cost of preventing eligible voters who cannot obtain or have left at home the required forms of identification, the integrity of the ballot may not have been improved; the harm may be as great as the benefit.

Assessing the effectiveness of voter ID as a way to protect the integrity of the ballot should logically include an estimate of the nature and frequency of vote fraud. The EAC has informed us that it has commissioned a separate analysis of the incidence of vote fraud. Consequently, this research does not include consideration of vote fraud nor the possible effectiveness of various voter ID regimes to counter attempts at vote fraud. As a result, our analysis of the effects of voter ID requirements on turnout cannot take into account how many potential voters who did not turn out under comparatively stricter voter ID requirements might have been ineligible or eligible to vote.

In some states, voters lacking required ID, or who have ID that does not reflect their current address, are able to vote only by casting a provisional ballot.[9] Voter ID requirements that require voters to bring a document to the polls --rather than simply sign their names-- can divert more voters to the provisional ballot. Requiring poll workers to request and check ID, can put stress on the already demanding environment of the polling place. Scrutiny of ID can create lines at the polling places. Further delays can result when voters cast a provisional ballot and fill out the ballot envelope. Voters who cast a provisional ballot because they lack their ID on Election Day, and who then fail to return with the needed document or documents, will have their ballot

---

[9] For example, the Florida voter ID law adopted after the 2004 election and pre-cleared by the Department of Justice, permits voters who cannot meet the ID requirements to sign an affidavit on the envelope of a provisional ballot, which will be counted if the signature matches that on the voter's registration form.

rejected.[10] And, of course, the cost of processing provisional ballots is greater than the cost of regular ballots.

Each of these potential consequences of more elaborate voter identification processes can increase the chance of litigation. Long lines will, at best, discourage voters and at worst make voting seem a hassle, an impression that could keep more citizens (even those with ID) from the polls. In conducting this analysis, we were sensitive to the observation that the problem with American elections may well be that too many people do not vote rather than that a few people may vote more than once.

Evaluating the effect of different Voter ID regimes can be most effective when based on clear standards --legal, equitable, practical. The standards outlined here can best be described as the questions policy-makes should ask about Voter ID requirements. We suggest 7 questions that address important dimensions of the problem.

1. Is the Voter ID system designed on the basis of valid and reliable empirical studies of the incidence of the sorts of vote fraud it is designed to prevent?[11]
2. How effective is the ID requirement in increasing the security of the ballot? How well can it be coordinated with a statewide voter database?[12]
3. How practical is the requirement? (Can it be administered smoothly by the staff and budget likely to be made available? How much additional training of polling place workers might be required?) Is it simple enough or can it be defined with sufficient clarity that poll workers throughout the state can administer it uniformly and with a minimum of local interpretation made on the fly under the pressure of Election Day?[13]
4. How cost-effective is the system? Does it demonstrably increase the security of the ballot affordably, measured in both monetary and other costs? To improve

---

[10] The EAC's Election Day Study found "improper ID," to be the third most common reason for a provisional ballot to be rejected. "Improper ID" was cited by 7 states responding to the survey, compared to 14 mentions for voting in the wrong precinct. *Election Day Study*, Chapter 6, p. 5.

[11] "Often where the battle over voter identification is most heated, real evidence of voter fraud proves scarce: in Georgia, for example, the Secretary of State averred that she had never encountered a single instance of voter impersonation at the polls. State laws might sometimes impose tighter restrictions on in-person voting than on absentee ballots, which yield the greatest incidence of, and provide the easiest avenue for, voter fraud. . ." Harvard Law Review 127:1144 (2006)

[12] See the final section of this report for a brief overview of possible effects of a statewide voter database on voter identification issues.

[13] In New York, in 2004, disparities in training and voting information were made apparent in a study finding elections officials had wildly varying interpretations of what the state's voter identification requirement actually was. Tova Wang, "Warning Bell in Ohio," December 5, 2005. Website, the Foundation for National Progress.

understanding of the non-monetary component of the costs, conducting a voter impact study might be appropriate. The voter impact study would examine, before the adoption of the regulation, the cost of compliance by the voter (such as the cost in time and money of acquiring a photo ID card), any offsetting benefits to voters, and the possible disparate effects of the regulation on various groups of voters.[14] A thorough, objective impact statement that demonstrated the nexus between the identification regime and the integrity of the ballot could provide protection against inevitable legal challenges.

5. If a side effect of the Voter ID regulation is likely to reduce turnout, generally or among particular groups, is it possible to take other steps to ameliorate the adverse consequences?[15]
6. Does it comply with the letter and spirit of Voting Rights Act?
7. The seventh question is the most difficult to answer. Does the Voter ID requirement have a neutral result on the composition of the qualified and eligible electorate? ID requirements should not be designed to, nor unintentionally, reduce the turnout of particular groups of voters or supporters of one party or another.

Voter ID and Turnout

As of the 2004 election, the states and the District of Columbia could be divided into 5 different Voter ID regimes. These are shown in Table 1, *Voter ID Requirements*. Nine states required that voters give their names; 14 that they sign their names; 8 match the signature to a sample in the registration book; 15 require some form of ID (ranging from a utility bill to a government-issued photo ID), and 5 states in 2004 required a photo ID, although in all those states voters without that credential could cast a regular ballot after signing an affidavit concerning their identity and eligibility or provide other forms of ID.

We recognize the difficulties in summarizing each state's voter ID requirements. The problem is illustrated by the number of footnotes to Table 1 below. The variety of statutory and regulatory details among the states is complex. Moving beyond the statutes and regulations,

---

[14] "Absent clear empirical evidence demonstrating widespread individual voter fraud, legislatures need to fashion narrowly tailored voter identification provisions with an eye toward the inevitable and well-grounded constitutional challenges that will arise in the courts. Only as states grow more adept at administering elections will courts likely demonstrate greater willingness to uphold strict identification requirements." Harvard Law Review 127:1144 (2006)

[15] For example, the Carter-Baker Commission coupled its recommendation for a national voter ID card to a call for an affirmative effort by the states to reach out and register the unregistered, that is, to use the new Voter ID regime as a means to enroll more voters. Similarly, Richard Hasen has suggested combining a national voter ID with universal registration. See his "Beyond the Margin of Litigation: Reforming U.S. Election Administration to Avoid Electoral Meltdown," 62 Washington and Lee Law Review 937 (2005).

we also recognize that the assignment of each state to one category may fail to reflect actual practice at many polling places.

Like any system run by fallible people, the voter ID process is subject to variation in practice.[16] Voters may be confronted with demands for identification different from the directives in state statutes or regulation. Under the pressures of Election Day, there is no sure way to report the wide variety of conditions each voter encounters. It seems reasonable to conclude, however, that while actual practices may vary, the variance is around each state's legal requirement for ID. The analysis of the effect of state requirements on turnout must be viewed with some caution. Nevertheless, we are satisfied that the categories used in this report provide a level of discrimination among voter identification regimes sufficient for the analysis that we have undertaken.

TABLE 1 -- Voter ID Requirements[17]

* States applies only HAVA's ID requirement, applicable for first-time voters who registered by mail and did not provide applicable ID at the time of registration.

[1] Arizona voters who lack a photo ID may present 2 forms of ID with no photograph.

[2] Florida required a photo ID in 2004. Voters without that credential could sign an affidavit concerning their identity and eligibility and cast a regular ballot. Florida subsequently changed its law to require that voters present photo ID to cast a regular ballot, though voters without photo ID may still cast a provisional ballot by signing an affidavit, which ballot should ordinarily be counted.

[3] Louisiana required a photo ID in 2004. Voters without that credential could sign an affidavit concerning their identity and eligibility and cast a regular ballot.

[4] Pennsylvania requires ID of all first-time voters, whether they registered by mail or in-person.

[5] Voters lacking a photo ID could vote by providing another form of ID in 2004.

[6] Voters lacking a photo ID could vote by providing another form of ID in 2004.

[7] Tennessee voters must provide signature and address. In counties without computerized lists, the signature is compared to the registration card. In counties with computerized lists, the signature is compared to a signature on ID presented with the registration.

[8] Texas voters must present a current registration certificate. Those without a certificate can vote provisionally after completing an affidavit.

Effect of Voter ID requirements on Turnout

We examined the potential variation in turnout rates based on the type of voter identification required in each state on Election Day 2004 using two sets of data: aggregate turnout data at the county level for each state, as compiled by the Eagleton Institute of Politics, and individual-level survey data included in the November 2004 Current Population Survey conducted by the U.S. Census Bureau. Classification of voter identification requirements comes from a review of state statutes conducted by the Moritz College of Law at the Ohio State University.

The Voter ID category assigned to each state is shown in Table 1. We analyzed turnout data for each county according to the voter identification requirements of its state. We also assessed self-reported turnout by the sample interviewed in the November 2004 Current Population Survey of the Census Bureau. [18]

Voter turnout at the state level in 2004 varied based on voter identification requirements. An average of 64.6 percent of the citizen voting age population turned out in states that required voters to state their names, compared to 58.1 percent in states that required photo identification. Other factors, of course, also influence turnout. Taking those other factors into account in the county-level analysis makes the effect of the voter ID requirement less dramatic. But the analysis supports the hypothesis that as voter identification requirements become more stringent, turnout declines. The effect is particularly noticeable in counties with concentrations of Hispanic residents or of people living below the poverty line.

The individual-level analysis, based on the CPS, produced a similar result. Voter identification requirements exert a statistically significant, negative effect on whether survey respondents said they had voted in 2004. The probability that a respondent to the survey voted dropped with each level of voter identification requirement, with a total drop of 2.5 percent across the five types of identification.

Methods

Based on research performed for this study by the Moritz College of Law, states had one of five types of requirements in place on Election Day 2004. Upon arrival at polling places, voters had

---

[18] See Appendix for the full report: Tim Vercellotti, "Analysis of Voter Identification Requirements on Turnout," The Eagleton Institute of Politics, Rutgers University, May 4, 2006.

to: state their names (nine states); sign their names (13 states and the District of Columbia); match their signature to a signature on file with the local election board (eight states); provide a form of identification that did not necessarily include a photo (15 states); or provide a photo identification (five states).[19]

We coded the states according to these requirements to test the assumption that voter identification requirements would pose an increasingly demanding requirement in this order: stating one's name, signing one's name, matching one's signature to a signature on file, providing a form of identification, and providing a form of photo identification.

Election laws in many states, however, offer exceptions to these requirements if potential voters lack the necessary form of identification, and laws in those states set a minimum standard that a voter must meet in order to vote using a regular ballot (as opposed to a provisional ballot). In recognition of this fact, we also categorized states based on the *minimum* requirement for voting with a regular ballot.

In 2004 none of the states required photo identification as a minimum standard for voting with a regular ballot. Four states, however, required voters to swear an affidavit as to their identity (Florida, Indiana, Louisiana, and North Dakota The five categories for minimum requirements were: state name (12 states), sign name (14 states and the District of Columbia), match one's signature to a signature on file (six states), provide a non-photo identification (14 states), or swear an affidavit (four states).

We treated the minimum ID in terms of increasing demand on the voter: state name, sign name, match signature, provide non-photo identification, and, given the potential legal consequences for providing false information, swearing an affidavit.

We examined turnout among U.S. citizens of voting age in both the aggregate and the individual-level data. Determining citizenship status in the individual-level data simply involved restricting the analyses to individuals who identified themselves as citizens in the November 2004 Current Population Survey. (Those who said they were not citizens did not have the

---

[19] Oregon conducts elections entirely by mail. Voters sign their mail-in ballots, and election officials match the signatures to signatures on file. For the purposes of this analysis, Oregon is classified as a state that requires a signature match.

opportunity to answer the supplemental voting questions contained in the Current Population Survey.)

The aggregate data posed a greater challenge to determine percentage of the voting-age population that has U.S. citizenship. The Census Bureau gathers information on the citizenship status of adults ages 18 and older only during the decennial census. While the Census Bureau provides annual estimates of the population to account for changes between decennial censuses, the bureau does not offer estimates for the proportion of the adult population who are citizens as part of the annual estimates. To address this issue we estimated the 2004 citizen voting-age population for each county using a method reported. Therefore, we calculated the percentage of the 2000 voting-age population who were citizens in 2000, and applied that percentage to the July 1, 2004 estimates for voting-age population in each county. This method was used in the analysis of the 2004 Election Day Survey conducted for the U.S. Election Assistance Commission.

We classified each state as having one of five types of identification requirements in place on Election Day 2004. Upon arrival at polling places, voters had to either: state their names (9 states); sign their names (13 states and the District of Columbia); match their signature to a signature on file with the local election board (8 states); provide a form of identification that did not necessarily include a photo (15 states); or provide a photo identification (5 states). We then tested the assumption that voter identification requirements would prove to be increasingly demanding on the voter, with providing photo ID the most rigorous. In the statistical analysis, we coded the voter identification requirements on a scale of one to five, with one representing the least demanding form of identification and five representing the most demanding form of identification.

Findings

As the level of required ID proof increases, with photo identification as the most demanding requirement, turnout declines. Averaging across counties in each state, statewide turnout is negatively correlated with maximum voter identification requirements ($r = -.30$, $p < .0001$). In considering the array of minimum requirements, with affidavit as the most demanding requirement, voter identification also is negatively correlated with turnout ($r = -.20$, $p < .0001$). Breaking down the turnout rates by type of requirement reveals in greater detail the relationship between voter identification requirements and voter turnout.

Table 2 – Variation in 2004 State Turnout Based on Voter Identification Requirements

Maximum Requirement		Minimum Requirement	
Voter Identification Required in the States	Mean Voter Turnout for States in that Category	Voter Identification Required in the States	Mean Voter Turnout for States in that Category
State Name	**64.6 %**	State Name	**63.0 %**
Sign Name	**61.1 %**	Sign Name	**60.8 %**
Match Signature	**60.9 %**	Match Signature	**61.7 %**
Provide Non-Photo ID	**59.3 %**	Provide Non-Photo ID	**59.0 %**
Provide Photo ID	**58.1 %**	Swear Affidavit	**60.1 %**
Average Turnout (All States)	***60.9 %***		

The aggregate data show that 60.9 percent of the estimated citizen voting age population voted in 2004. Differences in voter turnout at the state level in 2004 varied based on voter identification requirements. Taking into account the maximum requirements, an average of 64.6 percent of the voting age population turned out in states that required voters to state their names, compared to 58.1 percent in states that required photo identification. A similar trend emerged when considering minimum requirements. Sixty-three percent of the voting age population turned out in states requiring voters to state their names, compared to 60.1 percent in states that required an affidavit from voters.

Voter identification requirements alone do not determine voter turnout. Other factors make a difference in turnout, often a greater difference than the ID requirements. Multivariate models can take into account other predictors of turnout and therefore paint a more complete picture of the relationship between voter identification requirements and turnout. The model used here also took into account such variables as:

- Was the county in a presidential battleground state?
- Was the county was in a state with a competitive race for governor and/or the U.S. Senate?
- Percentage of the voting-age population in each county that was Hispanic or African-American
- Percentage of county residents age 65 and older
- Percentage of county residents below the poverty line

The dependent variable in each model was voter turnout at the county level, with turnout calculated as the percentage of the citizen voting-age population that voted in the 2004 election.

The maximum ID requirements had a small and negative effect on turnout in 2004 controlling for electoral context and demographic factors. Both contextual factors (whether the county was in a state that was a battleground state and whether that state had a competitive race for governor and/or U.S. Senate) increased voter turnout. The more senior citizens and African-Americans in the county, the higher the turnout. The percentage of the population living below the poverty reduced turnout. The effect of the percentage of Hispanic adults in the county on turnout fell just short of statistical significance (p = .05).

The analysis tested the hypothesis that stricter voter ID requirements dampen turnout among minorities. The data revealed no statistically significant effect on turnout for African-Americans in general. But it revealed a significant reduction in turnout for Hispanics and the poor. The analysis using the minimum ID categories produced similar results.

Analysis of the aggregate data at the county level supports the hypothesis that as voter ID requirements grow stricter, turnout declines. This effect is strongest in counties with concentrations of Hispanic residents or families below the poverty line. But aggregate data cannot fully capture the individual demographic factors that may figure into the decision to turn out to vote. For example, previous research has found that education is a powerful determinant of turnout.[20] Married people are more likely to vote than those who are not married. To explore the effects of voter identification requirements on turnout, examining individual-level data is important.

Individual-level Analysis

Information collected for the Census Bureau Current Population Survey in November 2004 makes it possible to examine the influence of voter ID requirements at the individual level. Self-identified registered voters reported their experience at the polls in the survey. Note that the voter turnout rate for the CPS sample, an average of 89%, is much higher than the turnout rates presented in the aggregate data analysis, which average 60.9%. The difference is a result of several factors, including different denominators in calculating the turnout rate – self-reported registered voters in the CPS versus the much larger citizen voting-age population for the

---

[20] Education is an important factor in predicting turnout. One version of the aggregate model not reported here included the percentage of adults in the county who had at least a college degree. The measure was highly collinear with the percentage of residents living below the poverty line, necessitating removal of the college degree variable from the model.

aggregate data. Also some survey respondents overstate their incidence of voting. Nevertheless, the CPS serves as a widely accepted source of data on voting behavior.

One of the advantages of the CPS is the sheer size of the sample. The survey's Voting and Registration Supplement consisted of interviews, either by telephone or in person, with 96,452 respondents.[21] The large sample size permits analyses of smaller groups, such as Black or Hispanic voters or voters with less than a high school education. The analyses reported here are based on reports from self-described registered voters. Excluded are those who said they were not registered to vote and those who said they cast absentee ballots because the identification requirements for absentee ballots may differ from those required when one votes in person. Also excluded are respondents who said they were not U.S. citizens.[22]

The dependent variable in these analyses is whether a respondent reported voting in the November 2004 election. As in the aggregate analysis, stricter voter ID requirements exert a statistically significant, negative effect on whether survey respondents said they had voted in 2004.

Table 3 Predicted probability of voter turnout

ID Category	Maximum requirement	Minimum requirement
State name	91.2%	91.1%
Sign name	90.6%	90.3%
Match signature	90.0%	89.5%
ID	89.4%	88.7%
Photo ID	88.7%	----
Affidavit	----	87.8%
Difference from lowest to highest	**2.50%**	**3.30%**
N	54,973	

Predicted probability of registered voters saying they voted as the identification requirement varies from the lowest to the highest point in the scale, with all other variables held constant. Data source: U.S. Census Bureau, Current Population Survey, Voting and Registration Supplement, November 2004.

---

[21] The Census Bureau allows respondents to answer on behalf of themselves and others in the household during the interview. While proxy reporting of voter turnout raises the possibility of inaccurate reports, follow-up interviews with those for whom a proxy report had been given in the November 1984 CPS showed 99 percent agreement between the proxy report and the information given by the follow-up respondent.

[22] The CPS did not ask the voting questions of respondents who were not U.S. citizens. The design of the questionnaire skips those questions for non- citizens.

The influence of voter identification requirements, holding all other variables constant, is shown in Table 3 below. The probability of voting dropped with each level of voter identification requirement, with a total drop of 2.5 percent, across the five types of identification for the maximum requirement and 3.3% for the minimum requirements. [23]

Among the key variables of interest in the debate over voter identification requirements are race, age, income, and education. Given the large sample size (54,973 registered voters), it was possible to break the sample into sub-samples along those demographic lines to explore variation in predicted probability by group.

Both the maximum and minimum identification requirements had negative and statistically significant effects for White/Non-Hispanic voters. Allowing the requirements to vary from stating one's name to providing photo identification or an affidavit showed drops of 2.5 percent and 3.2 percent respectively in the predicted probability of voting. The predicted probability of Hispanics voting ranged from 87 percent if stating one's name was the required form of identification to 77.3 percent if a voter would have to provide an affidavit in order to vote, a difference of 9.7 percent.

The effects of voter identification requirements also varied by age, with the greatest variation occurring among voters ages 18 to 24.

- Turnout in states requiring photo ID was predicted as 8.9 percentage points lower than in states where voters simply stated their names.
- The strictest ID requirements reduced the probability that White/Non-Hispanic voters in the 18- to 24-year-old category would turn out by 7.8 to 9.2 percentage points.
- For African-Americans in the 18- to 24-year-old age group the gap was 10.6 percentage points.

Variation also emerged along the lines of income, with the effects of voter identification requirements varying to a greater extent for voters in households below the poverty line compared to those living above the poverty line.[24] Allowing the maximum voting requirement to

---

[23] The voter turnout percentages may seem disproportionately high compared to the turnout rates reported in the aggregate data analysis. It is important to consider that the turnout rates in the aggregate data were a proportion of all citizens of voting-age population, while the turnout rates for the individual-level data are the proportion of only registered voters who said they voted.

[24] Respondents were coded as being above or below the U.S. Census Bureau's 2004 poverty line based on their reported annual household income and size of the household.

vary from the least to the most demanding, the probability that African-American voters below the poverty line said they had voted dropped by 7.5 percent.

The effects of voter identification requirements varied across education levels as well. Registered voters who had less than a high school education had a 77.5 percent probability of voting if the maximum requirement would be stating one's name, and a 70.8 percent probability if they would have to provide photo identification under the maximum requirement, a difference of 6.7 percent. The range of effects of voter identification requirements was smaller among those with higher levels of education (and non-existent for one category – voters with some college education).

Conclusions of the Analysis

As the stringency of voter identification requirements increases, voter turnout declines. This point emerged from both the aggregate data and the individual-level data, although not always for both the maximum and minimum sets of requirements. The overall effect for all registered voters was fairly small, but statistically significant.

The effects of voter identification requirements were more pronounced for specific subgroups. Hispanic voters and the poor appeared to be less likely to vote as the level of required identification became more demanding, according to both the aggregate and the individual-level data.

- In the individual-level data, for Hispanic voters, the probability of voting dropped by 9.7 percent across the various levels of minimum identification requirements.
- Survey respondents living in poor households were 5.3 percent less likely to vote as the requirements varied from stating one's name to attesting to one's identity in an affidavit.
- African-American voters from households below the poverty line were 7.5 percent less likely to vote as the maximum requirements varied from stating one's name to providing photo identification.

Effects of voter requirements also varied with education.

- Registered voters who had not graduated from high school were 6.7 percent less likely to say they voted as the maximum requirements ranged from stating one's name to providing photo identification.

- When considering the minimum requirements, those with less than a high school education were 7.4 percent less likely to say they voted if the requirement was an affidavit as opposed to stating one's name.

Age was also a key factor, with voters ages 18 to 24 being 7.7 percent to 8.9 percent less likely to vote as the requirements ranged from stating one's name to providing a photo identification or affidavit. Breaking down the age group by race, the effects were significant for young White/Non-Hispanic and Black/Non-Hispanic voters.

The results shed additional light on the effects of voter identification requirements on two groups often projected as being particularly sensitive to such requirements: African-American voters and elderly voters.

- The effects on African-American voters were pronounced for two specific sub-samples, African-American voters living below the poverty line and those in the 18- to 24-year-old age group.
- The elderly, while they would be slightly less likely to vote as requirements ranged from least to most demanding, would not necessarily be affected in the dramatic manner predicted by some opposed to photo identification requirements in particular.

The data examined in this project could not capture the dynamics of how identification requirements might lower turnout. Do potential voters who cannot or do not want to meet the identification requirements simply stay away from the polls? Or, do the requirements result in some voters being turned away when they cannot meet the requirements on Election Day? (Proponents of stricter voter ID requirements might argue that some part of the reduction comes from keeping the truly ineligible from voting.)

Our data alone cannot resolve these questions. Knowing more about the "on the ground" experiences of voters concerning identification requirements could guide policy-makers at the state and local level in determining whether and at what point in the electoral cycle a concerted public information campaign might be most effective in helping voters to meet identification requirements. Such knowledge also could help in designing training for election judges to handle questions about, and potential disputes over, voter identification requirements.
It is important to note that the 2004 data do not allow us to draw conclusions about the effect of laws such as those recently passed in Georgia and Indiana, which require government-issued

photo ID. No such laws were in place in 2004, and the five states that then required photo ID at the time allowed voters who signed an affidavit or provided another form of identification to cast a regular ballot.

Litigation Over Voter ID Requirements

A handful of cases have challenged identification requirements in court in recent years. In general, requirements that voters provide some identifying documentation have been upheld, where photo ID is *not* the only acceptable form. Whether laws requiring photo ID will be upheld is more doubtful. To date, only one court has considered a law requiring voters to show photo ID (*Common Cause v. Billups*), and that court concluded that this requirement is likely unconstitutional. Cases challenging the mandatory disclosure of voters' Social Security numbers on privacy grounds have yielded mixed results.

Non-photo identification. For the most part, courts have looked favorably on requirements that voters present some form of identifying documents if the photo identification is not the only form accepted. In *Colorado Common Cause v. Davidson,* No. 04CV7709, 2004 WL 2360485, at *1 (Colo. Dist. Ct. Oct. 18, 2004), plaintiffs challenged a law requiring all in-person voters to show identification (not just first-time registrants). The court upheld this requirement against a constitutional challenge. Similarly, in *League of Women Voters v. Blackwell,* 340 F. Supp. 2d 823 (N.D. Ohio 2004), the court rejected a challenge to an Ohio directive requiring first-time voters who registered by mail to provide one of the HAVA-permitted forms of identification, in order to have their provisional ballots counted. Specifically, the directive provided that their provisional ballots would be counted if the voter (a) orally recited his driver's license number or the last four digits of his social security number or (b) returned to the polling place before it closed with some acceptable identification (including reciting those identification numbers). *Id.* This was found to be consistent with HAVA.

Photo ID. Since the 2004 election, two states have adopted laws requiring photo identification in order to have one's vote counted, without an affidavit exception: Georgia and Indiana. Both these requirements were enacted in 2005 and both have been challenged in court. The Georgia law required voters attempting to cast a ballot in person present a valid form of photographic identification. O.C.G.A. § 21-2-417. On October 18, 2005, the District Court granted the Plaintiff's motion for a preliminary injunction,

enjoining the application of the new identification requirements on constitutional grounds. In granting the injunction, the court held that plaintiffs' claims under both the Fourteenth Amendment (equal protection) and Twenty-Fourth Amendment (poll tax) had a substantial likelihood of succeeding on the merits at trial (*Common Cause v. Billups,* Prelim. Inj. 96, 104). In January 2006, Georgia enacted a modified version of its photo ID law, which the court has not yet ruled on. In the other state that has enacted a photo ID requirement without an affidavit exception (Indiana), legal challenges have also been filed. (*Indiana Democratic Party v. Rokita* and *Crawford v. Marion County Election Board*). Cross-motions for summary judgment are currently pending. Another case of significance, for purposes of photo ID requirements, is *American Civil Liberties Union of Minnesota v. Kiffmeyer,* No. 04-CV-4653, 2004 WL 2428690, at *1 (D. Minn. Oct. 28, 2004). In that case, the court enjoined a Minnesota law that allowed the use of tribal photo ID cards, only for an Indian who lived on the reservation. 2004 WL 2428690, at *1. The Court found no rational basis for distinguishing based on whether or not the cardholder lives on the reservation. *Id.* at *1, 3. The court's decision in this case indicates that courts are likely to look strictly on photo ID requirements.

Privacy. In *Greidinger v. Davis*, 988 F.2d 1344 (4th Cir. 1993), the court struck down on due process grounds a Virginia law requiring disclosure of voters' social security numbers for voter registration. The social security numbers recorded in voter registration lists had been disclosed to the public and political parties that had requested the lists. The court found that the requirement to give the social security number effectively conditioned rights on the consent to an invasion of privacy. It concluded that this public disclosure of the social security numbers was not necessary to achieve the government's interest in preventing fraud. On the other hand, in *McKay v. Thompson,* 226 F.3d 752 (6th Cir. 2000), the court rejected privacy challenges based on both the Constitution and federal statutes, to a Tennessee law requiring social security numbers for voter registration since 1972. 226 F.3d at 755. Second, the NVRA only permits requiring the minimum amount of information necessary to prevent duplicate voter registration and to determine eligibility. The distinction appears to be between the use of Social Security numbers for internal purposes only, which was deemed permissible, and the disclosure of those numbers to the public which was not.

These decisions suggest that the courts will look strictly at requirements that voters produce a photo ID in order to cast a regular ballot. The courts have used a balancing test to weigh the

legitimate interest in preventing election fraud against the citizen's right to privacy (protecting social security numbers from public disclosure, for example) and the reasonableness of requirements for identity documents. To provide both the clarity and certainty in administration of elections needed to forestall destabilizing challenges to outcomes, these early decisions suggest that best practice may be to limit requirements for voter identification to the minimum needed to prevent duplicate registration and ensure eligibility.

Developments since 2004

Since the passage of HAVA, with its limited requirements for voter identification, and following the 2004 election, debate over voter ID has taken place in state legislatures across the country. That debate has not been characterized by solid information on the consequences of tightening requirements for voters to identify themselves before being permitted to cast a regular, rather than a provisional, ballot.

Better information might improve the quality of the debate. Answers to the following key questions are not available in a form that might satisfy those on both sides of the argument.

- What is the overall incidence of vote fraud?
- How does fraud take place in the various stage of the process: registration, voting at the polls, absentee voting, or ballot counting?
- What contribution can tighter requirements for voter ID make to reducing vote fraud?
- What would be the other consequences of increasingly demanding requirements for voters to identify themselves? This is the question addressed, within the limits of the available data, in the analysis in this report.

Answering these questions would provide the information needed for more informed judgment in the states as they consider the tradeoffs among the competing goals of ballot integrity, ballot access, and administrative efficiency. The Carter-Baker Commission recognized the tradeoffs when it tied recommendation for national ID to an affirmative effort by government to identify unregistered voters and make it easy for them to register.

State Voter Databases and Voter ID

With the implementation of the HAVA Computerized Statewide Voter Registration List, an application for voter registration for an election for Federal office may not be accepted or processed unless the application includes a driver's license number or last four digits of the

Social Security number on the voter registration form. This information can be used to verify the identity of the registrant through interfacing with lists maintained by the Motor Vehicle office and Social Security office. If registrants do not have either a driver's license or Social Security number, the State will assign a unique identifier number to that person.

HAVA does not require that the states notify registrants to remedy any failure to provide either of these numbers or to confirm that they have provided a verifiable number. Verification at the time of registration could forestall difficulties at the polling place. HAVA is silent on how the ID might be required at the polling place for new voters whose driving license or Social Security number could not be verified. Errors in recording those numbers are sure to occur.

Some states are wrestling now with these unresolved issues. In New Jersey, for example, pending legislation would require that voters must be able to confirm their registration through a secure access to the SVRL. It also requires voters to present ID at the polls in order to cast a regular ballot if the numbers recorded on the registration have not been verified (or if no verifiable number appears on the registration). It recognizes the HAVA requirement that if the number provided by the voter has not been verified and if the voter does not present ID at the polls, that voter may cast a provisional ballot. The bill does not specify they have to provide ID within 48 hours in order for their vote to count, as is the case with first-time mail-in registrants.

As some states gain experience in this area, the EAC would perform a useful service by making timely recommendations of best practices for all states to consider.

Conclusions

The form of Voter ID required of voters affects turnout. Lack of ID can keep voters from the polls. Or, when they go to the polls, it is reasonable to conclude that stricter Voter ID requirements will divert more voters into the line for provisional ballots. (This conclusion is a conjecture because we lack good data on why voters must cast their ballots provisionally.) The result can be longer lines at the polls and confusion, without a clear demonstration that the security of the ballot is correspondingly increased. [25]

---

[25] In this connection, the Brennan Center's response to the Carter-Baker Commission report observes that, "while it might be true that in a close election "a small amount of fraud could make the margin of difference," it is equally true that the rejection of a much larger number of eligible voters could make a much bigger difference in the outcome." *Response to the Report of the 2005 Commission on Federal*

The dynamics of Voter ID requirements –how the more rigorous Voter ID requirements—affect the decision by potential voters to go or stay away from the polls are not well understood. This lack of understanding should be recognized in the policy process. The debate over voter ID in the states would be improved by additional research sponsored by the EAC. So far as it may be necessary to reduce vote fraud made possible by inadequate voter ID, the research could identify methods to eliminate the need for voters to bring specific identity documents with them to the polls while assuring that each voter who casts a ballot is eligible and votes only once. One way to break the connection between the benefits of photo ID and the need for the voter to bring identification to the polling place, as recommended elsewhere by one of the authors of this report, Edward Foley: keep the information to verify a voter's identity in the records at the polling place. Other approaches could be developed. [26]

Election Reform, The Brennan Center for Justice at NYU School of Law and Spencer Overton, On Behalf Of The National Network on State Election Reform, September 19, 2005

[26] "A potential solution to this problem is to break the connection with the photo requirement and the obligation to produce identification at the polls. Eligible citizens could be required to provide a photograph at the time they *register* to vote, and poll workers would match this photograph with the image of the person standing in front of them. Given the availability of digital photography, the photos of registered voters could be stored in electronic poll books and easily "pulled up" with a click of a computer mouse when voters sign in to vote. . . Of course, to satisfy the concerns of liberals, a requirement to provide a digital photograph at time of registration would have to address the cost and accessibility issues identified earlier. "

Summary of Voter Identification Requirements By State

Prepared by
Sara A. Sampson, Reference Librarian,
The Ohio State University Moritz College of Law.

Voter ID Requirements

State	Forms of ID Required 2004	Statutory Language	Statutory Citation
Alabama	Provide ID	(b) Each elector shall provide identification to an appropriate election official prior to voting. A voter required to show identification when voting in person shall present to the appropriate election official either of the following forms of identification: (1) A current valid photo identification. (2) A copy of a current utility bill, bank statement, government check, paycheck, or other government document that shows the name and address of the voter. The term "other government document" may include, but is not limited to, any of the following: a. A valid identification card issued by a branch, department, agency, or entity of the State of Alabama, any other state, or the United States authorized by law to issue personal identification. b. A valid United States passport. c. A valid Alabama hunting or fishing license. d. A valid Alabama permit to carry a pistol or revolver. e. A valid pilot's license issued by the Federal Aviation Administration or other authorized agency of the United States. f. A valid United States military identification card. g. A certified copy of the elector's birth certificate. h. A valid Social Security card. i. Certified naturalization documentation. j. A certified copy of court records showing adoption or name change. k. A valid Medicaid card, Medicare card, or an Electronic Benefits Transfer Card (formerly referred to as a "food stamp card"). (c) For voters required to show identification when voting by mail, the voter shall submit with the ballot a copy of one of the forms of identification listed in subsection (b). (e) An individual required to present identification in accordance with this section who is unable to meet the identification requirements of this section shall be permitted to vote by a challenged or provisional ballot, as provided for by law. (f) In addition, an individual who does not have identification in his or her possession at the polls shall be permitted to vote if the individual is positively identified by two election officials as a voter on the poll list who is eligible to vote and the election official signs the voters list by where the voter signs. Effective Date: June 24, 2003	Ala. Code § 17-11A-1
Alaska	Provide ID	(a) Before being allowed to vote, each voter shall exhibit to an election official one form of identification, including (1) an official voter registration card, driver's license, state identification card, current and valid photo identification, birth certificate, passport, or hunting or fishing license; or (2) an original or a copy of a current utility bill, bank statement, paycheck, government check, or other government document; an item exhibited under this	Alaska Stat. § 15.15.225

		paragraph must show the name and current address of the voter. (b) An election official may waive the identification requirement if the election official knows the identity of the voter. The identification requirement may not be waived for voters who are first-time voters who initially registered by mail or by facsimile or other electronic transmission approved by the director under AS 15.07.050, and did not provide identification as required in AS 15.07.060. (c) A voter who cannot exhibit a required form of identification shall be allowed to vote a questioned ballot. effective June 17, 2003	
Arizona	Provide ID	B. If a statewide voter registration database is not yet operational, for any person who has registered to vote by mail for the first time in this state after January 1, 2003 or who is reregistering by mail after January 1, 2003 after moving from one county to another county in this state, the person shall comply with the following in order to be issued a ballot: 1. The person shall present either one of the following: (a) A current form of identification that bears a photograph of the person and the name of the person. (b) A current utility bill, bank statement, paycheck, government issued check or other government document that shows the name and registration address of the person. 2. If the person does not present a document that complies with paragraph 1, the person is only eligible to vote a provisional ballot as prescribed by § 16-584. Effective Dec. 1, 2003	Ariz. Rev. Stat. Ann. § 16-579
Arkansas	Provide ID	7-5-305. Requirements. (a) Before a person is permitted to vote, the election official shall: (1) Request the voter to identify himself in order to verify the existence of his name on the precinct voter registration list; (2) Request the voter, in the presence of the election official, to state his address and state or confirm his date of birth; (3) Determine that the voter's date of birth and address are the same as those on the precinct voter registration list; (4) If the date of birth given by the voter is not the same as that on the precinct voter registration list, request the voter to provide identification as the election official deems appropriate; (5)(A) If the voter's address is not the same as that on the precinct voter registration list, verify with the county clerk that the address is within the precinct. (B) If the address is within the precinct, request the voter to complete a voter registration application form for the purpose of updating county voter registration record files. (C) If the address is not within the precinct, instruct the voter to contact the county clerk's office to determine the proper precinct; (6) If the voter's name is not the same as that on the precinct voter registration list, request the voter to complete a voter registration application form for purposes of updating county voter registration record files; (7) Request the voter, in the presence of the election official, to sign his name, including his given name, his middle name or initial, if any, and his last name in the space provided on the precinct voter registration list. If a person is unable to sign his signature or make his mark or cross, the election official shall enter his initials and the voter's date of birth in the space for the person's signature on the precinct voter registration list; and	Arkansas Code Annotated § 7-5-305

		(8)(A) Request the voter for purposes of identification to provide a valid driver's license, photo identification card issued by a governmental agency, voter card, social security card, birth certificate, United States passport, employee identification card issued by a governmental agency containing a photograph, employee identification card issued in the normal course of business of the employer, student identification card, Arkansas hunting license, or United States military identification card. (B)(i) If a voter is unable to provide this identification, the election official shall indicate on the precinct voter registration list that the voter did not provide identification. (ii) Following each election, the county board of election commissioners may review the precinct voter registration lists and may provide the information of the voters not providing identification at the polls to the prosecuting attorney. (iii) The prosecuting attorney may investigate possible voter fraud; and (9) Follow the procedures under §§ 7-5-310, 7-5-311, and 7-5-523, if the preson is a disabled voter and presents himself or herself to vote. Effective: July 16, 2003	
California	Sign Name	Any person desiring to vote shall announce his or her name and address in an audible tone of voice, and when one of the precinct officers finds the name in the index, the officer shall in a like manner repeat the name and address. The voter shall then write his or her name and residence address or, if the voter is unable to write, shall have the name and residence address written by another person on a roster of voters provided for that purpose, whereupon a challenge may be interposed as provided in this article. (Enacted in 1994, no amendments since)	Cal. Elec. Code § 14216
Colorado	Provide ID	(1) Except as provided in subsection (4) of this section, any eligible elector desiring to vote shall show his or her identification as defined in section 1-1-104(19.5), write his or her name and address on the signature card, and give the signature card to one of the election judges, * * * (4) An eligible elector who is unable to produce identification may cast a provisional ballot in accordance with article 8.5 of this title. (19.5)(a) "Identification" means: (I) A valid Colorado driver's license; (II) A valid identification card issued by the department of revenue in accordance with the requirements of part 3 of article 2 of title 42, C.R.S.; (III) A valid United States passport; (IV) A valid employee identification card with a photograph of the eligible elector issued by any branch, department, agency, or entity of the United States government or of this state, or by any county, municipality, board, authority, or other political subdivision of this state; (V) A valid pilot's license issued by the federal aviation administration or other authorized agency of the United States; (VI) A valid United States military identification card with a photograph of the eligible elector; (VII) A copy of a current utility bill, bank statement, government check, paycheck, or other government document that shows the name and address of the elector; (VIII) A valid medicare or medicaid card issued by the United States health care	Colo. Rev. Stat. Ann. § 1-7-110; Colo. Rev. Stat. Ann. § 1-1-104

		financing administration; (IX) A certified copy of a birth certificate for the elector issued in the United States; or (X) Certified documentation of naturalization. (b) Any form of identification indicated in paragraph (a) of this subsection (19.5) that shows the address of the eligible elector shall be considered identification only if the address is in the state of Colorado. Effective 5/28/2004	
Connecticut	Provide ID	(a) In each primary, election or referendum, when an elector has entered the polling place, the elector shall announce the elector's street address, if any, and the elector's name to the checkers in a tone sufficiently loud and clear as to enable all the election officials present to hear the same. Each elector who registered to vote by mail for the first time on or after January 1, 2003, and has a "mark" next to the elector's name on the official registry list, as required by section 9-23r, shall present to the checkers, before the elector votes, either a current and valid photo identification that shows the elector's name and address or a copy of a current utility bill, bank statement, government check, paycheck or other government document that shows the name and address of the elector. Each other elector shall (1) present to the checkers the elector's Social Security card or any other preprinted form of identification which shows the elector's name and either the elector's address, signature or photograph, or (2) on a form prescribed by the Secretary of the State, write the elector's residential address and date of birth, print the elector's name and sign a statement under penalty of false statement that the elector is the elector whose name appears on the official checklist. Such form shall clearly state the penalty of false statement. A separate such form shall be used for each elector. If the elector presents a preprinted form of identification under subdivision (1) of this subsection, the checkers shall check the name of such elector on the official checklist. If the elector completes the form under subdivision (2) of this subsection, the assistant registrar of voters shall examine the information on such form and either instruct the checkers to check the name of such elector on the official checklist or notify the elector that the form is incomplete or inaccurate. Effective May 10., 2004	Conn. Gen. Stat. Ann. § 9-261
Delaware	Provide ID	(a) A voter, upon entering the room where an election is being held, shall announce his or her name and address and provide proof of identity, whereupon the clerks shall place a mark or make a notation of his or her name upon the election district record. In the event the voter does not have proof of identity with them, he or she shall sign an affidavit of affirmation that he or she is the person listed on the election district record. Effective: July 9, 2002	15 Del. Code § 4937
D.C.	Sign Name	(i)(1) A person shall be entitled to vote in an election in the District of Columbia if he or she is a duly registered voter. A qualified elector shall be considered duly registered in the District if he or she has met the requirements for voter registration and, on the day of the election, either resides at the address listed on the Board's records or files an election day change of address pursuant to this subsection. (2) Each registered voter who changes his or her place of residence from that listed on the Board's records shall notify the Board, in writing, of the new residence address. A change of address shall be effective on the date the notification was mailed as shown by the United States Postal Service postmark. If not postmarked, the notification shall be effective on the date of receipt by the Board. Change of address notifications from registrants shall be accepted pursuant to subsection (g) of this section, except that any registrant who has not notified the Board of his or her current residence address by the deadline established by subsection (g) of this section may be permitted to vote at the	D.C. Code § 1-1001.07

		polling place that serves the current residence address by filing an election day change of address notice pursuant to paragraph (4) of this subsection. (3) Each registered voter who votes at a polling place on election day shall affirm his or her residence address as it appears on the official registration roll for the precinct. The act of signing a copy of the official registration roll for the precinct shall be deemed affirmation of the voter's address as it appears on the Board's registration records. (Effective April 3, 2001)(not added as part of 2005 amendment)	
Florida	Photo ID	101.043 (1) The precinct register, as prescribed in s. 98.461, shall be used at the polls in lieu of the registration books for the purpose of identifying the elector at the polls prior to allowing him or her to vote. The clerk or inspector shall require each elector, upon entering the polling place, to present a current and valid picture identification as provided in s. 97.0535(3)(a). If the picture identification does not contain the signature of the voter, an additional identification that provides the voter's signature shall be required. The elector shall sign his or her name in the space provided, and the clerk or inspector shall compare the signature with that on the identification provided by the elector and enter his or her initials in the space provided and allow the elector to vote if the clerk or inspector is satisfied as to the identity of the elector. (2) Except as provided in subsection (3), if the elector fails to furnish the required identification, or if the clerk or inspector is in doubt as to the identity of the elector, such clerk or inspector shall follow the procedure prescribed in s. 101.49. **97.0535** (3)(a) The following forms of identification shall be considered current and valid if they contain the name and photograph of the applicant and have not expired: 1. Florida driver's license. 2. Florida identification card issued by the Department of Highway Safety and Motor Vehicles. 3. United States passport. 4. Employee badge or identification. 5. Buyer's club identification. 6. Debit or credit card. 7. Military identification. 8. Student identification. 9. Retirement center identification. 10. Neighborhood association identification. 11. Entertainment identification. 12. Public assistance identification. (b) The following forms of identification shall be considered current and valid if they contain the name and current residence address of the applicant: 1. Utility bill.	West's Fla. Stat. Ann. § 101.043 & West's Fla. Stat. Ann. § 97.0535

		2. Bank statement. 3. Government check. 4. Paycheck. 5. Other government document (excluding voter identification card). Version effective 1/1/2005-12/31/2005	
Georgia	Provide ID	(a) Each elector shall present proper identification to a poll worker at or prior to completion of a voter's certificate at any polling place and prior to such person's admission to the enclosed space at such polling place. Proper identification shall consist of any one of the following: (1) A valid Georgia driver's license; (2) A valid identification card issued by a branch, department, agency, or entity of the State of Georgia, any other state, or the United States authorized by law to issue personal identification; (3) A valid United States passport; (4) A valid employee identification card containing a photograph of the elector and issued by any branch, department, agency, or entity of the United States government, this state, or any county, municipality, board, authority, or other entity of this state; (5) A valid employee identification card containing a photograph of the elector and issued by any employer of the elector in the ordinary course of such employer's business; (6) A valid student identification card containing a photograph of the elector from any public or private college, university, or postgraduate technical or professional school located within the State of Georgia; (7) A valid Georgia license to carry a pistol or revolver; (8) A valid pilot's license issued by the Federal Aviation Administration or other authorized agency of the United States; (9) A valid United States military identification card; (10) A certified copy of the elector's birth certificate; (11) A valid social security card; (12) Certified naturalization documentation; (13) A certified copy of court records showing adoption, name, or sex change; (14) A current utility bill, or a legible copy thereof, showing the name and address of the elector; (15) A bank statement, or a legible copy thereof, showing the name and address of the elector; (16) A government check or paycheck, or a legible copy thereof, showing the name and address of the elector; or (17) A government document, or a legible copy thereof, showing the name and address of the elector. (b) If an elector is unable to produce any of the items of identification listed in subsection (a) of this Code section, he or she shall sign a statement under oath in a form approved by the Secretary of State, separate and distinct from the elector's voter certificate, swearing or affirming that he or she is the person identified on the elector's voter certificate. Such person shall be allowed to vote without undue delay; provided, however, that an elector who registered for the first time in this state by mail and did not provide one of the forms of identification set forth in subsection (a) of this Code section at the time of registration and who is voting for the first time may vote a provisional ballot pursuant to Code Section 21-2-418 upon swearing or affirming that the elector is the person identified in the elector's voter certificate. Such provisional ballot shall only be counted if the registrars are able to verify current and valid identification of the elector as provided in this Code section within the time period for verifying provisional ballots pursuant to Code Section 21-2-419. Falsely swearing or affirming such statement under oath shall be punishable as a felony, and the penalty shall be distinctly set forth on the face of the statement." effective June, 2003	Ga. Code. Ann. § 21-2-417

Hawaii	Photo ID	(b) The voter shall present valid identification to the official in charge of the pollbook. ***Do I Need an I.D. to Vote on Election Day?*** **Yes.** Be sure to have an I.D. with a picture and signature (such as a Hawaii driver's license or state I.D. card) when you go to vote. The NVRAC card is not an acceptable form of identification. From the 2004 version of the administrative code. **§ 11-136 Poll book, identification, voting.** Every person upon applying to vote shall sign the person's name in the poll book prepared for that purpose. This requirement may be waived by the chairperson of the precinct officials if for reasons of illiteracy or blindness or other physical disability the voter is unable to write. Every person shall provide identification if so requested by a precinct official. A poll book shall not contain the social security number of any person. After signing the poll book and receiving the voter's ballot, the voter shall proceed to the voting booth to vote according to the voting system in use in the voter's precinct. The precinct official may, and upon request shall, explain to the voter the mode of voting. Last amended 2003.	Haw. Code. R. § 2-51-80 (Paper ballots; voting procedure at the polls), § 2-51-83 (Punchcard ballots; voting procedure at polls), 2-51-85.1 (Marksense ballots; voting procedure at the polls.) – All have same subsection (b) Haw. Code. R. T. 2, SUBT. 4, CH. 51, Appendix HRS 11-136
Idaho	Sign Name	(1) An elector desiring to vote shall state his name and address to the judge or clerk in charge of the combination election record and poll book. (2) Before receiving his ballot, each elector shall sign his name in the combination election record and poll book following his name therein. (5) The elector shall then be given the appropriate ballots which have been stamped with the official election stamp and shall be given folding instructions for such ballots. (Last amended in 1972)	Id. St. §34-1106
Illinois	Give Name	Any person desiring to vote shall give his name and, if required to do so, his residence to the judges of election, one of whom shall thereupon announce the same in a loud and distinct tone of voice, clear, and audible; the judges of elections shall check each application for ballot against the list of voters registered in that precinct to whom absentee or early ballots have been issued for that election, which shall be provided by the election authority and which list shall be available for inspection by pollwatchers. A voter applying to vote in the precinct on election day whose name appears on the list as having been issued an absentee or early ballot shall not be permitted to vote in the precinct. All applicable provisions of Articles 4, 5 or 6 shall be complied with and if such name is found on the register of voters by the officer having charge thereof, he	10 Ill. Comp. Stat. 5/17-9

		shall likewise repeat said name, and the voter shall be allowed to enter within the proximity of the voting booths, as above provided. One of the judges shall give the voter one, and only one of each ballot to be voted at the election, on the back of which ballots such judge shall indorse his initials in such manner that they may be seen when each such ballot is properly folded, and the voter's name shall be immediately checked on the register list. In those election jurisdictions where perforated ballot cards are utilized of the type on which write-in votes can be cast above the perforation, the election authority shall provide a space both above and below the perforation for the judge's initials, and the judge shall endorse his or her initials in both spaces. Whenever a proposal for a constitutional amendment or for the calling of a constitutional convention is to be voted upon at the election, the separate blue ballot or ballots pertaining thereto shall, when being handed to the voter, be placed on top of the other ballots to be voted at the election in such manner that the legend appearing on the back thereof, as prescribed in Section 16-6 of this Act, shall be plainly visible to the voter. At all elections, when a registry may be required, if the name of any person so desiring to vote at such election is not found on the register of voters, he or she shall not receive a ballot until he or she shall have complied with the law prescribing the manner and conditions of voting by unregistered voters. If any person desiring to vote at any election shall be challenged, he or she shall not receive a ballot until he or she shall have established his right to vote in the manner provided hereinafter; and if he or she shall be challenged after he has received his ballot, he shall not be permitted to vote until he or she has fully complied with such requirements of the law upon being challenged. Besides the election officer, not more than 2 voters in excess of the whole number of voting booths provided shall be allowed within the proximity of the voting booths at one time. The provisions of this Act, so far as they require the registration of voters as a condition to their being allowed to vote shall not apply to persons otherwise entitled to vote, who are, at the time of the election, or at any time within 60 days prior to such election have been engaged in the military or naval service of the United States, and who appear personally at the polling place on election day and produce to the judges of election satisfactory evidence thereof, but such persons, if otherwise qualified to vote, shall be permitted to vote at such election without previous registration.	
Indiana	Sign Name		West's Annotated Indiana Code § 3-11-8-25
Iowa	Sign Name	1. The board members of their respective precincts shall have charge of the ballots and furnish them to the voters. Any person desiring to vote shall sign a voter's declaration provided by the officials, in substantially the following form: VOTER'S DECLARATION OF ELIGIBILITY I do solemnly swear or affirm that I am a resident of the .... precinct, ... ward or township, city of ...., county of ...., Iowa. I am a registered voter. I have not voted and will not vote in any other precinct in said election. I understand that any false statement in this declaration is a criminal offense punishable as provided by law. ______________________ Signature of Voter ______________________ Address ______________________ Telephone Approved:	Iowa Code § 49.77

		Board Member 2. One of the precinct election officials shall announce the voter's name aloud for the benefit of any persons present pursuant to section 49.104, subsection 2, 3, or 5. Any of those persons may upon request view the signed declarations of eligibility and may review the signed declarations on file so long as the person does not interfere with the functions of the precinct election officials. 3. A precinct election official shall require any person whose name does not appear on the election register as an active voter to show identification. Specific documents which are acceptable forms of identification shall be prescribed by the state commissioner. A precinct election official may require of the voter unknown to the official, identification upon which the voter's signature or mark appears. If identification is established to the satisfaction of the precinct election officials, the person may then be allowed to vote. (From 2004 version of Iowa Annotated Code; effective January 1, 1995)	
Kansas	Sign Name	(b) A person desiring to vote shall provide to the election board: (1) the voter's name; (2) if required, the voter's address; and (3) the voter's signature on the registration or poll book. A signature may be made by mark, initials, typewriter, print, stamp, symbol or any other manner if by placing the signature on the document the person intends the signature to be binding. A signature may be made by another person at the voter's direction if the signature reflects such voter's intention. (Approved April 14, 2004, 2004 Kansas Laws Ch. 93)	Kan. Stat. Ann. § 25-2908(b)
Kentucky	Provide ID	117.227 Confirmation of voter's identity Election officers shall confirm the identity of each voter by personal acquaintance or by a document, such as a motor vehicle operator's license, Social Security card, or credit card. The election officer confirming the identity shall sign the precinct voter roster and list the method of identification. Effective: 7/15/02 31 KAR 4:010. Voter identification cards. Section 1. In addition to the forms of identification specifically provided for by KRS 117.227, any identification card that bears both the picture and signature of the voter, or any identification card that has been issued by the county, and which has been approved in writing by the State Board of Elections, shall be acceptable for confirmation of the voter's identity.	Ky Rev. Stat. Ann. 117.227 31 Ky. Admin. Regs. 4:010.
Louisiana	Photo ID	A. Identification of voters. (1) A person who desires to vote in a primary or general election shall give his name and address to a commissioner, who shall announce the applicant's name and address to the persons at the polling place. (2) Each applicant shall identify himself, in the presence and view of the bystanders, and present to the commissioners a Louisiana driver's license, a Louisiana special identification card issued pursuant to R.S. 40:1321, or other generally recognized picture identification card. If the applicant does not have a Louisiana driver's license, a Louisiana special identification card, or other generally recognized picture identification card, the applicant shall sign an affidavit, which is supplied by the secretary of state, to that effect before the commissioners who shall place the affidavit in the envelope marked "Registrar of Voters" and attach the envelope to the precinct register, and the applicant	La. Rev. Stat. Ann. 18:562

		shall provide further identification by presenting his current registration certificate, giving his date of birth or providing other information stated in the precinct register that is requested by the commissioners. However, an applicant that is allowed to vote without the picture identification required by this Paragraph is subject to challenge as provided in R.S. 18:565. Effective: 1/1/2002	
Maine	Give Name	The voting procedure is as follows. 1. Name announced. A voter who wishes to vote must state the voter's name and, upon request, residence address to an election clerk who shall announce the name in a loud, clear voice. (In effect at time of 2003 amendment: 2003, c. 584, § 9)	Me. Rev. Stat. Ann. tit. 21-A, § 671
Maryland	Sign Name	10-310. (a) For each individual who seeks to vote, an election judge, in accordance with instructions provided by the local board, shall: (1) locate the individual's name in the precinct register and locate the preprinted voting authority card and then authorize the individual to vote a regular ballot; (2)(i) if the individual's name is not found on the precinct register, search the inactive list and if the name is found, authorize the individual to vote a regular ballot; or (ii) if the individual's name is not on the inactive list, refer the individual for provisional ballot voting under § 9-404 of this article; (3) establish the identity of the voter by requesting the voter to state the month and day of the voter's birth and comparing the response to the information listed in the precinct register; (4) verify the address of the voter's residence; (5) if any changes to the voting authority card are indicated by a voter, make the appropriate changes in information on the card or other appropriate form; and (6) have the voter sign the voting authority card and either issue the voter a ballot or send the voter to a machine to vote.	Md. Elec. Law § 10-310
Mass.	Give Name	Each voter desiring to vote at a polling place shall give his name and, if requested, his residence to one of the officers at the entrance to the space within the guard rail, who shall thereupon distinctly announce the same. If such name is found on the voting list, the election officer shall check and repeat the name and shall admit the voter to the space enclosed by the guard rail and, in case official ballots, other than those marked "Challenged Ballots" as provided by section thirty-five A, are used, such voter shall be given one ballot. The use of electronic means such as tape recording equipment or radio broadcasting equipment for the recording or broadcasting of the names of voters not yet checked as having voted shall be prohibited. Last amended in 1981 (5B) Identification. If so authorized by the city or town clerk or registrars of voters, an election officer may request any voter to present written identification. Such requests shall not discriminate in any way, but shall be entirely random, consistent, or based on reasonable suspicion. For the purpose of 950 CMR 52.03(5B), of M.G.L. c. 54, § 76B, and of 950 CMR 52.03(5)(b), suitable written identification includes a driver's license, recent utility bill, rent receipt on a landlord's printed letterhead, lease, duplicate copy of a voter registration affidavit, or any other printed identification which contains the voter's name and address. If voters fail to present suitable written identification when so requested, they must still be allowed to vote, but an election officer or any other person may challenge their right to vote under M.G.L. c. 54, § 85 and 950 CMR 52.03(23).	Mass. Ann. Laws 54 § 76 950 Mass. Code Regs. 52.03
Michigan	Sign Name	(1) At each election, before being given a ballot, each registered elector offering to vote shall identify himself or herself by presenting an official state	Mich. Comp. Laws Ann. §

		identification card issued to that individual pursuant to Act No. 222 of the Public Acts of 1972, being sections 28.291 to 28.295 of the Michigan Compiled Laws, an operator's or chauffeur's license issued to that individual pursuant to the Michigan Vehicle Code, Act No. 300 of the Public Acts of 1949, being sections 257.1 to 257.923 of the Michigan Compiled Laws, or other generally recognized picture identification card and by executing an application showing his or her signature or mark and address of residence in the presence of an election official. If the voter registration cards are used in the precinct, the election official in charge of the precinct registration file shall compare the signature upon the application with the signature upon the registration card. If voter registration lists are used in the precinct, the election inspector shall determine if the name on the application to vote appears on the voter registration list. If the name appears on the voter registration list, the elector shall provide further identification by giving his or her date of birth or other information stated upon the voter registration list. In precincts using voter registration lists, the date of birth may be required to be placed on the application to vote. If the signature or an item of information does not correspond, the vote of the person shall be challenged, and the same procedure shall be followed as provided in this act for the challenging of an elector. If the person offering to vote has signed the registration card or application by making a mark, the person shall identify himself or herself by giving his or her date of birth, which shall be compared with the date of birth stated upon the registration card or voter registration list, or shall give other identification as may be referred to upon the registration card or voter registration list. If the elector does not have an official state identification card, operator's or chauffeur's license as required in this subsection, or other generally recognized picture identification card, the individual shall sign an affidavit to that effect before an election inspector and be allowed to vote as otherwise provided in this act. However, an elector being allowed to vote without the identification required under this subsection is subject to challenge as provided in section 727. (2) If, upon a comparison of the signature or other identification, it is found that the applicant is entitled to vote, the election officer having charge of the registration list shall approve the application and write his or her initials on the application, after which the number on the ballot issued shall be noted on the application. The application shall serve as 1 of the 2 poll lists required to be kept as a record of a person who has voted. The application shall be filed with the township, city, or village clerk. If voter registration cards are used in the precinct, the date of the election shall be noted by 1 of the election officials upon the precinct registration card of each elector voting at an election. If voter registration lists are used in the precinct, the election official shall clearly indicate upon the list each elector voting at that election. The clerk of a city, village, or township shall maintain a record of voting participation for each registered elector. The Attorney General declared that this statute violated the Equal Protection Clause of the Fourteenth Amendment. Op. Atty. Gen. 1997, No. 6930. That decision is binding on all state agencies. (Effective March 31, 1997)	168.523
Minnesota	Sign Name	(a) An individual seeking to vote shall sign a polling place roster which states that the individual is at least 18 years of age, a citizen of the United States, has resided in Minnesota for 20 days immediately preceding the election, maintains residence at the address shown, is not under a guardianship in which the court order revokes the individual's right to vote, has not been found by a court of law to be legally incompetent to vote or convicted of a felony without having civil rights restored, is registered and has not already voted in the election. The roster must also state: "I understand that deliberately providing false information is a felony punishable by not more than five years imprisonment and a fine of not	Minn. Stat. § 204C.10

		more than $10,000, or both." (b) A judge may, before the applicant signs the roster, confirm the applicant's name, address, and date of birth. (c) After the applicant signs the roster, the judge shall give the applicant a voter's receipt. The voter shall deliver the voter's receipt to the judge in charge of ballots as proof of the voter's right to vote, and thereupon the judge shall hand to the voter the ballot. The voters' receipts must be maintained during the time for notice of filing an election contest. (Effective January 1, 2004)	
Mississippi	Sign Name	* * * When any person entitled to vote shall appear to vote, he shall first sign his name in a receipt book or booklet provided for that purpose and to be used at that election only and said receipt book or booklet shall be used in lieu of the list of voters who have voted formerly made by the managers or clerks; whereupon and not before, the initialing manager or, in his absence, the alternate initialing manager shall indorse his initials on the back of an official blank ballot, prepared in accordance with law, and at such place on the back of the ballot that the initials may be seen after the ballot has been marked and folded, and when so indorsed he shall deliver it to the voter, which ballot the voter shall mark in the manner provided by law, which when done the voter shall deliver the same to the initialing manager or, in his absence, to the alternate initialing manager, in the presence of the others, and the manager shall see that the ballot so delivered bears on the back thereof the genuine initials of the initialing manager, or alternate initialing manager, and if so, but not otherwise, the ballot shall be put into the ballot box; and when so done one (1) of the managers or a duly appointed clerk shall make the proper entry on the pollbook. If the voter is unable to write his name on the receipt book, a manager or clerk shall note on the back of the ballot that it was receipted for by his assistance. (Effective January 1, 1987)	Miss. Code Ann. § 23-15-541
Missouri	Provide ID	1. Before receiving a ballot, voters shall identify themselves by presenting a form of personal identification from the following list: (1) Identification issued by the state of Missouri, an agency of the state, or a local election authority of the state; (2) Identification issued by the United States government or agency thereof; (3) Identification issued by an institution of higher education, including a university, college, vocational and technical school, located within the state of Missouri; (4) A copy of a current utility bill, bank statement, government check, paycheck or other government document that contains the name and address of the voter; (5) Driver's license or state identification card issued by another state; or (6) Other identification approved by the secretary of state under rules promulgated pursuant to subsection 3 of this section other identification approved by federal law. Personal knowledge of the voter by two supervising election judges, one from each major political party, shall be acceptable voter identification upon the completion of a secretary of state-approved affidavit that is signed by both supervisory election judges and the voter that attests to the personal knowledge of the voter by the two supervisory election judges. The secretary of state may provide by rule for a sample affidavit to be used for such purpose. (Last amended in 2002)	Mo. Rev. Stat. §115.427.1

Montana	Provide ID	(1) (a) Before an elector is permitted to receive a ballot or vote, the elector shall present to an election judge a current photo identification showing the elector's name. If the elector does not present photo identification, including but not limited to a valid driver's license, a school district or postsecondary education photo identification, or a tribal photo identification, the elector shall present a current utility bill, bank statement, paycheck, notice of confirmation of voter registration issued pursuant to 13-2-207, government check, or other government document that shows the elector's name and current address. (From 2004 version of the Montana Code Annotated; No updates in 2004, only in 2005 [Unrelated section was amended in 2005])	Mont. Code. Ann. §13-13-114(1)(a)
Nebraska	Sign Name	(1) The clerks of election shall have a list of registered voters of the precinct and a sign-in register at the polling place on election day. The list of registered voters shall be used for guidance on election day and may be in the form of a computerized, typed, or handwritten list or precinct registration cards. Registered voters of the precinct shall place and record their signature in the sign-in register before receiving any ballot. The list of registered voters and the sign-in register may be combined into one document. (Last amended in 2003) Official ballots shall be used at all elections. No person shall receive a ballot or be entitled to vote unless and until he or she is registered as a voter except as provided in section 32-914.01, 32-914.02, 32-915, 32-915.01, or 32-936. Except as otherwise specifically provided, no ballot shall be handed to any registered voter at any election until (1) he or she announces his or her name and address to the clerk of election, (2) the clerk has found that he or she is a registered voter at the address as shown by the precinct list of registered voters unless otherwise entitled to vote in the precinct under section 32-328, 32-914.01, 32-914.02, 32-915, or 32-915.01, (3) if the voter registered by mail after January 1, 2003, and has not previously voted in an election for a federal office within the county, the clerk shall ask the registered voter to present a photographic identification which is current and valid or a copy of a utility bill, bank statement, government check, paycheck, or other government document that is current and that shows the name and address of the voter, (4) the clerk has instructed the registered voter to personally write his or her name in the precinct sign-in register on the appropriate line which follows the last signature of any previous voter, and (5) the clerk has listed on the precinct list of registered voters the corresponding line number and name of the registered voter. (Last updated in 2003)	Neb. Rev. Stat. § 32-913 Neb. Rev. Stat. § 32-914
Nevada	Match Sig.	1. Except as otherwise provided in NRS 293.541, if a person's name appears in the election board register or if he provides an affirmation pursuant to NRS 293.525, he is entitled to vote and must sign his name in the election board register when he applies to vote. His signature must be compared by an election board officer with the signature or a facsimile thereof on his original application to register to vote or one of the forms of identification listed in subsection 2. 2. Except as otherwise provided in NRS 293.2725, the forms of identification which may be used individually to identify a voter at the polling place are: (a) The card issued to the voter at the time he registered to vote; (b) A driver's license; (c) An identification card issued by the Department of Motor Vehicles; (d) A military identification card; or	Nev. Rev. Stat.§ 293.277

		(e) Any other form of identification issued by a governmental agency which contains the voter's signature and physical description or picture. Last Amendment Effective Jan. 1, 2004.	
NH	Give Name	A person desiring to vote shall, before being admitted to the enclosed space within the guardrail, announce his or her name to one of the ballot clerks who shall thereupon repeat the name; and, if the name is found on the checklist by the ballot clerk, the ballot clerk shall put a checkmark beside it and again repeat the name. The ballot clerk shall state the address listed on the checklist for the voter, and ask if the address is correct; if the address on the checklist is not correct, the ballot clerk shall correct the address in red on the checklist. The voter, if still qualified to vote in the town or ward and unless challenged as provided for in RSA 659:27-33, shall then be allowed to enter the space enclosed by the guardrail. After the voter enters the enclosed space, the ballot clerk shall give the voter one of each ballot to be voted on in that election which shall be folded as it was upon receipt from the secretary of state. Last Amendment Effective July 2, 2002.	N.H. Rev. Stat. Ann. 659:13
New Jersey	Match Sig.	19:15-17. Comparison of signatures or statements made openly; provisional ballots for newly registered voters without proper identification a. The comparison of signatures of a voter made upon registration and upon election day, and if the voter alleges his inability to write, the comparison of the answers made by such voter upon registration and upon election day, shall be had in full view of the challengers. b. If a voter has registered by mail after January 1, 2003 to vote for the first time in his or her current county of residence and did not provide personal identification when registering pursuant to section 16 of P.L.1974, c. 30 (C.19:31-6.4), the voter shall be permitted to vote starting at the first election held after January 1, 2004 at which candidates are seeking federal office after displaying one of the following items: (1) a current and valid photo identification card; (2) a current utility bill, bank statement, government check or pay check; (3) any other government document that shows the voter's name and current address; or (4) any other identifying document that the Attorney General has determined to be acceptable for this purpose. If the voter does not display one of these documents, the voter shall not be permitted to vote by machine but shall instead be provided with a provisional ballot, pursuant to the provisions of P.L.1999, c. 232 (C.19:53C-1 et seq.). This subsection shall not apply to any voter entitled to vote by absentee ballot under the "Uniformed and Overseas Citizens Absentee Voting Act" (42 U.S.C. 1973ff-1 et seq.) or to any voter who is provided the right to vote other than in person under section 3 of Pub.L.98-435, the "Voting Accessibility for the Elderly and Handicapped Act," or any other voter entitled to vote otherwise than in person under any other federal law. This subsection shall also not apply to any person who registers to vote by appearing in person at any voter registration agency or to any person whose voter registration form is delivered to the county commissioner of registration or to the Attorney General, as the case may be, through a third party by means other than by mail delivery. c. Each county commissioner of registration shall collect and maintain, in the manner prescribed by the Attorney General, the information provided pursuant to subsection b. of this section and section 16 of P.L.1974, c. 30 (C.19:31- 6.4). Access to the personal identification information provided pursuant to subsection b. of this section and section 16 of P.L.1974, c. 30 (C.19:31- 6.4). shall be prohibited, in accordance with subsection a. of section 6 of P.L.2001, c. 404 (C.47:1A-5). Last Amendment Effective July 9, 2004	N.J. Stat. Ann. 19:15-17
New Mexico	Sign Name	D. The judge assigned to the voter list used for confirmation of registration and voting shall determine that each person offering to vote is registered and, in the	N.M. Stat. Ann §1-5-10

		case of a primary election, that the voter is registered in a party designated on the primary election ballot. If the person's registration is confirmed by the presence of his name on the voter list or if the person presents a certificate under the seal and signature of the county clerk showing that he is entitled to vote in the election and to vote in that precinct, the judge shall announce to the election clerks the list number and the name of the voter as shown on the voter list. E. The election clerk shall locate that list number and name on the signature roster and shall require the voter to sign his usual signature or, if unable to write, to make his mark opposite his printed name. If the voter makes his mark, it shall be witnessed by one of the judges of the precinct board. If the signature roster indicates that the voter is required to present a form of identification before voting, the election judge shall ask the voter for a current and valid photo identification or a copy of a current utility bill, bank statement, government check, paycheck or other government document that shows and matches the name and address of the voter as indicated on the signature roster. If the voter does not provide the required identification, he shall be allowed to vote on a provisional paper ballot. G. A voter shall not be permitted to vote until he has properly signed his usual signature or made his mark in the signature roster. (From 2004 version of New Mexico Annotated Statutes, amended in 2005 to require presentation of ID)	(Recompiled as §1-12 -7.1 by L. 2005, Ch. 270, §63, effective July 1, 2005)
New York	Match Sig.	1. A person before being allowed to vote shall be required, except as provided in this chapter, to sign his name on the back of his registration poll record on the first line reserved for his signature at the time of election which is not filled with a previous signature, or on the line of the computer generated registration list reserved for his signature. The two inspectors in charge shall satisfy themselves by a comparison of this signature with his registration signature and by comparison of his appearance with the descriptive material on the face of the registration poll record that he is the person registered. If they are so satisfied they shall enter the other information required for the election on the same line with the voter's latest signature, shall sign their names or initials in the spaces provided therefor, and shall permit the applicant to vote. Any inspector or inspectors not satisfied shall challenge the applicant forthwith. 2. If a person who alleges his inability to sign his name presents himself to vote, the board of inspectors shall permit him to vote, unless challenged on other grounds, provided he had been permitted to register without signing his name. The board shall enter the words "Unable to Sign" in the space on his registration poll record reserved for his signature or on the line of the computer generated registration list reserved for his signature at such election. If his signature appears upon his registration record or upon the computer generated registration list the board shall challenge him forthwith, except that if such a person claims that he is unable to sign his name by reason of a physical disability incurred since his registration, the board, if convinced of the existence of such disability, shall permit him to vote, shall enter the words "Unable to Sign" and a brief description of such disability in the space reserved for his signature at such election. At each subsequent election, if such disability still exists, he shall be entitled to vote without signing his name and the board of inspectors, without further notation, shall enter the words "Unable to Sign" in the space reserved for his signature at such election. 3. The voter's signature made by him upon registration and his signature made at subsequent elections shall be effectively concealed from the voter by a blotter or piece of opaque paper until after the voter shall have completed his signature. 4. In any case where a person who has heretofore voted has placed his voting signature on the back of his registration poll record on the first or any succeeding line or lines at the time or times of an election, instead of on the last line of the	N.Y. Law § 8-304 (McKinney)

		space thereon required to be reserved for such voting signatures and on any lines next running upward therefrom, the inspectors of election shall obliterate such misplaced signature or signatures, initial the obliteration and require such voter to sign his name again in the correct place on such registration poll record. 5. Any person who has heretofore registered and who at such time placed his or her registration signature on the back of the registration poll record otherwise than in the space required to be provided therefor at the bottom of such poll record, shall, before being permitted to vote at any election thereafter, subscribe a new registration signature for himself on the last line at the bottom of such poll record, and, at the same time, if the inspectors of election are satisfied that the signatures were made by the same person, obliterate his original registration signature placed elsewhere than on the bottom of such record. Such obliterations may be made by crossing out the signature so as to completely efface the same or by affixing thereover a piece of gummed tape of a size sufficient only to cover such signature and of a type adequate to fully conceal the same Last Amended 1986	
North Carolina	Give Name	(a) Checking Registration. --A person seeking to vote shall enter the voting enclosure through the appropriate entrance. A precinct official assigned to check registration shall at once ask the voter to state current name and residence address. The voter shall answer by stating current name and residence address. In a primary election, that voter shall also be asked to state, and shall state, the political party with which the voter is affiliated or, if unaffiliated, the authorizing party in which the voter wishes to vote. After examination, that official shall state whether that voter is duly registered to vote in that precinct and shall direct that voter to the voting equipment or to the official assigned to distribute official ballots. If a precinct official states that the person is duly registered, the person shall sign the pollbook, other voting record, or voter authorization document in accordance with subsection (c) of this section before voting.	N.C. Gen. Stat. Ann. § 163-166.7
North Dakota	Provide ID	16.1-05-07 Poll clerks to check identification and verify eligibility -- Poll clerks to request, correct, and update incorrect information contained in the pollbook. 1. Before delivering a ballot to an individual according to section 16.1-13- 22, the poll clerks shall request the individual to show a driver's license issued by the state, another form of identification displaying a photograph of the individual and the individual's date of birth, or another appropriate form of identification prescribed by the secretary of state. If an individual offering to vote fails or refuses to show an appropriate form of identification, the individual may be allowed to vote without being challenged according to section 16.1-05-06 if the individual provides to the election board the individual's date of birth and if a member of the election board or a clerk knows the individual and can personally vouch that the individual is a qualified elector of the precinct. After verifying that the individual's name is contained in the pollbook generated from the central voter file, poll clerks shall verify the individual's residential address and mailing address, if different from the individual's residential address. (From 2003 version of N.D. Century Code; only amendment to this statute that became effective in 2003 was in 2005)	N.D. Cent. Code § 16.1-05-07

Ohio	Match Sig.	When an elector appears in a polling place to vote he shall announce his full name and address to the precinct election officials. He shall then write his name and address at the proper place in the poll lists or signature pollbooks provided therefore, except that if, for any reason, an elector shall be unable to write his name and address in the poll list or signature pollbook, the elector may make his mark at the place intended for his name and a precinct official shall write the name of the elector at the proper place on the poll list or signature pollbook following the elector's mark, upon the presentation of proper identification. The making of such mark shall be attested by the precinct official who shall evidence the same by signing his name on the poll list or signature pollbook as a witness to such mark. The elector's signature in the poll lists or signature pollbooks shall then be compared with his signature on his registration form or a digitized signature list as provided for in section 3503.13 of the Revised Code, and if, in the opinion of a majority of the precinct election officials, the signatures are the signatures of the same person, the clerks shall enter the date of the election on the registration form or shall record the date by such other means as may be prescribed by the secretary of state. If the right of the elector to vote is not then challenged, or, if being challenged, he establishes his right to vote, he shall be allowed to proceed into the voting machine. If voting machines are not being used in that precinct, the judge in charge of ballots shall then detach the next ballots to be issued to the elector from Stub B attached to each ballot, leaving Stub A attached to each ballot, hand the ballots to the elector, and call his name and the stub number on each of the ballots. The clerk shall enter the stub numbers opposite the signature of the elector in the pollbook. The elector shall then retire to one of the voting compartments to mark his ballots. No mark shall be made on any ballot which would in any way enable any person to identify the person who voted the ballot. (Effective at time of last update, 1992 H 182, eff. 4-9-93)	Ohio Rev. Code Ann. § 3505.18
Oklahoma	Sign Name	Each person presenting himself to vote shall announce his name to the judge of the precinct, whereupon the judge shall determine whether said person's name is in the precinct registry. (Last amended in 1990) Persons who have been determined to be eligible to vote shall sign, in the presence of the clerk, the proper precinct registry. Said clerk shall thereupon issue proper ballots to said person. The voter's signature on said precinct registry shall be the best evidence of said voter's having voted at said election. Said precinct registry shall be retained in the office of the county election board for a period of twenty-two (22) months following the election and shall be subject to public inspection during regular office hours. (Last amended in 1990)	Okla. Stat. Ann. tit. 26, § 7-114 Okla. Stat. Ann. tit. 26, § 7-117
Oregon	Match Sig.	All elections in Oregon are Vote by Mail. An Elections Official will compare the signature on your ballot return envelope to the signature on your voter registration card to verify your identity (http://www.uhavavote.org/votingguide/votebymail.html) (unknown date, but use of wayback machine shows that this provision on site on following dates: 7/11/04, 10/20/04 and 10/29/04)	Or. Rev. Stat. § 254.385
Penn.	Match Sig.	(a.3) All electors, including any elector that shows identification pursuant to subsection (a), shall subsequently sign a voter's certificate, and, unless he is a State or Federal employee who has registered under any registration act without declaring his residence by street and number, he shall insert his address therein, and hand the same to the election officer in charge of the district register. Such election officer shall thereupon announce the elector's name so that it may be heard by all members of the election board and by all watchers present in the	25 Pa. Stat. Ann. § 3050

		polling place and shall compare the elector's signature on his voter's certificate with his signature in the district register. If, upon such comparison, the signature upon the voter's certificate appears to be genuine, the elector who has signed the certificate shall, if otherwise qualified, be permitted to vote: Provided, That if the signature on the voter's certificate, as compared with the signature as recorded in the district register, shall not be deemed authentic by any of the election officers, such elector shall not be denied the right to vote for that reason, but shall be considered challenged as to identity and required to make the affidavit and produce the evidence as provided in subsection (d) of this section. When an elector has been found entitled to vote, the election officer who examined his voter's certificate and compared his signature shall sign his name or initials on the voter's certificate, shall, if the elector's signature is not readily legible, print such elector's name over his signature, and the number of the stub of the ballot issued to him or his number in the order of admission to the voting machines, and at primaries a letter or abbreviation designating the party in whose primary he votes shall also be entered by one of the election officers or clerks. As each voter is found to be qualified and votes, the election officer in charge of the district register shall write or stamp the date of the election or primary, the number of the stub of the ballot issued to him or his number in the order of admission to the voting machines, and at primaries a letter or abbreviation designating the party in whose primary he votes, and shall sign his name or initials in the proper space on the registration card of such voter contained in the district register. (In effect at time of, and unaltered by: 2004, Oct. 8, P.L. 807, No. 97, § 5.1 (changes procedure for first time voters, not established voters))	
Rhode Island	Give Name	(a) Each person desiring to vote shall state his or her name and residence, including that person's street address, if he or she has any, to one of the first pair of bi-partisan supervisors, who shall then announce the name and residence in a loud and distinct voice, clear and audible. As each voter's name is announced, the voter shall be handed a ballot application in the following form: BALLOT APPLICATION (Poll List) Senatorial District ____________________ Representative District ____________ Voting District ________________________ Election Date ____________________________________ I hereby certify that I am a registered and qualified elector in the above voting district of City of and hereby make application for ballots to be voted at this election. ____ (Signature of Voter) ____ (Residence Address) Number Approved ____ (Supervisor of Election)	R.I. Gen. Laws § 17-19-24

		(b) The voter shall sign the application in the presence and view of a bipartisan pair. They shall locate the voter's name on the certified voting list for the voting district. Upon finding the voter's name on the certified voting list for the district, they shall initial the ballot application in the place provided next to the word "Approved" and shall enter on the certified list of voters a proper notation that the applicant has voted in the election. They shall then return the ballot application to the voter who shall pass down the line and present it to the clerk. After the voter has handed the approved ballot application to the clerk, the clerk shall provide the voter with the appropriate computer ballot and security sleeve, the warden shall direct the voter to the voting booth which the voter shall use, and unless the voter needs instruction or assistance as provided in this chapter, the voter shall cast his or her vote, and if he or she desires place the voted computer ballot in a security sleeve, and shall proceed to the optical scan precinct count unit and shall personally place his or her voted ballot into the designated ballot slot on the unit, and after doing so, shall leave the enclosure at once. No voter shall remain within the voting booth longer than ten (10) minutes, and if the voter refuses to leave after the lapse of ten (10) minutes, the voter shall be removed from the voting booth by order of the warden. Except for the election officials and the election inspector, not more than two (2) voters in excess of the number of voting booths shall be permitted within the enclosed space at any time. (Last amended 2004, Current through January 2005 Session)	
South Carolina	Photo ID	**§ 7-13-710. Proof of right to vote; signing poll list; comparison of signatures.** When any person presents himself to vote, he shall produce his valid South Carolina driver's license or other form of identification containing a photograph issued by the Department of Motor Vehicles, if he is not licensed to drive, or the written notification of registration provided for by §§ 7-5- 125 and 7-5-180 if the notification has been signed by the elector. If the elector loses or defaces his registration notification, he may obtain a duplicate notification from his county board of registration upon request in person, or by telephone or mail. After presentation of the required identification, his name must be checked by one of the managers on the margin of the page opposite his name upon the registration books, or copy of the books, furnished by the board of registration. The managers shall keep a poll list which must contain one column headed "Names of Voters". Before any ballot is delivered to a voter, the voter shall sign his name on the poll list, which must be furnished to the appropriate election officials by the State Election Commission. At the top of each page the voter's oath appropriate to the election must be printed. The signing of the poll list or the marking of the poll list is considered to be an affirmation of the oath by the voter. One of the managers shall compare the signature on the poll list with the signature on the voter's driver's license, registration notification, or other identification and may require further identification of the voter and proof of his right to vote under this title as he considers necessary. If the voter is unable to write or if the voter is prevented from signing by physical handicap, he may sign his name to the poll list by mark with the assistance of one of the managers. Last amended: 1968	S.C. Code Ann. § 7-13-710
South Dakota	Photo ID	When a voter is requesting a ballot, the voter shall present a valid form of personal identification. The personal identification that may be presented shall be either: (1) A South Dakota driver's license or nondriver identification card; (2) A passport or an identification card, including a picture, issued by an agency of the United States government; (3) A tribal identification card, including a picture; or (4) An identification card, including a picture, issued by a high school or an accredited institution of higher education, including a university, college, or	S.D. Codified Laws § 12-18-6.1

		technical school, located within the State of South Dakota. Last amended March 2004	
Tennessee	Provide ID	Identification of eligible voters (a)(1) A voter shall sign an application for ballot, indicate the primary in which the voter desires to vote, if any, and present it to a registrar. The application for ballot shall include thereon a space for the address of the voter's current residence, and the voter shall write or print such address on the application when the voter signs it. The registrar shall compare the signature and information on the application with the signature and information on the duplicate permanent registration record. The registrar shall make a determination whether the voter's address is different from the address on the voter's permanent registration record or if the registration is in inactive status. If the voter has changed residence, or the voter's registration is inactive, the registrar shall follow the procedures for voting pursuant to § 2-7-140. If, upon comparison of the signature and other identification, it is found that the applicant is entitled to vote, the registrar shall initial the application and shall note on the reverse side of the voter's duplicate permanent registration record the date of the election, the number of the voter's ballot application, and the elections in which the voter votes. If the applicant's signature is illegible, the registrar shall print the name on the application. The registrar shall give the voter the ballot application which is the voter's identification for a paper ballot or ballots or for admission to a voting machine. The voter shall then sign the duplicate poll lists without leaving any lines blank on any poll list sheet. (2) In any computerized county, the county election commission shall have the option of using an application for a ballot as provided in this section, or using the computerized voter signature list. A computerized voter signature list shall include the voter's name, current address of residence, social security number or registration number, birth date and spaces for the voter's signature, elections voted, ballot number and precinct registrar's initials. The following procedures shall be followed in the case of computerized voter signature lists: (A) The voter shall sign the signature list and indicate the election or elections the voter desires to vote in and verify the voter's address in the presence of the precinct registrar; (B) The registrar shall compare the voter's signature and information on the signature list with other evidence of identification supplied by the voter. If, upon comparison of the signature and other evidence of identification, it is found that the applicant is entitled to vote, the registrar shall initial the signature list; (C) If the applicant's signature is illegible, the registrar shall print the name of the applicant on the voter list; and (D) If a voter is unable to present any evidence of identification specified in subsection (c), the voter shall be required to execute an affidavit of identity on a form provided by the county election commission. Last amended 2003	Tenn. Code Ann. § 2-7-112
Texas	Provide ID	(b) On offering to vote, a voter must present the voter's voter registration certificate to an election officer at the polling place. (Last amended in 1997)	Tex. Elec. Code Ann. § 63.001
Utah	Give Name	(1)(a) Any registered voter desiring to vote shall give his name, and, if requested, his residence, to one of the election judges. (b) If an election judge does not know the person requesting a ballot and has reason to doubt that person's identity, the judge shall request identification or have the voter identified by a known registered voter of the district. (3) If the election judge determines that the voter is registered: (a) the election judge in charge of the official register shall: (i) write the ballot number opposite the name of the voter in the official register; and	Utah Code Ann. § 20A-3-104

		(ii) direct the voter to sign his name in the election column in the official register; (b) another judge shall list the ballot number and voter's name in the pollbook; and (c) the election judge having charge of the ballots shall: (i) endorse his initials on the stub; (ii) check the name of the voter on the pollbook list with the number of the stub; (iii) hand the voter a ballot; and (iv) allow the voter to enter the voting booth. (In effect at time of last update prior to 2005: Laws 2003, c. 37, § 1, eff. May 5, 2003)	
Vermont	Give Name	Before a person may be admitted to vote, he or she shall announce his or her name and if requested, his or her place of residence in a clear and audible tone of voice, or present his or her name in writing, or otherwise identify himself or herself by appropriate documentation. The election officials attending the entrance of the polling place shall then verify that the person's name appears on the checklist for the polling place. If the name does appear, and if no one immediately challenges the person's right to vote on grounds of identity or having previously voted in the same election, the election officials shall repeat the name of the person and: (1) If the checklist indicates that the person is a first-time voter in the municipality who registered by mail and who has not provided required identification before the opening of the polls, require the person to present any one of the following: a valid photo identification; a copy of a current utility bill; a copy of a current bank statement; or a copy of a government check, paycheck, or any other government document that shows the current name and address of the voter. If the person is unable to produce the required information, the person shall be afforded the opportunity to cast a provisional ballot, as provided in subchapter 6A of this chapter. The elections official shall note upon the checklist a first-time voter in the municipality who has registered by mail and who produces the required information, and place a mark next to the voter's name on the checklist and allow the voter to proceed to the voting booth for the purpose of voting. (2) If the voter is not a first-time voter in the municipality, no identification shall be required, the clerk shall place a check next to the voter's name on the checklist and allow the voter to proceed to the voting booth for the purpose of voting (Last amended in 2003)	Vt. Stat. Ann. tit. 17, § 2563
Virginia	Provide ID	§ 24.2-643. Qualified voter permitted to vote; procedures at polling place; voter identification A. After the polls are open, each qualified voter at a precinct shall be permitted to vote. The officers of election shall ascertain that a person offering to vote is a qualified voter before admitting him to the voting booth and furnishing an official ballot to him. B. An officer of election shall ask the voter for his full name and current residence address and repeat, in a voice audible to party and candidate representatives present, the full name and address stated by the voter. The officer shall ask the voter to present any one of the following forms of identification: his Commonwealth of Virginia voter registration card, his social security card, his valid Virginia driver's license, or any other identification card issued by a government agency of the Commonwealth, one of its political subdivisions, or the United States; or any valid employee identification card containing a photograph of the voter and issued by an employer of the voter in the ordinary course of the employer's business. If the voter's name is found on the pollbook, if he presents one of the forms of	Va. Code. Ann.

		identification listed above, if he is qualified to vote in the election, and if no objection is made, an officer shall enter, opposite the voter's name on the pollbook, the first or next consecutive number from the voter count form provided by the State Board, or shall enter that the voter has voted if the pollbook is in electronic form; an officer shall provide the voter with the official ballot; and another officer shall admit him to the voting booth. Except as provided in subsection E of this section, if a voter is entitled to vote except that he is unable to present one of the forms of identification listed above, he shall be allowed to vote after signing a statement, subject to felony penalties for false statements pursuant to § 24.2-1016, that he is the named registered voter who he claims to be. A voter who requires assistance in voting by reason of physical disability or inability to read or write, and who requests assistance pursuant to § 24.2-649, may be assisted in preparation of this statement in accordance with that section. The provisions of § 24.2-649 regarding voters who are unable to sign shall be followed when assisting a voter in completing this statement. (Version in effect as of 2004- effective 4/12/2004)	
Washington	Sign Name	29A.44.201. A voter desiring to vote shall give his or her name to the precinct election officer who has the precinct list of registered voters. This officer shall announce the name to the precinct election officer who has the copy of the inspector's poll book for that precinct. If the right of this voter to participate in the primary or election is not challenged, the voter must be issued a ballot or permitted to enter a voting booth or to operate a voting device. For a partisan primary in a jurisdiction using the physically separate ballot format, the voter must be issued a nonpartisan ballot and each party ballot. The number of the ballot or the voter must be recorded by the precinct election officers. If the right of the voter to participate is challenged, RCW 29A.08.810 and 29A.08.820 apply to that voter. (In effect at time of last update prior to 2005: 2004 c 271 § 136, eff. June 10, 2004) 29A.44.210. Any person desiring to vote at any primary or election is required to sign his or her name on the appropriate precinct list of registered voters. If the voter registered using a mark, or can no longer sign his or her name, the election officers shall require the voter to be identified by another registered voter. The precinct election officers shall then record the voter's name. Effective date: July 1, 2004	Wash. Rev. Code § 29A.44.201 & 29A.44.210
West Virginia	Match Sig.	(a) Any person desiring to vote in an election shall, upon entering the election room, clearly state his or her name and residence to one of the poll clerks who shall thereupon announce the same in a clear and distinct tone of voice. If that person is found to be duly registered as a voter at that precinct, he or she shall be required to sign his or her name in the space marked "signature of voter" on the pollbook prescribed and provided for the precinct. If that person is physically or otherwise unable to sign his or her name, his or her mark shall be affixed by one of the poll clerks in the presence of the other and the name of the poll clerk affixing the voter's mark shall be indicated immediately under the affixation. No ballot may be given to the person until he or she so signs his or her name on the pollbook or his or her signature is so affixed thereon. * * * (c) When the voter's signature is properly on the pollbook, the two poll clerks shall sign their names in the places indicated on the back of the official ballot and deliver the ballot to the voter to be voted by him or her without leaving the	W. Va. Code § 3-1-34 (a)

		election room. If he or she returns the ballot spoiled to the clerks, they shall immediately mark the ballot "spoiled" and it shall be preserved and placed in a spoiled ballot envelope together with other spoiled ballots to be delivered to the board of canvassers and deliver to the voter another official ballot, signed by the clerks on the reverse side required by this subsection. The voter shall thereupon retire alone to the booth or compartment prepared within the election room for voting purposes and there prepare his or her ballot using a ballpoint pen of not less than five inches in length or other indelible marking device of not less than five inches in length. In voting for candidates in general and special elections, the voter shall comply with the rules and procedures prescribed in section five, article six of this chapter. (In effect at time of last update prior to 2005: Acts 2003, c. 100, eff. 90 days after March 7, 2003)	
Wisconsin	Give Name	6.79(2)(a) Except as provided in sub. (6), where there is registration, each person, before receiving a voting number, shall state his or her full name and address. Upon the prepared registration list, after the name of each elector, the officials shall enter the serial number of the vote as it is polled, beginning with number one. Each elector shall receive a slip bearing the same serial number. A separate list shall be maintained for electors who are voting under s. 6.15, 6.29 or 6.55(2) or (3) and electors who are reassigned from another polling place under s. 5.25(5)(b). Each such elector shall have his or her full name, address and serial number likewise entered and shall be given a slip bearing such number. (In effect at time of last update prior to 2005: 2003 Act 327, § 4, eff. June 12, 2004)	Wis. Stat. § 6.79
Wyoming	Give Name	(a) Unless a voter is challenged pursuant to W.S. 22-15-101 through 22- 15-109, no identification shall be required when: (i) Voting in person or by mail after having registered in person; or (ii) Voting in person or by mail after having registered by mail and having previously voted in a Wyoming federal election. (In effect at time of last update prior to 2005: Effective dates. -- Laws 2004, ch. 94, § 5, makes the act effective immediately upon completion of all acts necessary for a bill to become law as provided by art. 4, § 8, Wyo. Const. Approved March 5, 2004.)	Wyo. Stat. Ann. § 22-3-118

APPENDIX B –Court Decisions and Literature on Voter Identification and Related Issues

Court Decisions

Summary of Relevant Cases:

Challenges Prevailed:

American Civil Liberties Union of Minnesota v. Kiffmeyer, 2004

- Action for temporary restraining order – granted
- Statute: allowed use of tribal identification cards w/ name, address & photo as a valid identification to register to vote only if the voter lives on the reservation to "complete" a mail-in application (which only affected about 600 voters w/ incomplete applications)
- Claim -14th Amendment EPC: likely to prevail, no rational basis for a distinction between Indians residing on reservations and those not
- Statute: may use certain forms of photo identification lacking address together with a utility bill but not tribal identification cards
- Claim -14th Amendment EPC: likely to prevail

Greidinger v. Davis, 1993

- Statute: mandated disclosure of SS # as a precondition to voter registration (rationale was voter identification, but the numbers were rarely used to verify identity & were disclosed in voter lists to both political parties and the public upon request)
- Claims:
  - 14th Amendment EPC: no classification (applied strict scrutiny)
  - Substantive due process: law invalid; found that the statute conditioned the fundamental right to vote on the consent to an invasion of privacy; this was found to be a substantial burden (applied strict scrutiny)
    - Compelling interests: preventing voter fraud (deemed compelling)
    - Necessary: fails, preventing voter fraud when allowing names for inspection could be achieved by supplying addresses and DOBs or use of voter registration numbers
    - HOWEVER: Court also made it clear that if the registration scheme kept the SS# for internal use only – it would be valid

Challenges Rejected:

League of Women Voters v. Blackwell, 2004.

- Sec. of State Directive: provisional ballots issued if first-time voter, who registered by mail and did not provide ID, cannot produce proper ID at the polls AND that the provisional ballot will only be counted if the voter returns to the poll before it closes w/ ID or can recite SS# or DL#
- Claims – Supremacy Clause & HAVA: ruled that HAVA did not specify how the first-time voters' identifications should be verified and this method was not unreasonable or too burdensome

Colorado Common Clause v. Davidson, 2004

- Statute: required all voters to show ID (most types permitted) before voting
- Claims:
  - HAVA: ruled that HAVA did not preempt more strict state laws & allowed States to be more strict as long as consistent with the purpose of HAVA (both HAVA & CO provisions' purposes were to prevent voter fraud)
  - Substantive due process and equal protection
    - No improper discrimination

  - Preventing voter fraud is a compelling interest since it is irreversible once vote is cast
  - Only marginally more intrusive than HAVA, many types of identification permitted – thus, valid

McKay v. Thompson, 2000

- Statute: mandated disclosure of SS # as a precondition to voter registration
- Claims:
  - Privacy Act, Section 7: ruled that Tennessee voter system exempt from Privacy Act because it is pre-75
  - NVRA, permitting only min. amt. of info. necessary to prevent duplicate registration and determine eligibility: ruled that NVRA does not specifically forbid the use of SS#s & the Privacy Act specifically permits them pre-75
  - Substantive due process: ruled that internal use of SS# not a burden
  - Free Exercise, based on Bible's supposed prohibition on use of universal identifiers: ruled that law is generally applicable and thus valid
  - P&I, Article IV: does not protect in-state citizens
  - P&I, 14th Amend.: no protection for privilege where Congress authorized its infringement

Kemp v. Tucker, 1975

- Statute: required name, occupation, address, sex, race, height, hair color, eye color, and date of birth be listed on voter registration card for identification purposes
- Claims:
  - VRA: ruled that race was not made a "qualification" for voting
  - 15th Amendment: ruled that it did not abridge right to vote on account of race because rejection of application was due to failure to provide information, not race; race only one factor in identification
  - 14th Amendment EPC: ruled there was no distinction among voters

Perez v. Rhiddlehoover, 1966

- Statute: date of birth, place of birth, mother's first or maiden name, color of eyes, sex, race, occupation, and whether owner, tenant or boarder must appear on the registration for identification
- Claims:
  - VRA: ruled that it was not a "test or device" because it applied equally
  - 15th Amendment: same reasons

Cases in Which the Plaintiffs Have Prevailed in Challenging the Statute Requiring Voter Identification:

***American Civil Liberties Union of Minnesota v. Kiffmeyer*, No. 04-CV-4653, 2004 WL 2428690, at *1 (D. Minn. Oct. 28, 2004).**

This was an action just before the November 2004 election for a temporary restraining order, which was granted. The ACLU challenged a Minnesota law allowing the use of tribal identification cards with the name, address, and photograph as a valid identification (equal to a driver's license) for use in "completing" an incomplete mail-in voter registration only if the Indian lives on the reservation. 2004 WL 2428690, at *1. The Court ruled that this distinction would likely violate the Equal Protection Clause because there was no rational basis for differentiating

between the validity of the identification based on whether or not the cardholder lives on the reservation. *Id.* at *1, 3.

Secondly, the ACLU challenged a second statute which allowed the use of certain photo identification lacking the voter's address to be used together with a utility bill or bank statement as valid identification for registration. *Id.* at *3. The statute did not, however, permit using a tribal identification for this same purpose. *Id.* The Court ruled that this likely violated the equal protection clause as well. *Id.*

***Greidinger v. Davis*, 988 F.2d 1344 (4th Cir. 1993).**

This case challenged a Virginia law requiring the social security number for voter registration, which the State subsequently disclosed to the public and political parties upon request in voter registration lists, which included the social security numbers. Failure to provide the social security number resulted in the denial of the registration application. The law was challenged under the Equal Protection Clause and under substantive due process. The Court quickly rejected the equal protection challenge because the law made no classification. 988 F.2d at 1350.

The law was invalidated under substantive due process. *Id.* at 1355. The Court found that the statutory scheme conditioned the fundamental right to vote on the consent to an invasion of privacy, based on concerns of identity theft. *Id.* at 1353-54. The Court found this to be a substantial burden on the right to vote. *Id.* at 1354. The Court recognized that the government's interest in preventing voter fraud was compelling. *Id.* However, the Court found that disclosure of the information to the public and political parties was not necessary to achieve that interest. *Id.* Disclosure of addresses or dates of birth would be sufficient to aid the public in distinguishing between two voters with the same name. *Id.* at 1355. The Court did state that required disclosure of the social security number for internal use only would be valid. *Id.* at 1354 n.10.

Cases in Which the Statute or Practice of Voter Identification Has Been Upheld:

***League of Women Voters v. Blackwell*, 340 F. Supp. 2d 823 (N.D. Ohio 2004).**

The League of Women Voters challenged the Secretary of State's directive that provisional ballots should be issued to all first-time voters who registered by mail without providing identification who cannot show proper identification at the polls. 340 F. Supp. 2d at 828. The Directive also stated that the provisional ballots would only be counted if the voter orally recited his driver's license number or the last four digits of his social security number or returned to the polling place before it closed with some acceptable identification, including reciting those identification numbers. *Id.* The Court stated that HAVA only requires verification of eligibility of first time voters registering by mail; it does not say how that should be done. *Id.* at 831. The Court found the burden on the right to vote to be slight. *Id.* The Directive was found valid under HAVA and the Supremacy Clause because the number of uncounted votes would be small, the requirement was reasonable, and there was adequate notice of the requirement on the registration forms. *Id.* at 829-30.

***Colorado Common Cause v. Davidson*, No. 04CV7709, 2004 WL 2360485, at *1 (Colo. Dist. Ct. Oct. 18, 2004).**

In this case, the validity of three Colorado statutory provisions was challenged. The laws (1) required <u>all</u> in-person voters to show identification (not just first-time registrants); (2) provided that votes cast in the wrong precinct would not be counted; and (3) provided that

provisional ballots would not be counted if the voter applied for an absentee ballot. 2004 WL 2360485, at *1. The plaintiffs also challenged the provisions under HAVA. The identification provision allowed nearly all forms of acceptable identification under HAVA. *Id.* at *6.

The challenge to the identification requirement failed under both challenges. The Court interpreted HAVA as not intended to preempt state laws and as permitting states to be more strict than, but not inconsistent with, HAVA. *Id.* at *10. The Court felt that the purpose of both laws was the same, to reduce voter fraud, and thus, both laws could coexist. As to the Constitutional claim, both equal protection and substantive due process, the Court felt that preventing voter fraud, which is impossible to remedy once a vote is cast, is a compelling interest, and the Court also felt that a voter identification requirement for all voters, with many types of acceptable identification, was only marginally more intrusive than HAVA. *Id.* at 12. The Court also found no improper discrimination between voters. *Id.* Thus, the provision was upheld.

***McKay v. Thompson*, 226 F.3d 752 (6th Cir. 2000).**

The Sixth Circuit ruled that the Privacy Act, the National Voter Registration Act, Substantive Due Process, the Privileges and Immunities Clauses (Fourteenth Amendment & Article IV), and the First Amendment right to free exercise do not prohibit requiring disclosure of social security numbers as a precondition to voter registration.

The Privacy Act, Section 7, mandates that it is unlawful for a government to deny a right or privilege because of a citizen's refusal to disclose his social security number, unless the disclosure was required for a system established prior to 1975. 226 F.3d at 755 (citing Privacy Act of 1974, Pub. L. No. 93-579 (1974)). Since Tennessee required social security numbers for voter registration since 1972, his challenge was rejected. 226 F.3d at 755. Second, the NVRA only permits requiring the minimum amount of information necessary to prevent duplicate voter registration and to determine eligibility. *Id.* at 755-56 (citing 42 U.S.C. §1973gg-3(c)(2)(B)). The Court rejected this challenge because the NVRA does not specifically forbid the use of social security numbers, and the Privacy Act, a more specific statute, grandfathered their use if prior to 1975. 226 F.3d at 756.

Finally, the plaintiff's constitutional claims were all rejected. His substantive due process claim was rejected because internal receipt and use of social security numbers does not burden the fundamental right to vote. *Id.* The free exercise challenge, based on the Bible's supposed prohibition of universal identifiers, was rejected because the law was generally applicable and not directed at particular religious practices. *Id.* The Privileges and Immunities Clause claim was rejected because the Clause does not apply to citizens of the state. *Id.* The Fourteenth Amendment Privileges and Immunities claim, based on the right to vote as unique to U.S. citizenship, was rejected because the Clause provides no protection where Congress has authorized the infringement. *Id.*

***Kemp v. Tucker*, 396 F. Supp. 737 (M.D. Pa. 1975), *aff'd*, 423 U.S. 803.**

A statute was upheld, which required name, occupation, address, sex, race, height, hair color, eye color, and date of birth to be recorded on the voter registration card and allowed registration officials to reject an incomplete application. 396 F. Supp. at 738. Claims were alleged under the Fourteenth Amendment's Equal Protection Clause, the Fifteenth Amendment, and the Voting Rights Act.

As to the Fourteenth and Fifteenth Amendment claims, the Court reasoned that preventing voter fraud is a compelling goal, and identification provisions are "an essential means of achieving the goal." *Id.* at 739. The Court also rejected the equal protection claim because the statutes did not create a distinction at all. *Id.* at 740 n.3. Since race is just one of

several characteristics required, the Court found that it was intended for preventing voter fraud, not some other motive. *Id.* at 740. As to the VRA, the Court rejected the claim that it added race as a qualification for voting as frivolous. *Id.* As to a Fifteenth Amendment claim that it abridged the right to vote on account of race, the Court also made a distinction between rejecting a voter application because of race and rejecting an application because of failure to answer all relevant questions to assist in preventing voter fraud. *Id.* The statute was upheld.

***Perez v. Rhiddlehoover,* 186 So. 2d 686 (La. Ct. App. 1966).**

A voter registration requirement was challenged and upheld. The statute stated that date of birth, place of birth, mother's first or maiden name, color of eyes, sex, race, occupation, and whether owner, tenant or boarder must appear on the registration. 186 So.2d at 690. This information was required for identification of voters, especially when voters had the same name, to prevent duplicate voting. It was challenged under the Voting Rights Act of 1965 Section 4(a) which prohibits denying the right to vote for failure to comply with a "test or device." The Court felt that this requirement was not a test or device for discrimination because it applied equally. *Id.* at 691. The Court also determined that it was not in conflict with the Fifteenth Amendment either. *Id.*

***Friendly House, et al. v. Janet Napolitano et al.,* CV 04-649 TUC DCB**

On November 30, 2004, the Mexican American Legal Defense and Educational Fund (MALDEF) filed suit seeking to halt the implementation of Proposition 200. . Proposition 200 created a number of legal requirements to ensure that public benefits are not available to illegal immigrants. In particular, Proposition 200 requires that a person attempting to register to vote provide one of six specific forms of proof of United States citizenship. Compl. 12-13. Also, any person attempting to vote must present either one form of photo identification or two forms of non-photo identification. *Id.* at 13.

The lawsuit alleges two violations that directly relate to the voting identification restrictions. First, the lawsuit alleges a violation of the Twenty-Fourth and Fourteenth amendments in that a voter must pay a poll tax by spending money to purchase the required identification. *Id.* at 20. Second, the lawsuit alleges violation of the Voting Rights Act. *Id.* at 21. The lawsuit was recently dismissed by the 9th Circuit Court of Appeals for a lack of standing. The Circuit Court found that there was no injury-in-fact, meaning that once an injury occurs the suit will likely be refiled. Additionally, it should be noted that the voter identification issue is only a part of the lawsuit, and much of the focus has been on other aspects of Proposition 200.

Current Litigation Concerning Voter ID Issues[27]

Litigation is filled with uncertainty. Litigation stemming from newly passed voter identification requirements will continue into the foreseeable future. Lawsuits are currently pending over voter identification requirements in Georgia and Indiana. Other states, such as Ohio, are considering new identification requirements that could lead to further litigation. The Georgia lawsuit has already succeeded in getting a preliminary injunction against the law in question, which will likely galvanize interested parties in other states to pursue similar litigation. Of course, if the injunction is eventually overturned at the appellate level it could have a similar chilling affect on future litigation.

This summary major litigation pending in Georgia and Indiana includes a brief assessment of the likelihood of success:

---

[27] As of January 2, 2006

Georgia (*Common Cause/Georgia v. Billups*):

On September 19, 2005, Common Cause of Georgia, in conjunction with several other non-profit organizations, filed suit in Federal District Court against the Georgia Secretary of State and other election officials, challenging the constitutionality of Georgia's new voter identification requirements. The new law requires all voters attempting to cast a ballot in person to present a valid form of photographic identification. O.C.G.A. § 21-2-417. A voter that is unable to provide proper identification is given a provisional ballot. However, that provisional ballot will be counted only if the voter is able to subsequently present valid identification within two days of the election. *Id.*

The lawsuit alleges five separate violations of state and federal law. First, the complaint alleges that the identification requirements infringe on the right to vote guaranteed in the Georgia constitution (Compl. 32)[28]. In addition, the Plaintiffs claim violations of the Federal Civil Rights Act and Voting Rights Act. (Compl. 36,38). Finally, the lawsuit alleges violations of the Fourteenth and Twenty-Fourth amendments to the U.S. Constitution. The complaint claims that the ID requirements constitute an "undue burden" on the right to vote, in violation of the Equal Protection Clause of the Fourteenth Amendment (Compl. 34). The ID requirement does not apply to most absentee voters, and thus the requirement is also over-broad and not narrowly tailored to address the stated purpose of preventing voter fraud (Compl. 34). The complaint further alleges that the cost of obtaining a photo ID constitutes a poll tax, in violation of the Twenty-Fourth Amendment, and that the cost is also a violation of the Fourteenth Amendment because it applies to voters who choose to vote in person, and not to those who vote absentee (Compl. 34,35).

On October 18, 2005, the District Court granted the Plaintiff's motion for a preliminary injunction, enjoining the application of the new identification requirements. In granting the injunction, the court held that both federal constitutional claims had a substantial likelihood of succeeding on the merits at trial (Prelim. Inj. 96, 104). The court also held that, while the two federal statutory claims were plausible, they both lacked sufficient evidence at the time to have a substantial likelihood of success. (Prelim. Inj. 109,111,116). Finally, the court held that the Georgia constitutional claim would be barred by the Eleventh Amendment to the U.S. Constitution. (Prelim. Inj. 77).

The Defendants appealed the motion for preliminary injunction to the Eleventh Circuit, and oral argument is scheduled for March 1, 2006. In addition, some news reports have claimed that the Georgia legislature is considering re-visiting the ID requirements in light of the on-going litigation.[29] As for the merits, in granting the preliminary injunction the District Court has already signaled its belief that the federal constitutional claims are likely meritorious. The Eleventh Circuit may have a different view, but for now the case looks to have a reasonable chance of success.

Indiana (*Indiana Democratic Party v. Rokita* and *Crawford v. Marion County Election Board*):

The Indiana lawsuit is similar to its Georgia counterpart in content, though not in status. In Indiana separate lawsuits, now joined, were filed by the state Democratic Party and the

---

[28] Litigation documents are available at the Election Law @ Moritz website. http://moritzlaw.osu.edu/electionlaw/litigation/index.php

[29] GA Legislature May Revisit Voter ID Law, State Net Capitol Journal, Dec. 19, 2005.

Indiana Civil Liberties Union (ICLU). The Democratic Party's lawsuit is directed against the Indiana Secretary of State, while the ICLU's lawsuit involves the Marion County Board of Elections and the State of Indiana. Like Georgia, Indiana law also requires citizens voting in person to present some form of official photo identification. IC § 3-11-8-25.1. Voters unable to present identification are given a provisional ballot, which is counted if they are able to provide the required identification by Noon on the second Monday following the election. IC § 3-11.7-5-1. Unlike Georgia, Indiana provides state issued identification at no charge. However, there are costs involved in the process, including transportation to the Bureau of Motor Vehicles, and payment for documents such as birth certificates, which are needed to obtain the ID. (Second Am. Compl. 6).

The Democratic Party's complaint raises Fourteenth Amendment claims similar to those in the Georgia lawsuit, including concerns about substantially burdening the right to vote, the enactment of a de-facto poll tax from the costs indirectly associated with obtaining ID, and the lack of applicability to voters who cast an absentee ballot. (Second Am. Compl. 6-9). In addition, the complaint alleges that the substantial burden placed on the right to vote violates the First Amendment protection of expressive or symbolic speech, as well as the freedom of association as applied to Democratic primary elections. (Second Am. Compl. 9-10). Finally, the complaint alleges violations of the Voting Rights Act, National Voter Registration Act, and the Help America Vote Act (Second Am. Compl. 10-11). The ICLU's complaint alleges many of the same violations, but also includes claims of a violation of Indiana's constitutional guarantee of a free and equal election system. (Compl. 15)

The case is currently in the pre-trial phase, with both sides awaiting decisions on their respective motions for summary judgment.[30] The likelihood of success is bolstered by the fact that the Fourteenth amendment constitutional claims have already been found persuasive by at least one other Federal District Court. However, the Indiana law is notably different than its Georgia counterpart in that it provides free identification. While the plaintiffs make a solid argument that related costs still amount to a poll-tax, it is possible that the court could distinguish on this matter.

Unlike the Georgia case, the Indiana lawsuit also claims a violation of the Help America Vote Act. Although the claim is not completely clear, it seems as though the Plaintiffs are arguing that the Indiana statute requires more stringent identification than what is required by HAVA. 42 U.S.C. § 15483(b)(1)-(2). While this is true, it is unclear how this violates the statute. HAVA merely states that certain voters unable to produce HAVA required identification be given a provisional ballot. *Id.* Indiana law meets this requirement. IC § 3-11-8-25.1. Although Indiana law requires more stringent identification for counting the provisional ballot, HAVA leaves theses decisions to state law. 42 U.S.C. § 15482(a).

---

[30] According to an AP article, the Plaintiffs filed some type of brief on December 21—however it is not yet up on the Moritz website and I am unsure how to access it otherwise.

Subject Revised Voter ID Analysis

Karen,

Attached is Tim Vercellotti's Voter ID analysis revised to use Citizen Voting Age population as the base for turnout calculations and to take account of comments or issues raised by the EAC and our Peer Review Group. This draft is for distribution to the reviewers who will meet by teleconference on May 11, at, we understand, 11:30 a.m.

You are receiving this at the same time that it is being distributed to the Eagleton-Moritz team so that the new reviewers will have a week to prepare for our conversation on the 11th. Early next week you will receive a revised summary paper on Voter ID that incorporates the new data and findings in Tim's revised analysis. That too will be for distribution to the new reviewers.

Tom O'Neill

Analysis of Effects of Voter Identification Requirements on Turnout

Tim Vercellotti
Eagleton Institute of Politics
Rutgers University

May 4, 2006

Introduction

A key area of disagreement in the policy debate over voter identification requirements concerns whether such requirements dampen voter turnout. Opponents of voter identification laws argue that they constitute an institutional barrier to voting, particularly among the poor, African-Americans, Hispanics, the elderly and people with disabilities (Baxter and Galloway 2005, Electionline.org 2002, Jacobs 2005, Young 2006). This argument holds that voter identification requirements create an extra demand on voters, and thus may discourage some of them from participating in elections. Further, critics of voter identification requirements contend that the effect is greater for some specific types of requirements. For example, critics argue that requiring voters to produce government-issued photo identification on Election Day is more demanding than, say, requiring that they state their names at the polling place. Supporters of voter identification requirements, on the other hand, argue that the requirements are necessary to combat voter fraud, safeguard the integrity of the electoral process, and engender faith in the electoral process among citizens (Young 2006).

This report examines the potential variation in turnout rates based on the type of voter identification requirement in place in each state on Election Day 2004. It draws on two sets of data – aggregate turnout data at the county level for each state, as compiled by the Eagleton Institute of Politics, and individual-level survey data included in the November 2004 Current Population Survey conducted by the U.S. Census Bureau. Classification of voter identification requirements comes from a review of state statutes conducted by the Moritz College of Law at the Ohio State University.

Types of voter identification requirements

Based on research performed for this study by the Moritz College of Law, states had one of five types of requirements in place on Election Day 2004. Upon arrival at polling places, voters had to: state their names (nine states); sign their names (13 states and the District of Columbia); match their signature to a signature on file with the local election board (eight states); provide a form of identification that did not necessarily include a photo (15 states); or provide a photo identification (five states).[1] It was then possible to code the states according to these requirements, and test the assumption that voter identification requirements would pose an increasingly demanding requirement in this order: stating one's name, signing one's name, matching one's signature to a signature on file, providing a form of identification, and providing a form of photo identification.

---

[1] Oregon conducts elections entirely by mail. Voters sign their mail-in ballots, and election officials match the signatures to signatures on file. For the purposes of this analysis, Oregon is classified as a state that requires a signature match.

But election laws in numerous states offer exceptions to these requirements if individuals lack the necessary form of identification, and laws in those states set a minimum standard that a voter must meet in order to vote using a regular ballot (as opposed to a provisional ballot). Thus it is also possible to categorize states based on the minimum requirement for voting with a regular ballot. In 2004 the categories were somewhat different compared to the maximum requirement, in that none of the states required photo identification as a minimum standard for voting with a regular ballot. Four states, however, required voters to swear an affidavit as to their identity (Florida, Indiana, Louisiana, and North Dakota The five categories for minimum requirements were: state name (12 states), sign name (14 states and the District of Columbia), match one's signature to a signature on file (six states), provide a non-photo identification (14 states), or swear an affidavit (four states). For the purposes of this analysis I treated the array of minimum identification requirements also in terms of increasing demand on the voter: state name, sign name, match signature, provide non-photo identification, and, given the potential legal consequences for providing false information, swearing an affidavit.

Estimating turnout among citizens in the voting-age population

This report examines turnout among U.S. citizens of voting age in both the aggregate- and the individual-level data. Determining citizenship status in the individual-level data simply involved restricting the analyses to individuals who identified themselves as citizens in the November 2004 Current Population Survey. (Those who said they were not citizens did not have the opportunity to answer the supplemental voting questions contained in the Current Population Survey.)

In the aggregate data, determining the percentage of the voting-age population that has U.S. citizenship posed a methodological challenge. The Census Bureau gathers information on the citizenship status of adults ages 18 and older only during the decennial census. While the Census Bureau provides annual estimates of the population to account for changes between decennial censuses, the bureau does not offer estimates for the proportion of the adult population who are citizens as part of the annual estimates. To address this issue I estimated the 2004 citizen voting-age population for each county using a method reported in the analysis of the 2004 Election Day Survey conducted for the U.S. Election Assistance Commission (U.S. Election Assistance Commission, 2005). I calculated the percentage of the 2000 voting-age population who were citizens in 2000, and applied that percentage to the July 1, 2004 estimates for voting-age population in each county. In other words, I assumed that the percentage of the voting-age population that had U.S. citizenship in 2004 was similar to the percentage of the voting-age population who were citizens in 2000.[2]

---

[2] McDonald and Popkin (2001) recommend an even more stringent approach to voter turnout calculations. They point out that voting-age population estimates include adults who are ineligible to vote (such as convicted felons), and the estimates overlook eligible citizens living overseas. While estimates of the voting-eligible population are available at the state level, I was unable to find such estimates for individual counties, which provide the unit of analysis for the aggregate data analyzed here.

Analysis of aggregate data

If one treats maximum voter identification requirements as an ordinal variable, with photo identification as the most demanding requirement, one finds some statistical support for the premise that as the level of required proof increases, turnout declines. Averaging across counties in each state, statewide turnout is negatively correlated with maximum voter identification requirements ($r = -.30$, $p < .0001$). In considering the array of minimum requirements, with affidavit as the most demanding requirement, voter identification also is negatively correlated with turnout ($r = -.20$, $p < .0001$). Breaking down the turnout rates by type of requirement reveals in greater detail the relationship between voter identification requirements and voter turnout.

[Table 1 here]

The aggregate data show that 60.9 percent of the estimated citizen voting age population voted in 2004. Differences in voter turnout at the state level in 2004 varied based on voter identification requirements. Taking into account the maximum requirements, an average of 64.6 percent of the voting age population turned out in states that required voters to state their names, compared to 58.1 percent in states that required photo identification. A similar trend emerged when considering minimum requirements. Sixty-three percent of the voting age population turned out in states requiring voters to state their names, compared to 60.1 percent in states that required an affidavit from voters.

Voter identification requirements alone, however, do not determine voter turnout. Multivariate models that take into account other predictors of turnout can paint a more complete picture of the relationship between voter identification requirements and turnout. I estimated the effects of voter identification requirements in multivariate models that also took into account the electoral context in 2004 and demographic characteristics of the population in each county. I coded the voter identification requirements on a scale of one to five, with one representing the least demanding form of identification and five representing the most demanding form of identification. To capture electoral context I included whether the county was in a presidential battleground state (any state in which the margin of victory for the winning candidate was five percent or less), and whether the county was in a state with a competitive race for governor and/or the U.S. Senate (also using the threshold of a margin of victory of five percent or less). Drawing from U.S. Census projections for 2003, I included the percentage of the voting-age population in each county that was Hispanic or African-American to control for ethnicity and race. I controlled for age using the 2003 Census projection for the percentage of county residents age 65 and older, and I controlled for socioeconomic status by including the percentage of individuals who fell below the poverty line in each county in the 2000 Census.

I estimated a series of random intercept models to account for the likelihood that data from counties were correlated within each state (for further explanation of random intercept and other multilevel models, see Bryk and Raudenbush 1992, Luke 2004, Singer 1998).[3] The

---

[3] The data analyses provided evidence that there was, indeed, a clustering of data within each state. The intraclass correlation, bounded by 0 and 1, measures the variation between the states. A random intercept model using only the

dependent variable in each model was voter turnout at the county level, with turnout calculated as the percentage of the estimated citizen voting-age population that voted in the 2004 election.

[Table 2 here]

Turning first to an analysis using the maximum identification requirements, those requirements had a small and negative effect on turnout in 2004 controlling for electoral context and demographic factors. Both contextual factors (whether the county was in a state that was a battleground state and whether that state had a competitive race for governor and/or U.S. Senate) increased voter turnout. As the percentage of senior citizens in the county increased, so did turnout. The percentage of African-Americans in the county exerted a positive effect on voter turnout, and the percentage of individuals living below the poverty line had a negative effect. The effect of the percentage of Hispanic adults in the county on turnout fell just short of statistical significance (p = .05).

I then sought to test the hypothesis that voter identification requirements dampen turnout among minorities and the poor, a claim voiced by some critics of the requirements. To test this idea I incorporated a series of interactions between the maximum voter identification requirements and the percentage of African-Americans, Hispanics, and poor individuals in the counties. The interaction involving African-Americans was not significant, but those involving Hispanics and poor individuals were significant.[4] In addition, adding the interactions to the model resulted in the percentage of Hispanics in the population having a direct and negative effect on turnout. The interactions suggest that voter identification requirements have a greater effect for Hispanics and those living below the poverty line. A chi-square test of the difference in the deviance for each model (represented by -2 log likelihood in Table 2), shows that the model with interactions provides a better fit to the data (p < 0.005).

I also estimated the effects of the minimum voter identification requirements holding constant the effects of electoral context and the demographic variables.

[Table 3 here]

The effects of the minimum requirements fell short of statistical significance (p = 0.08). The battleground state variable continued to exert a positive influence on turnout, while the presence of a competitive race for governor and/or U.S. Senate had no statistically significant effect. As in the maximum identification requirement model, as the percentage of the population that is poor increased, turnout declined. As the percentage of elderly increased, so did turnout. The proportion of African-Americans in the population had a positive effect on turnout, while the percentage of Hispanics did not affect turnout.

---

intercept as a predictor generated an intraclass correlation of .43, indicating considerable variation between the states.

[4] The interactions are labeled in Tables 2 and 3 as VID*African-American, VID*Hispanic, and VID*Poverty. To calculate the effects of voter identification requirements for a specific group, one must add the estimates for voter identification, the group, and the interaction. Doing so for Hispanic adults results in an estimate of -0.13 [-0.03 (voter id) - 0.13 (Hispanic) + 0.03 (voter id X Hispanic)].

Adding interactive effects to the model resulted in a statistically significant and negative effect of minimum voter identification requirements on turnout. The percentage of Hispanic adults in the county had a significant and negative effect on turnout, and the percentage of individuals below the poverty line continued to have a negative effect. Interactions between the percentages of Hispanics and those below the poverty line and minimum voter identification requirements also were significant. The percentage of African-Americans in the county and the interaction between African-Americans and voter identification requirements were not significant. A chi-square test for the difference in fit between the two models showed that the model with interactions provides a better fit to the data ($p < .025$).

Analysis of the aggregate data at the county level generates some support for the hypothesis that as the demands of voter identification requirements increase, turnout declines. This is particularly so for counties with concentrations of Hispanic residents or individuals who live below the poverty line. But aggregate data cannot fully capture the individual demographic factors that may figure into the decision to turn out to vote. For example, previous research has found that education is a powerful determinant of turnout (Wolfinger and Rosenstone 1980, but see also Nagler 1991).[5] Married individuals also are more likely to vote than those who are not married (Alvarez and Ansolabehere 2002; Alvarez, Nagler and Wilson 2004; Fisher, Kenny, and Morton 1993). To fully explore the effects of voter identification requirements on turnout, it is important to examine individual-level data as well.

Individual-level analysis

Individual-level turnout data exists in the November 2004 Current Population Survey conducted by the U.S. Census Bureau. The Census Bureau conducts the CPS monthly to measure unemployment and other workforce data, but the bureau adds a battery of voter participation questions to the November survey in even-numbered years to coincide with either a presidential or midterm Congressional election.

One of the advantages of the CPS is the sheer size of the sample. The survey's Voting and Registration Supplement consisted of interviews, either by telephone or in person, with 96,452 respondents.[6] The large sample size permits analyses of smaller groups, such as Black or Hispanic voters or voters with less than a high school education. The analyses reported here are based on reports from self-described registered voters. I omitted those who said they were not registered to vote. I also excluded those who said they cast absentee ballots because the identification requirements for absentee ballots may differ from those required when one votes in person. In addition, I eliminated from the sample respondents who said they were not U.S.

---

[5] A reviewer for an earlier version of this paper recommended adding an education variable to the aggregate model. One version of the aggregate model not reported here included the percentage of adults in the county who had at least a college degree. The measure was highly collinear with the percentage of residents living below the poverty line, necessitating removal of the college degree variable from the model.

[6] It is important to note that the Census Bureau allows respondents to answer on behalf of themselves and others in the household during the interview. While proxy reporting of voter turnout raises the possibility of inaccurate reports concerning whether another member of the household voted, follow-up interviews with those for whom a proxy report had been given in the November 1984 CPS showed 99 percent agreement between the proxy report and the information given by the follow-up respondent (U.S. Census Bureau 1990).

citizens because the questionnaire design skipped those individuals past the voter registration and turnout questions in the survey.

The dependent variable in these analyses is whether a respondent said he or she voted in the November 2004 election.[7] As in the analysis of aggregate data, I coded voter identification requirements for each respondent's state of residence on a scale of one to five, with one representing the least demanding requirement (stating one's name) and five representing the most demanding requirement (photo identification or affidavit).

In addition to the voter identification requirements, the models include two other state-level factors that might have influenced turnout in 2004: whether the state was considered a battleground state in the presidential election, and whether there was a gubernatorial and/or U.S. Senate race in the state (see Alvarez and Ansolabehere 2002, Alvarez et al. 2004, and Kenny et al. 1993 for similar approaches). As in the aggregate data analysis, the threshold that determined whether the state was a battleground state or had a competitive statewide race was a margin of victory of five percent or less. At the individual level, I controlled for gender, age in years, education, household income, and dummy variables representing whether a voter was Black/non-Hispanic, Hispanic, or another non-white race (with white/non-Hispanic voters as the omitted category for reference purposes).[8] Drawing on previous research on voting behavior, I also controlled for whether an individual was employed, or at least a member of the workforce (as opposed to being a full-time student, a homemaker, or retired). Both employment and workforce membership have been shown to be positive predictors of turnout (see Mitchell and Wlezien 1995). Marital status, whether one is a native-born citizen and residential mobility also have emerged as significant predictors of turnout (Alvarez and Ansolabehere 2002, Alvarez et al. 2004, Kenney et al. 1993, Wolfinger and Rosenstone 1980). I included in the model variables for whether a respondent was married (coded 1 if yes, 0 otherwise), and whether one was a native-born citizen (coded 1 if yes, 0 otherwise). I measured residential mobility by coding for whether the respondent had moved to a new address in the six months prior to the interview (coded 1 if yes, 0 otherwise).

Results

The dependent variable is whether a respondent said he or she voted in the November 2004 election (coded 1 for yes, 0 for no). I estimated models using probit analysis, which

---

[7] The U.S. Census Bureau reported, based on the November 2004 CPS, that 89 percent of those who identified themselves as registered voters said they voted in 2004 (U.S. Census Bureau 2005). Previous research has shown that, generally speaking, some survey respondents overstate their incidence of voting. Researchers speculate that over-reports may be due to the social desirability that accompanies saying one has done his or her civic duty, or a reluctance to appear outside the mainstream of American political culture (U.S. Census Bureau 1990). It is also possible that voting is an indication of civic engagement that predisposes voters to agree to complete surveys at a higher rate than non-voters (Flanigan and Zingale 2002). Hence the voter turnout rates reported in the CPS tend to be up to 10 percentage points higher than the actual turnout rate for the nation (Flanigan and Zingale 2002). Even with this caveat, however, the CPS serves as a widely accepted source of data on voting behavior.

[8] Asian-Americans are included in the "other non-white races" category. In response to a request from officials at the U.S. Election Assistance Commission who had read an earlier version of this paper and were curious about the experiences of Asian-Americans, I ran models using Asian-Americans as a separate category in addition to the models presented here. Voter identification requirements did not have a statistically significant effect on whether Asian-American voters said they turned out in the 2004 election.

calculates the effects of independent variables on the probability that an event occurred – in this case whether a respondent said he or she voted. I estimated the models using robust standard errors to control for correlated error terms for observations from within the same state.

[Table 4 here]

The two models in Table 4 use either the maximum or minimum voter identification requirements in each state. The two models generate virtually identical results. Voter identification requirements exert a statistically significant, negative effect on whether survey respondents said they had voted in 2004. Of the other state factors, only the competitiveness of the presidential race had a significant effect on turnout. In terms of demographic influences, African-American voters were more likely than white voters to say they had cast a ballot, while those of other non-white races were less likely than white voters to say they had turned out. Hispanic voters were not statistically different from white voters in terms of reported turnout. Consistent with previous research, age, education, income, and marital status all were positive predictors of voting. Women also were more likely to say they voted than men. Those who had moved within six months before the interview were less likely to say they had voted.

While the probit models provide statistical support for the influence of voter identification requirements and other variables on turnout, probit coefficients do not lend themselves to intuitive interpretation. Another common approach in studies of election requirements is to examine how the predicted probability of voter turnout would vary as election requirements vary. I used the probit coefficients to calculate the predicted probability of voting at each level of voter identification requirements while holding all other independent variables in the models at their means.[9] I calculated the probabilities taking into account both maximum and minimum requirements, with photo identification serving as the most demanding of the maximum requirements and affidavits as the most demanding minimum requirement.

[Table 5 here]

Allowing the voter identification requirement to vary while holding constant all other variables in the model showed that the predicted probability of turnout ranged from 0.912 for stating one's name to 0.887 for photo identification under the maximum requirements. In other words, the probability of voting dropped with each level of voter identification requirement, with a total drop of .025, or 2.5 percent, across the five types of identification.[10] When taking into account the minimum requirement for identification, the probability showed a similar decline, with a slightly larger total drop of 3.3 percent.

Among the key variables of interest in the debate over voter identification requirements are race, age, income, and education. Given the large sample size (54,973 registered voters), it

---

[9] In the case of dichotomous independent variables, holding them at their mean amounted to holding them at the percentage of the sample that was coded 1 for the variable (Long 1997).

[10] The voter turnout percentages may seem disproportionately high compared to the turnout rates reported in the aggregate data analysis. It is important to consider that the turnout rates in the aggregate data were a proportion of all citizens of voting-age population, while the turnout rates for the individual-level data are the proportion of only registered voters who said they voted.

was possible to break the sample into sub-samples along those demographic lines to explore variation in predicted probability by group. I disaggregated the sample by the variable of interest, omitting that variable while I re-ran the probit model with the remaining predictors of voter turnout, including the voter identification requirements.[11] If the analysis showed that the voter identification requirements had a statistically significant effect on turnout, I used the probit coefficients from the model to calculate the predicted probability of voting for each group across the five requirements while holding the other variables in the model constant.

[Table 6 here]

Both the maximum and minimum identification requirements had negative and statistically significant effects for White/Non-Hispanic voters. Allowing the requirements to vary from stating one's name to providing photo identification or an affidavit showed drops of 2.5 percent and 3.2 percent respectively in the predicted probability of voting. The identification requirements had no effect on the probability of Black/Non-Hispanics voting, but the minimum identification requirements had a comparatively sizable effect on voter turnout among Hispanics. The predicted probability of Hispanics voting ranged from 87 percent if stating one's name was the required form of identification to 77.3 percent if a voter would have to provide an affidavit in order to vote, a difference of 9.7 percent.

The effects of voter identification requirements also varied by age, with the greatest variation occurring among voters ages 18 to 24.

[Table 7 here]

Voters in that age group had a predicted probability of 83.9 percent when the maximum requirement was stating one's name, and the probability dropped 8.9 percentage points if voters would have to provide photo identification. The range was from 83.1 percent to 75.4 percent under the minimum requirements. The gap in probability narrowed in older age groups (4.8 percent for the maximum requirements and 5.8 percent for the minimum requirements for those ages 25 to 44; 1.8 percent for the minimum requirements for those ages 45 to 64, and 2.4 percent for the minimum requirements for those ages 65 and older).

Breaking down the 18- to 24-year-old age group by race shed additional light on the effects of voter identification requirements on specific groups.

[Table 8 here]

The gap in predicted probability that White/Non-Hispanic voters in the 18- to 24-year-old category would turn out was 9.2 percent when the identification requirements varied from stating one's name to providing photo identification. The gap was 7.8 percent when taking into account the minimum requirements. The effects of maximum voter identification requirements also were statistically significant for African-Americans in the 18- to 24-year-old age group, with a gap in

---

[11] See Nagler 1991 for a similar approach in analyzing the effects of registration closing dates broken down by education levels.

the predicted probability of voting of 10.6 percent. Maximum and minimum voter identification requirements were not a significant predictor of voting among Hispanics ages 18 to 24.

Variation also emerged along the lines of income, with the effects of voter identification requirements varying to a greater extent for voters in households below the poverty line compared to those living above the poverty line.[12]

[Table 9 here]

While the maximum set of requirements did not have a statistically significant effect for voters living below the poverty line, the minimum set of requirements had a significant and negative effect. The probability of voting was .784 for poor voters if they would have to identify themselves by giving their name, and the probability declined to .731 if they would have to provide an affidavit attesting to their identity. Both the maximum and minimum sets of requirements had a significant and negative effect on voters living above the poverty line, but the difference in probability across the effects was narrower (2.3 percent for the maximum requirements and 3.1 percent for the minimum requirements). Given that political discourse about voter identification requirements includes concerns about the effects of the requirements on poor and minority voters, I also ran probit analyses for sub-samples of white and minority voters who fell below the poverty line. The voter identification requirements did not exert statistically significant effects on turnout among poor White/Non-Hispanic and Hispanic voters, but did have a significant effect on Black/Non-Hispanic voters who were below the poverty line.[13] Allowing the maximum voting requirement to vary from the least to the most demanding, the probability that African-American voters below the poverty line said they had voted dropped by 7.5 percent.

The effects of voter identification requirements varied across education levels as well, with those lowest in education demonstrating the widest variation in probabilities as identification requirements ranged from least to most demanding.

[Table 10 here]

Registered voters who had less than a high school education had a 77.5 percent probability of voting if the maximum requirement would be stating one's name, and a 70.8 percent probability if they would have to provide photo identification under the maximum requirement, a difference of 6.7 percent. The difference from the lowest to the highest requirement among the minimum requirements was 7.4 percent. The difference in probabilities ranged from 3.3 percent for the maximum requirements to 4.5 percent for the minimum requirements for voters with a high school diploma. The range of effects of voter identification requirements was smaller among those with higher levels of education (and non-existent for one category – voters with some college education).

---

[12] I coded respondents as being above or below the U.S. Census Bureau's 2004 poverty line based on respondents' reported annual household income and size of the household.

[13] The lack of significant effects for poor Hispanic voters is in contrast to the results from the aggregate data analysis. The sub-sample of poor Hispanic voters was small (n = 491), which may have contributed to the lack of statistical significance.

Discussion and conclusion

The results presented here provide evidence that as the level of demand associated with voter identification requirements increases, voter turnout declines. This point emerged from both the aggregate data and the individual-level data, although not always for both the maximum and minimum sets of requirements. The overall effect for all registered voters was fairly small, but still statistically significant.

The effects of voter identification requirements were more pronounced for specific subgroups. Hispanic voters and the poor appeared to be less likely to vote as the level of required identification became more demanding, according to both the aggregate and the individual-level data. In the individual-level data, for Hispanic voters, the probability of voting dropped by 9.7 percent across the various levels of minimum identification requirements. Survey respondents living in poor households were 5.3 percent less likely to vote as the requirements varied from stating one's name to attesting to one's identity in an affidavit. African-American voters from households below the poverty line were 7.5 percent less likely to vote as the maximum requirements varied from stating one's name to providing photo identification.

Effects of voter requirements also varied with education. Registered voters who had not graduated from high school were 6.7 percent less likely to say they voted as the maximum requirements ranged from stating one's name to providing photo identification. When considering the minimum requirements, those with less than a high school education were 7.4 percent less likely to say they voted if the requirement was an affidavit as opposed to stating one's name. Age was also a key factor, with voters ages 18 to 24 being 7.7 percent to 8.9 percent less likely to vote as the requirements ranged from stating one's name to providing a photo identification or affidavit. Breaking down the age group by race, the effects were significant for young White/Non-Hispanic and Black/Non-Hispanic voters.

The results shed additional light on the effects of voter identification requirements on two groups often projected as being particularly sensitive to such requirements: African-American voters and elderly voters. The effects on African-American voters were pronounced for two specific sub-samples: African-American voters living below the poverty line and those in the 18- to 24-year-old age group. Also, the elderly, while they would be slightly less likely to vote as requirements ranged from least to most demanding, would not necessarily be affected in the dramatic manner predicted by some opposed to photo identification requirements in particular.

In examining the effects of voter identification requirements on turnout, there is still much to learn. The data examined in this project could not capture the dynamics of how identification requirements might lower turnout. If these requirements dampen turnout, is it because individuals are aware of the requirements and stay away from the polls because they cannot or do not want to meet the requirements?[14] Or, do the requirements result in some voters

---

[14] The individual-level data offer some insight here. If advance knowledge of the voter identification requirements were to dampen turnout, it is reasonable to expect that advance knowledge of those requirements also could discourage some individuals from registering to vote. I ran the same probit models using voter registration as the dependent variable (coded 1 if the respondent said he or she was registered, and 0 if the respondent was not

being turned away when they cannot meet the requirements on Election Day? The CPS data do not include measures that can answer this question. Knowing more about the "on the ground" experiences of voters concerning identification requirements could guide policy-makers at the state and local level in determining whether and at what point in the electoral cycle a concerted public information campaign might be most effective in helping voters to meet identification requirements. Such knowledge also could help in designing training for election judges to handle questions about, and potential disputes over, voter identification requirements.

---

registered). Neither the maximum nor minimum array of voter identification requirements had a statistically significant effect on the probability that a survey respondent was registered to vote.

Subject RE: Schedule for completion of Prov. Voting and Voter ID research

Thanks, Karen.

Just to be sure that our expectations are clear, I'll summarize the perspective behind the schedule we submitted for the recent extension.

A. Provisional Voting

1. We presented our Provisional Voting report to the commissioners several months ago, revised its organization and clarified findings and recommendations in line with the comments of staff and commissioners, and we researched Tom Wilkey's additional question of the effect of the time for review on the evaluation of provisional ballots, which will be included in the final revision.
2. The final draft will be completed by May 5 .
3. Based on discussions with you and the commissioners we look forward to presenting that revised, final report to the Advisory Board on May 24, following whatever additional review the Commission finds appropriate.
4. Our discussions with Commissioners and staff anticipated that we would make some presentation of the provisional voting work at the Commission's public meeting in June, a presentation that might include revisions occasioned by the comments of the Advisory Board.

B. Voter ID

1. We presented our Voter ID research to the Commissioners in April and are now revising it in line with their comments.
2. That revised research paper will be discussed in mid May by reviewers selected by the Commission. That date was set specifically to allow us to prepare a final report that would be ready for review by the Advisory Board on May 24.
3. We anticipate that the Commission will want the comments of its Advisory Board on the

Voter ID report before it receives it in June. (Indeed, we were advised that the Advisory Board members would be most interested in the accuracy of observations or findings specific to their individual states.)

4. The appropriate conclusion for our work is a presentation of findings and recommendations for both Provisional Voting and Voter ID, 2 closely related topics, to the Commission at its public meeting in late June, just a week before the termination of our contract under the extended schedule.

I hope you'll share this outline of our expectations with the others at the Commission involved in assuring a successful completion of this research and analysis.

Tom-

I am certain the provisional voting paper will be presented. The Chairman has asked that the Commissioners have an opportunity to review your corrected and final draft of that document prior to it being presented to the EAC Boards, preferably next week.

Because of the issues surrounding voter identification, I am less certain about the protocol that will be followed. I will ask Tom Wilkey and Julie Hodgkins to offer insights on that matter.

I will also ask them about the protocol to be followed regarding the formal submission and acceptance of both the papers.

Karen,

Thanks for your quick reply.

Am I correct in understanding that the presentation to the Board of Advisors on May 24 will include both the Provisional Voting report and the Voter ID report?

If the Commissioners do not consider the reports at its June meeting, when will it take action to receive and record the reports?

Tom-

Just had a good conversation with our folks in the legal department, who as you know, are responsible for coordinating our public meetings.

Original plans had slotted Eagleton for the presentation of its final reports on provisional voting and voter id, at a June public meeting. Those plans have been revised to have Eagleton, instead, present its findings to the EAC Board of Advisors and Standards Board on May 24th.

The details of the Board of Advisors and Standards Board meetings are being finalized this week and early next. I will be certain to get your more details, as I learn of them.

Also, I will get you the details on who will provide the EAC peer review of the Voter ID work, as soon as I have them.

Regards-

Subject No-Cost Extension Request

Karen - We are requesting a no-cost extension on the EAC contract to the Eagleton Institute of Politics at Rutgers University to have the contract's concluding date move from March 31, 2006 to June 30, 2006. As I indicated earlier, it would be very helpful if we could receive approval of this request no later than April 28th.

This extension is necessary to enable the following activities:

1. The EAC has informed us that it will assemble a panel of researchers the week of May 8th to review the Eagleton/Moritz draft background report on Voter Identification. The EAC wishes to supplement the review of this draft
already conducted by the Peer Review Group called for in the contract. The Eagleton/Moritz research team, as well as at least some of the Peer Review Group will participate in the conference call or meeting of the

EAC's reviewers;

2. Eagleton/Moritz will revise the draft Voter Identification report based upon comments made by the two sets of reviewers, and distribute the revised report to the EAC and its Advisory Board in mid-May.

3. Eagleton/Moritz will present its draft reports on Provisional Voting and Voter Idenfitication to the EAC Advisory Board at its May 25th meeting in Washington, D.C.;

4. Eagleton/Moritz will revise both draft reports to take into account comments made by the EAC Advisory Board, and submit printed final reports to the EAC before June 23rd. Eagleton/Moritz will also prepare a PowerPoint presentation for both reports.

5. Eagleton/Moritz will present both reports at the EAC public meeting in Washington, D.C. on June 23rd, thus concluding its work under this contract.

Please let me know if you need any additional information.

Thanks,

John

Hi -- nice to meet you in person, finally!

And thanks for inviting me to your gathering, I enjoyed it and hope I was helpful. Of course, any time you want anything, you do know where to track me down.

As to the potential reviewers of the Eagleton Voter ID study, here are my suggestions, in order:
Jonathan Nagler, New York University
Jan Leighley, University of Arizona
Ben Highton, UC-Davis
Adam Berinsky, MIT
Bernard Grofman, UC-Irvine

All have worked with the CPS turnout/registration data, and are very familiar with this research literature.

If these don't work, or you want more recommendations, let me know.

Washington, DC 20005

To: File
From: Tamar Nedzar, Law Clerk
Date: April 21, 2006
Re: No-Cost Extension to contract number E4014127 with the Eagleton Institute of Politics at Rutgers University

---

Background:
Contract E4014127 with the Eagleton Institute of Politics at Rutgers University ("contractor") was originally scheduled to be concluded on March 31, 2006. The contract's final products include a report on Voter Identification and a report on Provisional Voting. The contractor has vetted the reports with a Peer Review Group, pursuant to the terms of the contract.

Justification for No-Cost Extension:
The EAC wishes to supplement the contractor's Peer Review of the reports by adding another review process with some of the EAC's key stakeholders. The EAC proposes to assemble a panel of researchers during the week of May 8th to conduct the second review.

Following the second review, the contractor will revise its draft reports based on the comments it receives. The contractor will present its draft reports on Provisional Voting and Voter Identification to the EAC Advisory Board at its May 25th meeting in Washington, DC. The contractor will revise both draft reports, taking into account the EAC's Advisory Board's comments and submit the final reports to the EAC toward the end of June.

Recommendation:
The EAC recommends that contract E4014127 be modified at no cost to allow the contractor to complete their work by June 30, 2006.

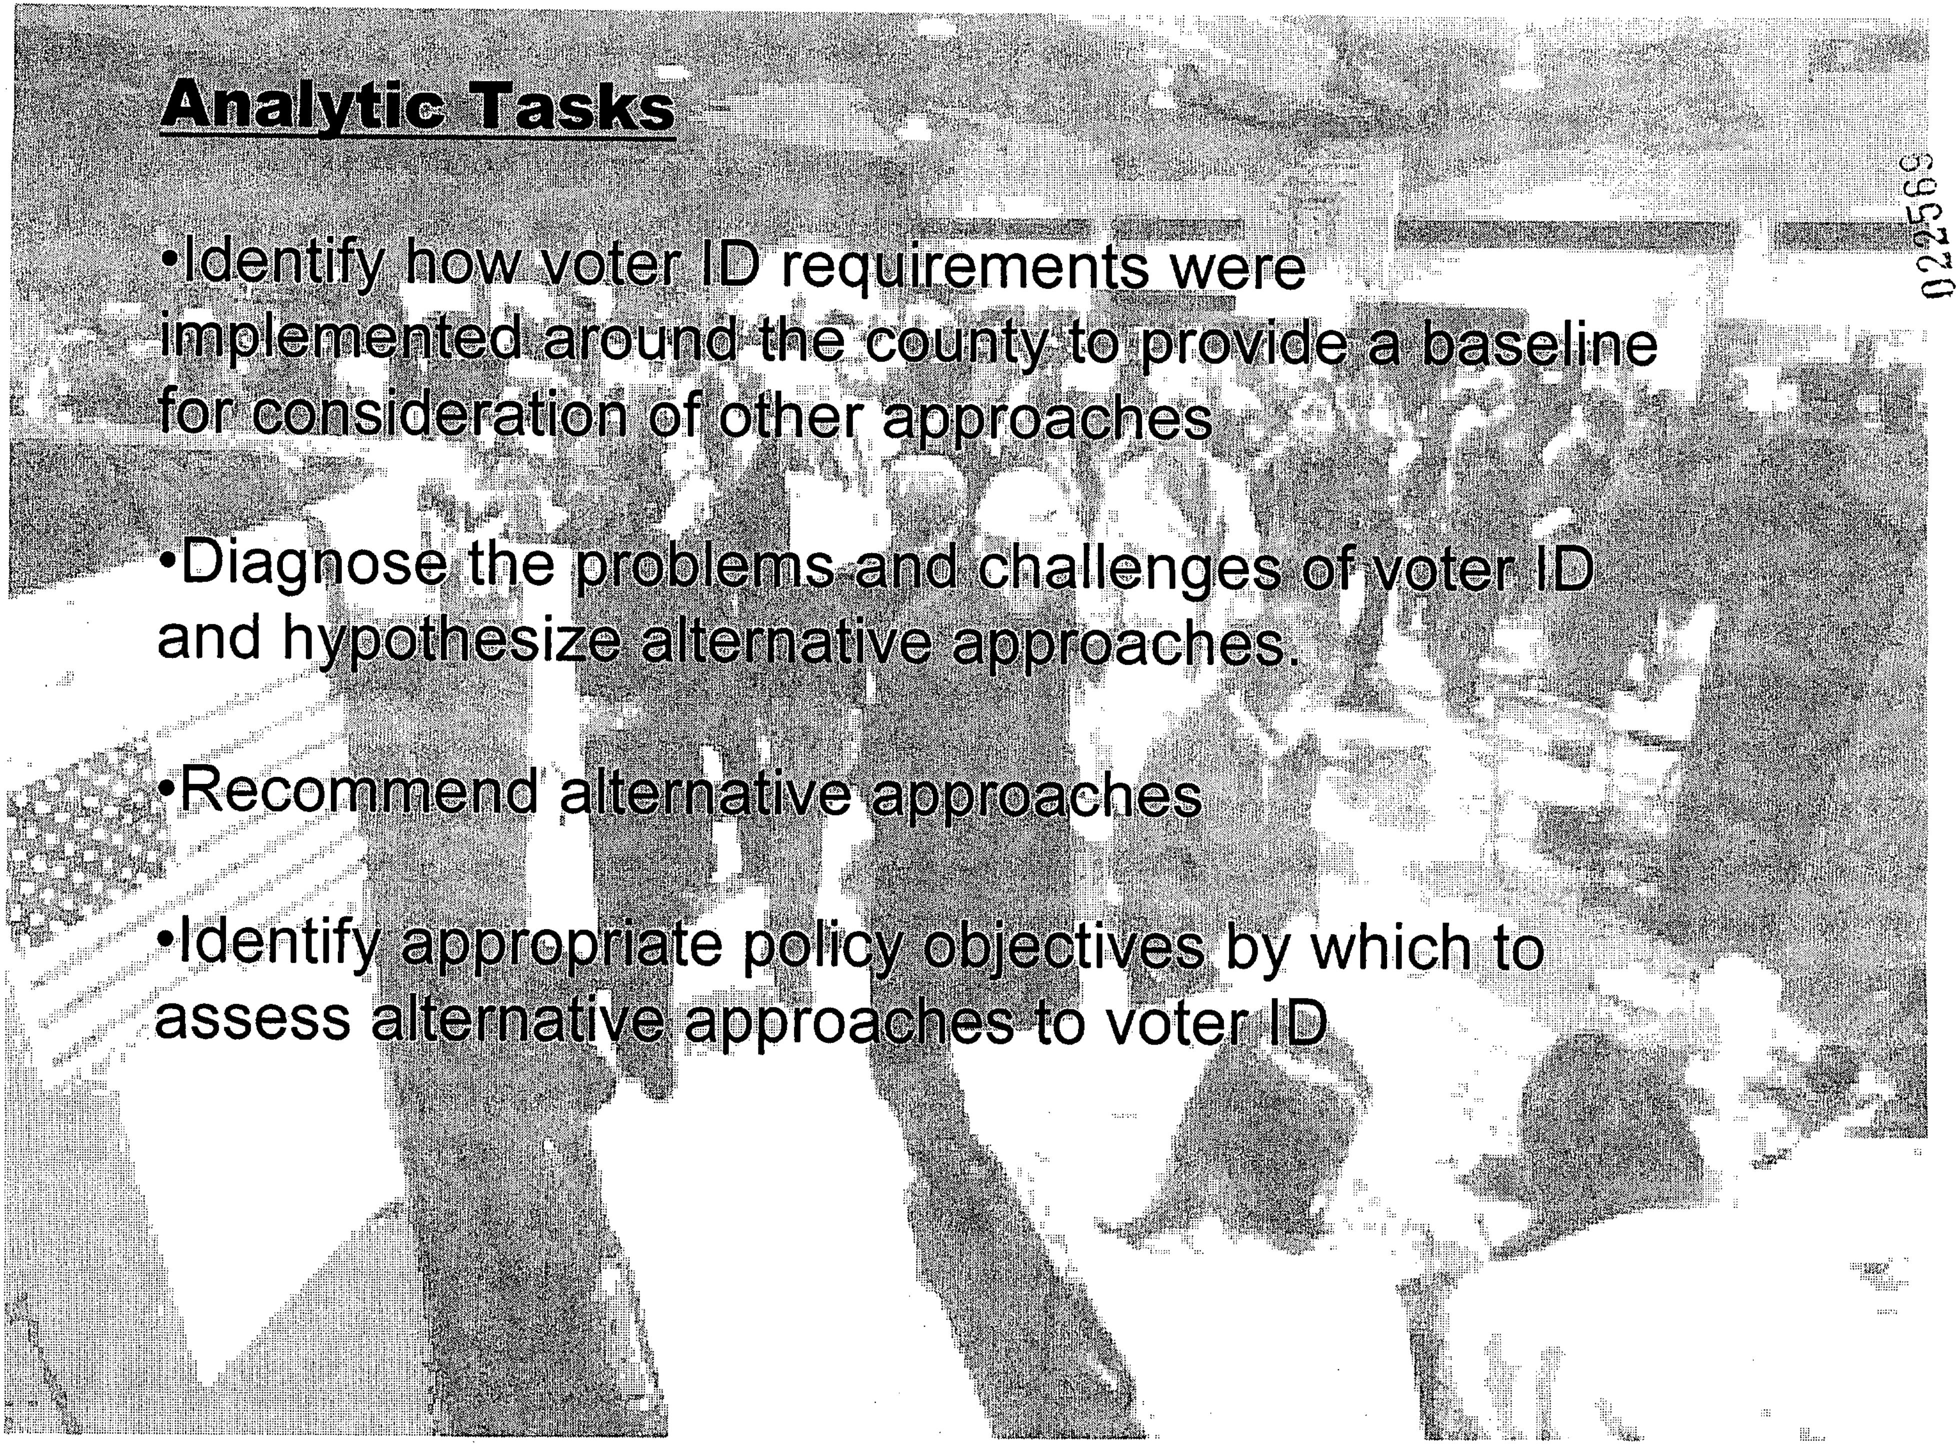
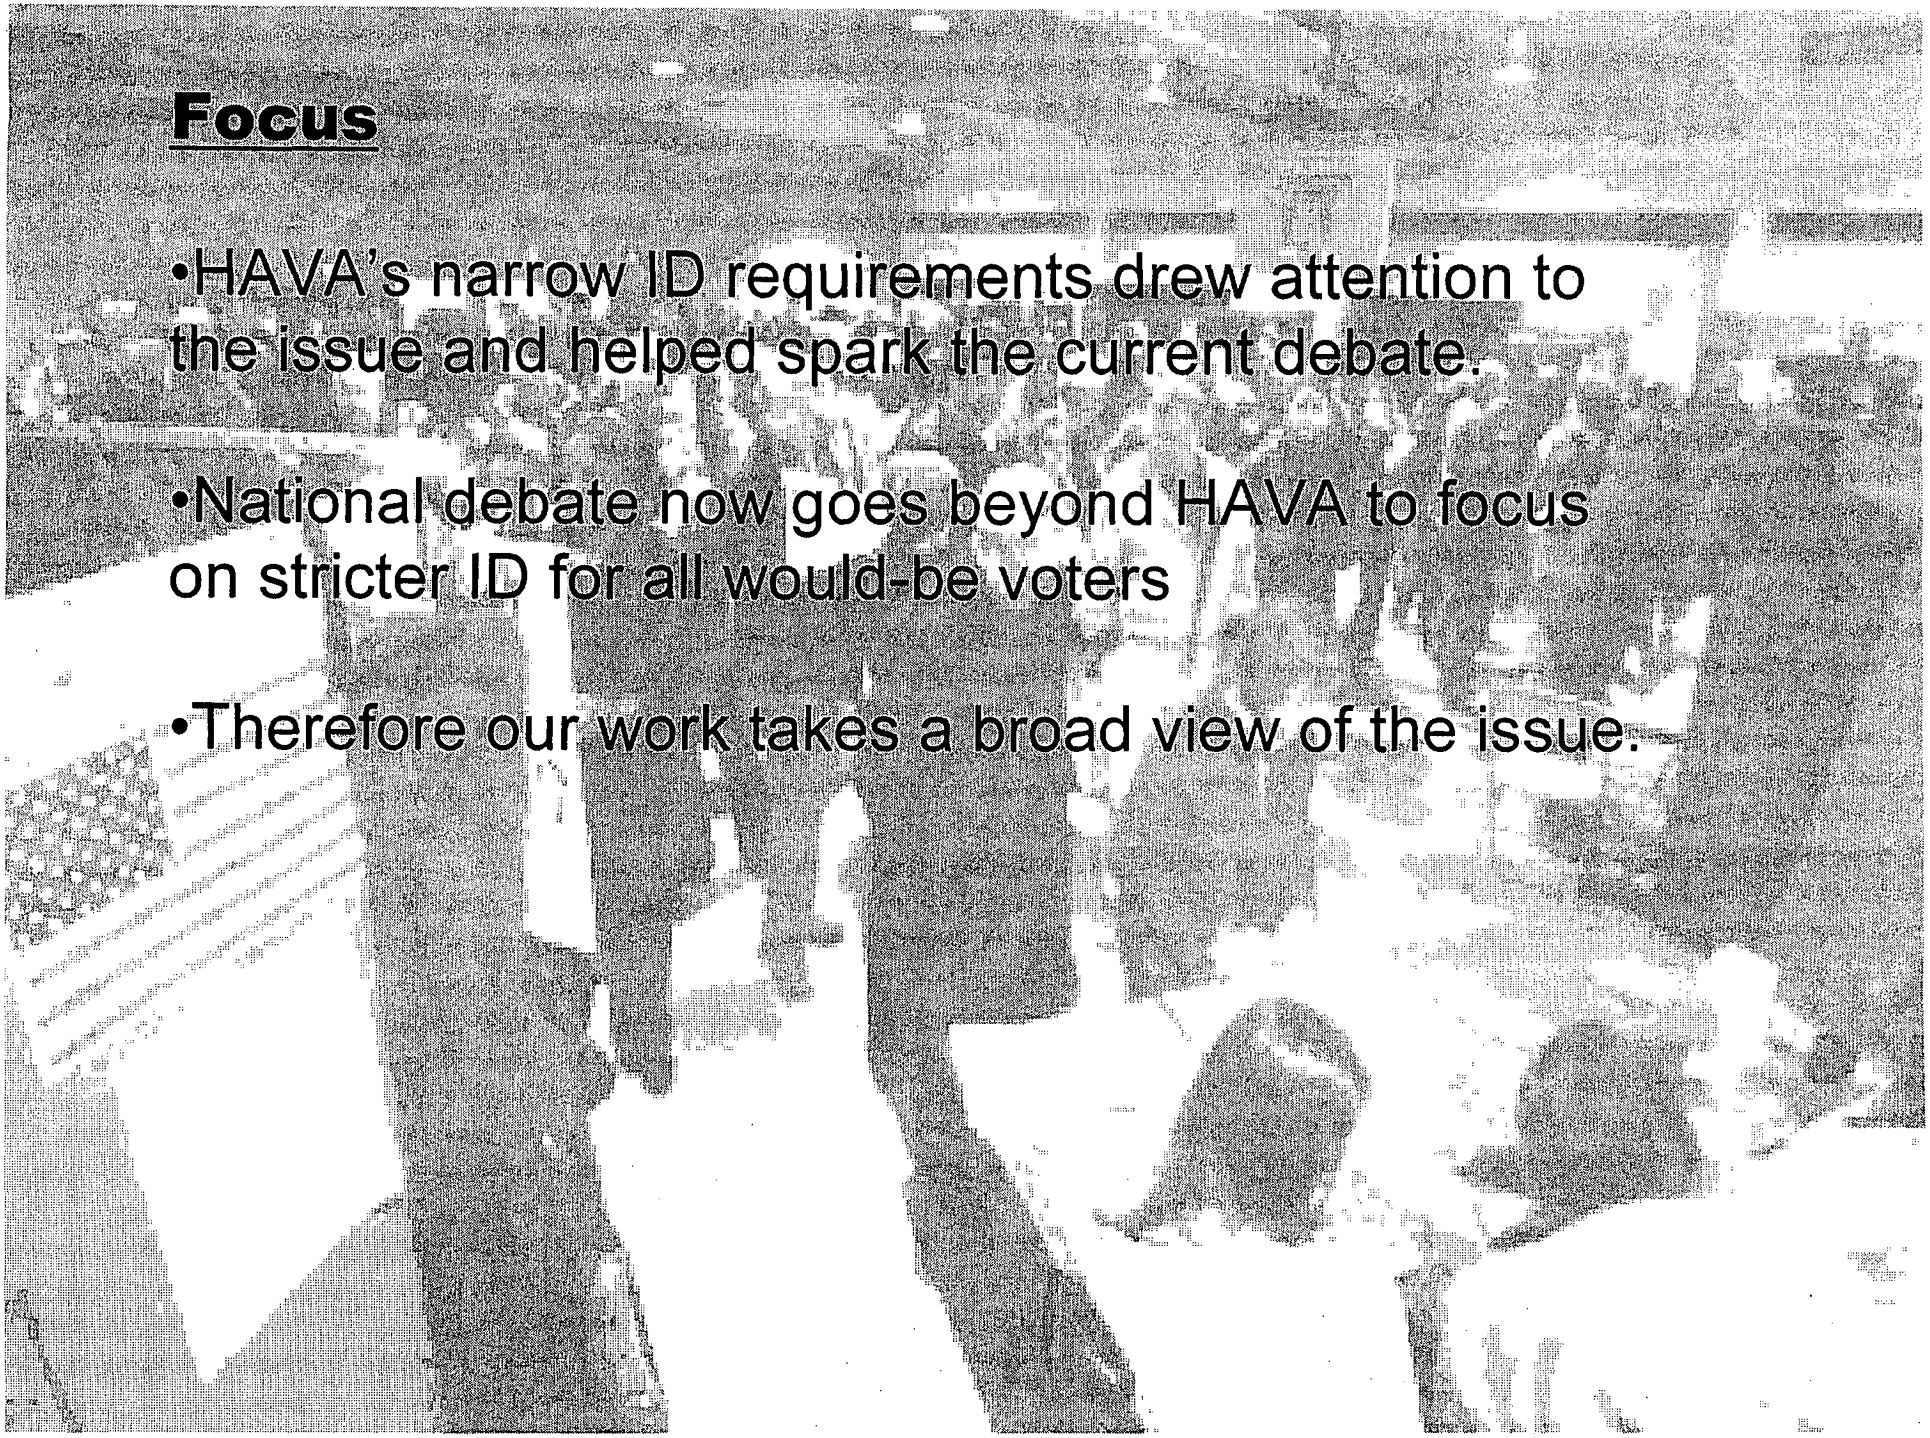
Voter Identification Issues
Analysis
&
Recommendations



Analytic Tasks

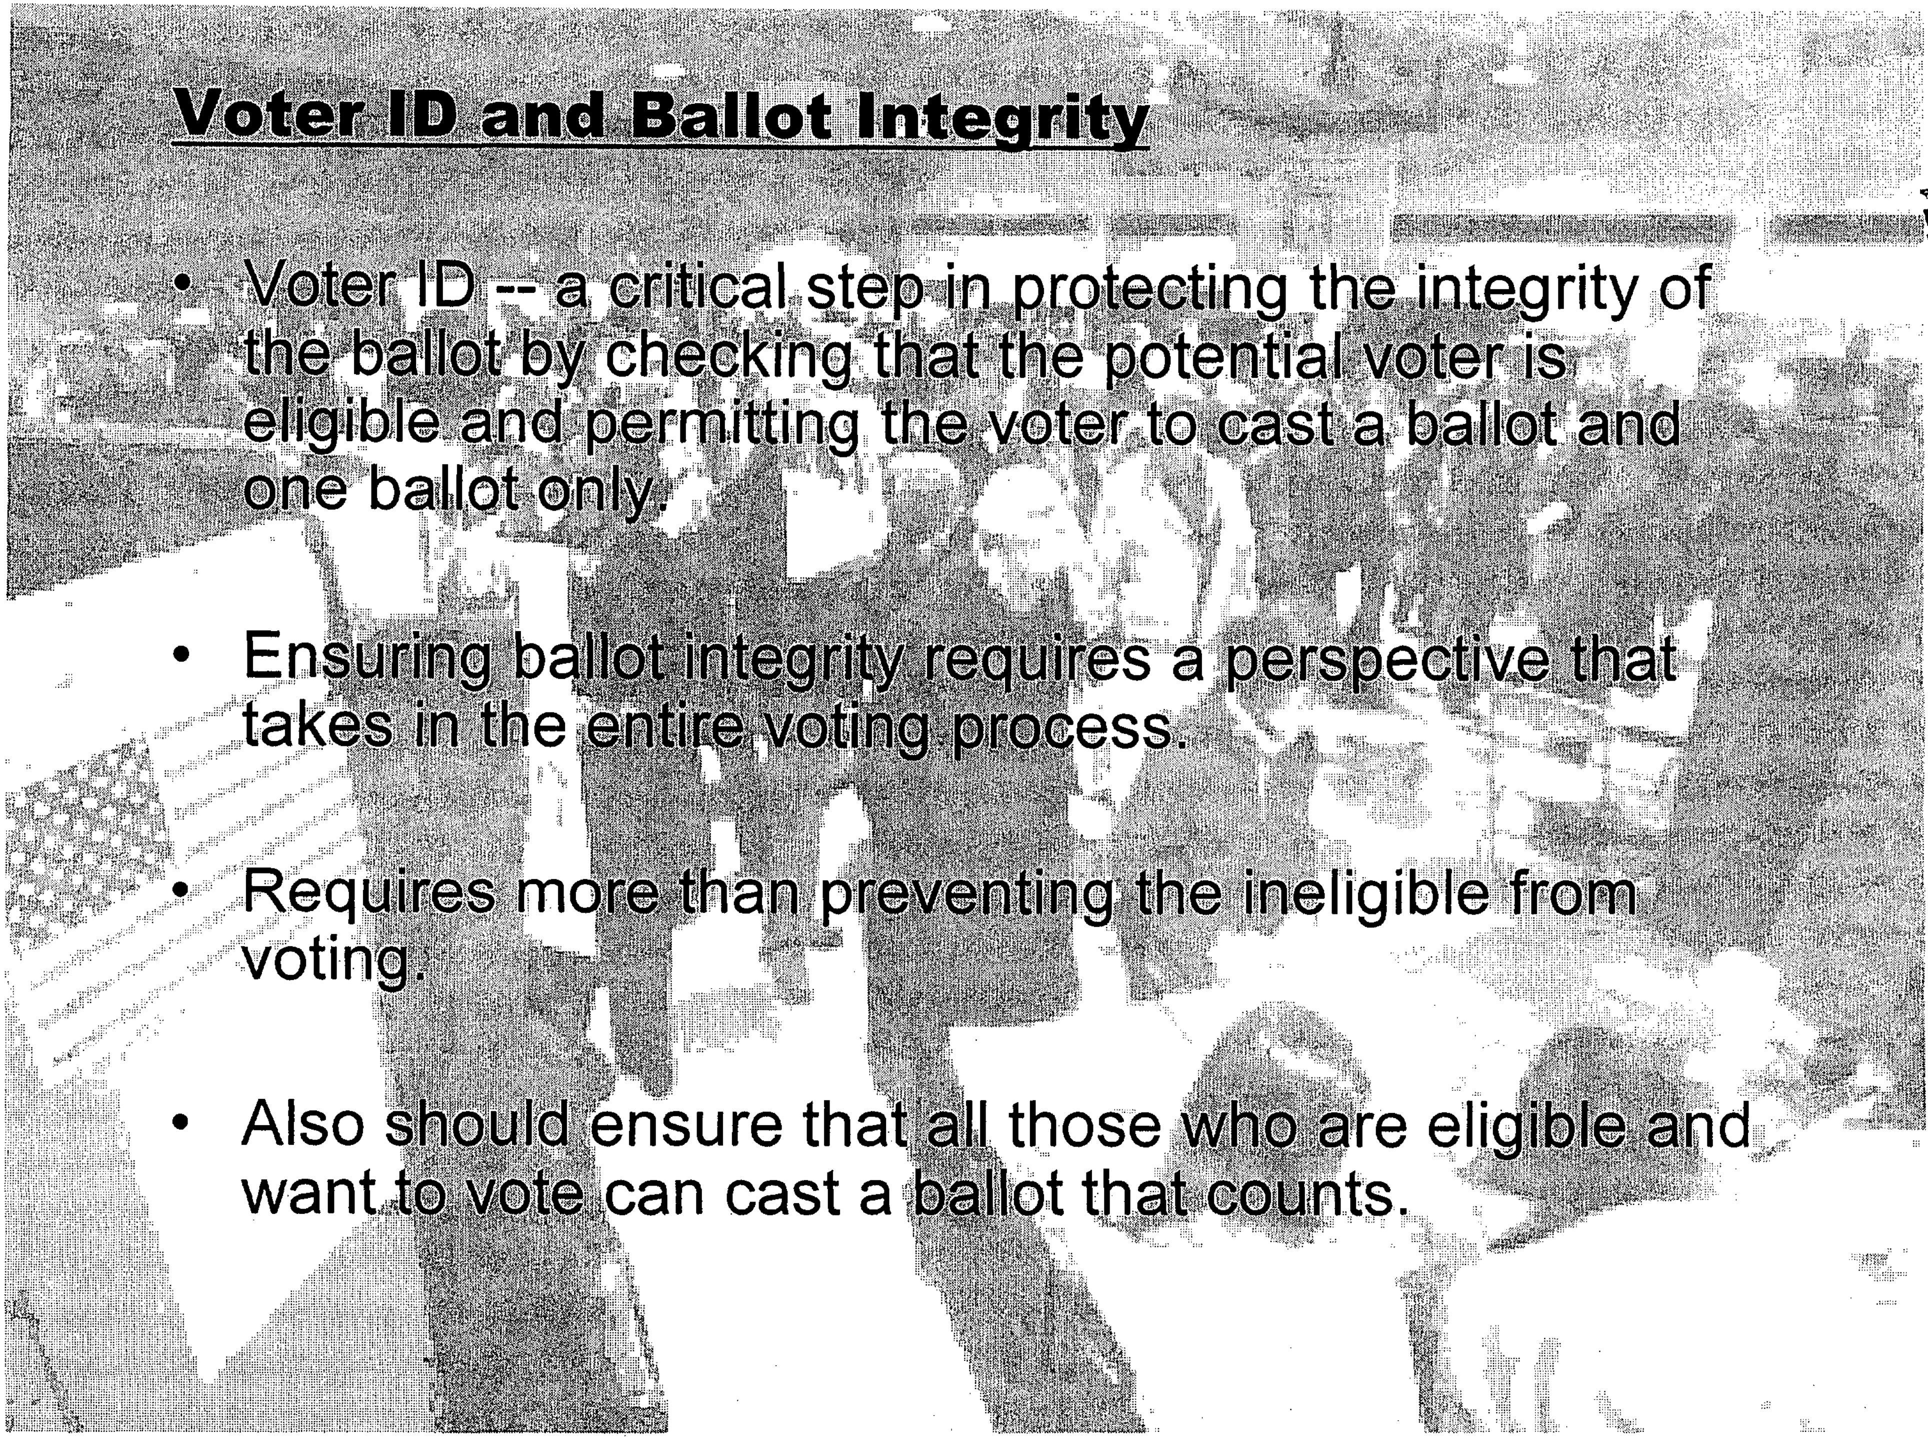
- Identify how voter ID requirements were implemented around the county to provide a baseline for consideration of other approaches
- Diagnose the problems and challenges of voter ID and hypothesize alternative approaches.
- Recommend alternative approaches
- Identify appropriate policy objectives by which to assess alternative approaches to voter ID



Focus

- HAVA’s narrow ID requirements drew attention to the issue and helped spark the current debate.
- National debate now goes beyond HAVA to focus on stricter ID for all would-be voters
- Therefore our work takes a broad view of the issue.

Voter ID and Ballot Integrity



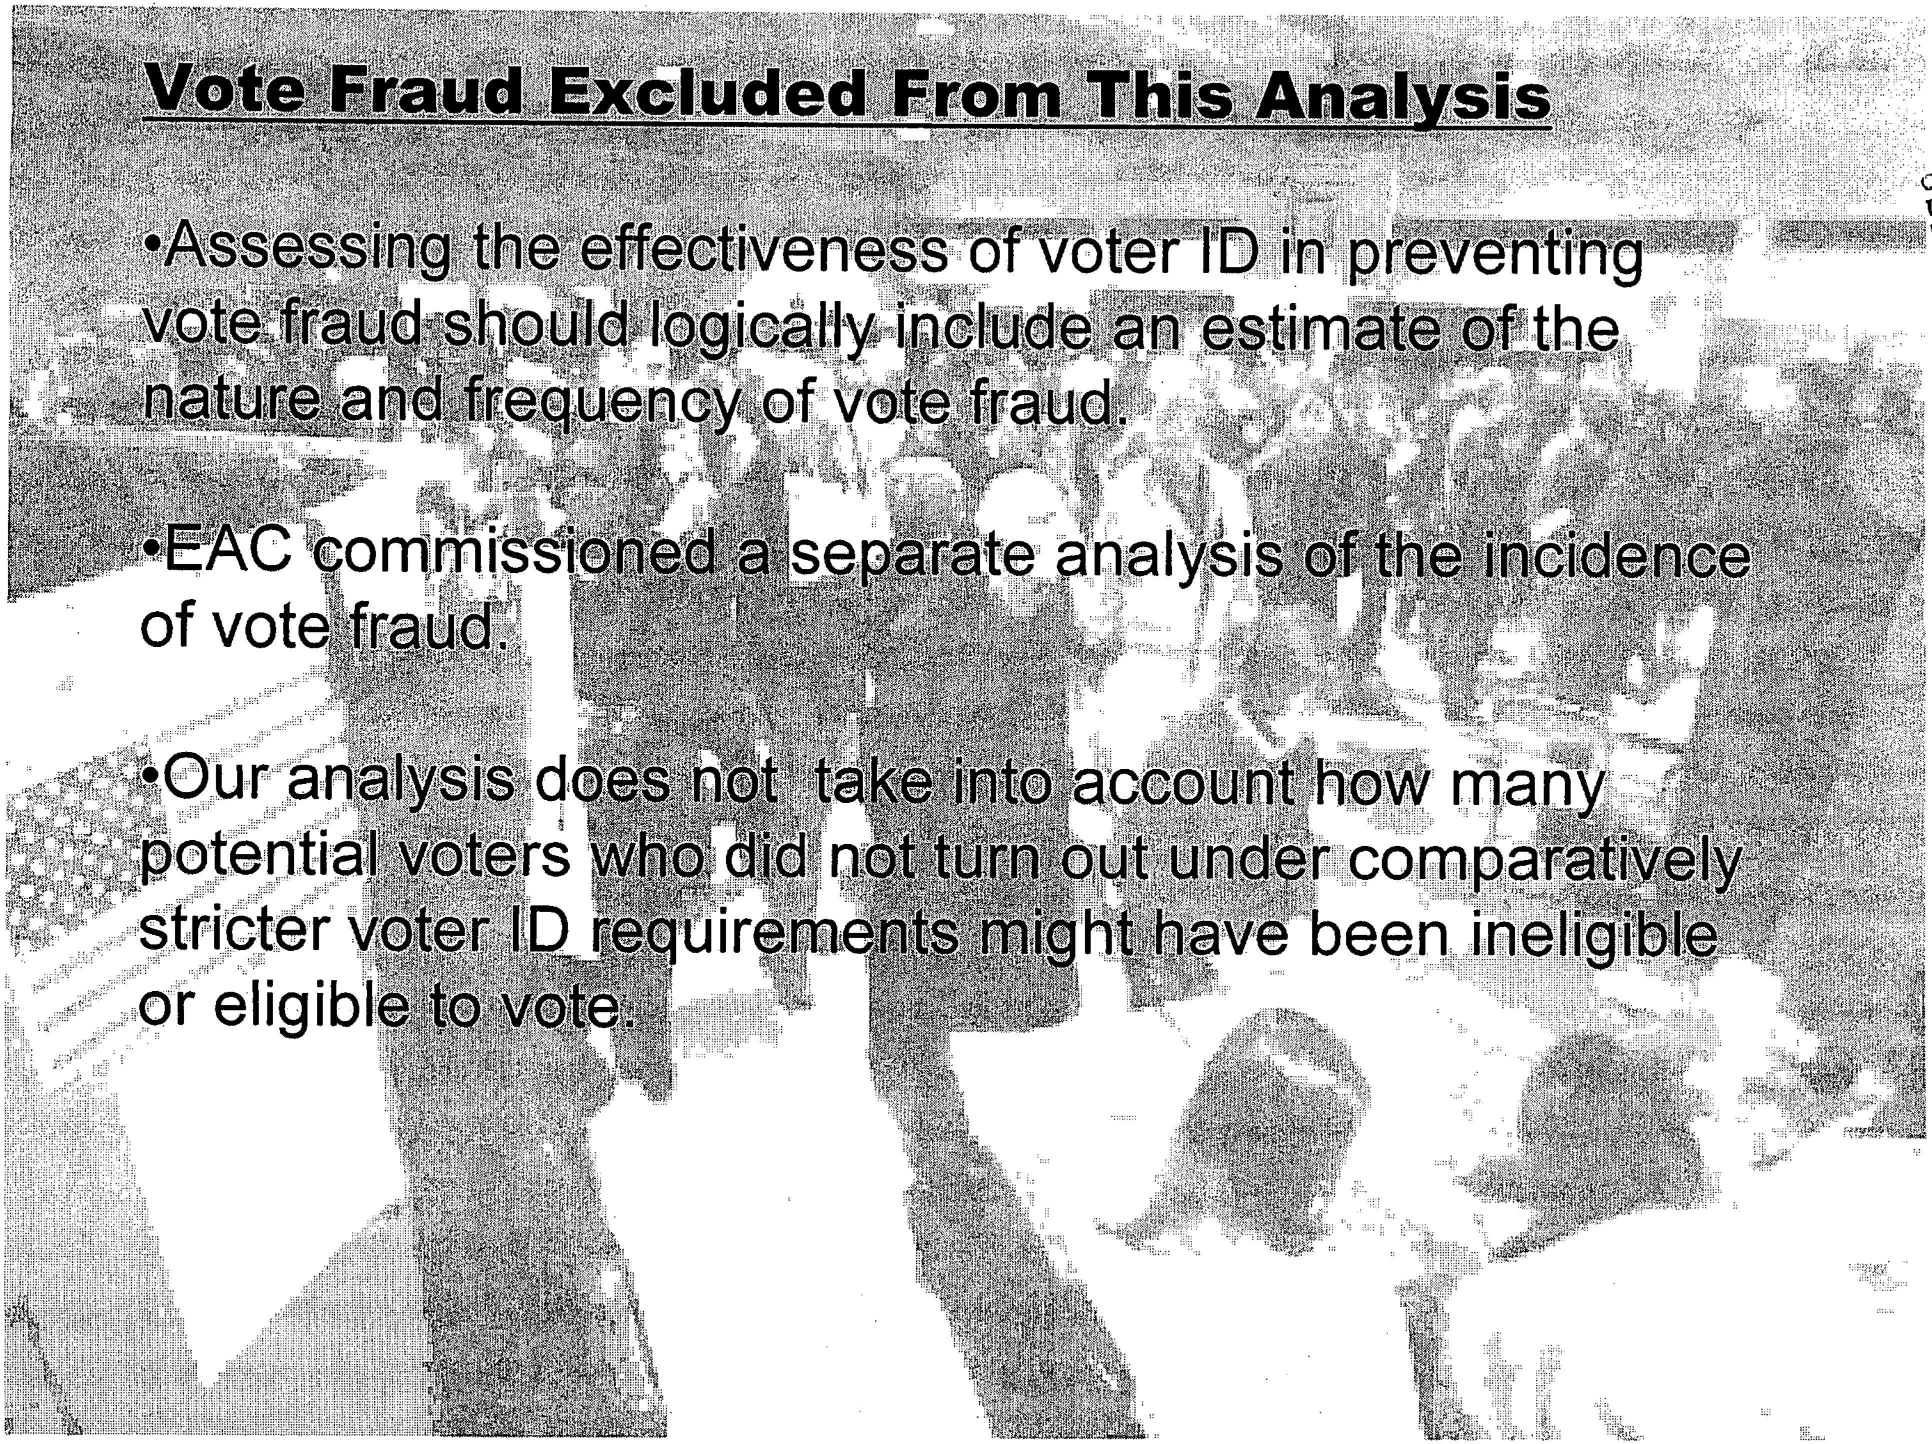
- Voter ID -- a critical step in protecting the integrity of the ballot by checking that the potential voter is eligible and permitting the voter to cast a ballot and one ballot only.

- Ensuring ballot integrity requires a perspective that takes in the entire voting process.

- Requires more than preventing the ineligible from voting.

- Also should ensure that all those who are eligible and want to vote can cast a ballot that counts.

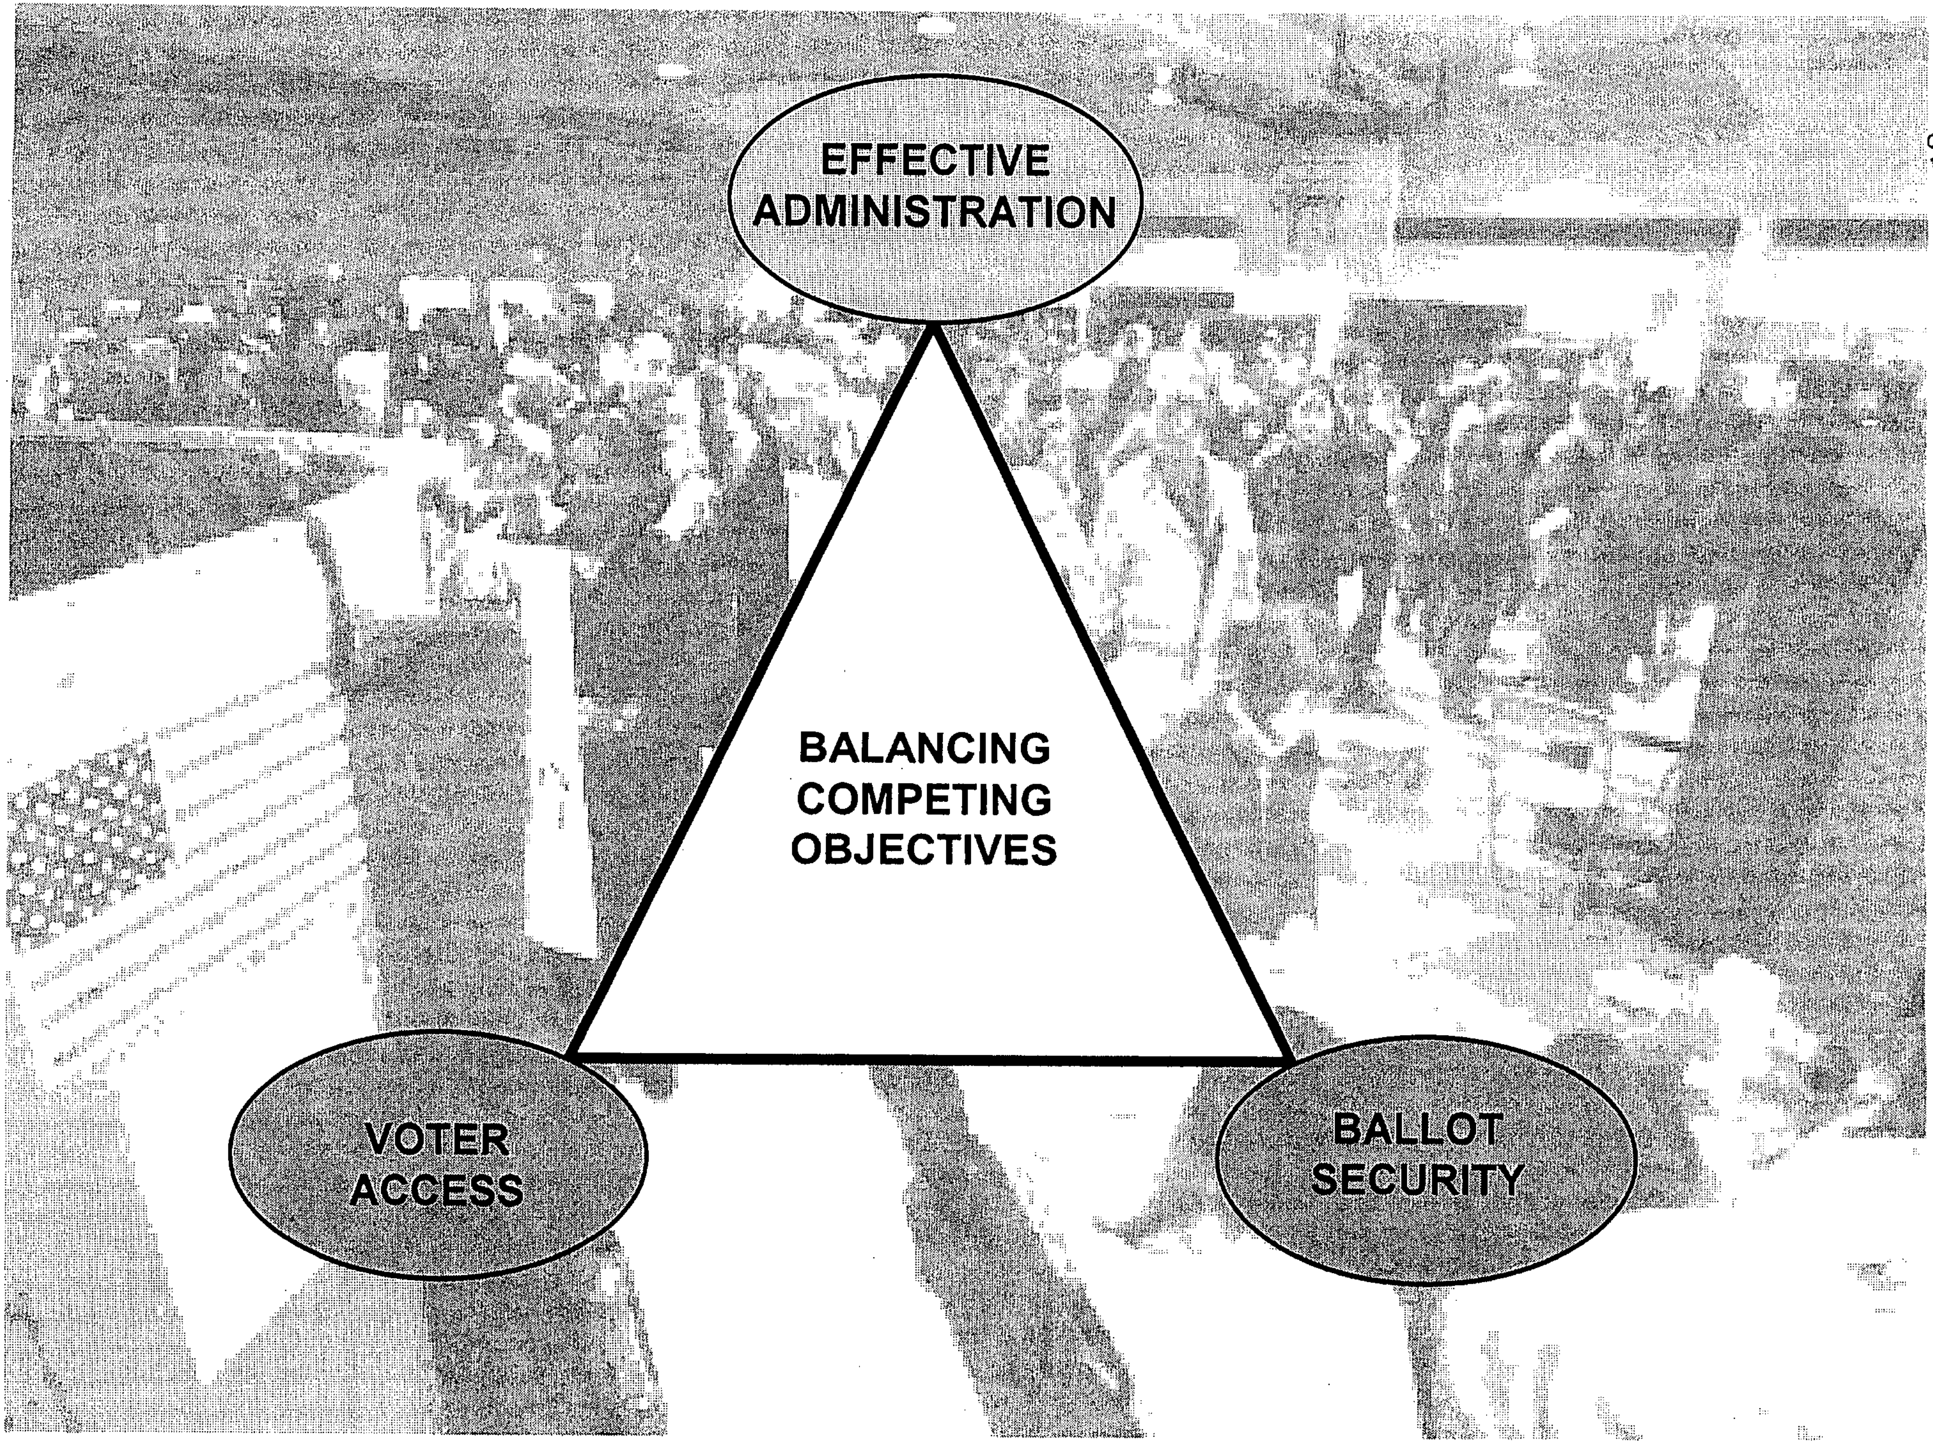
Vote Fraud Excluded From This Analysis



- Assessing the effectiveness of voter ID in preventing vote fraud should logically include an estimate of the nature and frequency of vote fraud.

- EAC commissioned a separate analysis of the incidence of vote fraud.

- Our analysis does not take into account how many potential voters who did not turn out under comparatively stricter voter ID requirements might have been ineligible or eligible to vote.

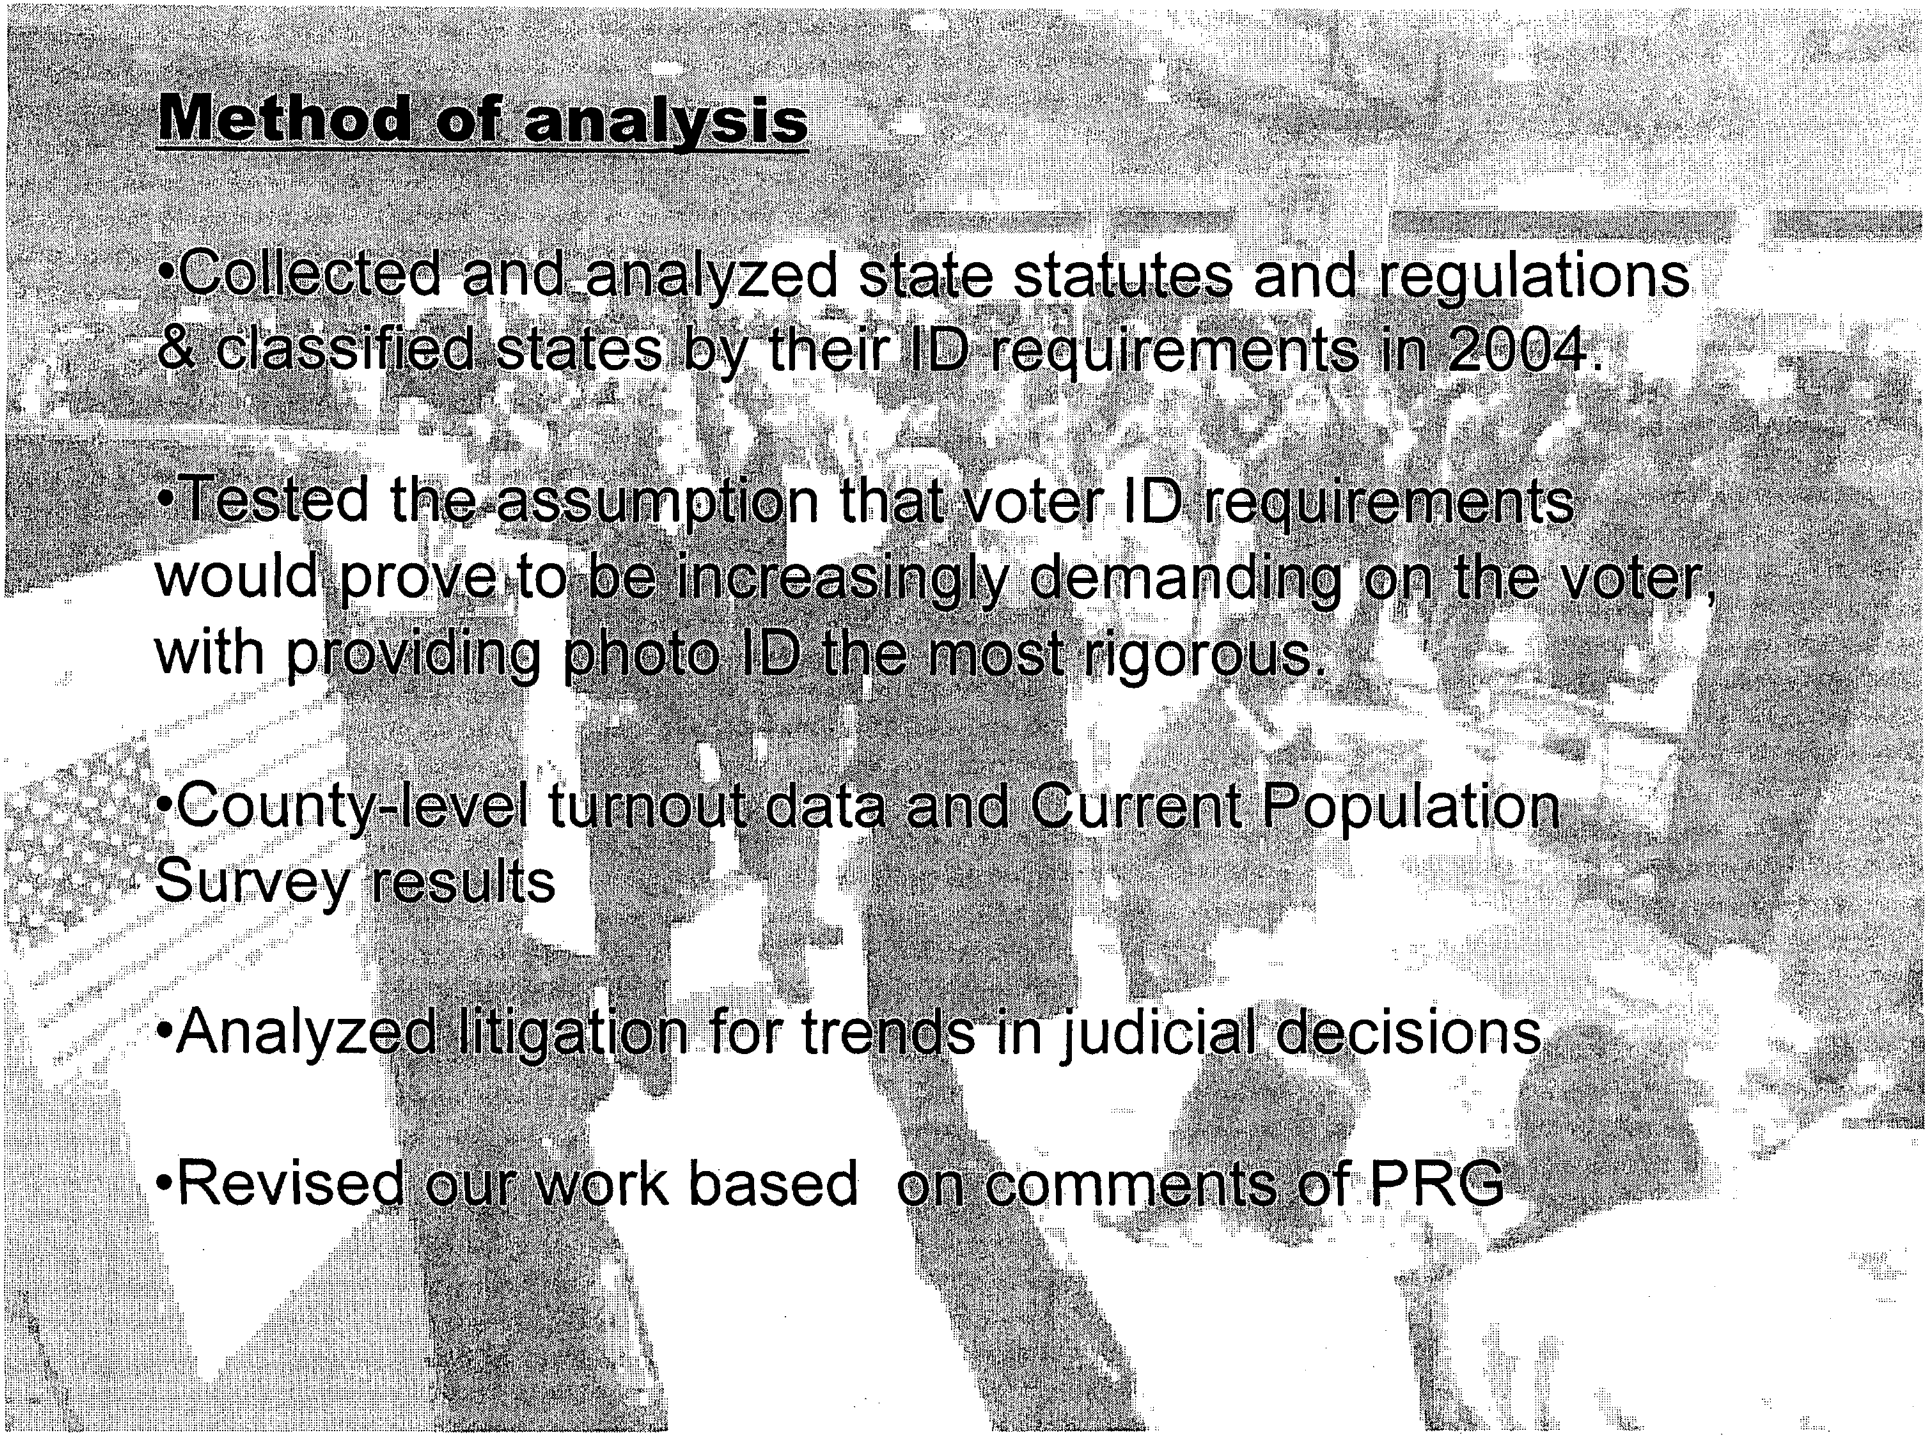


EFFECTIVE ADMINISTRATION

BALANCING COMPETING OBJECTIVES

VOTER ACCESS

BALLOT SECURITY



Method of analysis

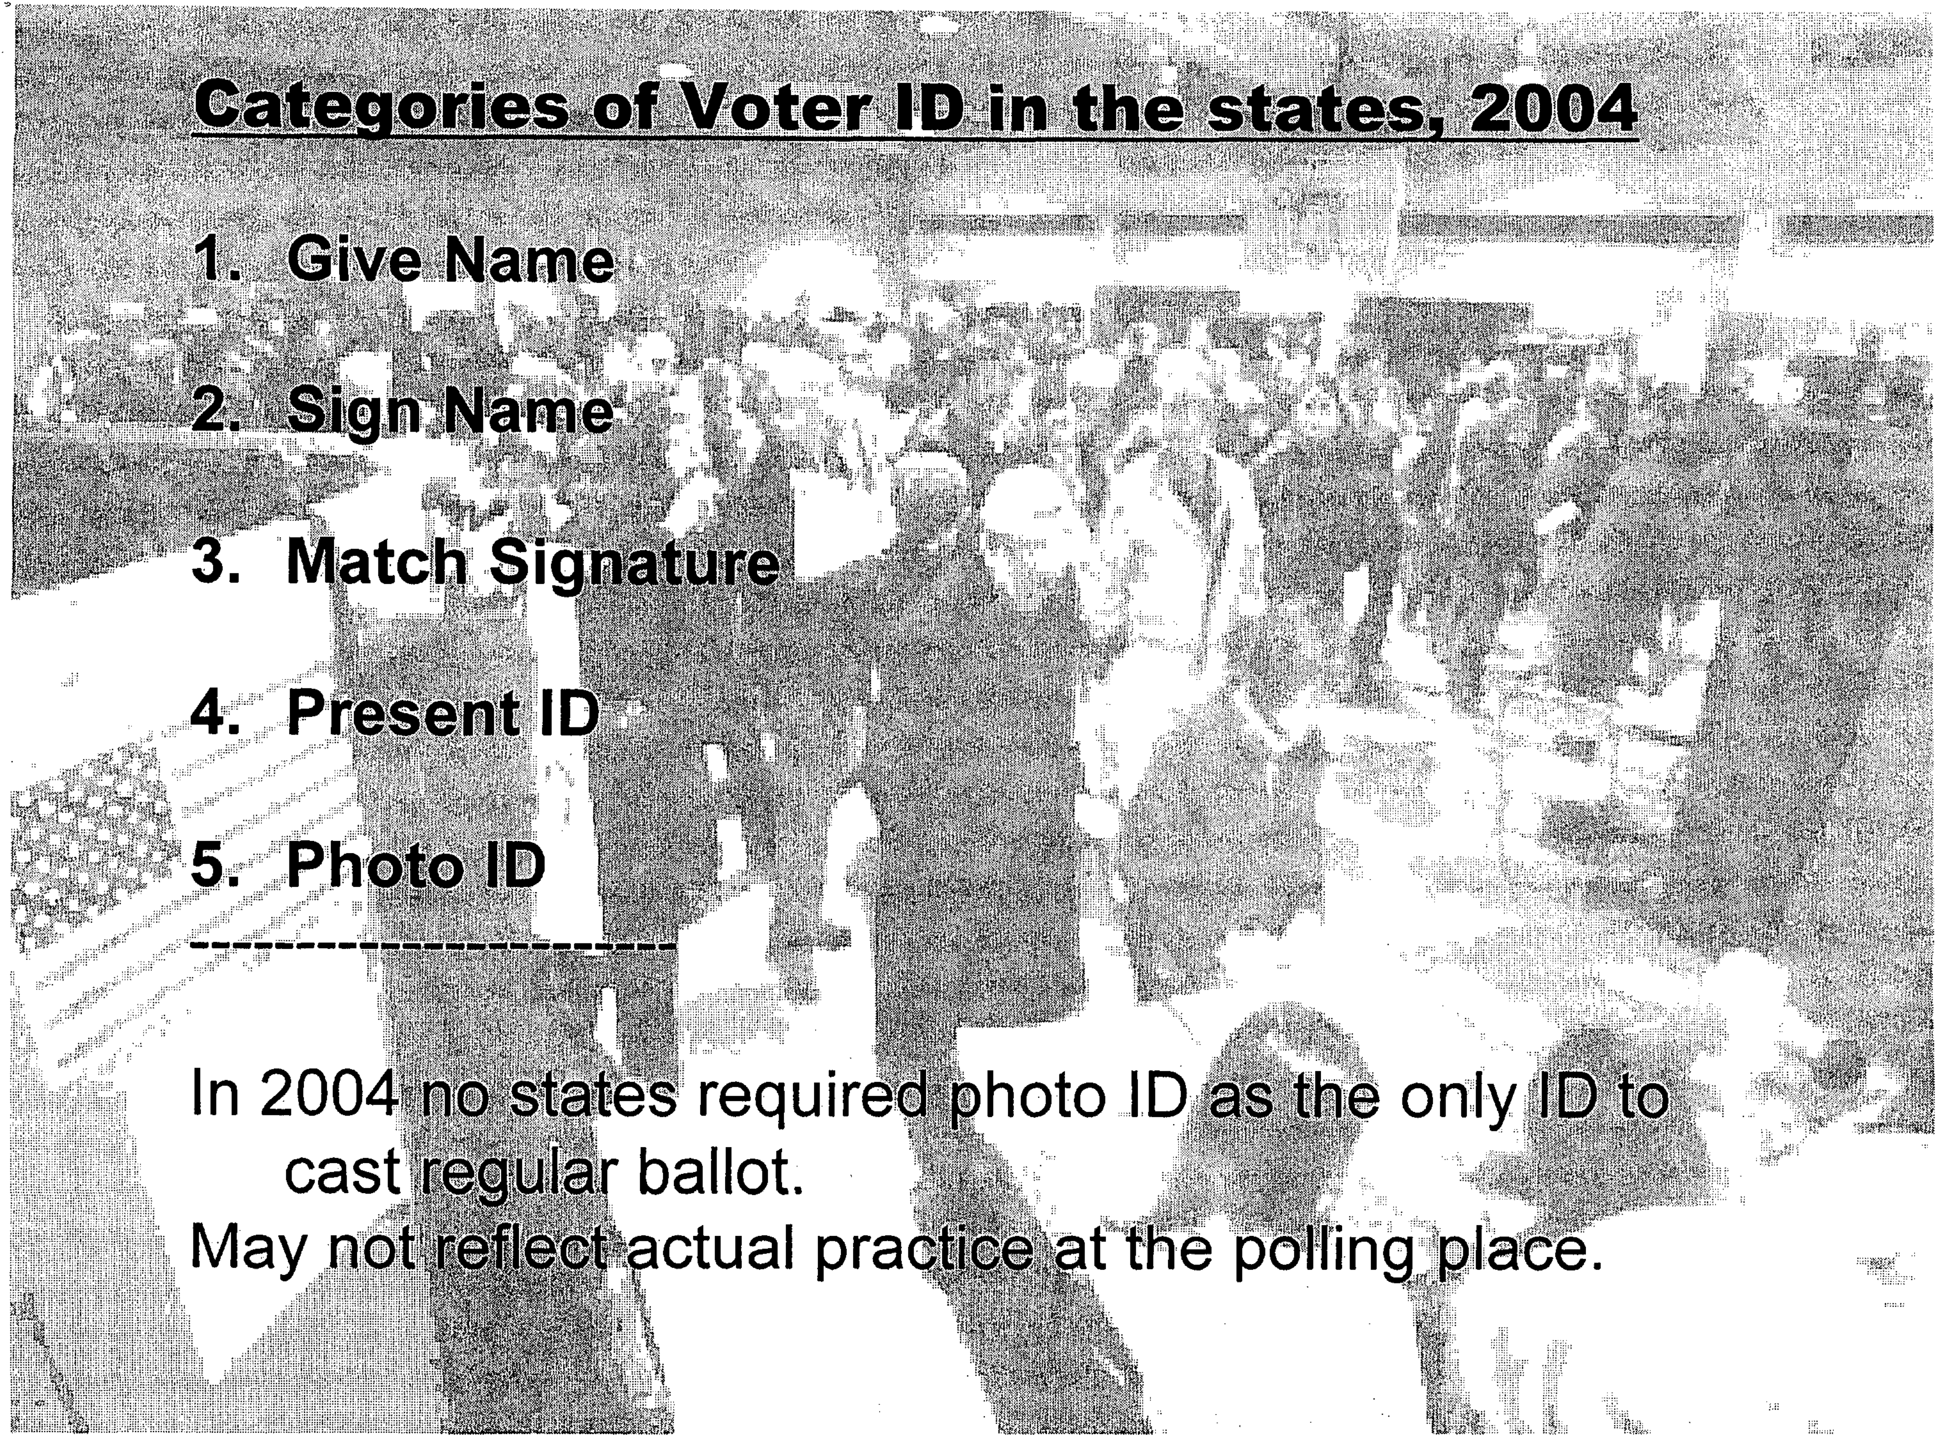
- Collected and analyzed state statutes and regulations & classified states by their ID requirements in 2004.

- Tested the assumption that voter ID requirements would prove to be increasingly demanding on the voter, with providing photo ID the most rigorous.

- County-level turnout data and Current Population Survey results

- Analyzed litigation for trends in judicial decisions

- Revised our work based on comments of PRG



Categories of Voter ID in the states, 2004

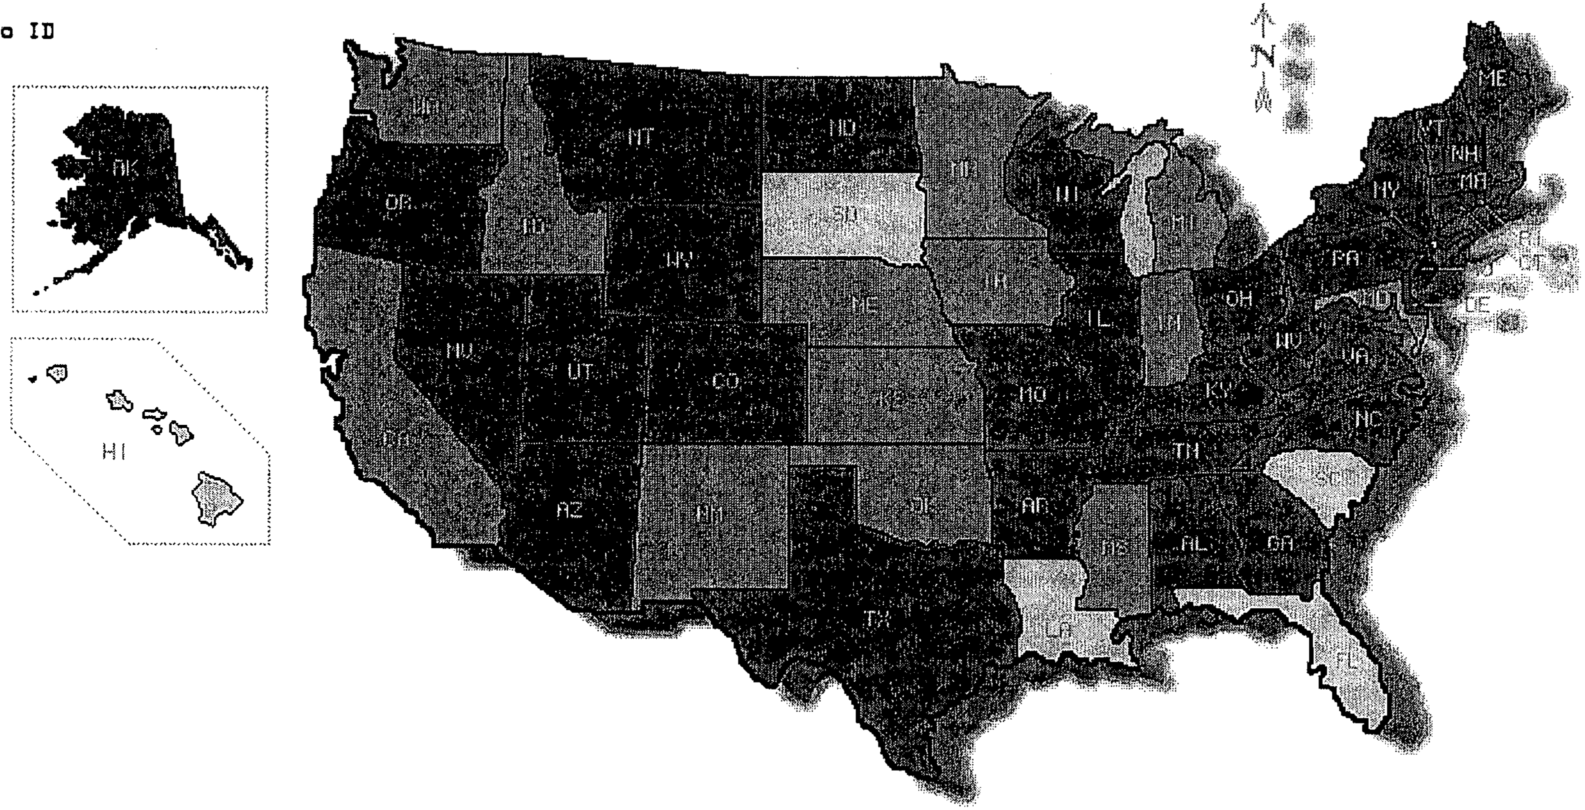
1. **Give Name**
2. **Sign Name**
3. **Match Signature**
4. **Present ID**
5. **Photo ID**

In 2004 no states required photo ID as the only ID to cast regular ballot.

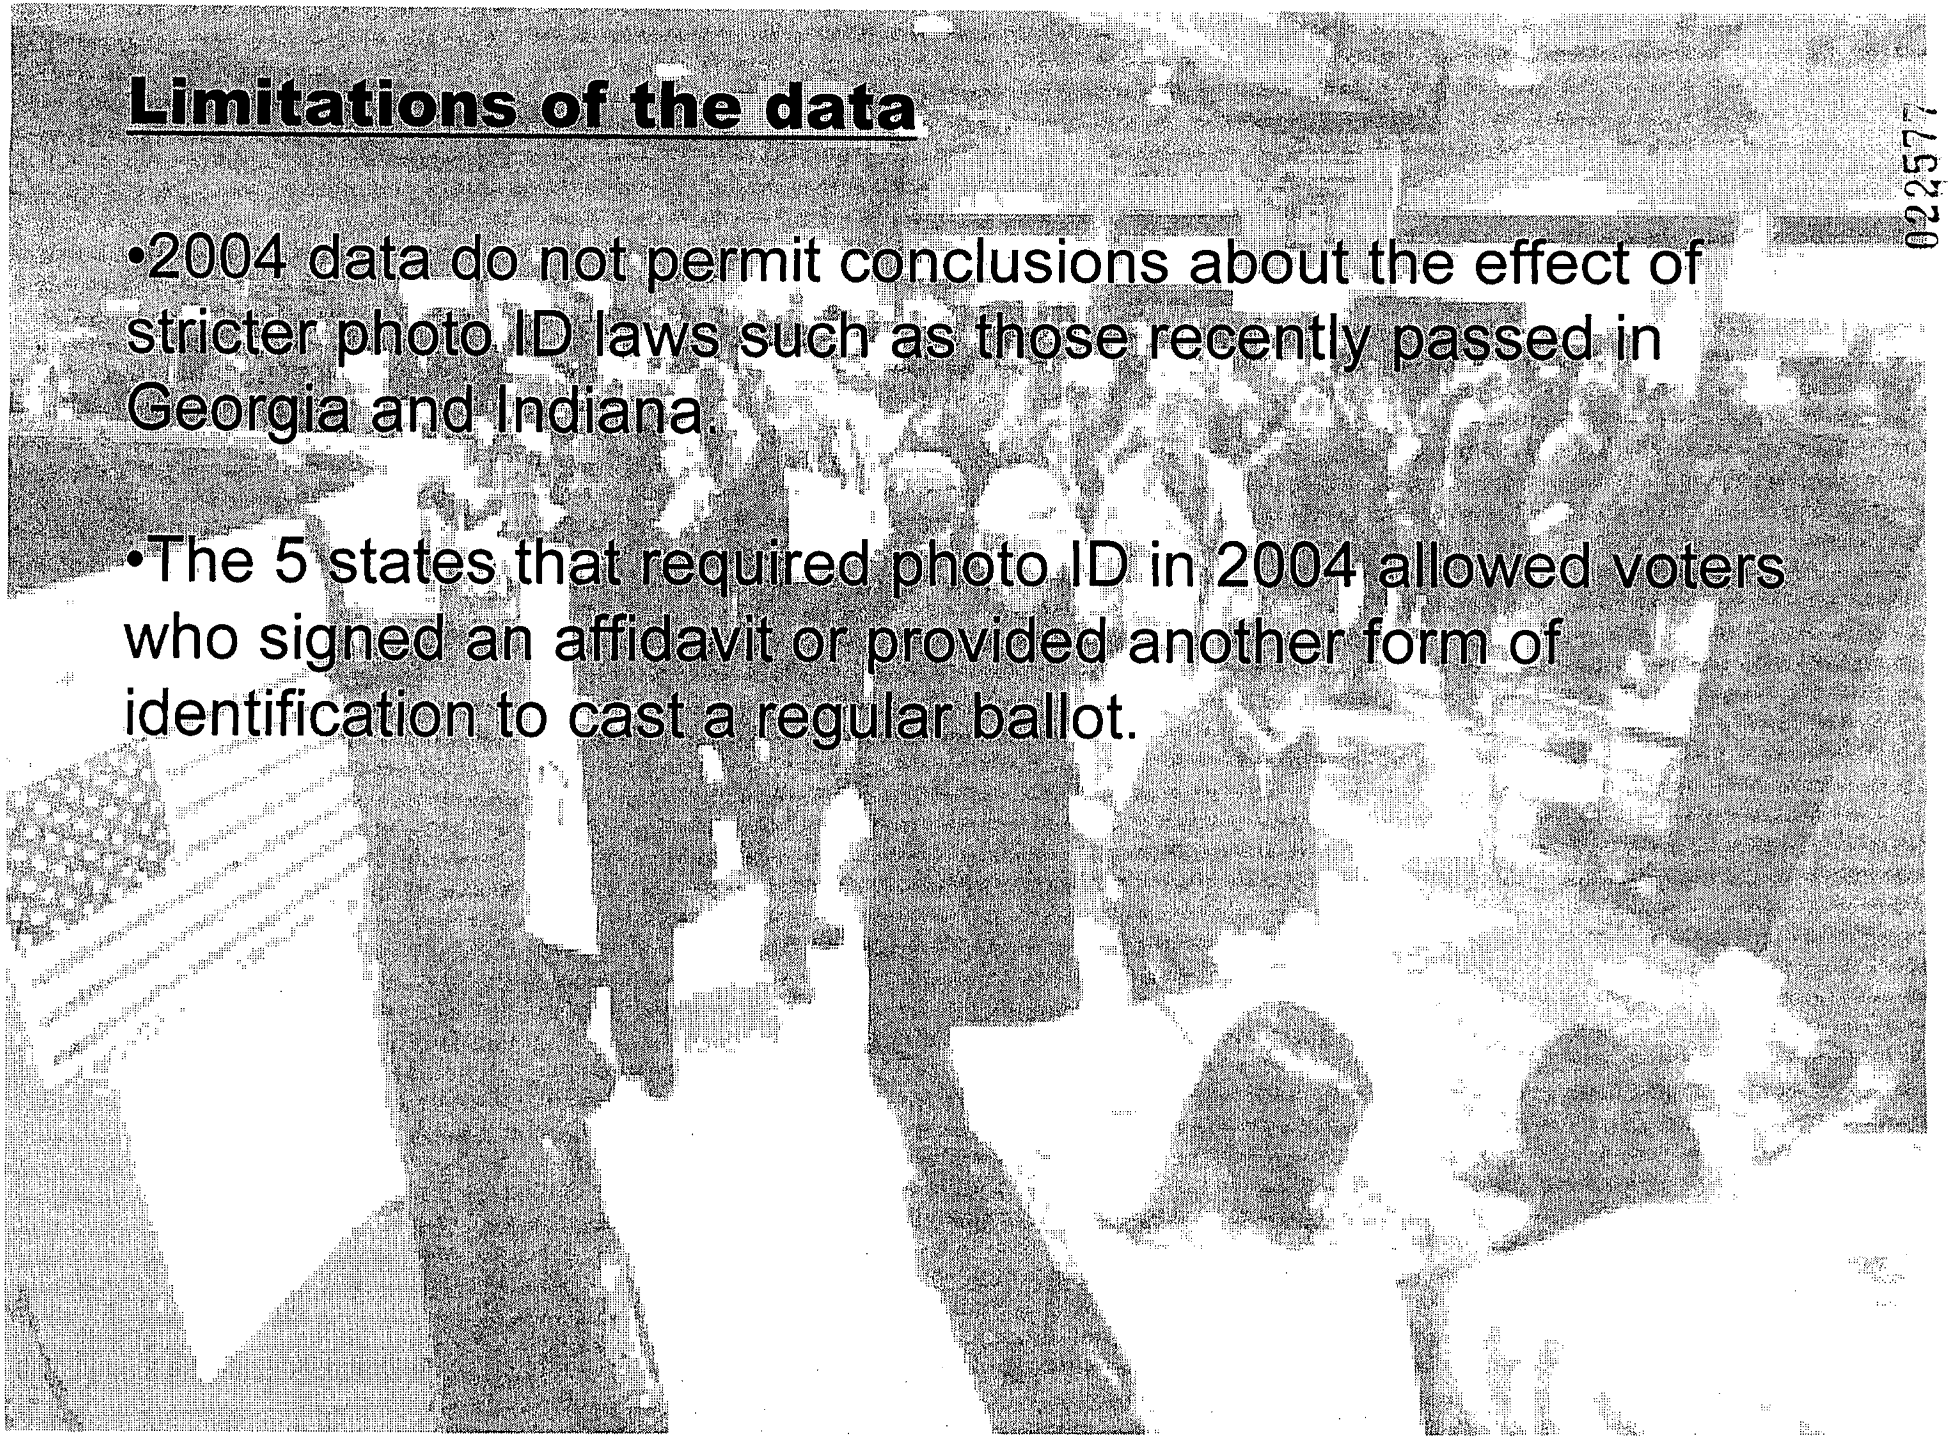
May not reflect actual practice at the polling place.

● - Give Name
● - Sign Name
● - Match Signature
● - ID
● - Photo ID

Voter ID Requirements 2004



3-27-06



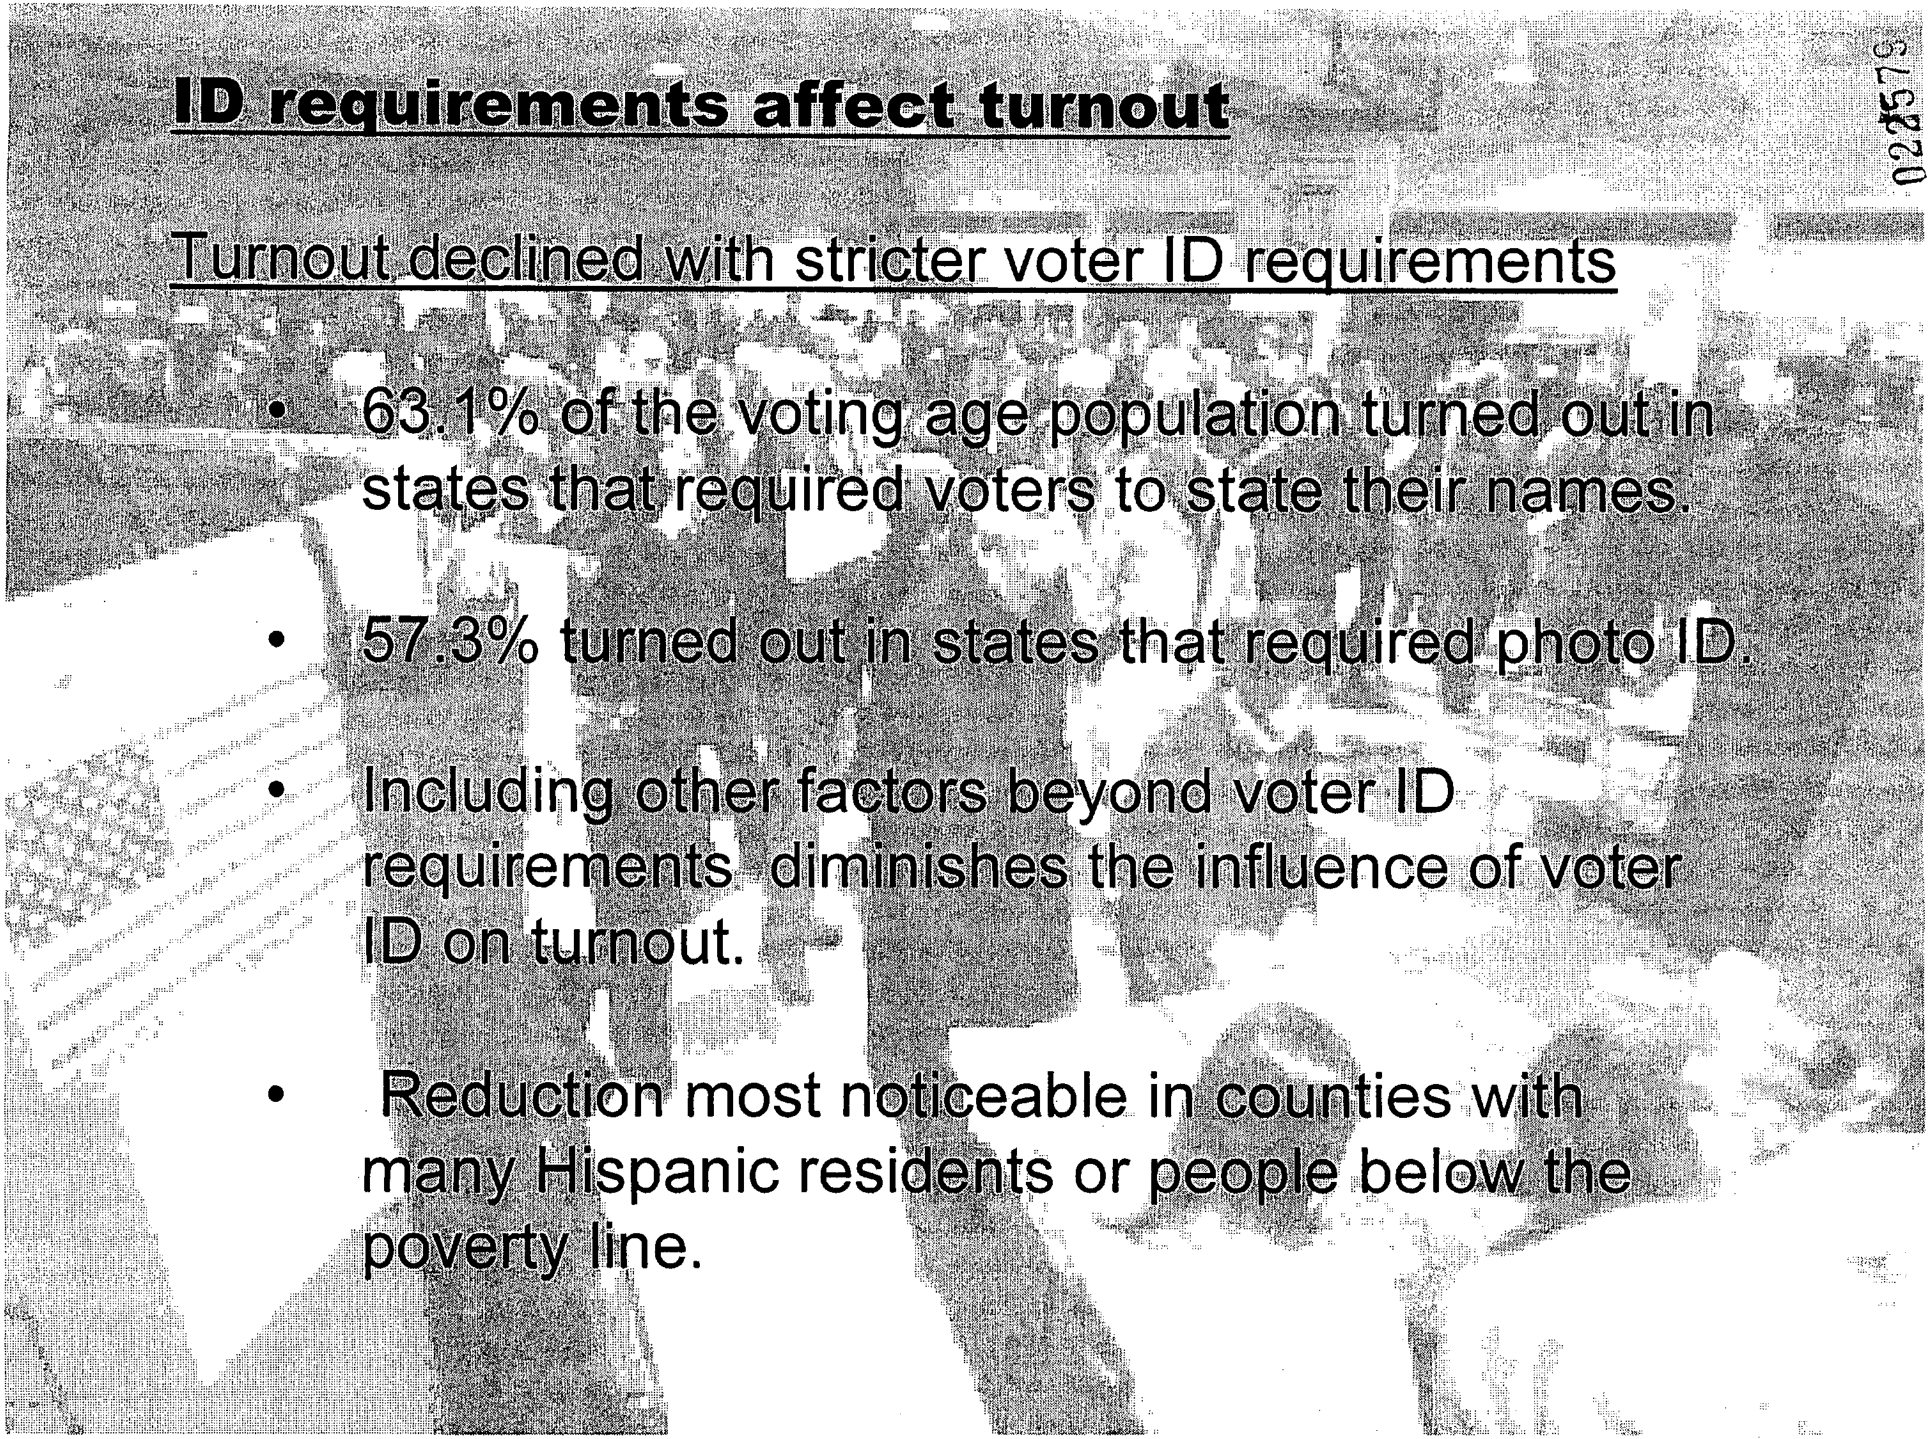
Limitations of the data

- 2004 data do not permit conclusions about the effect of stricter photo ID laws such as those recently passed in Georgia and Indiana.

- The 5 states that required photo ID in 2004 allowed voters who signed an affidavit or provided another form of identification to cast a regular ballot.

Analysis of Turnout and Voter ID Requirements

Tim Vercellotti

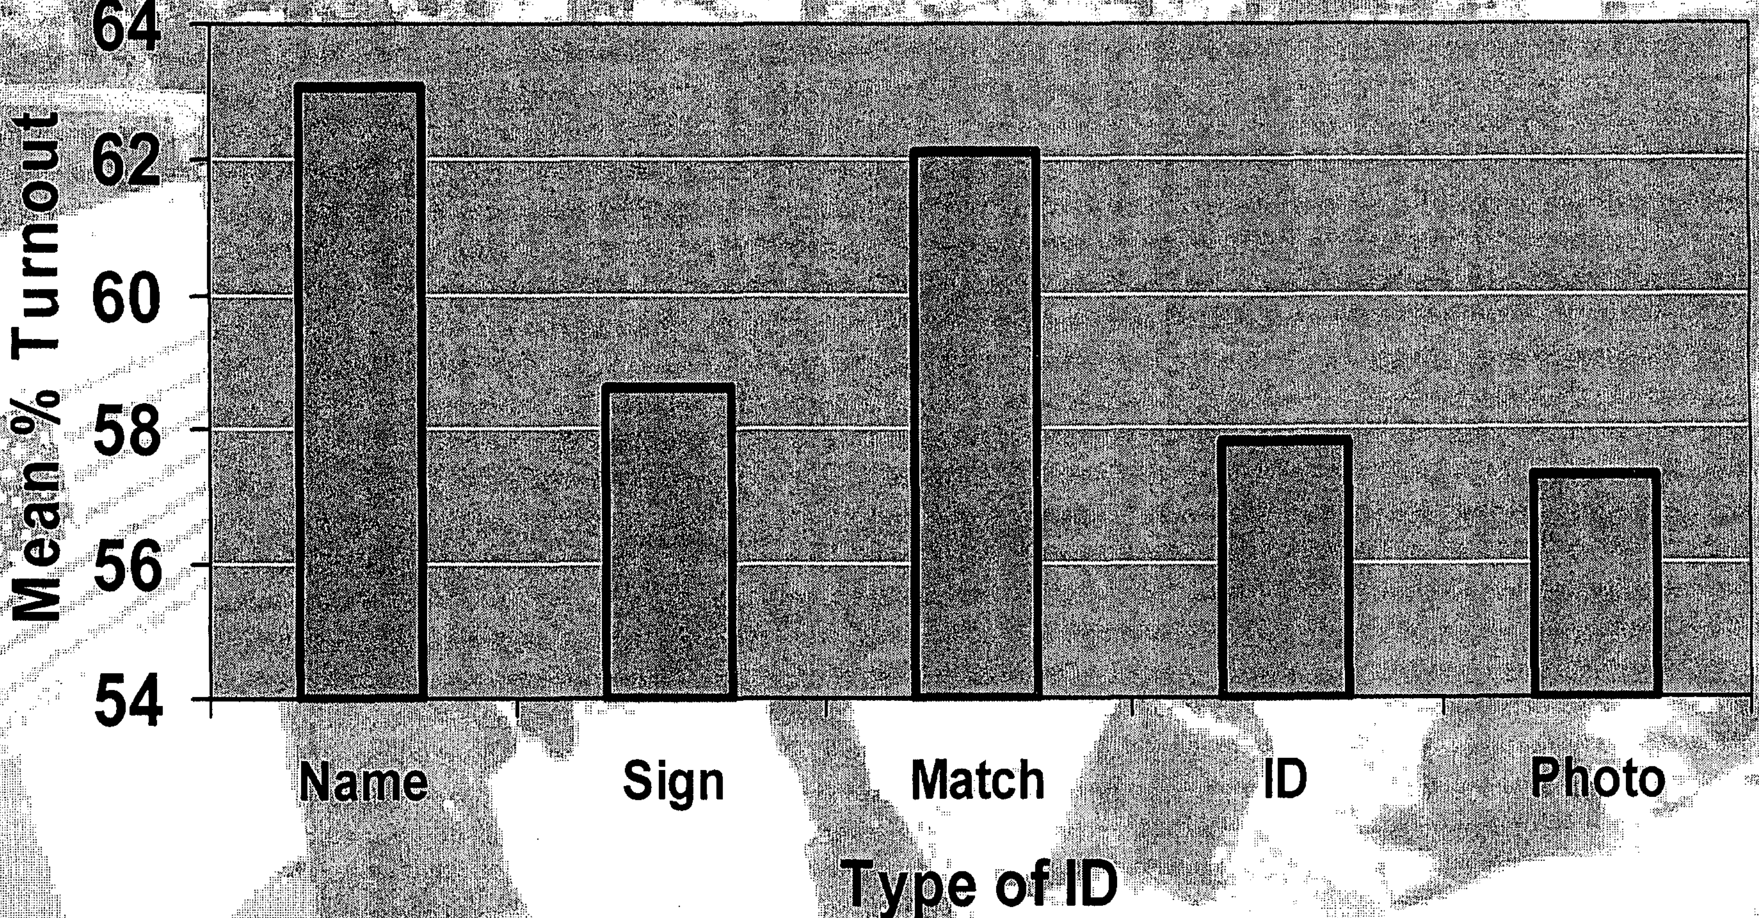


ID requirements affect turnout

Turnout declined with stricter voter ID requirements

- 63.1% of the voting age population turned out in states that required voters to state their names.
- 57.3% turned out in states that required photo ID.
- Including other factors beyond voter ID requirements diminishes the influence of voter ID on turnout.
- Reduction most noticeable in counties with many Hispanic residents or people below the poverty line.

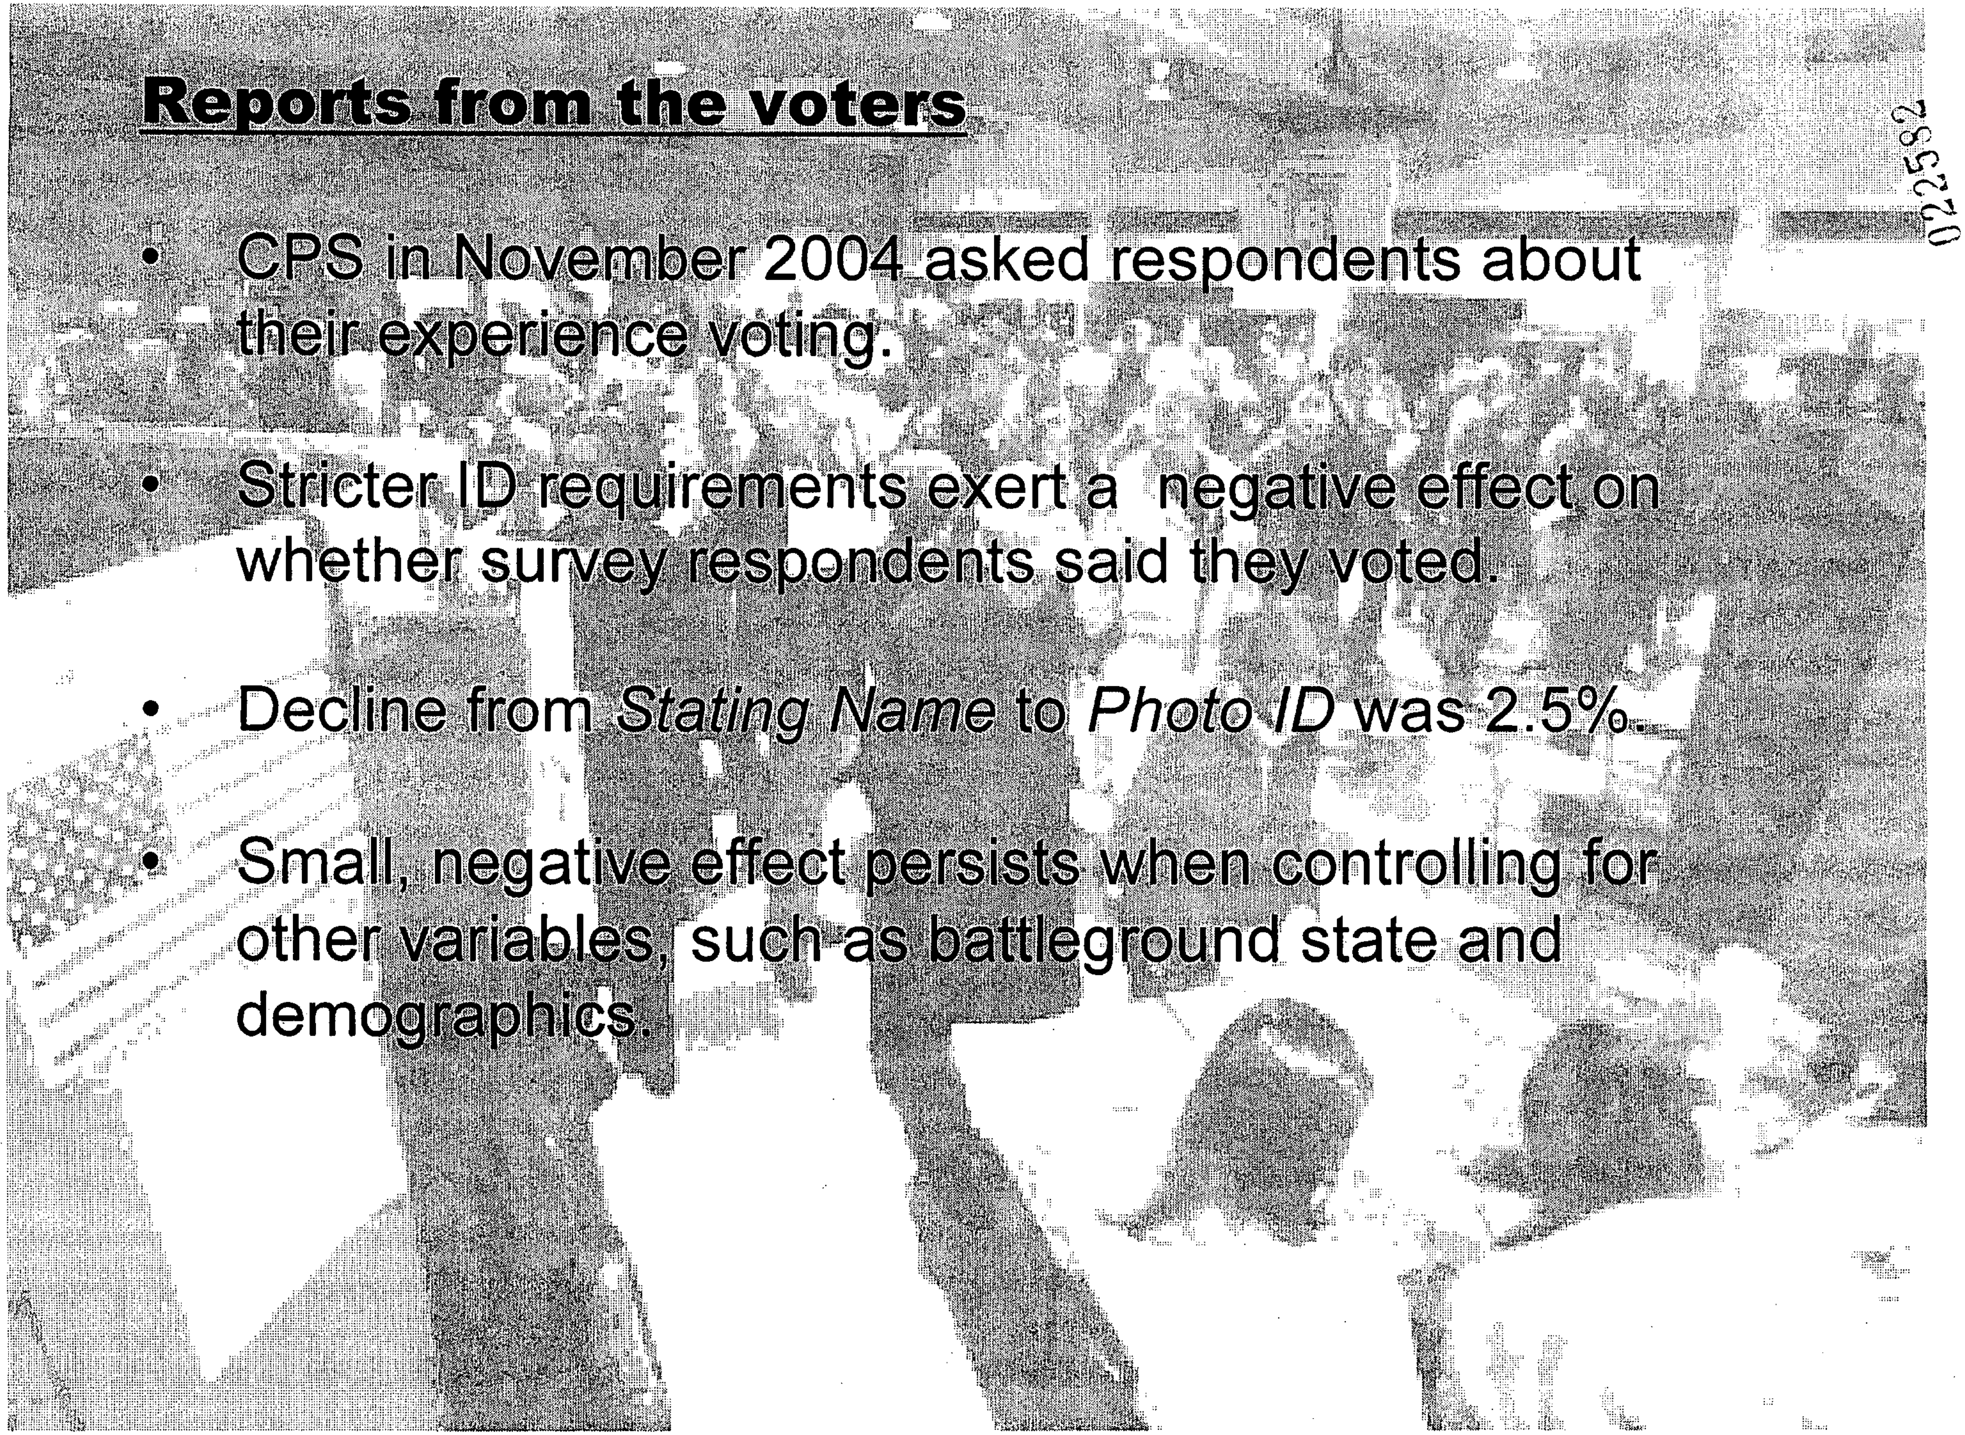
State Voter ID and Turnout



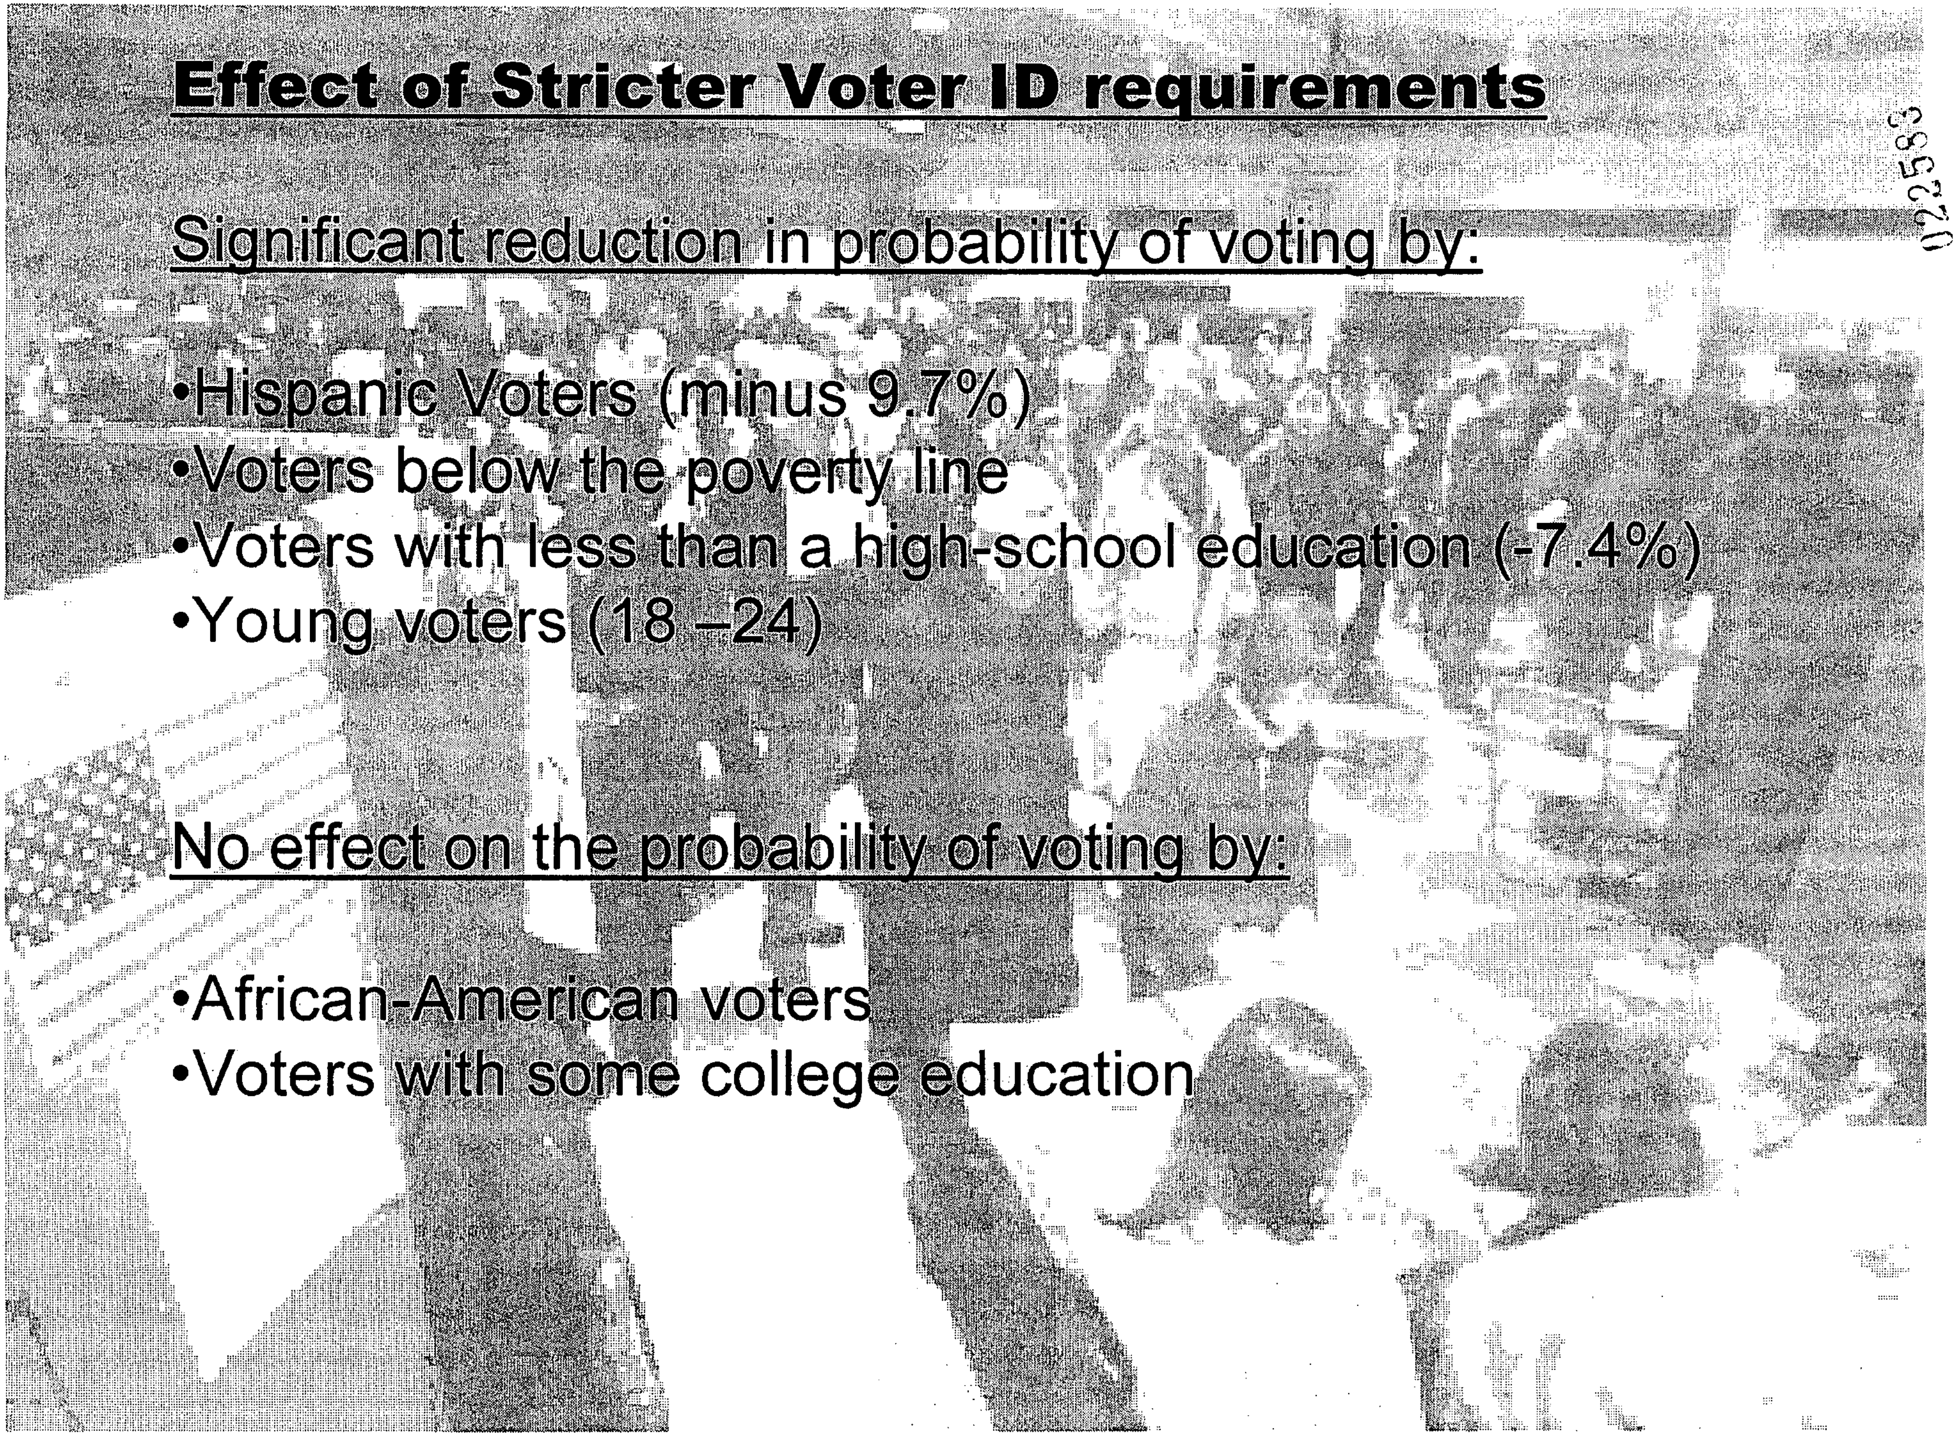
Variation in Turnout Based on Voter ID Requirements

Maximum Requirement		*Minimum Requirement*	
Voter Identification Required in the States	Mean Voter Turnout for States in that Category	*Voter Identification Required in the States*	*Mean Voter Turnout for States in that Category*
State Name	**63.1 %**	*State Name*	**61.3 %**
Sign Name	**58.6 %**	*Sign Name*	**60.4 %**
Match Signature	**62.1 %**	*Match Signature*	**59.2 %**
Provide Non-Photo ID	**57.8 %**	*Provide Non-Photo ID*	**57.6 %**
Provide Photo ID	**57.3 %**	*Swear Affidavit*	**58.7 %**
Average Turnout (All States)	**59.6 %**		

Reports from the voters



- CPS in November 2004 asked respondents about their experience voting.
- Stricter ID requirements exert a negative effect on whether survey respondents said they voted.
- Decline from *Stating Name* to *Photo ID* was 2.5%.
- Small, negative effect persists when controlling for other variables, such as battleground state and demographics.



Effect of Stricter Voter ID requirements

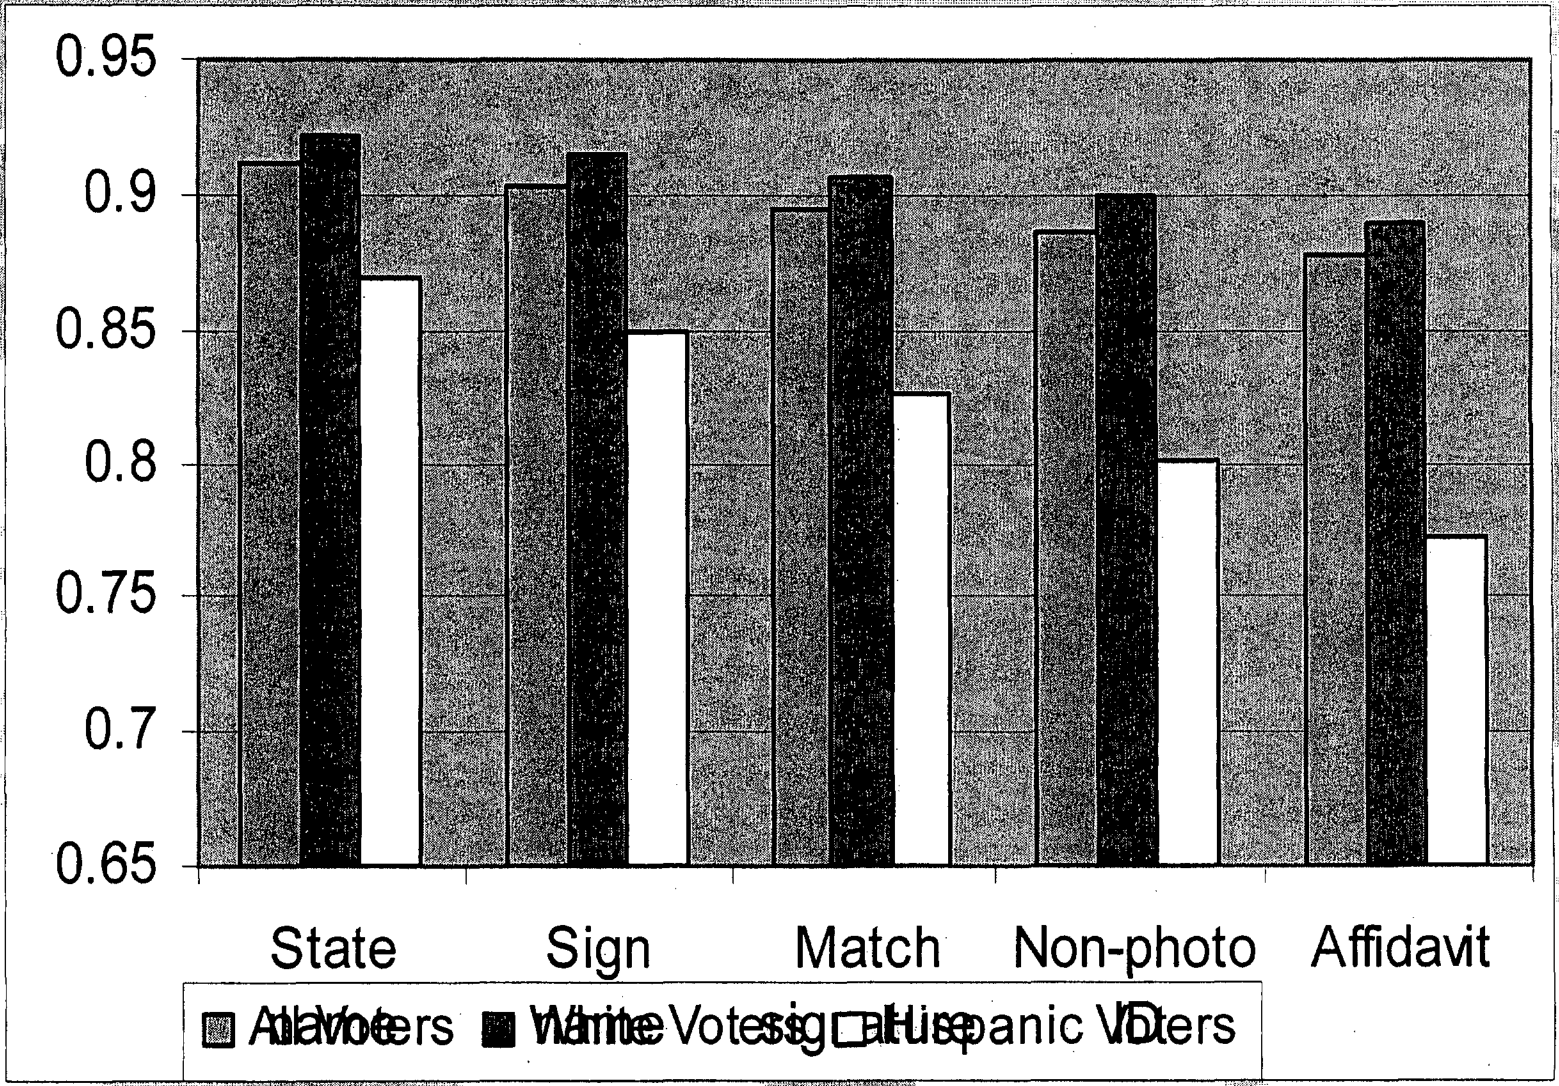
Significant reduction in probability of voting by:

- Hispanic Voters (minus 9.7%)
- Voters below the poverty line
- Voters with less than a high-school education (-7.4%)
- Young voters (18 –24)

No effect on the probability of voting by:

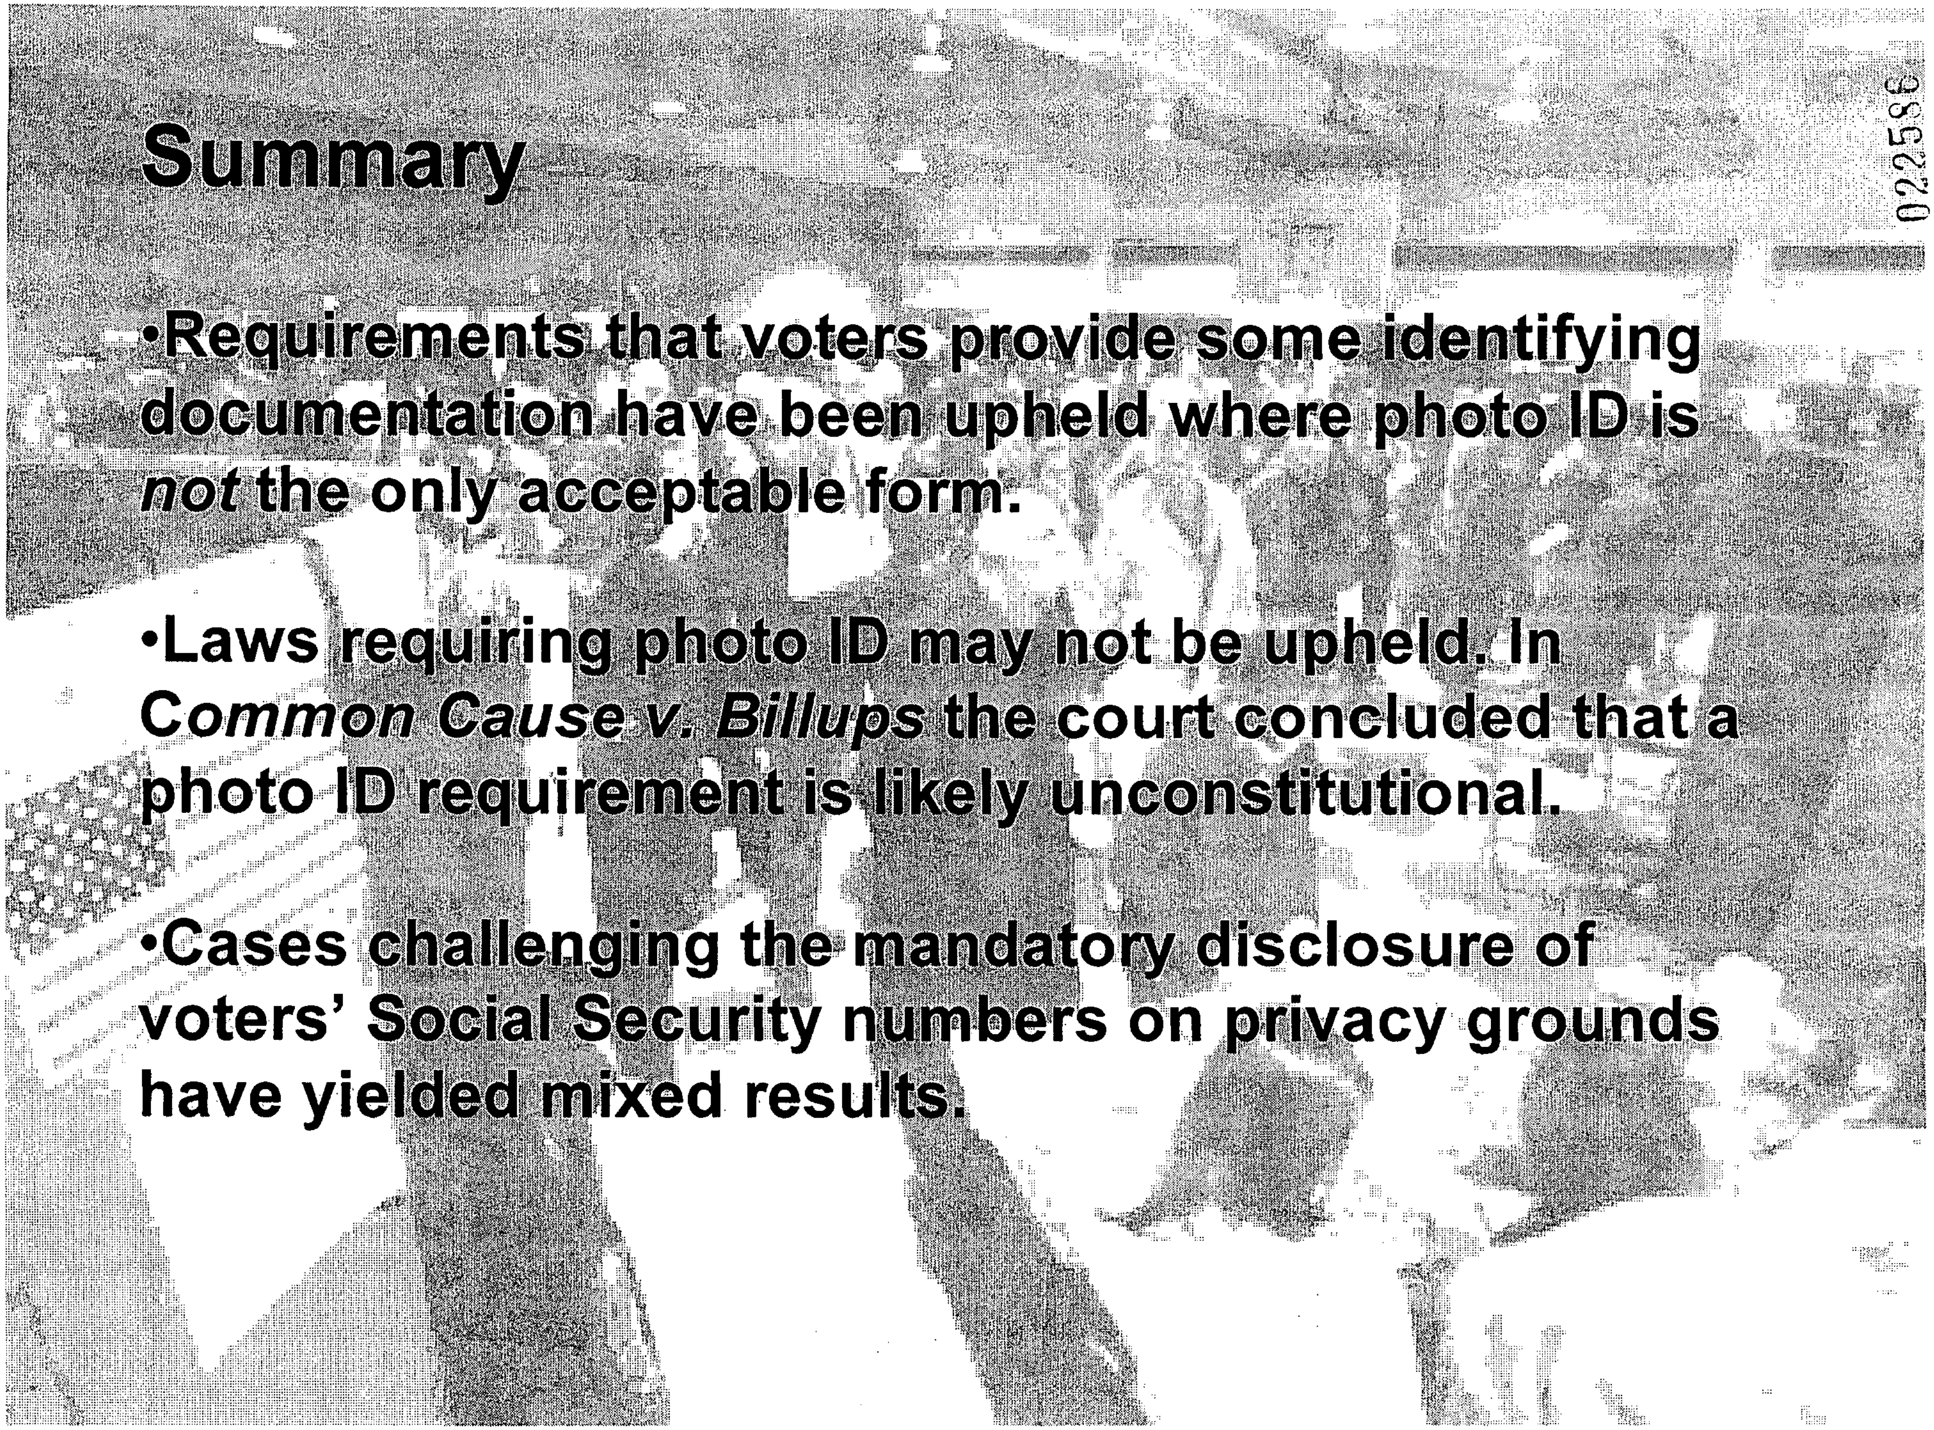
- African-American voters
- Voters with some college education

Voter Turnout By Minimum ID Requirement



Trends in Litigation

Dan Tokaji

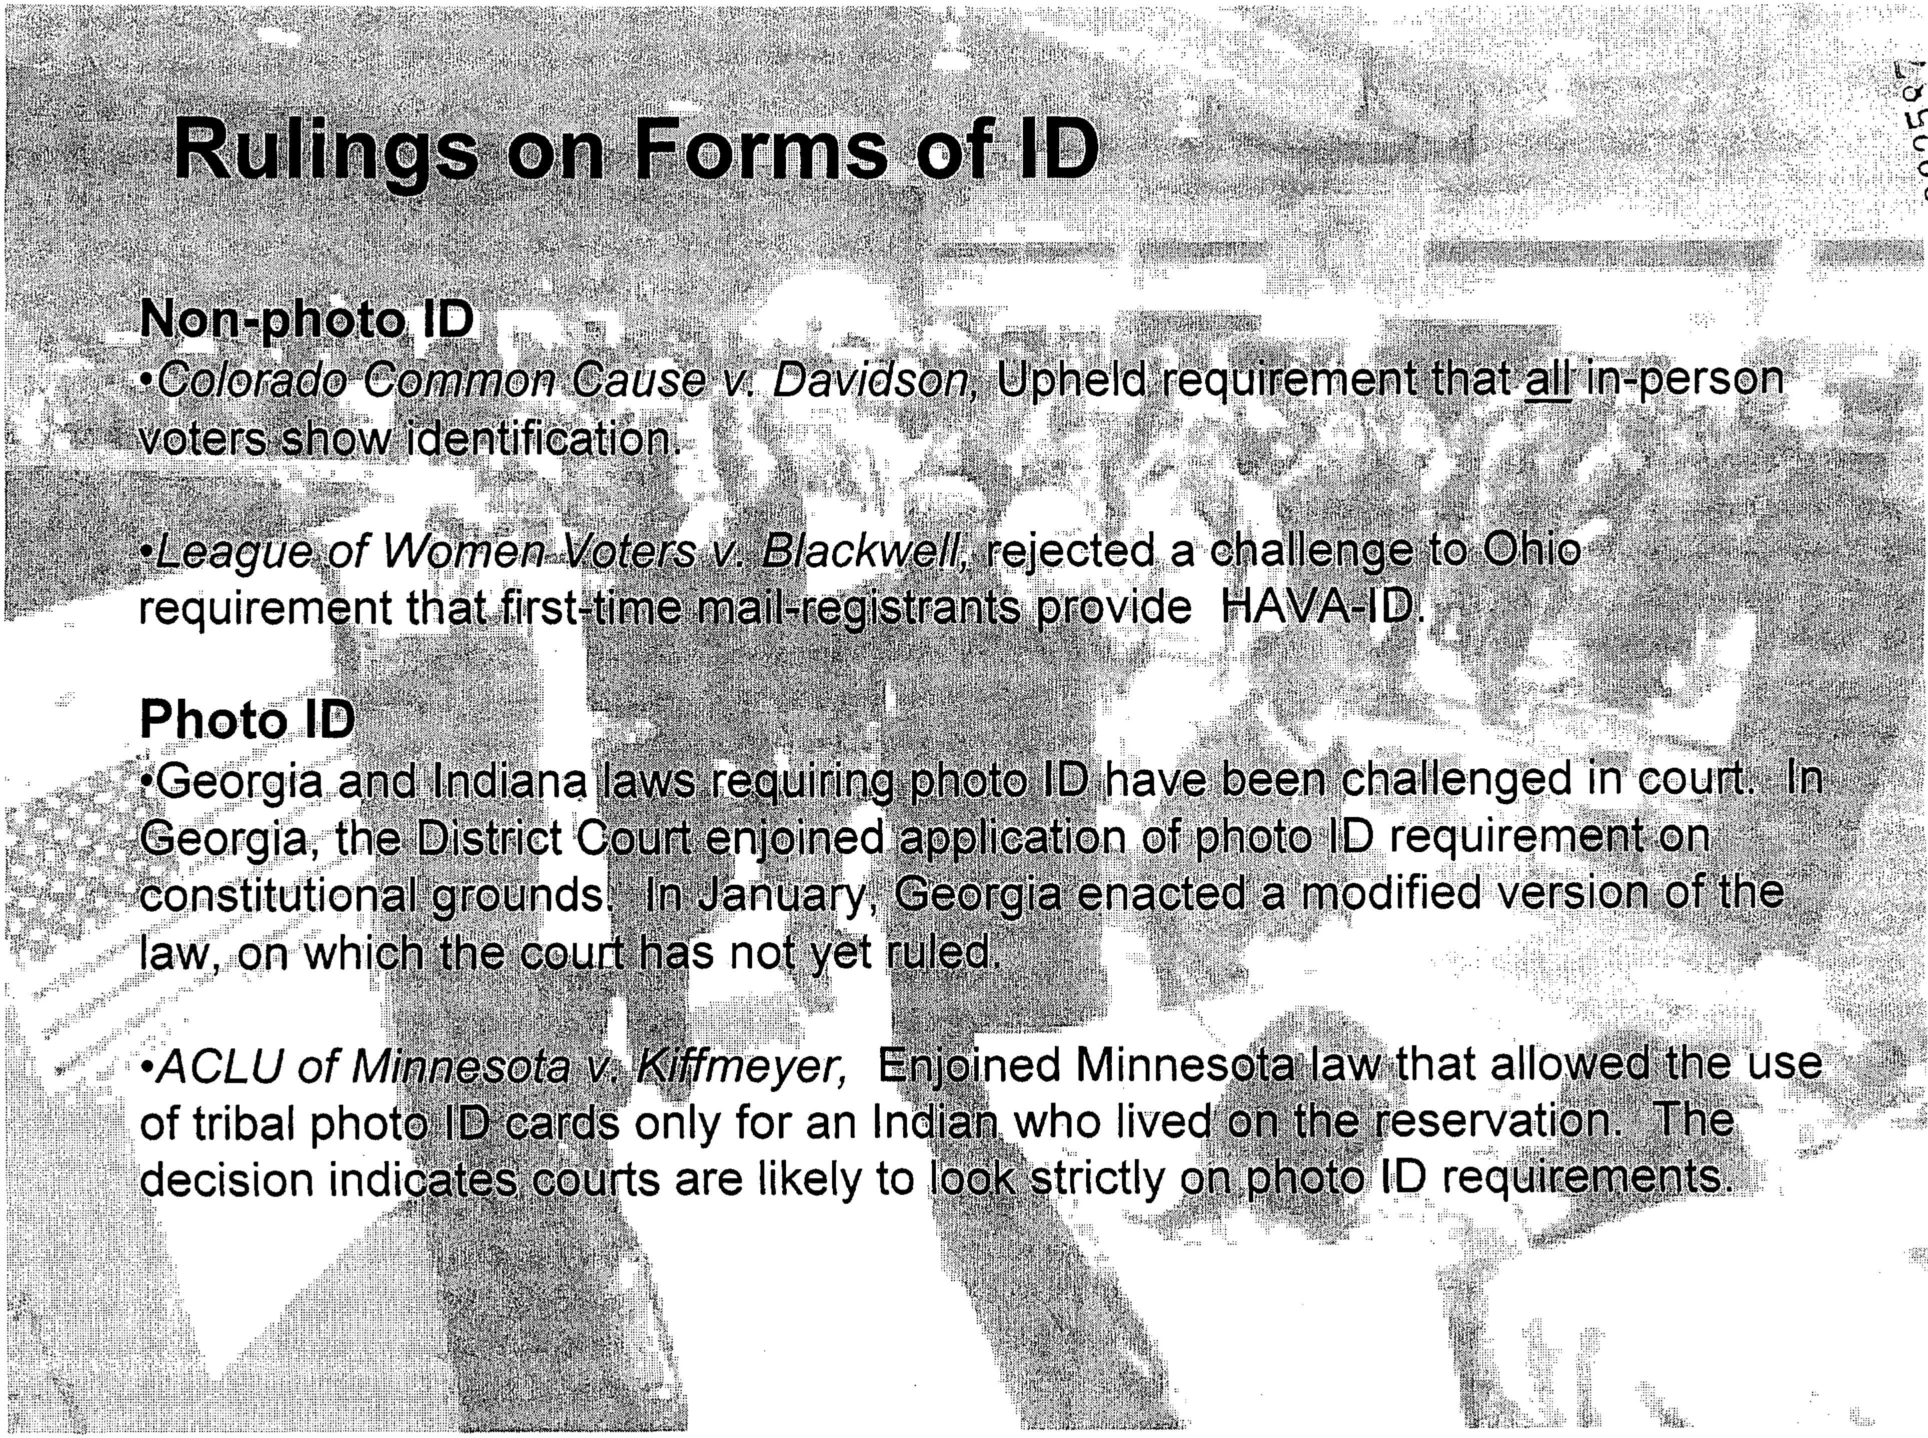


Summary

- Requirements that voters provide some identifying documentation have been upheld where photo ID is *not* the only acceptable form.

- Laws requiring photo ID may not be upheld. In *Common Cause v. Billups* the court concluded that a photo ID requirement is likely unconstitutional.

- Cases challenging the mandatory disclosure of voters' Social Security numbers on privacy grounds have yielded mixed results.



Rulings on Forms of ID

Non-photo ID

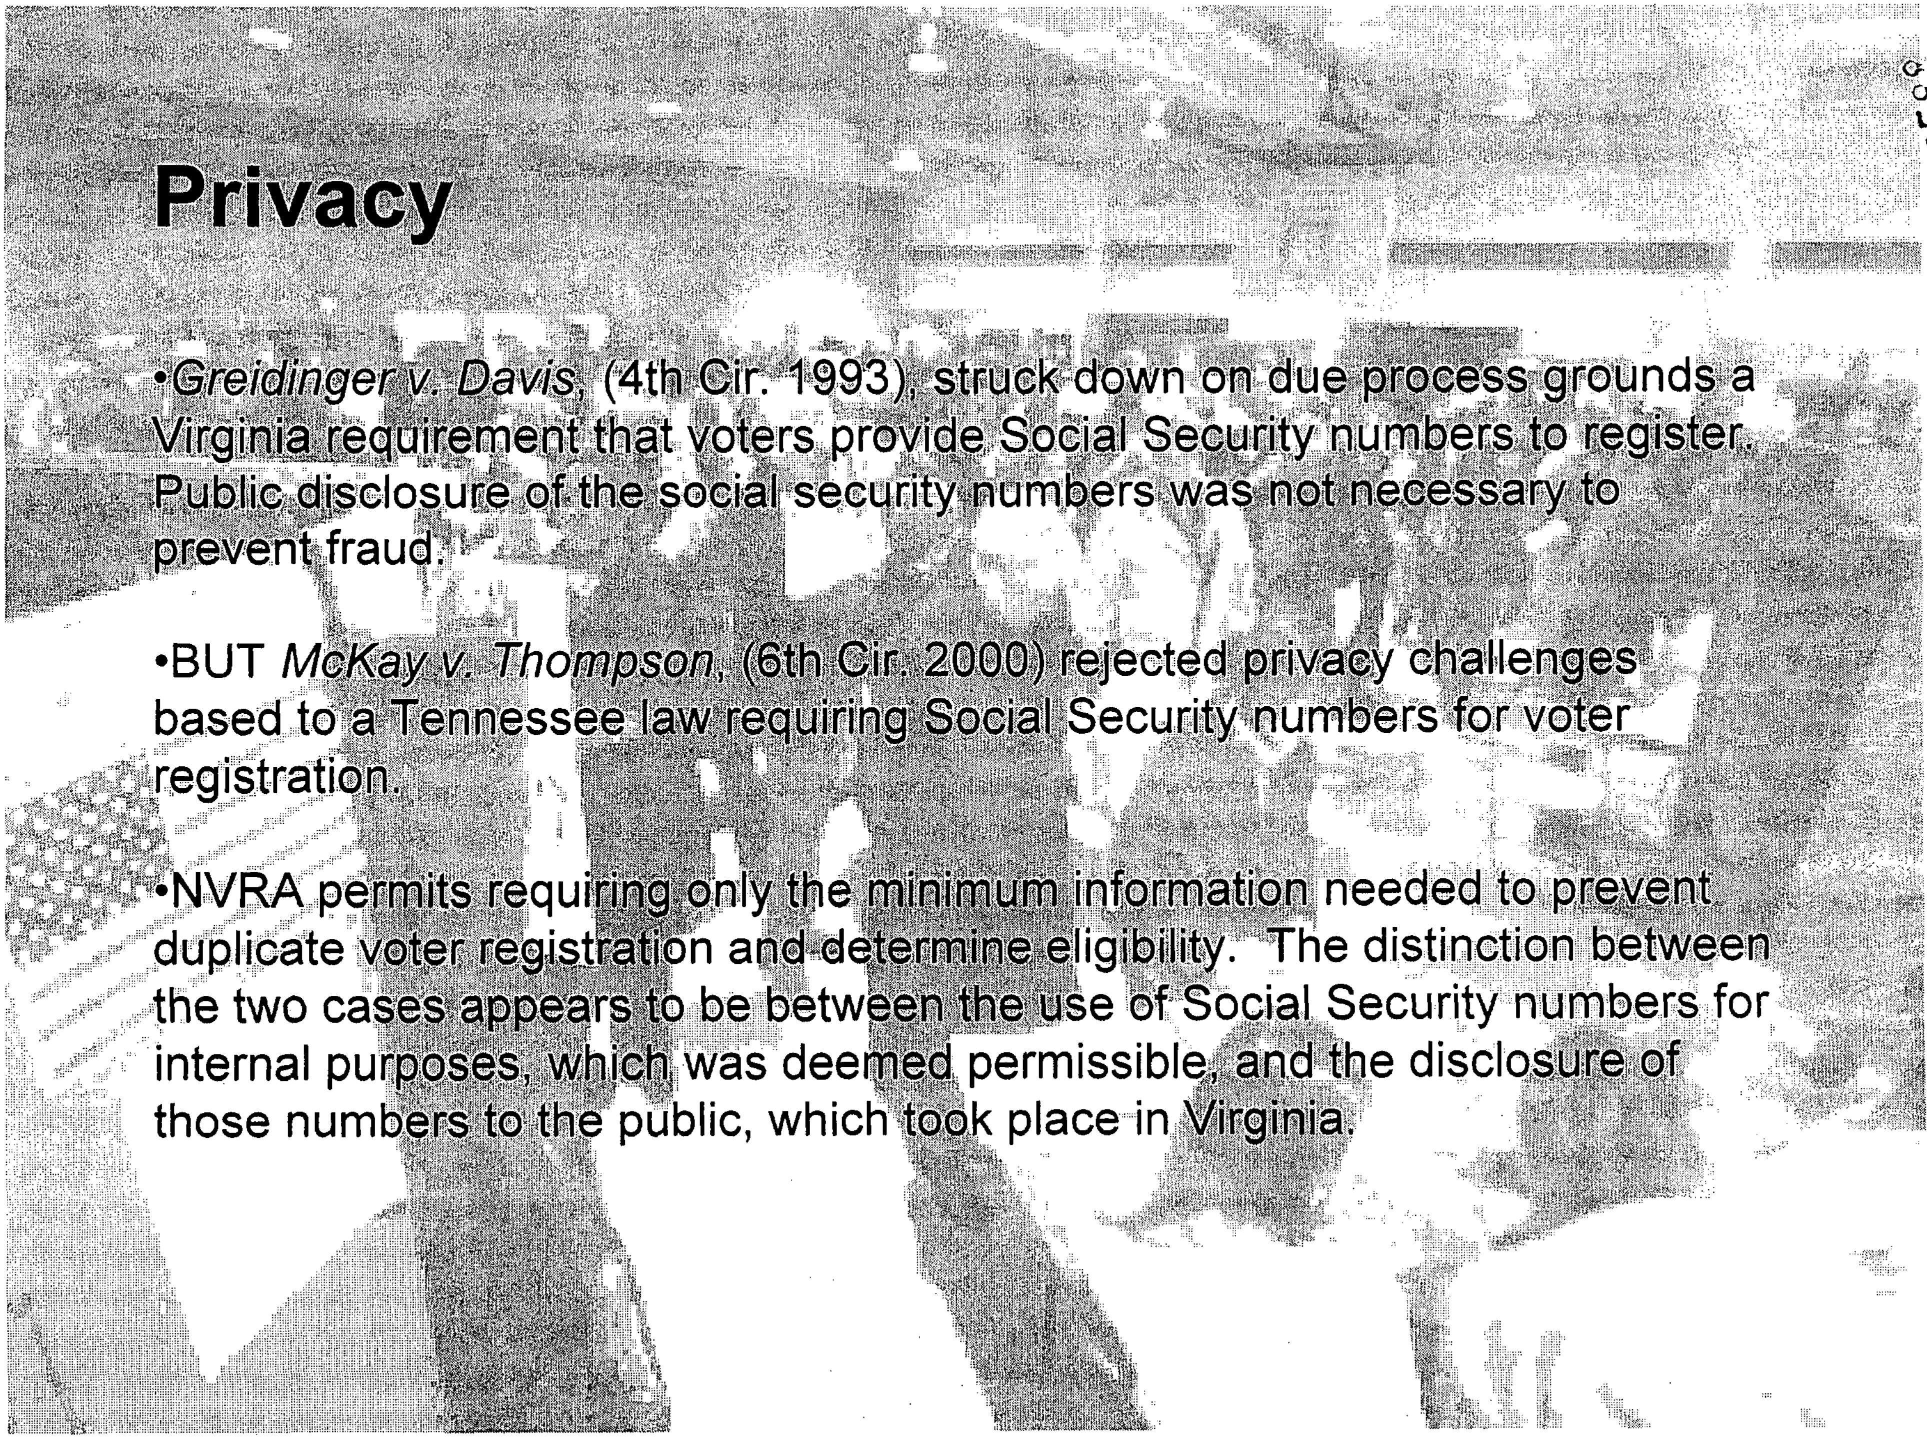
- *Colorado Common Cause v. Davidson,* Upheld requirement that <u>all</u> in-person voters show identification.

- *League of Women Voters v. Blackwell,* rejected a challenge to Ohio requirement that first-time mail-registrants provide HAVA-ID.

Photo ID

- Georgia and Indiana laws requiring photo ID have been challenged in court. In Georgia, the District Court enjoined application of photo ID requirement on constitutional grounds. In January, Georgia enacted a modified version of the law, on which the court has not yet ruled.

- *ACLU of Minnesota v. Kiffmeyer,* Enjoined Minnesota law that allowed the use of tribal photo ID cards only for an Indian who lived on the reservation. The decision indicates courts are likely to look strictly on photo ID requirements.

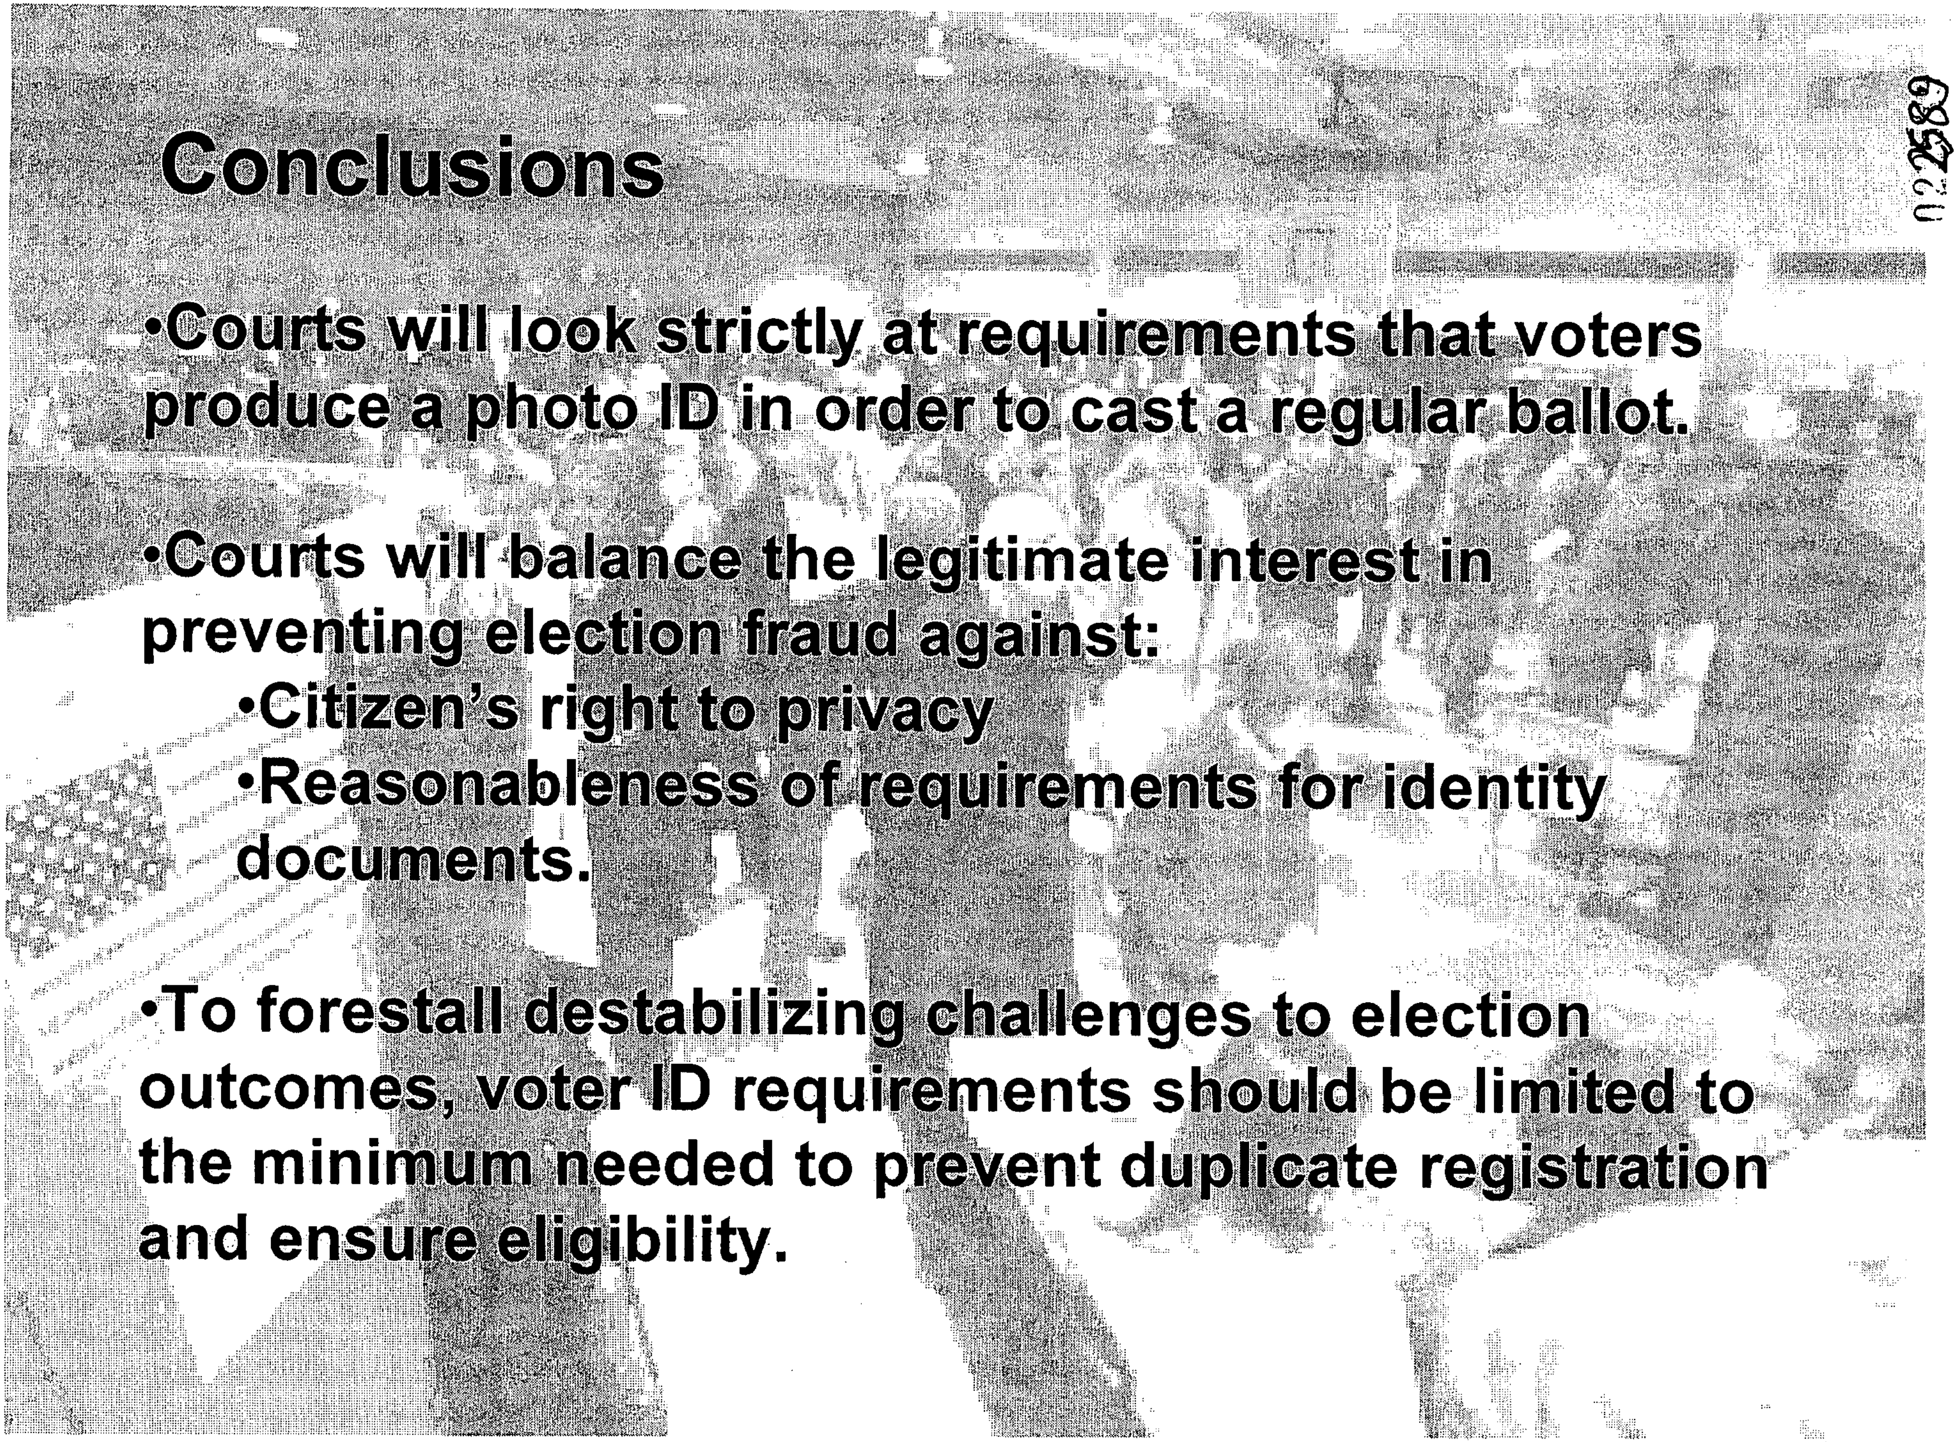


Privacy

- *Greidinger v. Davis*, (4th Cir. 1993), struck down on due process grounds a Virginia requirement that voters provide Social Security numbers to register. Public disclosure of the social security numbers was not necessary to prevent fraud.

- BUT *McKay v. Thompson*, (6th Cir. 2000) rejected privacy challenges based to a Tennessee law requiring Social Security numbers for voter registration.

- NVRA permits requiring only the minimum information needed to prevent duplicate voter registration and determine eligibility. The distinction between the two cases appears to be between the use of Social Security numbers for internal purposes, which was deemed permissible, and the disclosure of those numbers to the public, which took place in Virginia.

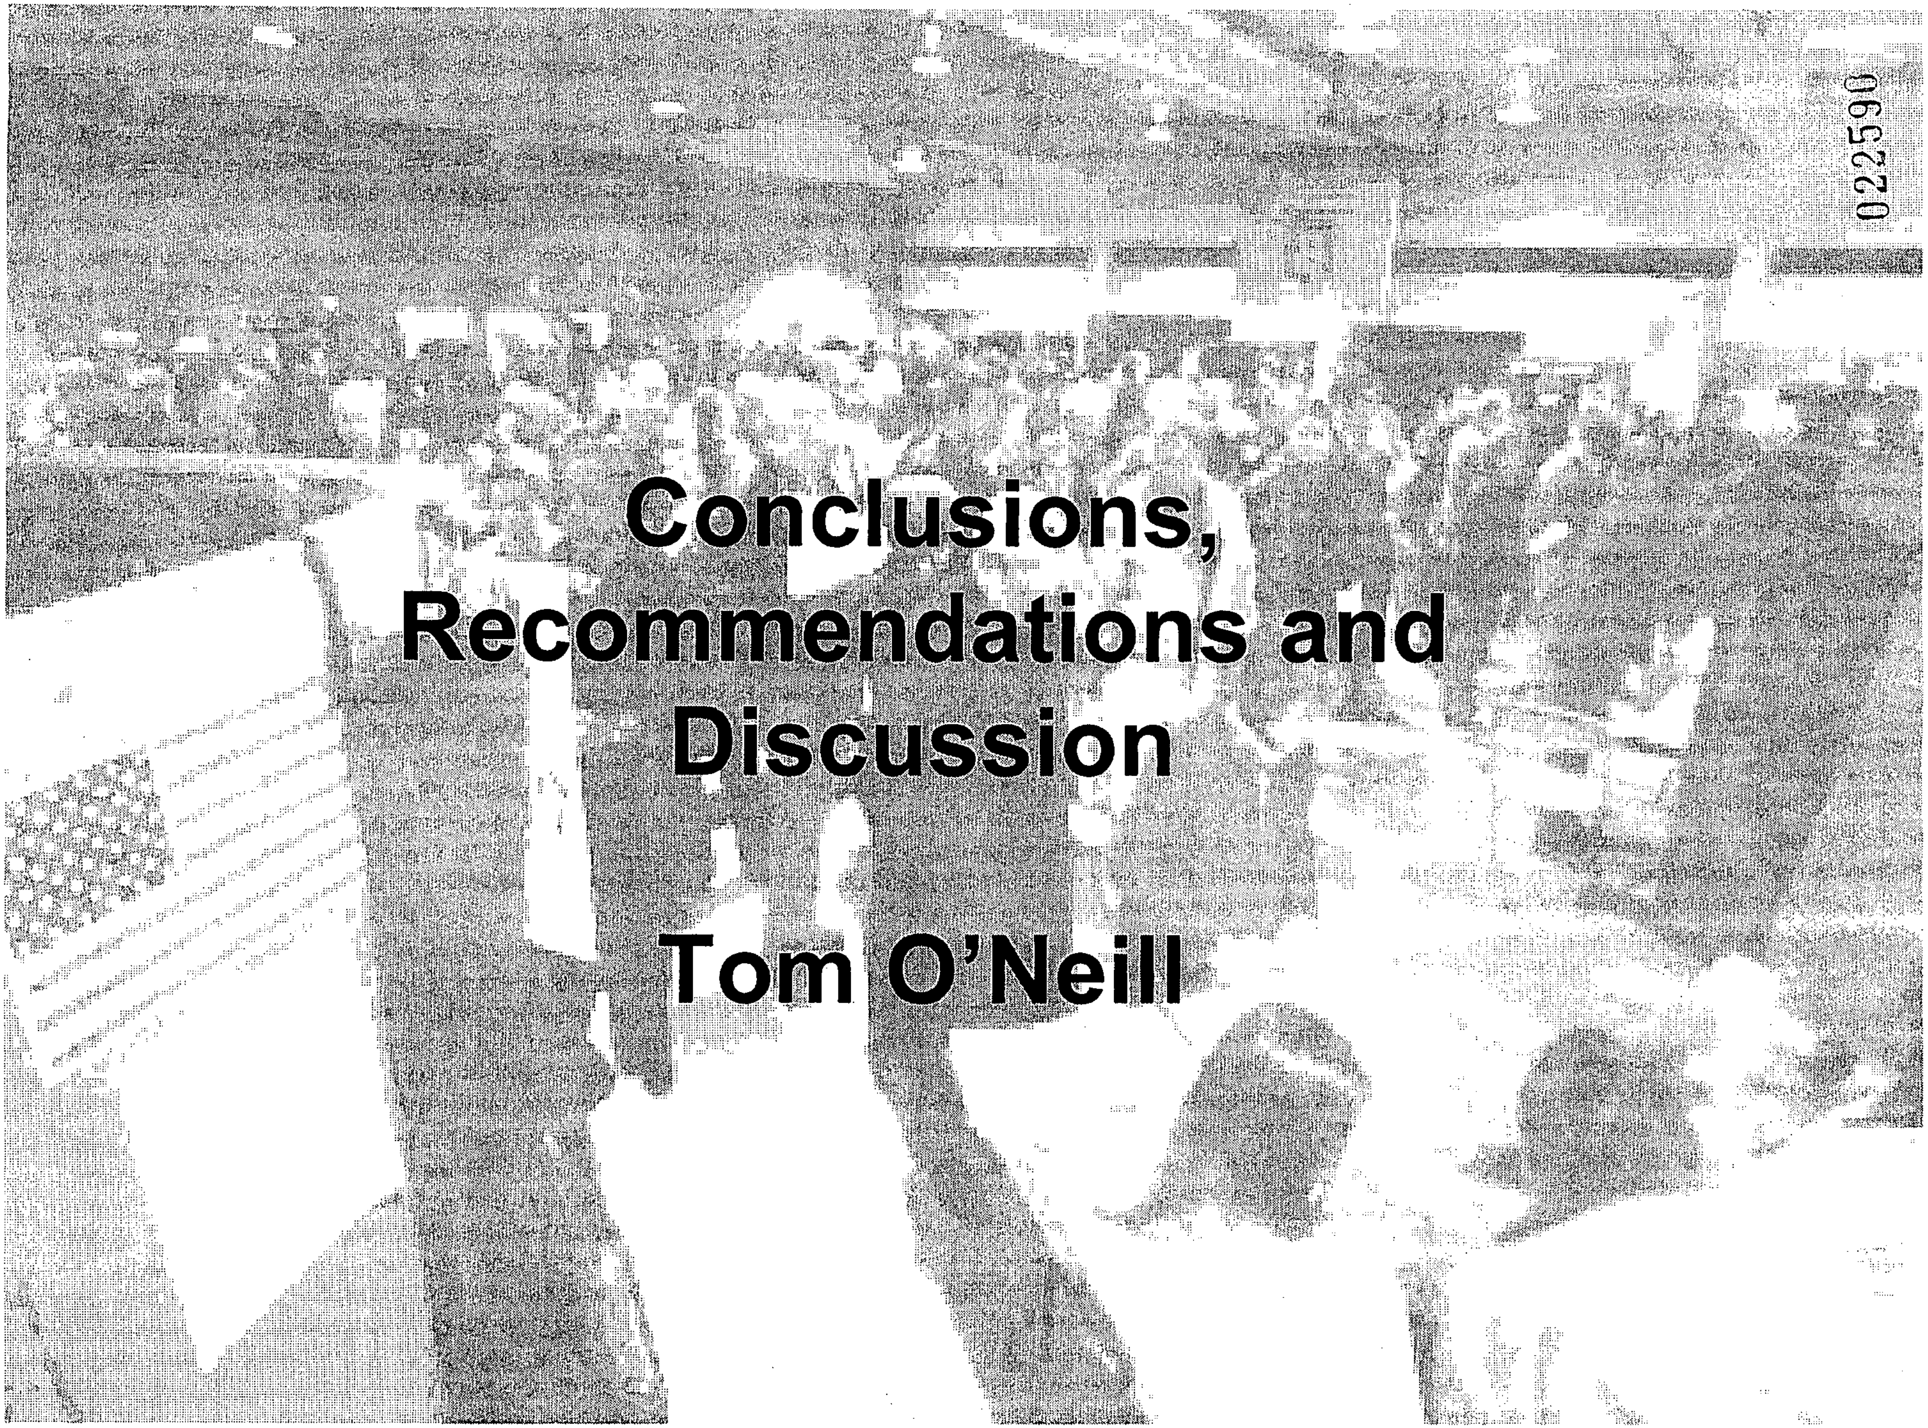


Conclusions

- Courts will look strictly at requirements that voters produce a photo ID in order to cast a regular ballot.

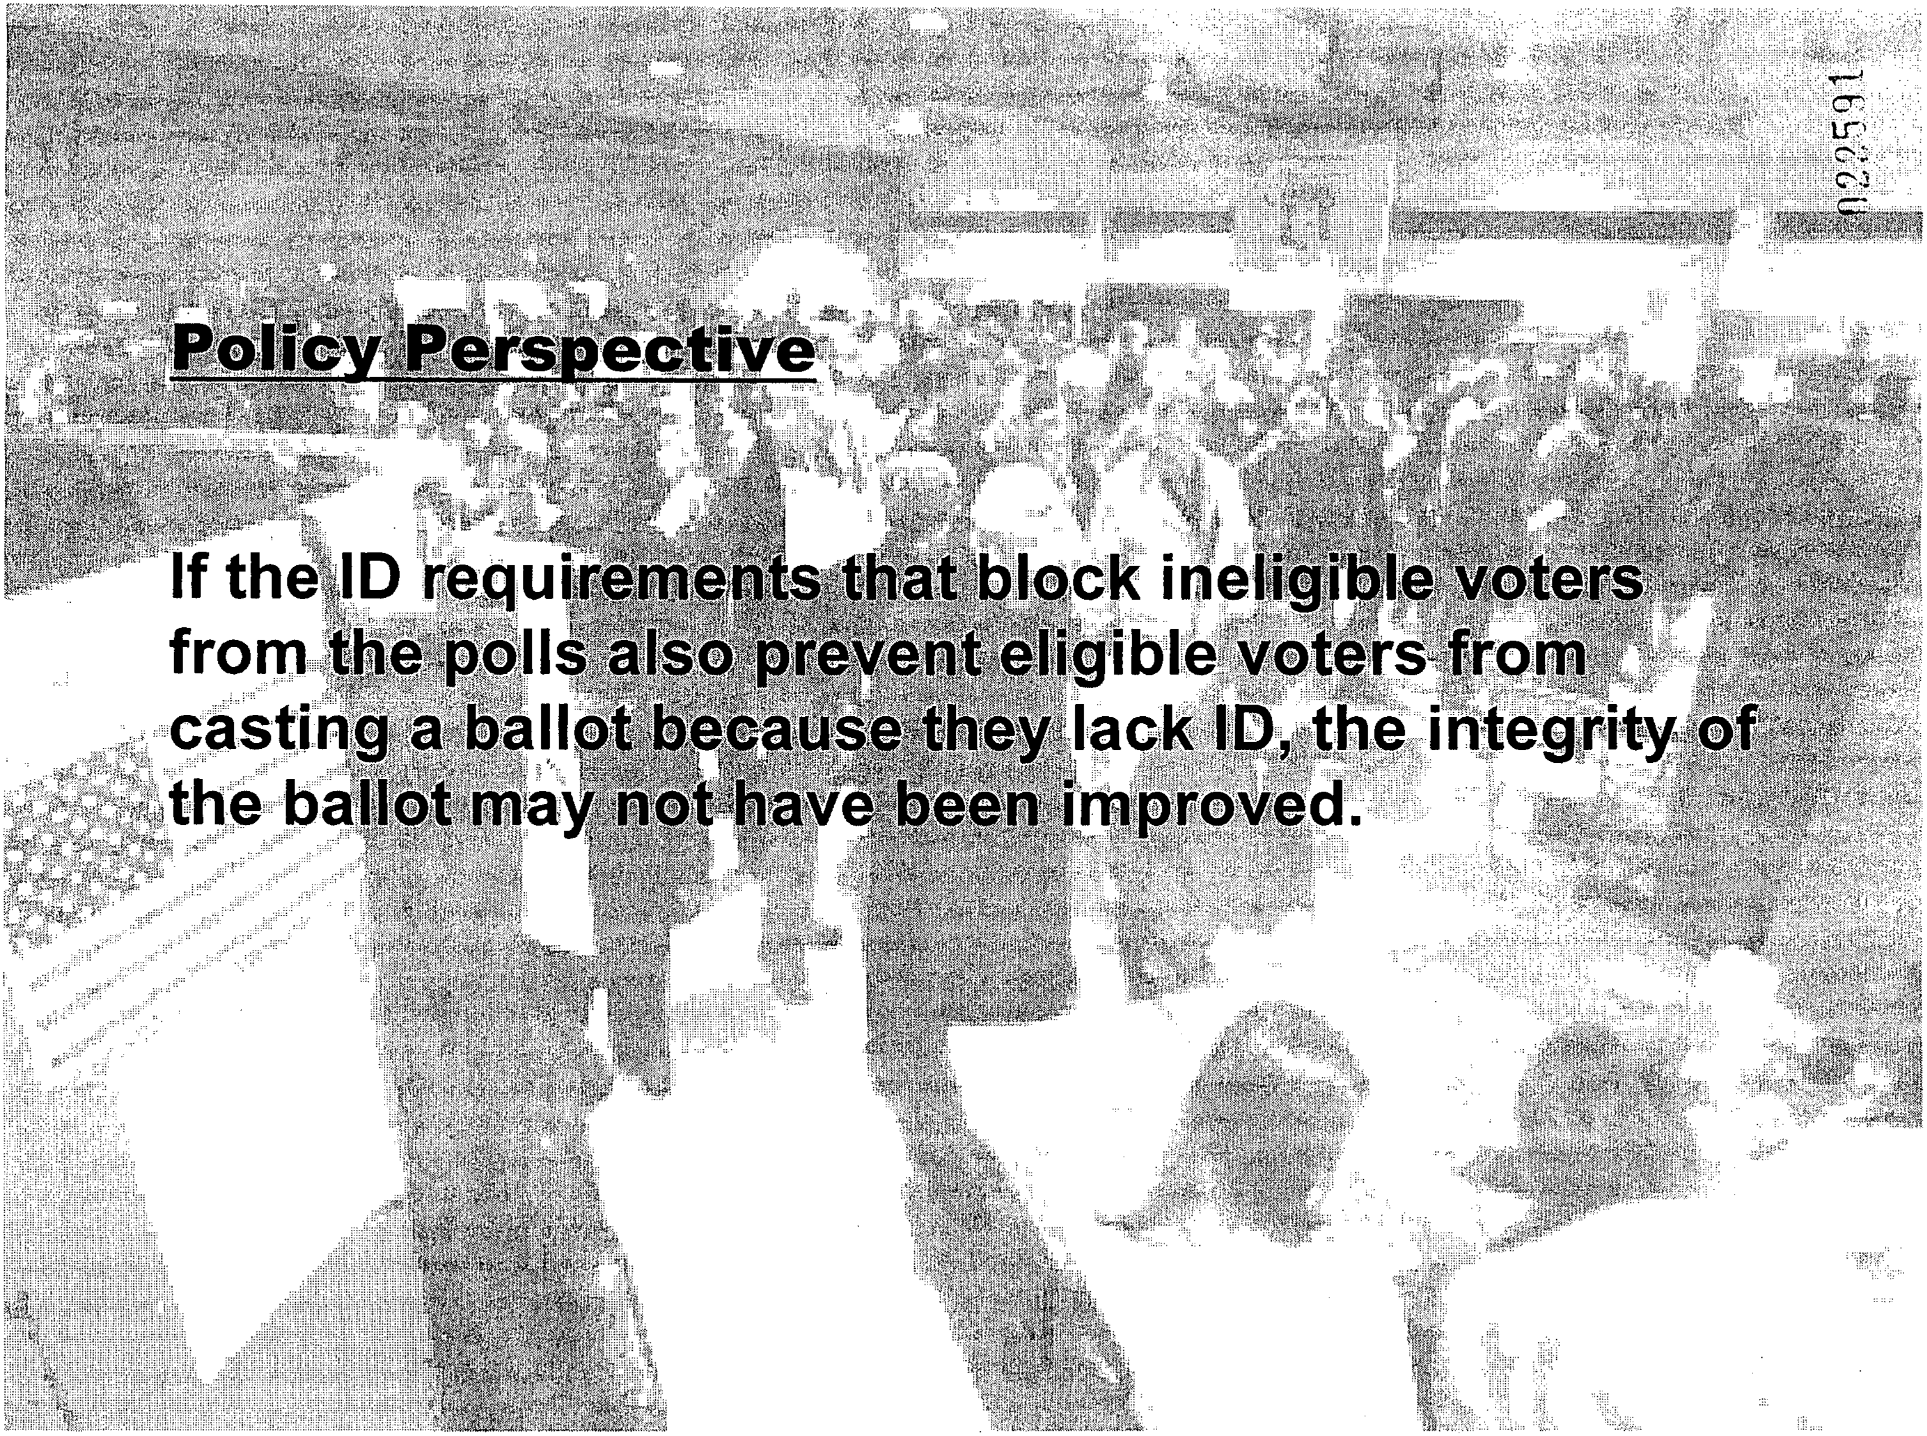
- Courts will balance the legitimate interest in preventing election fraud against:
  - Citizen's right to privacy
  - Reasonableness of requirements for identity documents.

- To forestall destabilizing challenges to election outcomes, voter ID requirements should be limited to the minimum needed to prevent duplicate registration and ensure eligibility.



Conclusions, Recommendations and Discussion

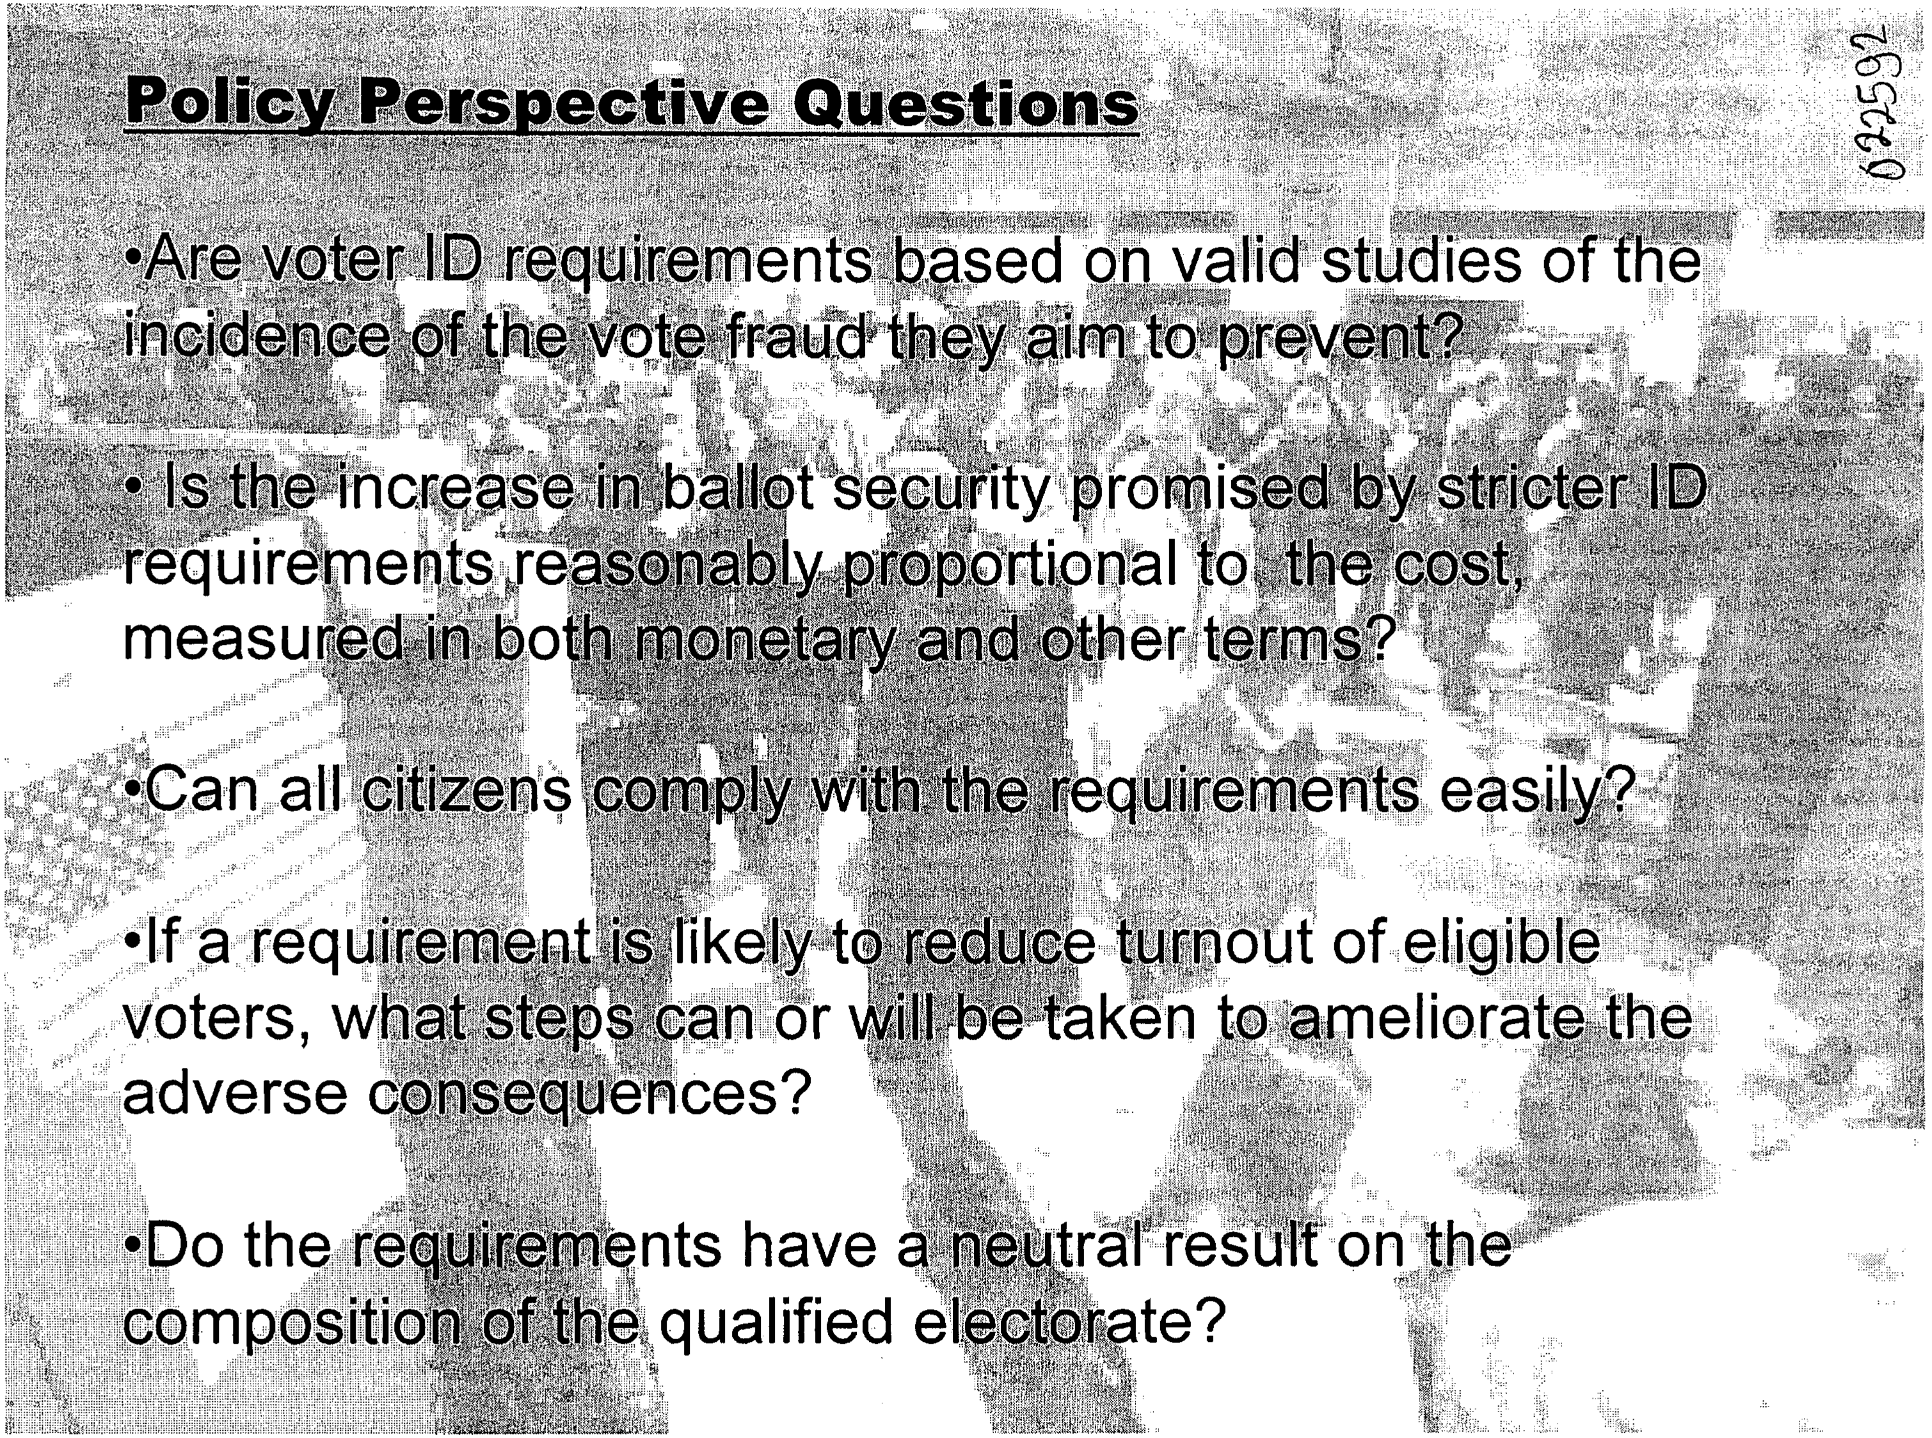
Tom O'Neill



Policy Perspective

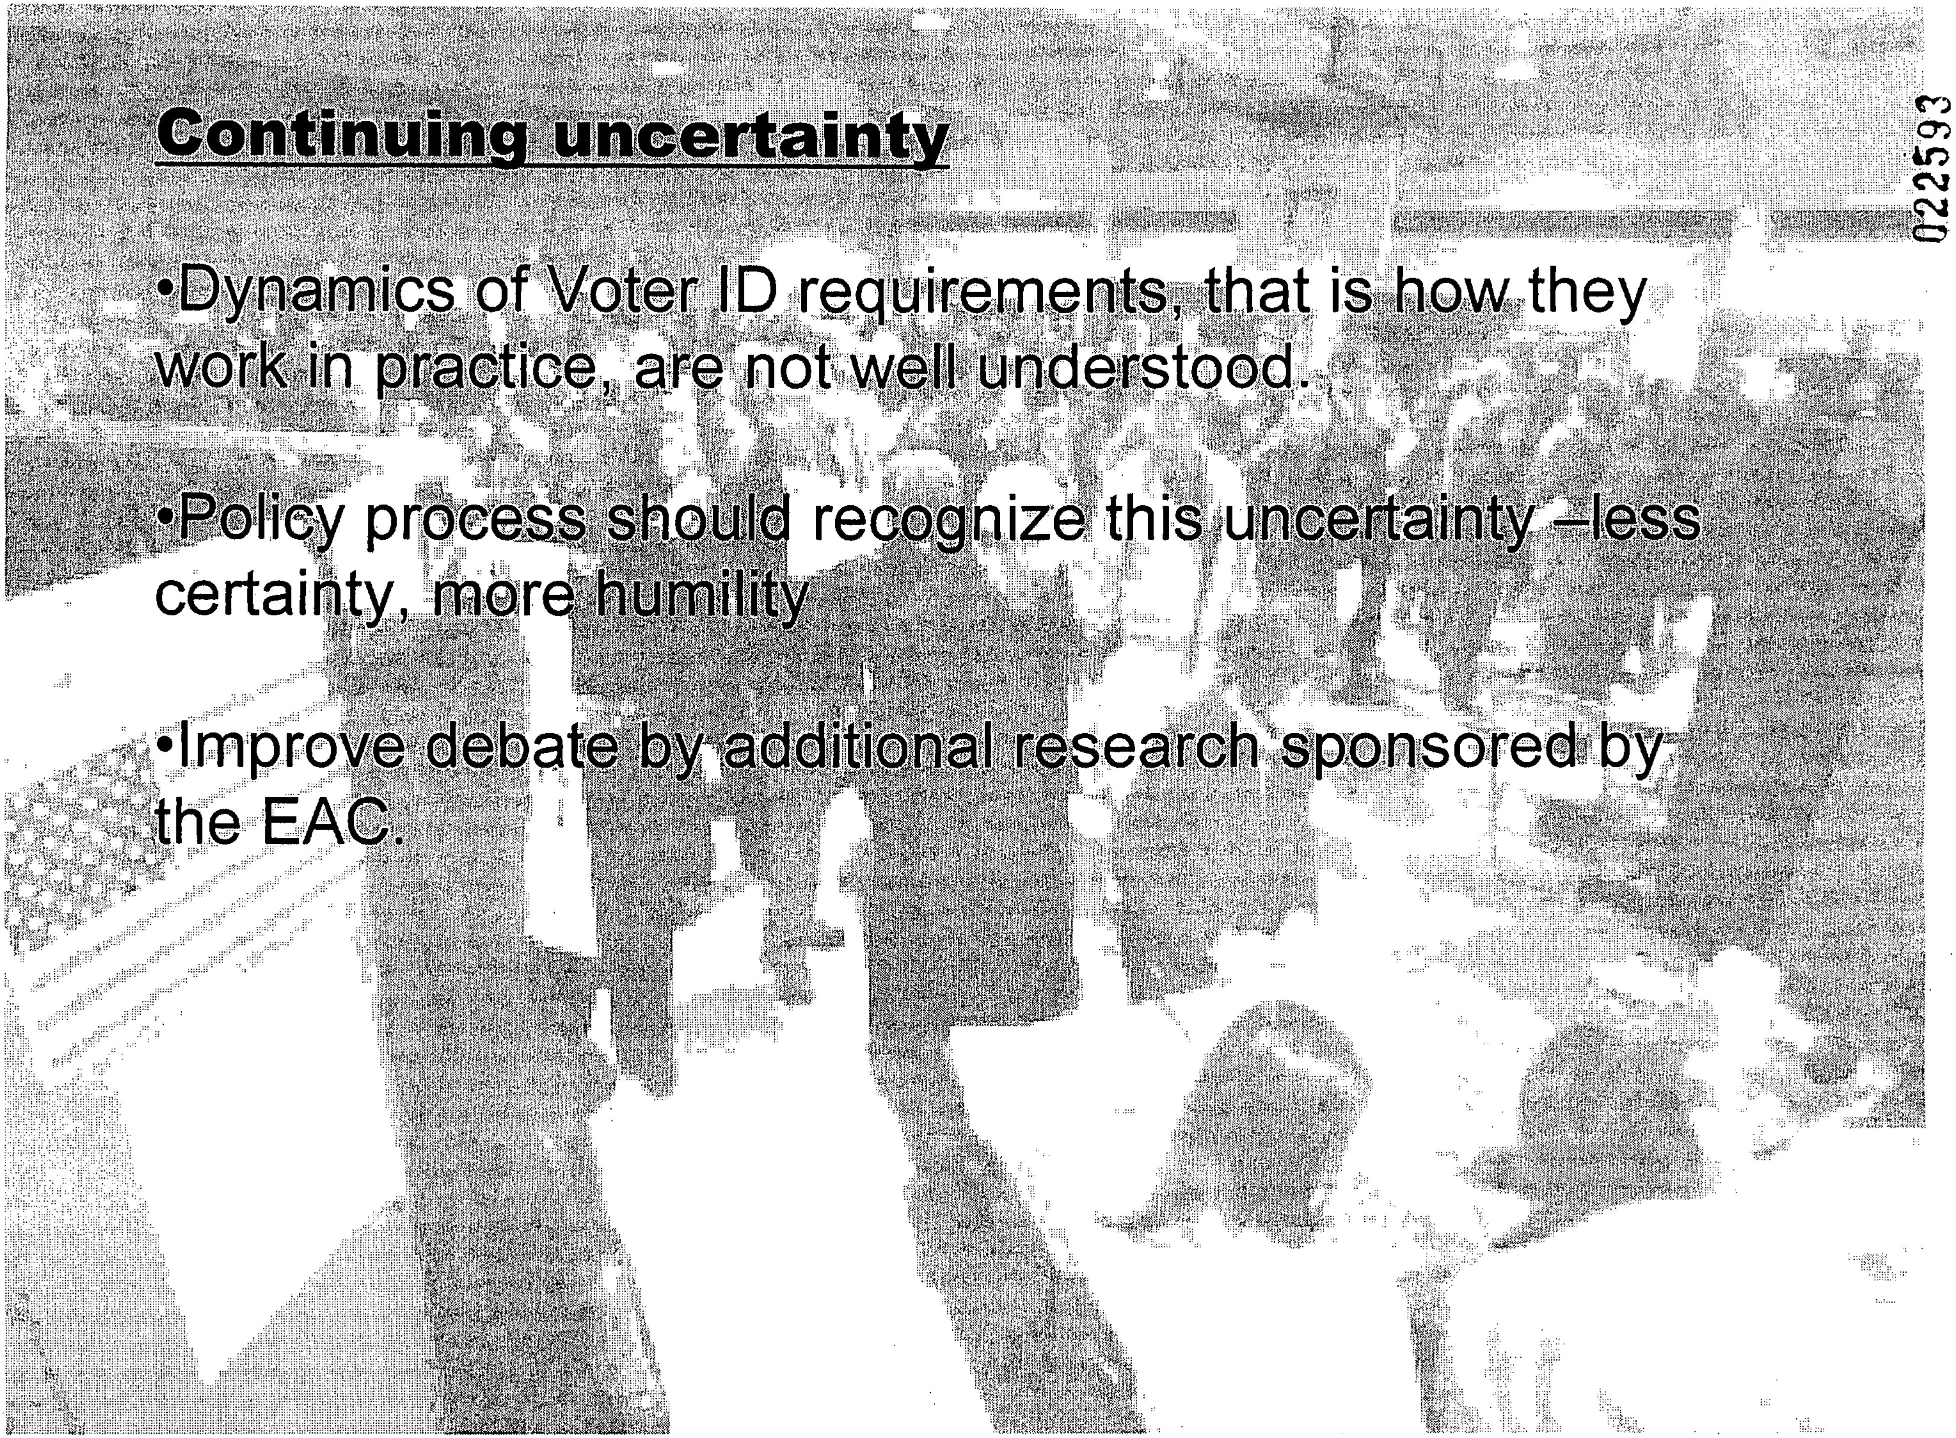
If the ID requirements that block ineligible voters from the polls also prevent eligible voters from casting a ballot because they lack ID, the integrity of the ballot may not have been improved.

Policy Perspective Questions

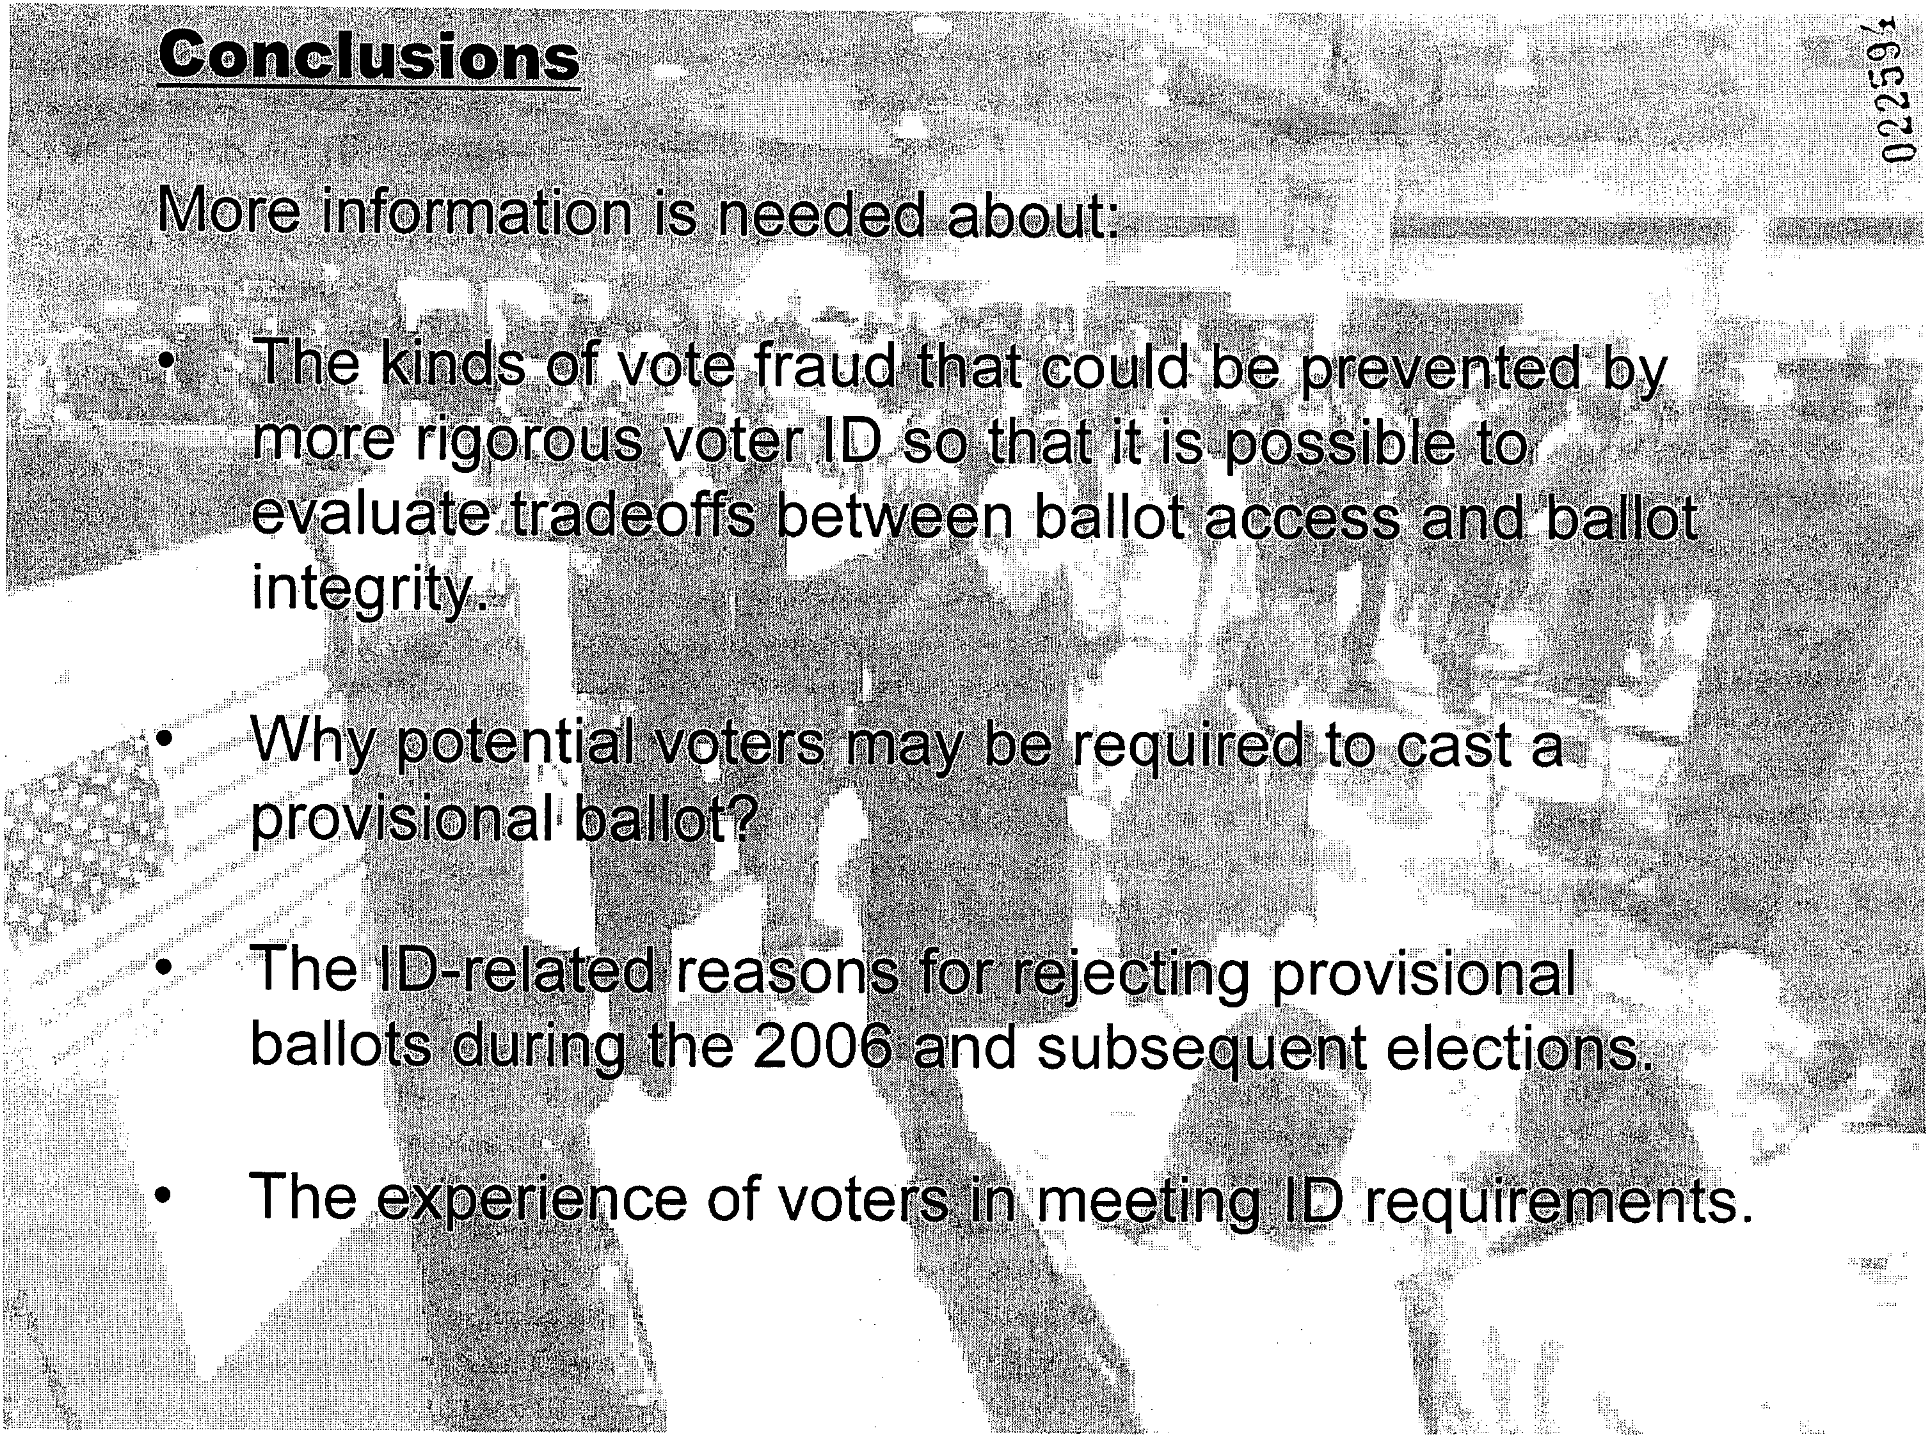


- Are voter ID requirements based on valid studies of the incidence of the vote fraud they aim to prevent?
- Is the increase in ballot security promised by stricter ID requirements reasonably proportional to the cost, measured in both monetary and other terms?
- Can all citizens comply with the requirements easily?
- If a requirement is likely to reduce turnout of eligible voters, what steps can or will be taken to ameliorate the adverse consequences?
- Do the requirements have a neutral result on the composition of the qualified electorate?

Continuing uncertainty



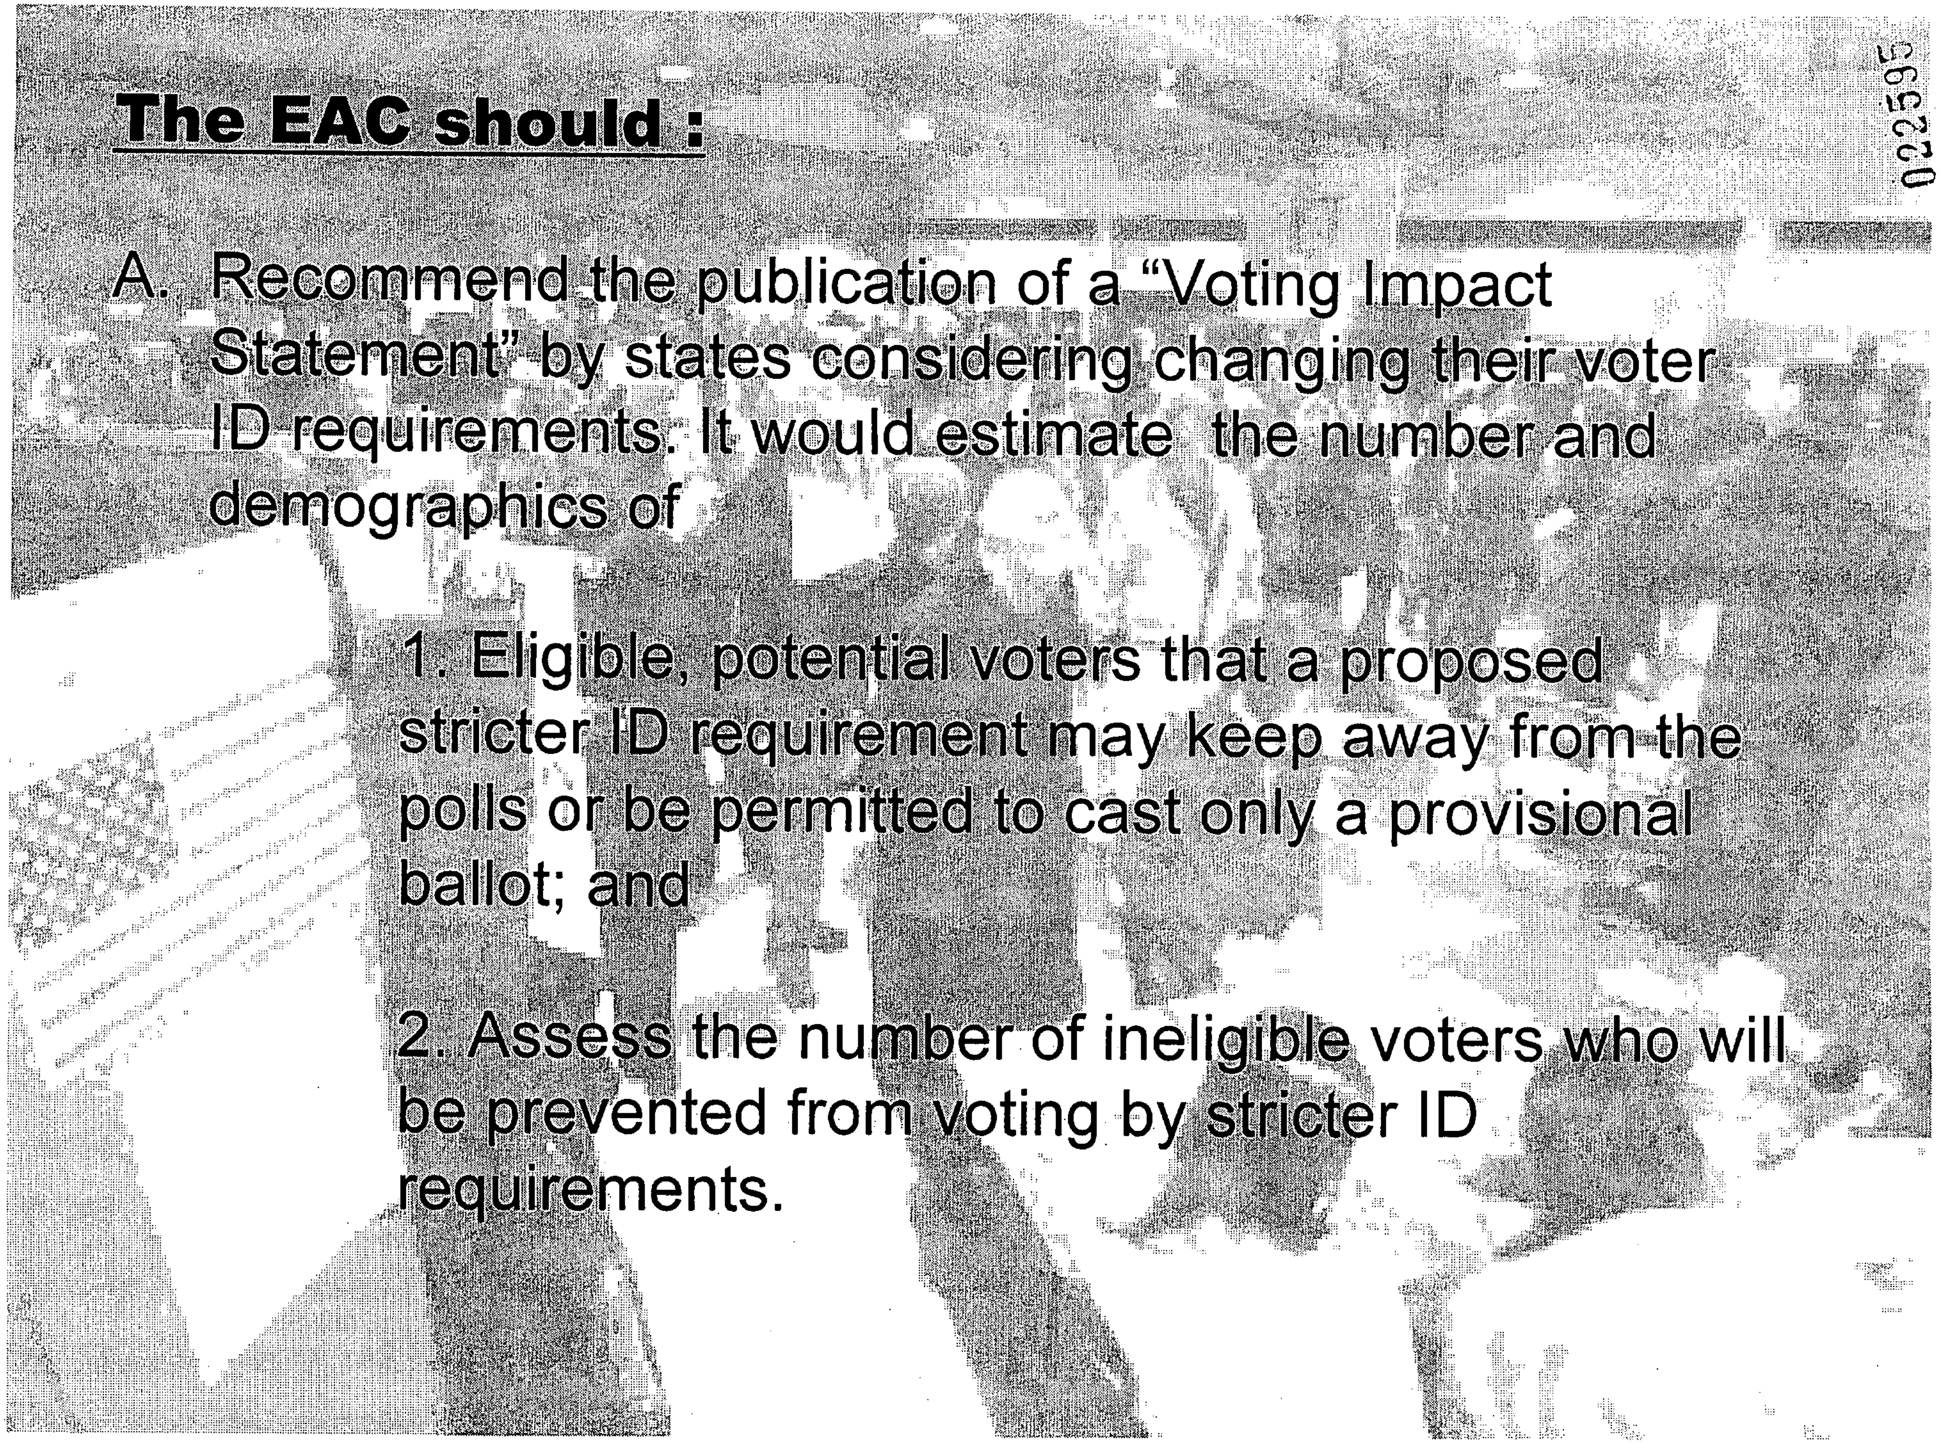
- Dynamics of Voter ID requirements, that is how they work in practice, are not well understood.
- Policy process should recognize this uncertainty –less certainty, more humility
- Improve debate by additional research sponsored by the EAC.



Conclusions

More information is needed about:

- The kinds of vote fraud that could be prevented by more rigorous voter ID so that it is possible to evaluate tradeoffs between ballot access and ballot integrity.
- Why potential voters may be required to cast a provisional ballot?
- The ID-related reasons for rejecting provisional ballots during the 2006 and subsequent elections.
- The experience of voters in meeting ID requirements.

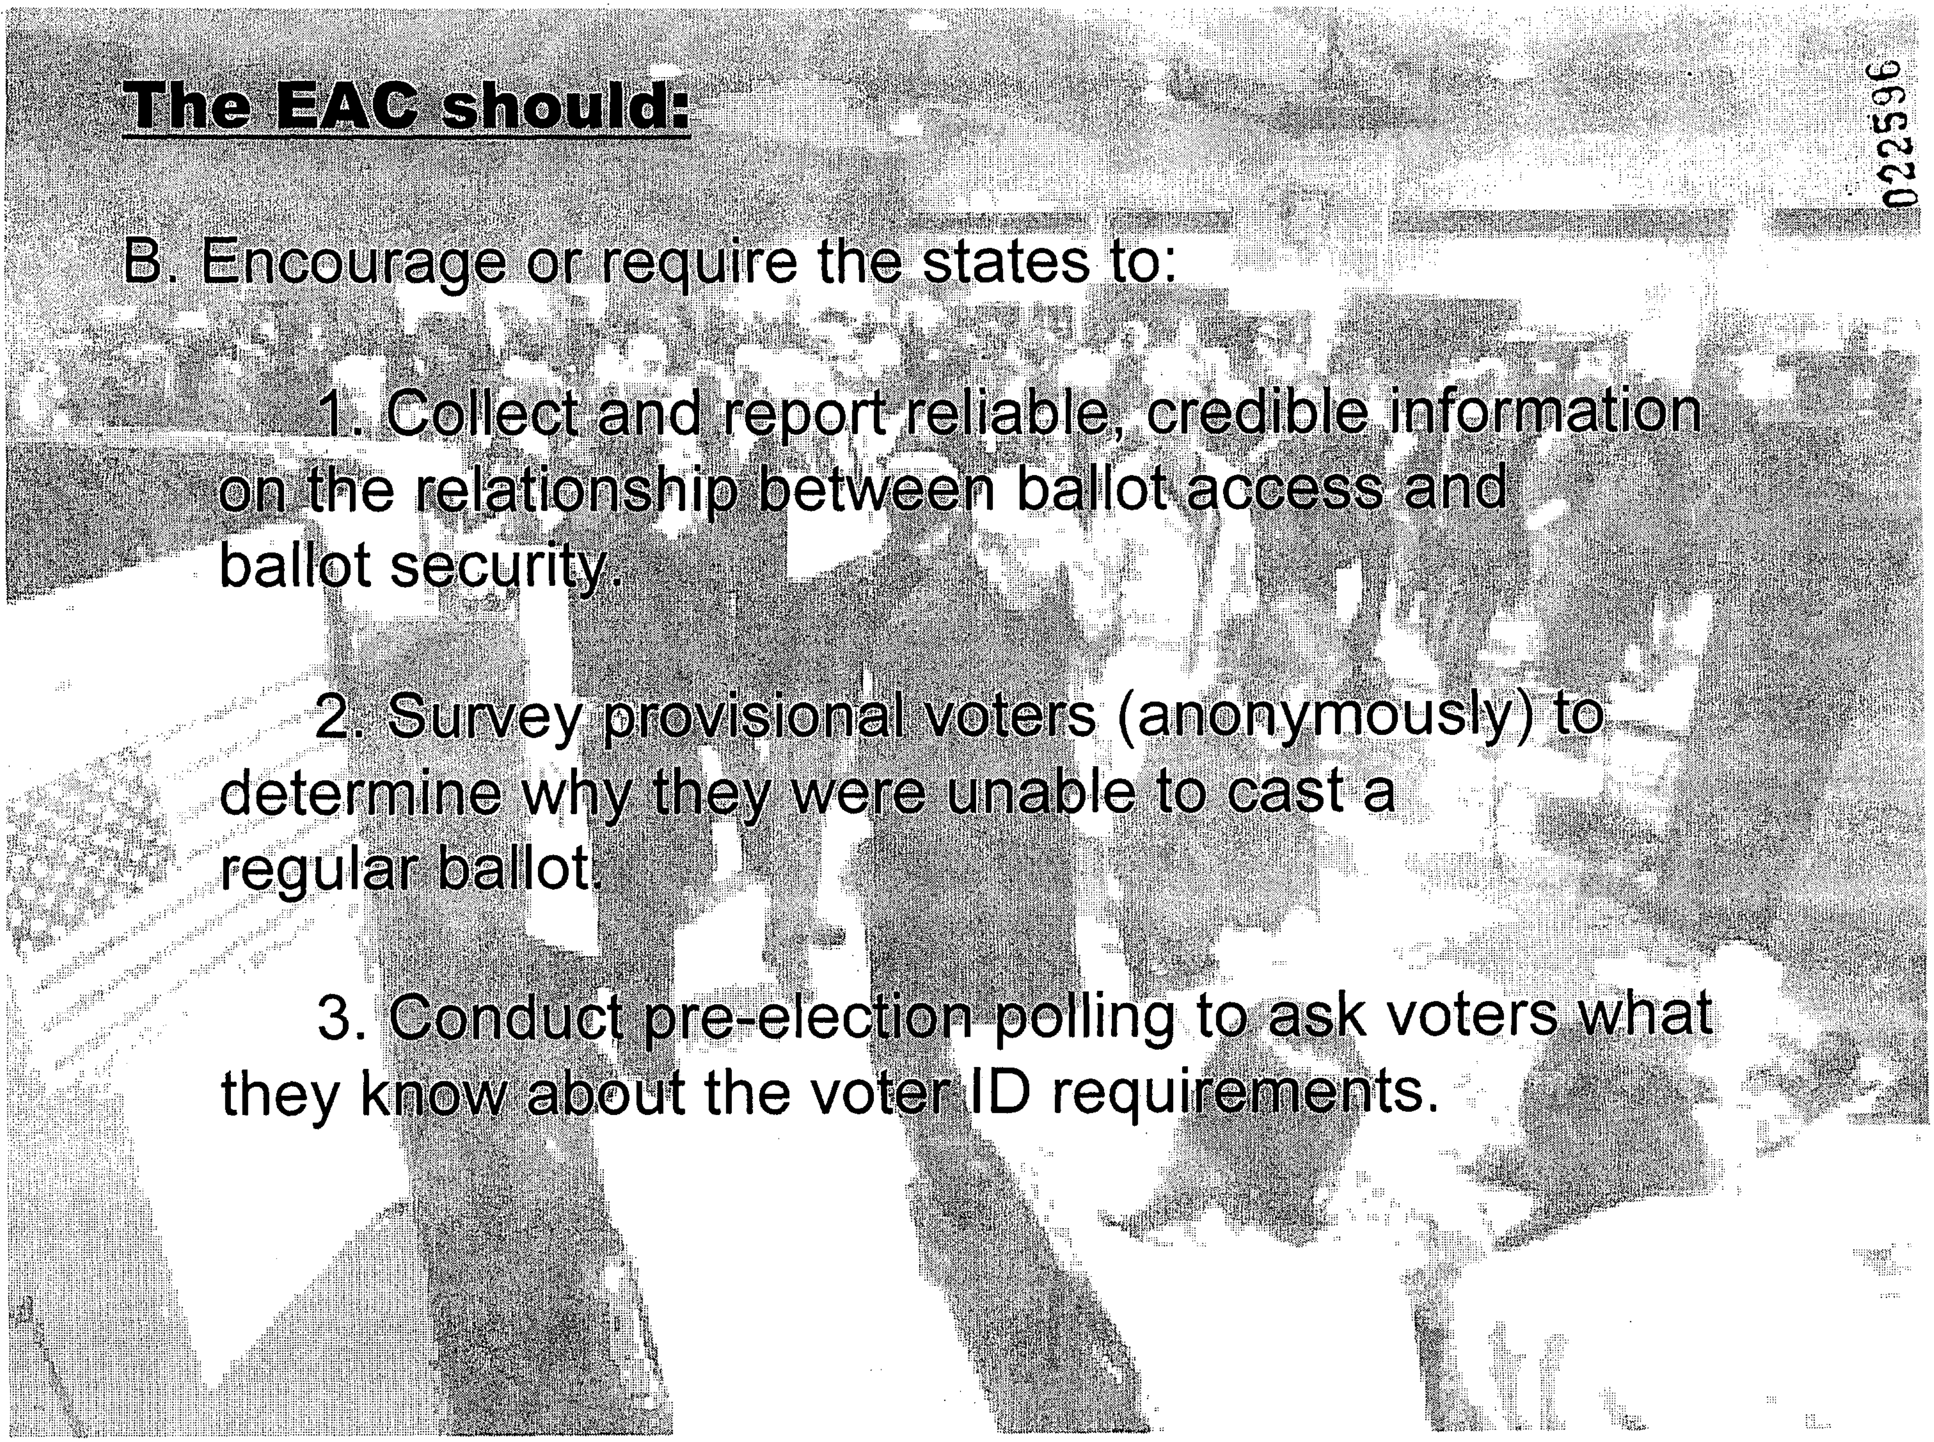


The EAC should :

A. Recommend the publication of a "Voting Impact Statement" by states considering changing their voter ID requirements. It would estimate the number and demographics of

1. Eligible, potential voters that a proposed stricter ID requirement may keep away from the polls or be permitted to cast only a provisional ballot; and

2. Assess the number of ineligible voters who will be prevented from voting by stricter ID requirements.



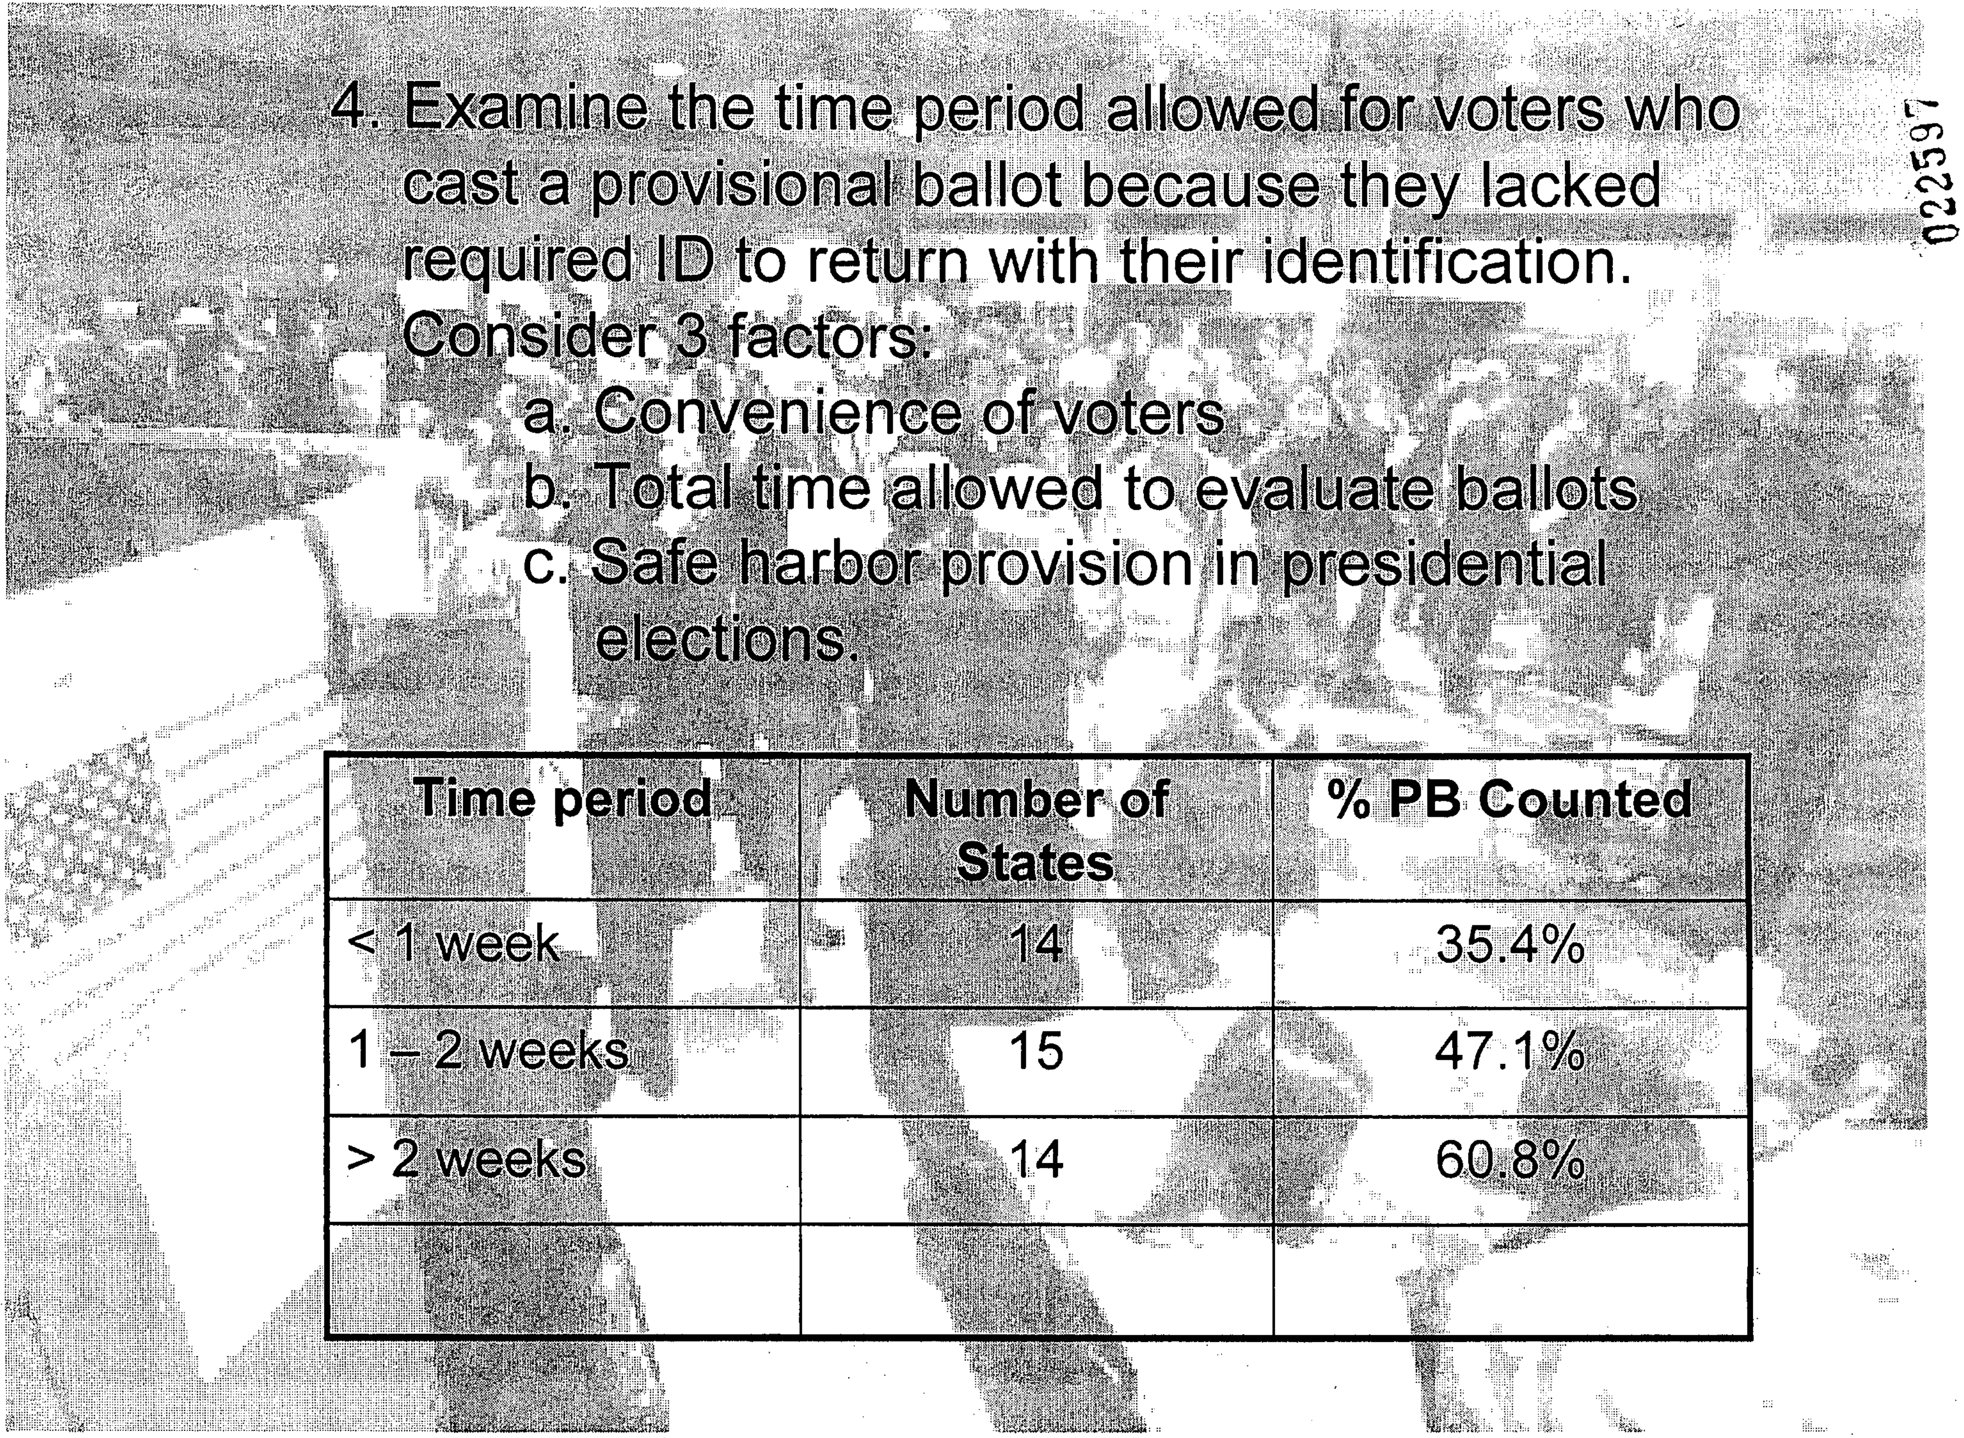
The EAC should:

B. Encourage or require the states to:

1. Collect and report reliable, credible information on the relationship between ballot access and ballot security.

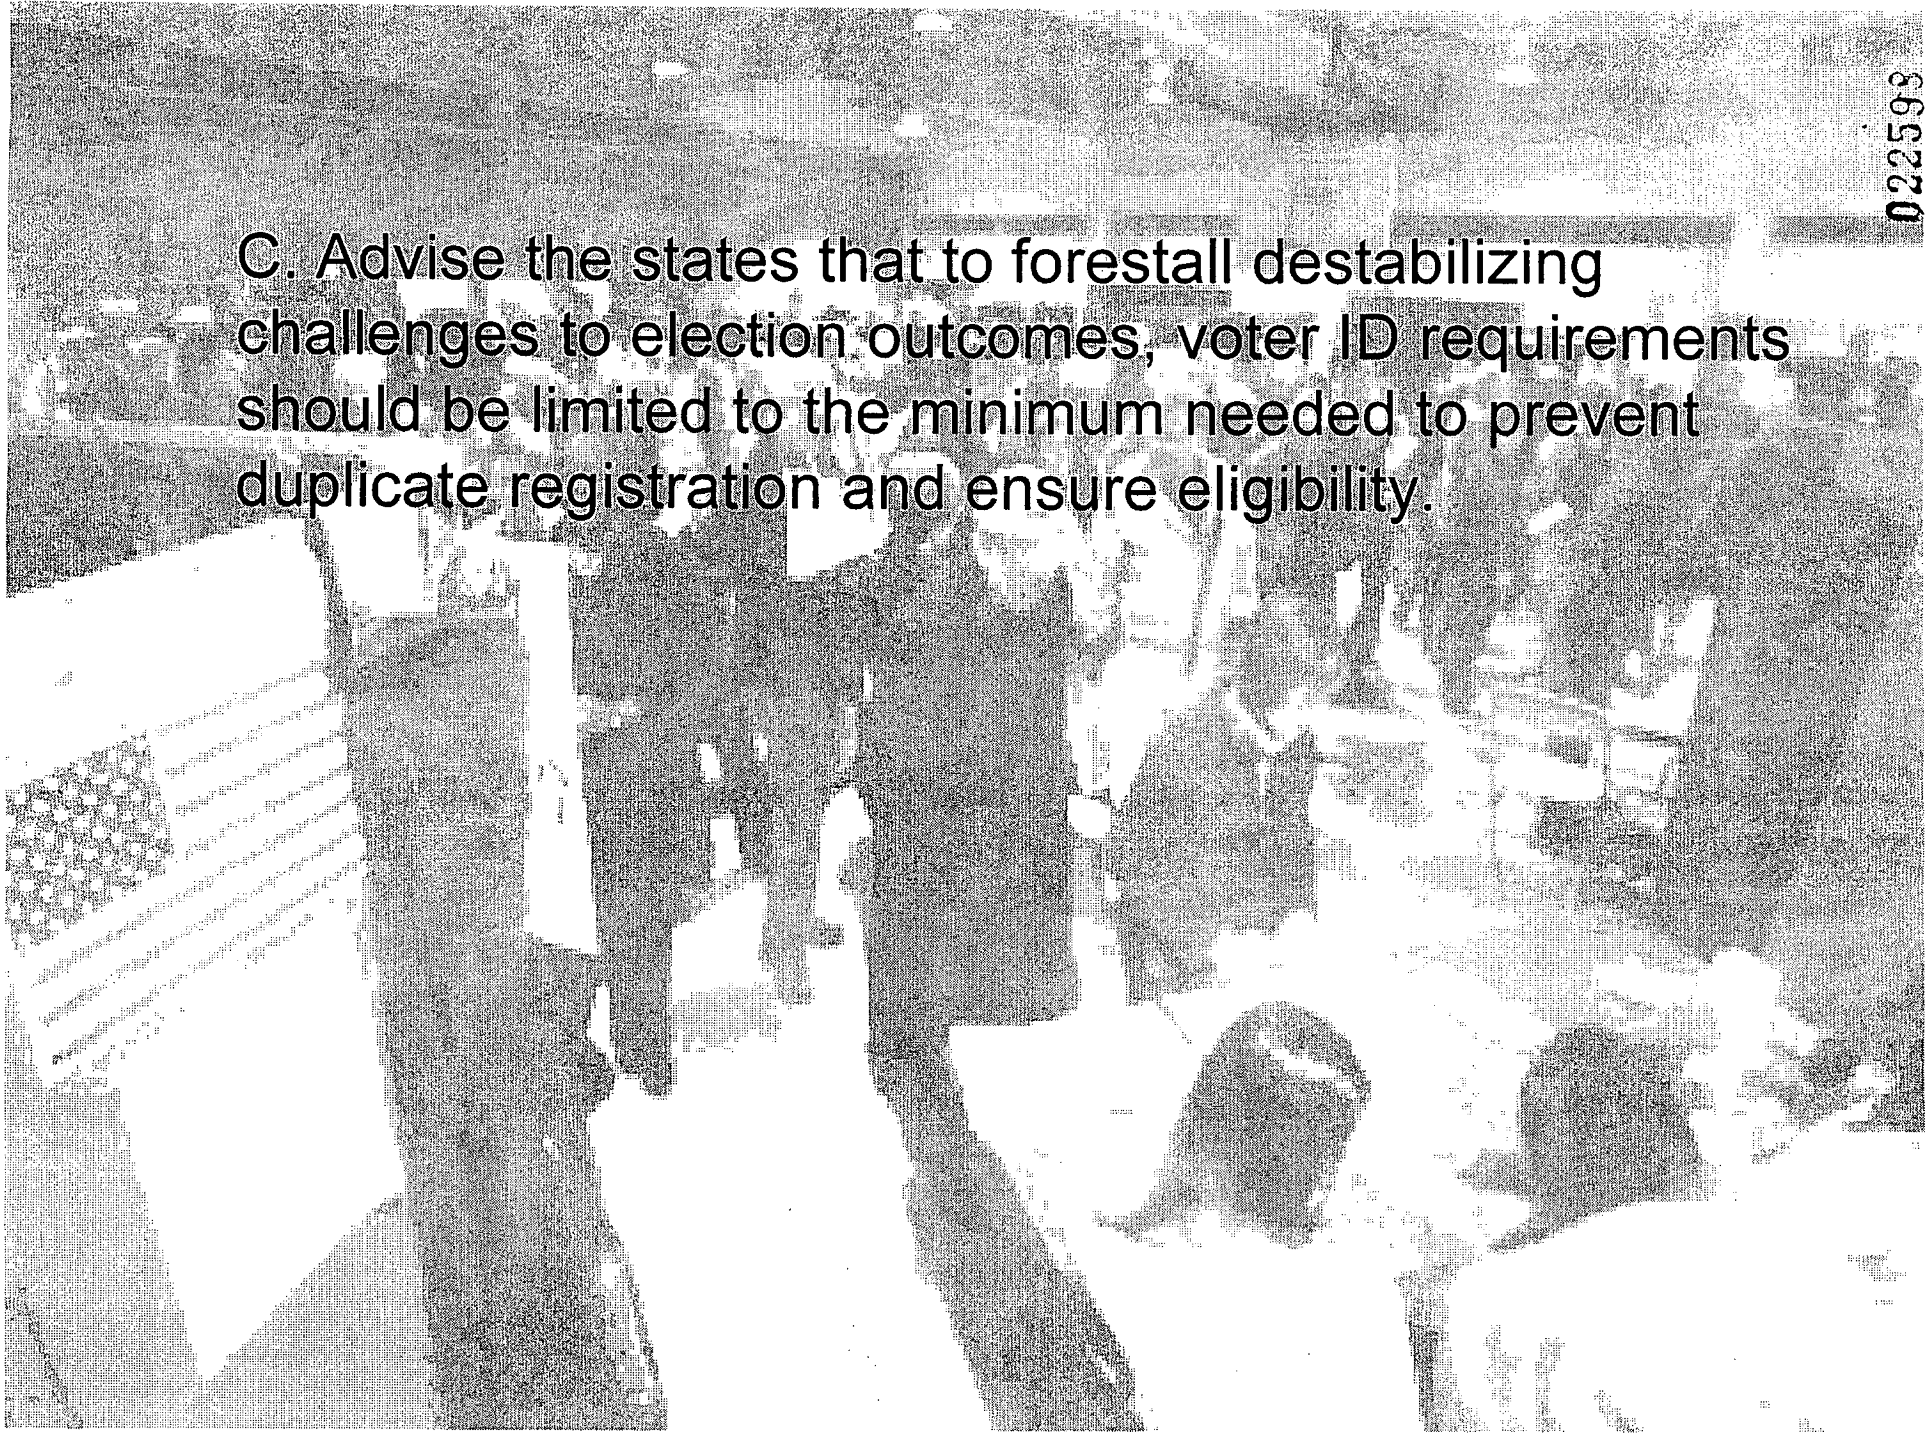
2. Survey provisional voters (anonymously) to determine why they were unable to cast a regular ballot.

3. Conduct pre-election polling to ask voters what they know about the voter ID requirements.



4. Examine the time period allowed for voters who cast a provisional ballot because they lacked required ID to return with their identification. Consider 3 factors:
    a. Convenience of voters
    b. Total time allowed to evaluate ballots
    c. Safe harbor provision in presidential elections.

Time period	Number of States	% PB Counted
< 1 week	14	35.4%
1 – 2 weeks	15	47.1%
> 2 weeks	14	60.8%



C. Advise the states that to forestall destabilizing challenges to election outcomes, voter ID requirements should be limited to the minimum needed to prevent duplicate registration and ensure eligibility.

NATIONAL SURVEY
OF
LOCAL ELECTIONS OFFICIALS' EXPERIENCES WITH PROVISIONAL VOTING

TABLE OF CONTENTS

EXECUTIVE SUMMARY: NATIONAL SURVEY OF LOCAL ELECTION OFFICIALS' EXPERIENCES WITH PROVISIONAL VOTING

To assess and improve the experiences of local elections officials with provisional voting, the Eagleton Center for Public Interest Polling (ECPIP) at the Eagleton Institute of Politics, Rutgers University conducted a national survey of local elections officials. Telephone interviews were conducted between July 21 and August 4, 2005 with a random sample of 400 local election officials. The sample of local election officials were drawn from counties, or equivalent election jurisdictions such as boroughs, municipalities, parishes, towns or cities. The sample of local election officials was then stratified according to when the state had enacted provisional voting systems -- before or after the passage of the Help America Vote Act of 2002 (HAVA) -- as well as the population size of the voting jurisdiction. Those states that offered voters lost in the system the opportunity to cast a ballot pre-HAVA (2002) were considered "old provisional voting states"; and the states where voters not found on the registration list were not offered any recourse and thus, were not permitted to vote in the 2000 Election were labeled "new provisional voting states."

Further adjustments were made to take into consideration the population size of the voting jurisdiction. The "Old" and "New" states were separated into three categories – small, medium, and large – based on the population size of the voting jurisdiction. A voting jurisdiction with a population of 49,999 or less was considered small, 50,000 to 199,999 regarded as medium, and large consisted of 200,000 or more. This sampling frame yielded 400 cases (196 Old; 204 New)[1] consisting of six sample types: New Small (n=83), Old Small (n=71), New Medium (n=83), Old Medium (n=75), New Large (n=38), and Old Large (n=50).

The survey addressed the following topics: experience with the administration of provisional voting system, state guidance for implementing provisional voting, implementing provisional voting, general perceptions, and recommendations for the future. This Executive Summary provides an overview of key findings from the study.

Experiences with Provisional Voting System in Jurisdiction

Survey participants were asked a number of questions regarding their general experience with provisional voting.

- A majority of the "New" states' election officials (62%), and nearly twice as many as the "Old" (33%), indicated that "100 or less ballots" were cast in the election jurisdiction. A significantly larger percentage (14%) of the "Old" (28%) estimated that "between 100 to just under 500" provisional ballots were cast.
- Most (61%) of the "Old" states reported that "A lot" of these provisional ballots were counted compared to only 19 percent for the "New" states. A

---

[1] At the studies conclusion it was determined that Rhode Island's affidavit voting system did not meet the criteria for placement in the Old State status and thus, the state was reassigned as "New." The reassignment of local election respondents representing Rhode Island resulted in a 49 (Old)/51 (New) split, rather than half of the sample being drawn from "Old" and half from "New." Unlike the other states (AL, KY, MI, MS, TX) with affidavit voting systems in place pre-HAVA, Rhode Island did not offer voters any real recourse to cast a ballot if the individual's name was not listed on the registration rolls. Instead, the state allowed voter's claiming eligibility, but not found on the registration rolls, to sign an affidavit enabling the election official to call the central registrar to verify the voter's eligibility. Only if the voter's name was found on the list was he or she permitted to cast a ballot.

much larger percentage of the "New" subgroup felt that only "Some" (32%) or "Very Few" (32%) provisional ballots were actually counted.

- A sizeable majority of both subgroups (Old=64%, New=77%) attributed the most need for the use of provisional ballots in their jurisdiction to "individual's name not listed on the voter registration rolls."
- More than 7-in-10 in both subgroups agreed that "individuals who were not registered at the time of casting their provisional ballots" constituted the most important reason that these ballots were not validated and counted in their jurisdiction.

State Guidance for Implementing Provisional Voting

- A sizeable majority of both subgroups (Old=85%, New=83%) received provisional voting instruction from their state governments.
- Appreciable differences in the type of instruction received involved "whether the provisional ballot could be used as an application to update the voter's registration" (Old=74%; New 59%); "guidelines for determining which provisional ballots were to be counted" (Old=87%; New=94%); and "how to design the structure of the provisional ballot (Old=71%; New 57%)."
- Overall, 98 percent of both subgroups found the voting instructions they received from the state government useful.

Implementing Provisional Voting in Jurisdiction

- When asked to describe the instructions or information provided to poll workers to help determine voters correct precinct or polling place, both subgroups employed various strategies including access to a list of eligible voters (Old=81%; New 80%), dedicated telephone line for poll workers (Old=93%; New=91%), and additional staff such as "greeters" (Old=46%; New=42%). Very few election officials in both (Old=11%, New=12%) reported the existence of a statewide voter registration database.

- A much larger percentage (70%) of "Old" states' election officials compared with 50 percent of the "New" used maps to help identify correct polling locations.
- 14 percent of all the election officials said that they did not provide written procedures or training to poll workers for the counting of provisional ballots. However, overall both subgroups felt that the administration of provisional voting in their jurisdiction was a success on all accounts.
- A variety of measures were employed to enable voters to determine if their provisional ballots were counted. In both subgroups the most widely used method was "the main telephone for the local or county election office" with 66 percent of the New compared to 75% of the Old indicating this method was provided.
- The measure least cited for voters to determine if their provisional ballots were counted was "email notification." Only 10% reported that the election jurisdiction offered voters this opportunity.

General Perceptions

- Close to half (40%) of the election officials felt more training for poll workers was needed.

- 39 percent of the "New" states' election officials agreed that more information should have been provided to voters about the jurisdiction where provisional ballots must be cast in order to be counted compared to 28% of the "Old".
- 13 percent more of the election officials from "New" states (39%) reported that more time was needed to implement provisional voting procedures.
- Only about half (56%) of the "New" states' election officials reported the provisional voting system was easy to implement while 73 percent from the "Old" found this to be the case.
- Seventeen percent more of the "Old" states' election officials (75%) agreed that the provisional voting system in their polling jurisdiction enabled more people to vote.

Recommendations for the Future

Survey participants were asked a number of questions regarding their general level of agreement with several statements regarding provisional voting.

- More election officials from "Old" states agreed that provisional voting sped up and improved polling place operations on Election Day (Old=53%; New=41%); and that the process helped election officials maintain more accurate registration databases (Old=63%; New=38%).
- 60 percent of the "New" states' election officials agreed that provisional voting created unnecessary problems for election officials and poll workers, compared with only 42% of the "Old."

- A majority of both subgroups agreed that "there is a need to offer voters the opportunity to cast provisional ballots." However, a 19 percent differential exists between the two subgroups (Old=81%; New=62%).
- A slightly larger percentage (9%) of the "Old" states' election officials (93%) felt that the provisional voting system in their polling jurisdiction was a success.
- Forty percent of the local election officials felt that the most effective way to increase the number of provisional ballots validated and counted in an election would be to administer provisional voting in a central location rather than at individual polling places.
- When asked what would be most effective in reducing the number of provisional ballots cast in an election, most (28%) of the local election officials chose providing a state sponsored website for individuals to check registration status online before going to the polling place. A slightly smaller number (26%) favored having a statewide voter registration database available at polling places.

CHAPTER 1

INTRODUCTION

A. Project Background and Objectives

To assess and improve the experiences of local election officials with provisional voting, the Eagleton Center for Public Interest Polling (ECPIP) at the Eagleton Institute of Politics, Rutgers University conducted a national survey of local elections officials.

The study was designed to examine the experiences, attitudes, and general impressions of local election officials with implementing provisional voting. Specifically, the study sought to ascertain the type of information, guidance, and training local election officials received from the State government in administering provisional voting, and how the information, guidance, and training was then distributed to poll workers and voters.

B. Summary of the Research Methodology

The survey involved telephone interviews conducted between July 21 and August 4, 2005 with a random sample of 400 local election officials. The sampling error for this total sample of 400 is ±4.9 percent at a 95 percent confidence level. Of these local election officials, 196 were selected to represent "old provisional voting states" and 204 for "new provisional voting states."[2] These subgroups have a sampling error of ±6.9 percent for the "New" and ±7.0 for the "Old" at a 95 percent confidence level.

Sampling error is the probability difference in results between interviewing everyone in a population versus interviewing a scientific sample taken from that population. Sampling error does not take into account any other possible sources of error inherent in any study of

---

[2] See footnote 1.

public opinion. A more comprehensive description of the research methodology is included in Appendix A.

C. Profile of Survey Participants

Table 1.1 provides a profile of survey participants by status including the entire sample of counties or equivalent and the subgroups within the "Old" or "New" status. The subgroup definitions of "Old" and "New" were provided by a report released by Election Line titled "The Provisional Voting Challenge" (December, 2001). The "New" states include: Connecticut, Delaware, Georgia, Hawaii, Illinois, Indiana, Louisiana, Massachusetts, Missouri, Montana, Nevada, Oklahoma, Pennsylvania, South Dakota, Tennessee, Utah, and Vermont; and the "Old" states include: Alabama, Alaska, Arizona, Arkansas, California, Colorado, Washington D.C., Florida, Iowa, Kansas, Kentucky, Maryland, Michigan, Mississippi, Nebraska, New Jersey, New Mexico, New York, North Carolina, Ohio, Oregon, Rhode Island, South Carolina, Texas, Virginia, Washington, and West Virginia.

D. Organization of the Report

The next chapter of this report examines the substantive survey results illustrated by statistical tables. The exact question wording precedes the table summarizing the percentages of the actual responses provided by the local election officials. In most cases the percentages on the tables read from top to bottom with the total equal to a 100 percent. In instances where there is statistical rounding, the total may be more or less than 100 percent.

The tables will also report the sample size "(n)" for each group referenced in the table. The "(n)" is the actual number of people in the group upon which the percentages are based. Readers should be aware of the "(n)" when referencing the percentages on a table. Smaller subgroups will have a higher margin of sampling error. Therefore, in some cases what may appear to be a large difference between groups is a result of the larger sampling error and may not be statistically significant.

Following the statistical tables there are four appendices. Appendix A provides additional information about the survey methodology so that interested readers may have a better understanding of the process used to obtain the data. Appendix B consists of the pre-notification letter explaining the purpose of the study and inviting local election officials to participate in the study if called. The text of the questions asked in the survey and used in the analysis of the data is contained in Appendix C. The verbatim responses (as recorded by the interviewers) to open-end questions included in the survey are found in Appendix D.

TABLE 2.1
EXPERIENCE WITH PROVISIONAL VOTING SYSTEM IN JURISDICTION [Q.3-6]

3. What is your best estimate of the total number of provisional ballots cast in the 2004 election in your jurisdiction, whether they were ultimately counted or not? Your best estimate is fine.

	Old versus New		(n)
	Old	New	
1 to less than 100	33%	62%	(191)
Between 100 to just under 500	28	14	(82)
Between 500 to just under 1000	12	5	(35)
1000 or more	19	9	(57)
(VOL) None/Zero	7	9	(31)
(VOL) Don't Know	1	1	(4)
(VOL) Refused	---	---	(---)
	100	100	(400)

*****statistically significant at the .000 level.**

4. In your opinion, how many of these provisional ballots were counted – a lot, some, very few, or none at all?

	Old versus New		(n)
	Old	New	
A lot	61%	19%	(146)
Some	17	32	(90)
Very few	18	32	(91)
None at all	4	17	(38)
(VOL) Don't Know	1	1	(4)
(VOL) Refused	---	---	---
	101	101	(369)

*****statistically significant at the .000 level.**

5. In your opinion, which one of the following, if any, created the <u>most</u> need for the use of provisional ballots in your jurisdiction on Election Day, 2004?

	Old versus New		(n)
	Old	New	
Individual's name not listed on the voter registration rolls	64%	77%	(260)
FIRST TIME voters couldn't provide the proper identification	5	7	(21)
Voter's eligibility challenged	12	5	(30)
Registered voters could not provide the proper identification	4	7	(19)
(VOL) Other (SPECIFY)	14	4	(32)
(VOL) Don't Know	2	2	(6)
(VOL) Refused	1	---	(1)
	102	102	(369)

*****statistically significant at the .01 level.**

6. In your opinion, which one of the following, if any, was the most important reason that provisional ballots cast in your jurisdiction were not validated and ultimately not counted in the 2004 Election?

	Old versus New		(n)
	Old	New	
Individual failed to provide the identification required to validate the provisional ballot	2%	3%	(10)
Signature on the provisional ballot did not match the signature on the registration form	1	---	(1)
Provisional ballot cast in the incorrect voting precinct	16	10	(48)
Individual was not registered	75	76	(280)
(VOL) All provisional ballots were validated and counted in 2004 Election	2	4	(12)
(VOL) Other (SPECIFY)	3	4	(13)
(VOL) Don't Know	1	2	(5)
(VOL) Refused	---	---	(---)
	100	99	(369)

TABLE 2.2
PRE-ELECTION EXPERIENCE:
STATE INSTRUCTION AND INFORMATION [Q.7-13]

7. Were provisional voting instructions provided by the state government for the 2004 Election?

	Old versus New		(n)
	Old	New	
Yes	85%	83%	(335)
No	14	17	(63)
(VOL) Don't know	1	---	(2)
(VOL) Refused	---	---	(---)
	100	100	(400)

8. Which of the following provisional voting instructions, if any, did you receive from the state government?

	Old versus New		(n=335)
	Old	New	
How to administer the provisional voting system	90%	91%	(303)
Who is eligible to vote using a provisional ballot	93	92	(310)
How individuals vote using a provisional ballot	90	85	(292)
The jurisdiction where individuals can vote by provisional ballot	78	80	(265)
Whether the provisional ballot could be used as an application to update the voter's registration*** *****statistically significant at the .01 level.**	74	59	(222)
How to train poll workers to process provisional ballots	89	88	(295)
How to provide voters with the opportunity to verify if their provisional ballot was counted	92	90	(304)
Guidelines for determining which provisional ballots are to be counted*** *****statistically significant at the .05 level.**	87	94	(304)
Strategies to reduce the need for voters to use provisional ballots	54	54	(182)
How to design the structure of the provisional ballot*** *****statistically significant at the .05 level.**	71	57	(213)
Other (VOL)	---	---	(---)

TABLE 2.5
GENERAL PERCEPTIONS [Q.26-35]

26. Now I am going to read you a list of items, please tell me which one you believe presented the <u>biggest</u> challenge in implementing provisional voting in your jurisdiction for the 2004 Election. (POSSIBLY BIGGEST PROBLEM)

(READ AND ROTATE 1-4)

	Old versus New		(n)
	Old	New	
Training of poll workers	38%	42%	(160)
Length of time provided before the election to implement the provisional voting process	13	14	(53)
Clarity of instruction received from your State Government	5	8	(27)
Having enough staff at the polling place	9	14	(46)
(VOL) Other (SPECIFY)	5	3	(15)
(VOL) All of the above	2	3	(9)
(VOL) None of the above	26	16	(83)
(VOL) Don't Know	3	1	(7)
(VOL) Refused	---	---	(---)
	101	101	(400)

Please tell me how much you agree or disagree with the following statements about Provisional voting in your jurisdiction for the 2004 Election. [IF AGREE OR DISAGREE, ASK:] Would you say you agree/disagree strongly or agree/disagree somewhat?

(READ AND ROTATE Q.27 –Q.35)

27. More <u>training</u> was needed on how to <u>administer</u> the provisional voting process.

	Old versus New		(n)
	Old	New	
Disagree	54%	46%	(200)
Neither Agree nor Disagree	6	5	(22)
Agree	38	49	(174)
(VOL) Don't Know	2	---	(4)
(VOL) Refused	---	---	(---)
	100	100	(400)

28. More <u>funding</u> was needed to <u>educate voters</u> about their rights to cast a provisional ballot.

	Old versus New		(n)
	Old	New	
Disagree	50%	43%	(185)
Neither Agree nor Disagree	11	12	(45)
Agree	39	45	(168)
(VOL) Don't Know	1	1	(2)
(VOL) Refused	---	---	(---)
	101	101	(400)

29. More <u>information</u> should have been provided to <u>voters</u> about the jurisdiction where provisional ballots must be cast in order to be counted.

	Old versus New		(n)
	Old	New	
Disagree	62%	50%	(222)
Neither Agree nor Disagree	8	8	(32)
Agree	28	39	(133)
(VOL) Don't Know	3	4	(13)
(VOL) Refused	---	---	(---)
	101	101	(400)

*****statistically significant at the .05 level.**

30. More <u>information</u> was needed for <u>poll workers</u> to determine the voter's assigned precinct and polling place.

	Old versus New		(n)
	Old	New	
Disagree	68%	63%	(261)
Neither Agree nor Disagree	7	5	(25)
Agree	23	29	(104)
(VOL) Don't Know	2	3	(10)
(VOL) Refused	---	---	(---)
	100	100	(400)

31. More <u>time</u> was needed to <u>implement</u> provisional voting procedures.

	Old versus New		(n)
	Old	New	
Disagree	66	55	(242)
Neither Agree nor Disagree	7	5	(24)

TABLE 2.6

RECOMMENDATIONS FOR THE FUTURE [Q.36-46]

36. Now I am going to read you a list of items. Please tell me which one you believe is the <u>most</u> important change needed in the implementation of provisional voting.

(RANDOMLY ROTATE 1-4)

	Old versus New		(n)
	Old	New	
More funding for poll worker training	24%	34%	(116)
More time for poll worker training	18	18	(72)
Clearer instruction from the Federal Government	19	18	(75)
Clearer instruction from the State Government	14	9	(47)
(VOL) Other (SPECIFY)	6	3	(19)
(VOL) All of the above	1	3	(7)
(VOL) None of the above	15	12	(55)
(VOL) No changes needed	2	1	(6)
(VOL) Don't Know	---	2	(3)
(VOL) Refused	---	---	(---)
	99	100	(400)

In general, please tell me how much you agree or disagree with the following statements about provisional voting. [IF AGREE OR DISAGREE, ASK:] Would you say you agree/disagree strongly or agree/disagree somewhat?

(READ AND ROTATE Q.37–Q.44)

37. A statewide voter registration database, accessible to poll workers on Election Day, would decrease the need for voters to cast provisional ballots.

	Old versus New		(n)
	Old	New	
Disagree	43%	35%	(155)
Neither Agree nor Disagree	7	6	(26)
Agree	49	56	(210)
(VOL) Don't Know	2	3	(9)
(VOL) Refused	---	---	(---)
	101	100	(400)

38. A state-sponsored website designed for individuals to check registration status online, before going to the polling place on Election Day, would decrease the need for voters to cast provisional ballots.

	Old versus New		(n)
	Old	New	
Disagree	24%	23%	(93)
Neither Agree nor Disagree	6	5	(22)
Agree	68	70	(277)
(VOL) Don't Know	2	2	(7)
(VOL) Refused	1	---	(1)
	101	100	(400)

In general, please tell me how much you agree or disagree with the following statements about provisional voting. [IF AGREE OR DISAGREE, ASK:] Would you say you agree/disagree strongly or agree/disagree somewhat? (cont'd.)

39. Provisional voting speeds up and improves polling place operation on Election Day by resolving disputes between voters and poll workers.

	Old versus New		(n)
	Old	New	
Disagree	40%	55%	(190)
Neither Agree nor Disagree	6	3	(18)
Agree	53	41	(188)
(VOL) Don't Know	1	1	(3)
(VOL) Refused	1	---	(1)
	101	100	(400)

40. Provisional voting helps election officials maintain more accurate registration databases.

	Old versus New		(n)
	Old	New	
Disagree	31%	49%	(161)
Neither Agree nor Disagree	4	11	(31)
Agree	63	38	(201)
(VOL) Don't Know	2	2	(7)
(VOL) Refused	---	---	(---)
	100	100	(400)

*****statistically significant at the .000 level.**

41. Provisional voting creates unnecessary problems for election officials and poll workers.

	Old versus New		(n)
	Old	New	
Disagree	52%	34%	(171)
Neither Agree nor Disagree	5	5	(20)
Agree	42	60	(206)
(VOL) Don't Know	1	1	(3)
(VOL) Refused	---	---	(---)
	100	100	(400)

*****statistically significant at the .01 level.**

In general, please tell me how much you agree or disagree with the following statements about provisional voting. [IF AGREE OR DISAGREE, ASK:] Would you say you agree/disagree strongly or agree/disagree somewhat? (cont'd.)

42. Provisional voting can be avoided by simplifying registration procedures.

	Old versus New		(n)
	Old	New	
Disagree	55%	43%	(195)
Neither Agree nor Disagree	6	5	(23)
Agree	38	50	(176)
(VOL) Don't Know	2	2	(6)
(VOL) Refused	---	---	(---)
	101	100	(400)

43. There is a need to offer voters the opportunity to cast provisional ballots.

	Old versus New		(n)
	Old	New	
Disagree	17%	31%	(98)
Neither Agree nor Disagree	2	6	(15)
Agree	81	62	(285)
(VOL) Don't Know	---	1	(2)
(VOL) Refused	---	---	(---)
	100	100	(400)

*****statistically significant at the .001 level.**

44. The provisional voting system in my polling jurisdiction was a <u>success</u>.

	Old versus New		(n)
	Old	New	
Disagree	5%	8%	(27)
Neither Agree nor Disagree	2	7	(18)
Agree	93	84	(353)
(VOL) Don't Know	1	1	(2)
(VOL) Refused	---	---	(---)
	101	100	(400)

*****statistically significant at the .05 level.**

45. Which one of the following do you think would be the <u>most effective</u> in increasing the number of provisional ballots validated and ultimately <u>counted</u> in an election?

(RANDOMLY ROTATE 1-3)

	Old versus New		
	Old	New	(n)
In-precinct provisional voting only	21%	18%	(79)
Provisional voting from a central location rather than in individual polling places	37	44	(161)
In-jurisdiction provisional voting only	21	18	(77)
(VOL) Other (SPECIFY)	1	3	(7)
(VOL) All of the above	1	1	(2)
(VOL) None of the above	15	8	(47)
(VOL) Don't Know	4	9	(27)
(VOL) Refused	---	---	(---)
	100	101	(400)

46. Which one of the following do you think would be the most effective in reducing the number of provisional ballots cast in an election?

(RANDOMLY ROTATE 1-5)

	Old versus New Old	 New	(n)
Having a statewide voter registration database available at polling places	22%	30%	(105)
Providing additional staff such as "greeters" at polling places to direct voters to the correct polling location	6	6	(24)
Providing a state sponsored website to enable individuals to check registration status online before going to the polling place	30	27	(113)
Providing poll workers access to an updated printed list of eligible voters in the jurisdiction	5	5	(20)
Providing a dedicated telephone line for poll workers to speak immediately to an election official with access to the list of eligible voters in the jurisdiction	14	18	(63)
(VOL) Other (SPECIFY)	---	1	(2)
(VOL) All of the above	4	3	(14)
(VOL) None of the above	16	9	(51)
(VOL) Don't Know	2	2	(7)
(VOL) Refused	---	1	(1)
	99	102	(400)

APPENDIX A:

SURVEY METHODOLOGY

I. INTRODUCTION

This survey represents a joint venture of two programs – the Eagleton Institute of Politics, Rutgers University and the Eagleton Institute's Center for Public Interest Polling (ECPIP). This survey was designed to assess and improve the experiences of local elections officials with provisional voting.

II. QUESTIONNAIRE DEVELOPMENT

The questionnaire was developed for telephone administration by ECPIP researchers in consultation with Eagleton staff. The draft questionnaire was pretested with a random group of local election officials that yielded five completes. Only minor changes were made from that version and no further pretest was needed.

The questionnaire interview length averaged 18.4 minutes. An annotated version of the final survey instrument is included in this report (see Appendix C).

The questionnaire was programmed into a CATI (Computer Assisted Telephone Interviews) software system know as Quancept. The system facilitates the loops, rotations, randomization, and complex skip patterns found in this survey instrument. The programming was extensively checked and all logical errors were corrected.

III. SAMPLE DESIGN

A random national sample was compiled based on information acquired from the State Board of Elections in each of the 50 States and the District of Columbia. In all, 3,820 local election officials were eligible to participate in the study. To enhance compliance rates, pre-notification letters were sent to 2,471 of the local election officials. These letters explained the study's objectives and asked for the officials' participation in the study if contacted by an interviewer. Overall, 1,018 were contacted by telephone to participate in the study and among these, a total of 400 local election officials agreed to participate in the study.

The "Old" and "New" states were separated into three categories – small, medium, and large – based on the population size of the voting jurisdiction. A voting jurisdiction with a population of 49,999 or less was considered small, 50,000 to 199,999 regarded as medium, and large consisted of 200,000 or more. The sample was designed to make sure that each of the six sample types: New Small (n=83), Old Small (n=71), New Medium (n=83), Old Medium (n=75), New Large (n=38), and Old Large (n=50) were represented in the study. Overall, the survey yielded a response rate of 30 percent for the "Old" state sample and 53 percent for the "New" state sample.

APPENDIX B:

PRE-NOTIFICATION LETTER

DATE

NAME
TITLE
ADDRESS
CITY STATE ZIP

Dear NAME,

Rutgers, The State University of New Jersey, is conducting a national survey of elections officials' experiences with provisional voting in the 2004 national election. Through this survey we will learn the perspective of those who administer elections. It will improve our understanding of the process as we complete a broad research project on provisional voting in the context of effective election administration, voter access, and ballot security. The findings of the project will be the basis for recommendations to the U. S. Election Assistance Commission (EAC) to consider in the development of its guidance to the states in 2006.

The EAC was established by the Help America Vote Act (HAVA) of 2002. It is an independent, bipartisan, federal agency that provides federal funds to states to upgrade voting systems and improve election administration. The EAC publishes voluntary guidelines for the states and serves as a national clearinghouse of information regarding election administration. The EAC is funding the research project.

Participants in this study will be selected randomly and asked to share their experiences administering the provisional voting process in the 2004 election. The study will be conducted July 18th through August 5th. During that period a survey researcher <u>may</u> call you if you are, in fact, chosen at random from a national list of election officials. The researcher will ask you questions about your experience with provisional voting, your evaluation of the process, and your recommendations to improve it. The survey will take approximately 10-15 minutes. All of your answers will be completely confidential, and no statement or comment you make will be ascribed to you.

At the conclusion of the research project, we will present a report to the EAC including analysis of provisional voting procedures as well as recommendations for future practices and procedures. The guidance document based on our research will be published by the EAC in the Federal Register for public review and comment, and the EAC will hold a hearing on the guidance document this fall before adopting it.

Your participation in the survey will assure that we understand the views of election officials who have direct experience with provisional voting. We hope you will participate if called. Thank you for your consideration and interest.

Sincerely,

[scanned signature]

Ruth B. Mandel
Director
Board of Governors Professor of Politics

APPENDIX C:

ANNOTATED QUESTIONNAIRE

PROVISIONAL VOTING SURVEY

Sample: Local Elections Officials
National sample: 400 telephone interviews

Draft Version: July 19, 2005

Initial Screener

Hello, my name is _______________ and I'm calling on behalf of the Eagleton Institute of Politics at Rutgers University. Rutgers University is conducting a study on provisional voting based on experiences from the 2004 election. May I please speak to [INSERT NAME FROM SAMPLE]?

[IF UNSURE WHO THIS INDIVIDUAL IS – ASK:]

May I please speak to the individual who was responsible for overseeing voting procedures for the 2004 election at the county, borough, municipality, or parish level such as the Registrar of Elections, County Clerk, Commissioner of Elections, Director of Elections, Administrator of Elections, or Clerk of Court?

[SKIP TO "CONSENT OF INDIVIDUAL DIFFERENT FROM SAMPLE CONTACT"]

Consent

Hello, my name is _______________ and I'm calling on behalf of the Eagleton Institute of Politics at Rutgers University. Rutgers University is conducting a study on provisional voting based on experiences from the 2004 election. We recently sent you a letter requesting your participation in the confidential survey we are conducting with elections officials. Your participation in the survey will assure that we understand the views of election officials who have direct experience with provisional voting. We would very much like to include your opinions and would really appreciate it if you could assist us by providing as much information as you can to the best of your knowledge. You were randomly selected for the survey from a nationally representative list of election officials. We are not selling anything, and not asking for money.

The information you will be sharing today will be the basis for recommendations to the U. S. Election Assistance Commission (EAC) to consider in the development of its guidance to the states in 2006. This information will be maintained at a secure site and your name will not be identified in the report. All your answers are completely confidential.

The survey should take no more than 10 or 15 minutes to complete.

Consent of Individual Different from Sample Contact

Hello, my name is ________________ and I'm calling on behalf of the Eagleton Institute of Politics at Rutgers University. Rutgers University is conducting a study on provisional voting based on experiences from the 2004 election. We recently sent a letter to your office requesting participation in a confidential survey we are conducting with elections officials. Your participation in the survey will assure that we understand the views of election officials who have direct experience with provisional voting. We would very much like to include your opinions and would really appreciate it if you could assist us by providing as much information as you can to the best of your knowledge. You were randomly selected for the survey from a nationally representative list of election officials. We are not selling anything, and not asking for money.

The information you will be sharing today will be the basis for recommendations to the U. S. Election Assistance Commission (EAC) to consider in the development of its guidance to the states in 2006. This information will be maintained at a secure site and your name will not be identified in the report. All your answers are completely confidential.

The survey should take no more than 10 or 15 minutes to complete.

IF NECESSARY: If you should have any questions about the study, you may contact the Research Project Coordinator, April Rapp, at the Eagleton Center for Public Interest Polling at 732-932-9384 ext. 261.

IF RESPONDENT DECLINES TO PARTICIPATE, ADDITIONAL PRODDING NEEDED:

--Your participation is very important because only 400 election officials have been randomly selected for this survey and your views will be used to provide provisional voting policy recommendations. We would be happy to fax you a letter outlining the study objectives. [If yes, can I please have your fax number?] (RECORD FAX NUMBER)

Screener

1. On Election Day, November 2nd, 2004 was it your responsibility to supervise the election at the county, borough, municipality, or parish level?

(n=400)

100%	YES	GO TO Q2
--	NO	GO TO Q1a
--	DON'T KNOW	TERMINATE
--	REFUSED	TERMINATE

1a. May I please have the name and phone number of the individual who was responsible for supervising the 2004 election at the county, borough, municipality, or parish level?

[RECORD NAME/PHONE NUMBER OF REFERRAL] (THANK AND TERMINATE)

Jurisdiction

2. What was your job title on Election Day, November 2nd, 2004?

(DO NOT READ – VOLUNTEER RESPONSE)

(n=400)

10%	Administrator of Elections
3	Chairman of Elections
2	Clerk of Court
7	Commissioner of Elections
17	County Clerk
16	Director of Elections
8	Registrar of Elections
3	Secretary of Elections
7	Supervisor of Elections
4	Town Clerk
25	Other (specify)
--	Don't Know
--	Refused

General: Provisional Voting

Now, I would like to ask you some questions about provisional voting in your jurisdiction.

3. What is your best estimate of the total number of provisional ballots cast in the 2004 election in your jurisdiction, whether they were ultimately counted or not? Your best estimate is fine.

(n=400)

48%	Less than 100	
21	Between 100 to just under 500	
9	Between 500 to just under 1000	
14	1000 or more	
8	None/Zero	**(GO TO Q7)**
1	Don't Know	
--	Refused	

(ASK ONLY IF Q3=1-4)

4. In your opinion, how many of these provisional ballots were counted – a lot, some, very few, or none at all?

(n=400)

40%	A lot
24	Some
25	Very few
10	None at all
1	Don't Know
--	Refused

5. In your opinion, which one of the following, if any, created the <u>most</u> need for the use of provisional ballots in your jurisdiction on Election Day, 2004?

(READ AND ROTATE 1-4)

(n=369)

71%	Individual's name not listed on the voter registration rolls
6	<u>First time</u> voters couldn't provide the proper identification
8	Voter's eligibility challenged
5	Registered voters could not provide the proper identification
9	Other (specify)
2	Don't Know
--	Refused

6. In your opinion, which one of the following, if any, was the most important reason that provisional ballots cast in your jurisdiction were not validated and ultimately not counted in the 2004 Election?

(READ AND ROTATE 1-4)

(n=369)

3%	Individual failed to provide the identification required to validate the provisional ballot
--	Signature on the provisional ballot did not match the signature on the registration form
13	Provisional ballot cast in the incorrect voting precinct
76	Individual was not registered
3	All provisional ballots were validated and counted in 2004 election
4	Other (specify)
1	Don't Know
--	Refused

Pre-Election Experience: Instructions and Information Received (Content and Quality)

7. Were provisional voting instructions provided by the state government for the 2004 Election?

(n=400)

84%	Yes	**(GO TO Q8)**
16	No	**(GO TO Q14)**
1	Don't Know	**(GO TO Q14)**
--	Refused	

STATE GOVERNMENT INSTRUCTIONS AND INFORMATION

(ASK ONLY IF Q7=1)

8. Which of the following provisional voting instructions, if any, did you receive from the state government?

(ACCEPT MULTIPLE RESPONSES; ROTATE LIST)

(n=335)

	Yes	No
How to administer the provisional voting system	90%	10%
Who is eligible to vote using a provisional ballot	93	8
How individuals vote using a provisional ballot	87	13
The jurisdiction where individuals can vote by provisional ballot	79	21
Whether the provisional ballot could be used as an application to update the voter's registration	66	34
How to train poll workers to process provisional ballots	88	12
How to provide voters with the opportunity to verify if their provisional ballot was counted	91	9
Guidelines for determining which provisional ballots are to be counted	91	9
Strategies to reduce the need for voters to use provisional ballots	54	46
How to design the structure of the provisional ballot	64	37
Other (specify)	--	--
All of the above	7	93
None of the above	--	--
Don't know	2	99
Refused	--	--

(ASK ONLY IF Q8=4)

9. You said that you received provisional voting instructions from the state government. Please tell me how useful the instructions were on the jurisdiction where individuals can vote by provisional ballot -- very useful, somewhat useful, not very useful, or not useful at all?

(n=265)

73%	Very useful
23	Somewhat useful
2	Not very useful
--	Not useful at all
2	Don't know
--	Refused

(ASK ONLY IF Q8=7)

10. You said that you received provisional voting instructions from the state government. Please tell me how useful the instructions were on how to provide voters with the opportunity to verify if their provisional ballot was counted -- very useful, somewhat useful, not very useful, or not useful at all?

(n=304)

77%	Very useful
20	Somewhat useful
1	Not very useful
--	Not useful at all
2	Don't know
--	Refused

(ASK ONLY IF Q8=8)

11. You said that you received provisional voting instructions from the state government. Please tell me how useful the instructions were for establishing guidelines for determining which provisional ballots are to be counted -- very useful, somewhat useful, not very useful, or not useful at all?

(n=304)

80%	Very useful
16	Somewhat useful
2	Not very useful
1	Not useful at all
1	Don't know
--	Refused

(ASK ONLY IF Q8=9)

12. You said that you received provisional voting instructions from the state government. Please tell me how useful the instructions were for establishing strategies to reduce the need for voters to use provisional ballots -- very useful, somewhat useful, not very useful, or not useful at all?

(n=182)

60%	Very useful
31	Somewhat useful
5	Not very useful
2	Not useful at all
2	Don't know
--	Refused

(ASK ONLY IF Q8=1-10)

13. Thinking generally, overall how useful were the provisional voting instructions you received from the state government -- very useful, somewhat useful, not very useful, or not useful at all?

(n=330)

76%	Very useful
22	Somewhat useful
1	Not very useful
--	Not useful at all
1	Don't know
--	Refused

Implementation of Instructions and Distribution of Information to Election Employees

Now I'm going to ask you some questions about poll worker training.

14. Please tell me which of the following, if any, was provided in your jurisdiction for the 2004 Election to help poll workers determine voters' assigned precinct and polling place?

(ACCEPT MULTIPLE RESPONSES; READ EACH ITEM; AND ROTATE LIST)

(n=400)

	Yes	No
Access to a list of eligible voters in the jurisdiction	81%	20%
Telephone line for poll workers to speak immediately to an election official with access to the list of eligible voters in the jurisdiction	91	9
Maps of adjacent precincts for poll workers to help voters locate their resident and corresponding polling place	60	40
Additional staff such as "greeters" at polling places to direct voters to the correct polling location	44	56
Statewide voter registration database available at polling places	12	89
Other (specify)	--	--
None of the above	2	99
Don't know	--	--
Refused	--	--

When implementing provisional voting in your jurisdiction, please tell me how successfully you think the following activities were performed:

(READ AND ROTATE Q15-Q21)

[PROBE: Would you say that activity was performed very successfully, somewhat successfully, not very successfully, or not successfully at all?

15. Providing training to poll workers on how to administer provisional ballots.

(n=400)

69%	Very successfully
27	Somewhat successfully
1	Not very successfully
1	Not successfully at all
3	Didn't perform this activity
1	Don't Know
--	Refused

16. Providing written procedures to poll workers on how to administer provisional ballots.

(n=400)

71%	Very successfully
22	Somewhat successfully
1	Not very successfully
1	Not successfully at all
4	Didn't perform this activity
1	Don't Know
--	Refused

17. Providing your local election officials with written procedures on the casting of provisional ballots.

(n=400)

68%	Very successfully
27	Somewhat successfully
1	Not very successfully
--	Not successfully at all
3	Didn't perform this activity
1	Don't Know
--	Refused

18. Providing your local election officials with <u>written</u> procedures on the <u>counting</u> of provisional ballots.

(n=400)

65%	Very successfully
18	Somewhat successfully
1	Not very successfully
--	Not successfully at all
14	Didn't perform this activity
1	Don't Know
1	Refused

19. Providing your local election officials <u>training</u> for the <u>counting</u> of provisional ballots.

(n=400)

66%	Very successfully
17	Somewhat successfully
1	Not very successfully
1	Not successfully at all
14	Didn't perform this activity
1	Don't Know
--	Refused

20. Making <u>information</u> available to help poll workers determine voters' assigned precinct or polling place.

(n=400)

70%	Very successfully
22	Somewhat successfully
2	Not very successfully
1	Not successfully at all
5	Didn't perform this activity
1	Don't Know
--	Refused

21. Providing training to help poll workers determine voters' assigned precinct or polling place.

(n=400)

64%	Very successfully
26	Somewhat successfully
2	Not very successfully
--	Not successfully at all
7	Didn't perform this activity
2	Don't Know
--	Refused

Post-Election Experience: Counting Ballots

22. After the 2004 Election, which of the following, if any, did your jurisdiction offer voters to determine if their provisional ballot was counted?

(ACCEPT MULTIPLE RESPONSES;READ AND ROTATE LIST)

(n=400)

	Yes	No
Notification by mail	47%	54%
Dedicated Toll-Free Telephone Hotline	39	62
Email notification	10	90
Website confirmation	22	78
Main telephone number for the local or county election office	70	30
All of the above	--	--
None of the above	4	96
Other (specify)	1	99
Don't Know	--	--
Refused	--	--

(ASK Q23-Q25 ONLY IF Q3=1-4)

23. How confident are you that poll workers properly distributed provisional ballots to voters?

(n=369)

63%	Very confident
30	Somewhat confident
4	Not very confident
1	Not at all confident
2	Don't Know
--	Refused

24. How confident are you that election officials accurately assessed and validated provisional ballots?

(n=369)

75%	Very confident
20	Somewhat confident
2	Not very confident
--	Not at all confident
3	Don't Know
1	Refused

25. How confident are you that the validated provisional ballots were accurately included in the final vote count?

(n=369)

95%	Very confident
3	Somewhat confident
--	Not very confident
--	Not at all confident
1	Don't Know
--	Refused

General Perceptions

26. Now I am going to read you a list of items, please tell me which one you believe presented the biggest challenge in implementing provisional voting in your jurisdiction for the 2004 Election. (POSSIBLY BIGGEST PROBLEM)

(READ AND ROTATE 1-4)

(n=400)

40%	Training of poll workers
13	Length of time provided before the election to implement the provisional voting process
7	Clarity of instruction received from your State Government
12	Having enough staff at the polling place
4	Other (specify)
2	All of the above
21	None of the above
2	Don't Know
--	Refused

Please tell me how much you agree or disagree with the following statements about Provisional voting in your jurisdiction for the 2004 Election.

(READ AND ROTATE Q27 –Q35)

[IF AGREE OR DISAGREE, ASK:] Would you say you agree/disagree strongly or agree/disagree somewhat?

27. More training was needed on how to administer the provisional voting process

(n=400)

18%	Agree strongly
25	Agree somewhat
6	Neither agree nor disagree
22	Disagree somewhat
29	Disagree strongly
1	Don't Know
--	Refused

28. More funding was needed to educate voters about their rights to cast a provisional ballot.

(n=400)

24%	Agree strongly
18	Agree somewhat
11	Neither agree nor disagree
22	Disagree somewhat
24	Disagree strongly
1	Don't Know
--	Refused

29. More information should have been provided to voters about the jurisdiction where provisional ballots must be cast in order to be counted.

(n=400)

16%	Agree strongly
17	Agree somewhat
8	Neither agree nor disagree
22	Disagree somewhat
33	Disagree strongly
3	Don't Know
--	Refused

30. More information was needed for poll workers to determine the voter's assigned precinct and polling place.

(n=400)

8%	Agree strongly
18	Agree somewhat
6	Neither agree nor disagree
26	Disagree somewhat
39	Disagree strongly
3	Don't Know
--	Refused

31. More time was needed to implement provisional voting procedures.

(n=400)

16%	Agree strongly
17	Agree somewhat
6	Neither agree nor disagree
27	Disagree somewhat
33	Disagree strongly
1	Don't Know
--	Refused

32. The provisional voting system was easy to implement.

(n=400)

33%	Agree strongly
32	Agree somewhat
6	Neither agree nor disagree
15	Disagree somewhat
14	Disagree strongly
--	Don't Know
--	Refused

33. The provisional voting system in my polling jurisdiction enabled more people to vote.

(n=400)

40%	Agree strongly
27	Agree somewhat
8	Neither agree nor disagree
9	Disagree somewhat
15	Disagree strongly
1	Don't Know
--	Refused

34. I feel that voters in my jurisdiction were provided adequate information to successfully cast a provisional ballot.

(n=400)

70%	Agree strongly
22	Agree somewhat
3	Neither agree nor disagree
3	Disagree somewhat
2	Disagree strongly
1	Don't Know
--	Refused

35. Adequate support was provided to me to assist in the implementation of provisional voting.

(n=400)

57%	Agree strongly
29	Agree somewhat
5	Neither agree nor disagree
6	Disagree somewhat
3	Disagree strongly
--	Don't Know
--	Refused

Recommendations for the Future

36. Now I am going to read you a list of items. Please tell me which one you believe is the most important change needed in the implementation of provisional voting.

(RANDOMLY ROTATE 1-4)

(n=400)

29%	More funding for poll worker training
18	More time for poll worker training
19	Clearer instruction from the Federal Government
12	Clearer instruction from the State Government
5	Other: specify
2	All of the above
14	None of the above
2	No changes needed
1	Don't Know
--	Refused

In general, please tell me how much you agree or disagree with the following statements about provisional voting.

(READ AND ROTATE Q37-Q44)

[IF AGREE OR DISAGREE, ASK:] Would you say you agree/disagree strongly or agree/disagree somewhat?

37. A statewide voter registration database, accessible to poll workers on Election Day, would decrease the need for voters to cast provisional ballots.

(n=400)

34%	Agree strongly
19	Agree somewhat
7	Neither agree nor disagree
20	Disagree somewhat
20	Disagree strongly
2	Don't Know
--	Refused

38. A state-sponsored website designed for individuals to check registration status online, before going to the polling place on Election Day, would decrease the need for voters to cast provisional ballots.

(n=400)

45%	Agree strongly
25	Agree somewhat
6	Neither agree nor disagree
9	Disagree somewhat
15	Disagree strongly
2	Don't Know
--	Refused

39. Provisional voting speeds up and improves polling place operation on Election Day by resolving disputes between voters and poll workers.

(n=400)

25%	Agree strongly
23	Agree somewhat
5	Neither agree nor disagree
18	Disagree somewhat
30	Disagree strongly
1	Don't Know
--	Refused

40. Provisional voting helps election officials maintain more accurate registration databases.

(n=400)

27%	Agree strongly
24	Agree somewhat
8	Neither agree nor disagree
16	Disagree somewhat
24	Disagree strongly
2	Don't Know
--	Refused

41. Provisional voting creates unnecessary problems for election officials and poll workers.

(n=400)

31%	Agree strongly
21	Agree somewhat
5	Neither agree nor disagree
19	Disagree somewhat
24	Disagree strongly
1	Don't Know
--	Refused

42. Provisional voting can be avoided by simplifying registration procedures.

(n=400)

28%	Agree strongly
16	Agree somewhat
6	Neither agree nor disagree
20	Disagree somewhat
29	Disagree strongly
2	Don't Know
--	Refused

43. There is a need to offer voters the opportunity to cast provisional ballots.

(n=400)

44%	Agree strongly
28	Agree somewhat
4	Neither agree nor disagree
8	Disagree somewhat
17	Disagree strongly
1	Don't Know
--	Refused

44. The provisional voting system in my polling jurisdiction was a <u>success</u>.

(n=400)

59%	Agree strongly
30	Agree somewhat
5	Neither agree nor disagree
3	Disagree somewhat
4	Disagree strongly
1	Don't Know
--	Refused

45. Which one of the following do you think would be the most effective in increasing the number of provisional ballots validated and ultimately counted in an election?

(RANDOMLY ROTATE 1-3)

(n=400)

20%	In-precinct provisional voting only
40	Provisional voting from a central location rather than in individual polling places
19	In-jurisdiction provisional voting only
2	Other (specify)
1	All of the above
12	None of the above
7	Don't Know
--	Refused

46. Which one of the following do you think would be the most effective in reducing the number of provisional ballots cast in an election?

(RANDOMLY ROTATE 1-5)

(n=400)

26%	Having a statewide voter registration database available at polling places
6	Providing additional staff such as "greeters" at polling places to direct voters to the correct polling location
28	Providing a state sponsored website to enable individuals to check registration status online before going to the polling place
5	Providing poll workers access to an updated printed list of eligible voters in the jurisdiction
16	Providing a dedicated telephone line for poll workers to speak immediately to an election official with access to the list of eligible voters in the jurisdiction
1	Other (specify)
4	All of the above
13	None of the above
2	Don't Know
--	Refused

Demographics (ASK ALL)

I only have a few more questions for statistical purposes....

D1. As election official were you hired, appointed, promoted, or elected to the position?

(n=400)

14%	Hired
42	Appointed
2	Promoted
42	Elected
1	Other/Specify
--	Don't know
--	Refused

D2. For how many years have you served as the election official? [CODE IN WHOLE NUMBERS – IF LESS THAN 1 YEAR RECORD AS "LESS THAN ONE YEAR"]

(n=400)

LESS THAN 1 YEAR	1%

5. In your opinion, which one of the following, if any, created the most need for the use of provisional ballots in your jurisdiction on Election Day, 2004?

Q5	a lot of ppl have moved from one town to another and they weren't registered
Q5	ADDRESS CHANGES
Q5	change of address
Q5	college students (ellab) registered voters couldnt get home to vote!!
Q5	fail to change the address
Q5	FAILED TO REPORT ADDRESS CHANGE SO IN WRONG PRECINCT
Q5	inspector error
Q5	MOST HAD MOVED OUT OF A DIFERENT JURISDICTION
Q5	moved and no address change
Q5	MOVING FROM ONE PRECINCT TO ANOTHER
Q5	not registered
Q5	NOT REGISTERED IN PROPPER PLACE - ADDRESS CHANGES
Q5	NOT REGISTERED WITHIN 5 YEARS
Q5	OUT OF PRECINCT
Q5	they have moved within the county
Q5	they sd they didn't get their ballot and some were military
Q5	Unreported Move - their name does not show on their new address' voting precinct
Q5	voter fail to update their registration
Q5	Voter going to wrong polling place
Q5	VOTER WENT TO INCORECT POLLING PLACE
Q5	voters moved
Q5	VOTERS MOVED
Q5	VOTERS MOVING FROM ONE COUNTY TO ANOTHER OR WITHIN THE COUNTY AND NOT UPDATING THEIR REGISTRATION
Q5	voters not registered
Q5	voters showed up to wrong precinct
Q5	voters voting in the wrong precinct
Q5	voters were at wrong precinct
Q5	wrong precient

6. In your opinion, which one of the following, if any, was the most important reason that provisional ballots cast in your jurisdiction were not validated and ultimately not counted in the 2004 Election?

Q6	b/c they were not voters..
Q6	Combination of not being registered, also individual voted incorrect precinct (else)no
Q6	Individual registered in wrong county
Q6	individual was not registered in the right state
Q6	judge did not put provisional envelopes in ballot box
Q6	MEDIA DID NOT UNDERSTAND WHAT PROVISIONAL VOTING
Q6	NO SIGNATURE AT ALL
Q6	none
Q6	pirch for 10 year skip and voting
Q6	POLL WORKER DID NOT COMPLETE FORM CORRECTLY(ELSE)NO
Q6	There was confusion due to the newness of the provisional ballot procedure
Q6	THEY WERE IN THE WRONG COUNTY COLLEGE STUDENTS REGISTERED INOTHER COUNTIES
Q6	were not completed properly\

14. Please tell me which of the following, if any, was provided in your jurisdiction for the 2004 Election to help poll workers determine voters' assigned precinct and polling place?

Q14 NO POLL WORKERS IN OREGON

22. After the 2004 Election, which of the following, if any, did your jurisdiction offer voters to determine if their provisional ballot was counted?

Q22	THERE WAS ONLY ONE AND HE WAS INFORMED IN PERSON
Q22	voters were given written documents informing them on how to inquire about their votes

26. Now I am going to read you a list of items, please tell me which one you believe presented the <u>biggest</u> challenge in implementing provisional voting in your jurisdiction for the 2004 Election. (POSSIBLY BIGGEST PROBLEM)

Q26	
Q26	access to the voters after the election
Q26	age of the poll workers
Q26	getting the poll workers to understand what I was explaining. Implementing the provisional ballot and the purpose of a provisisional ballot was the biggest challenge in getting the poll workers to understand what this meant.
Q26	having enoug ballots
Q26	having the voter get and understand the information
Q26	lack of awareness of voter's opportunity for provisional voting
Q26	MISREPRESENTATION OF PROVISIONSL BALLOTING WAS THE KEY PROBLEM
Q26	NOT ENOUGH TIME TO VALIDATE THE BALLOT AFTER ELECTION OFFICE
Q26	people saying go anywhere and get a provisional ballot.. it was falsified information given through newspapers and political parties
Q26	POLL WORKERS MISUNDERSTOOD WHAT PROVISIONAL BALLOTS WERE FOR / PUBLIC EDUCATION
Q26	state worker getting back to us
Q26	the staff, not enough
Q26	to verify that they were a valid provisional voter after the election the research was quuite involved and time consuming
Q26	verification

36. Now I am going to read you a list of items. Please tell me which one you believe is the most important change needed in the implementation of provisional voting.

Q36	accessibilty for the voters
Q36	CHANGES IN STATE LAW
Q36	clearer instructions from both state and federal on who can vote provisional ballots
Q36	clearer intruction to the voter
Q36	Elimation of provisional voting should be dumped
Q36	ELIMINATE IT
Q36	MAKING THE FEDERAL AND STATE GOVERNMENTS TO AGREE ON WHO SHOULD AND WHERE THEY CAST PROVISIONAL BALLOTS
Q36	more correct information from the media
Q36	MORE EDUCATION FOR VOTERS...GENERAL INFO EDUCATION
Q36	more funding in every aspect in provisional voting, it has become very costly and time consuming (else) if the polls have to close for any reason, anyone who has not voted has to use a provisional vote, it is very costly, at 40
Q36	more simpler
Q36	more technical work force (ellab) if we could provide a laptop.. we did not have this, we need help in recruiting... what I would like to see is vote centers for provisional ballots..
Q36	NOT ENOUGH TIME TO VALIDATE VOTE AFTER THE ELECTION
Q36	PUBLIC EDUCATION ON PROVISIONAL VOTING
Q36	REGISTERATION OF THE VOTERS, AND THE VOTERS BEING MORE AWARE OF THE VOTING PROCESS
Q36	they need to look at the whole system... the system does not allow enough time from the time the provisional ballots are cast and the time they are actually counted is 3 days... therefore we dont have enough time to inquire more
Q36	VOTER AND PUBLIC EDUCATION - VOTER NEEDS TO KNOW WHAT A PROVISIONAL BALLOT IS
Q36	voters need to be trained
Q36	VOTERS SHOULD EDUCATE THEMSELVES BETTER. THE INFORMATION IS AVAILABLE TO THEM.

45. Which one of the following do you think would be the <u>most effective</u> in increasing the number of provisional ballots validated and ultimately <u>counted</u> in an election?

Q45	DON'T WANT TO INCREASE
Q45	how to correct provisional to educate the public.
Q45	INCREASE PROVISIONAL VOTING IN REGULAR VOTING PLACES (ELSE)NO
Q45	NOT ENOUGH TIME FOR VALIDATION AFTER ELECTION
Q45	they need to have provisional voting in BOTH a central location and in-precient location as well
Q45	UPDATE REGISTRATION BEFORE DEADLINE
Q45	VOTERS TAKE RESPONSIBILITY FOR REGISTRATION

46. Which one of the following do you think would be the most effective in reducing the number of provisional ballots cast in an election?

Q46 advanced voting
Q46 VOTERS UPDATE REGISTRATION

D1. As election official were you hired, appointed, promoted, or elected to the position?

D1	elected then turned out to be appointed
D1	I WAS ELECTED AS A PROBATE JUDGE PART OF THAT JOB IS SUPERVISING ELECTIONS
D1	INHERITTED

Subject Materials for Sept. 6 Meeting

Karen:

Attached are 3 documents that will be topics of discussion at our meeting tomorrow. The Power Point presentation is included so you will have a complete file (and as a backup in case something goes wrong with the version I am bringing.)

The "Script" document is a simple, MS Word version of the Power Point presentation. You might want to print out copies for those who would like to follow along and make notes on the slides as they are discussed.

The third document is the "Alternatives" paper we will discuss after the Power Point presentation. It outlines alternative points that might be included in the preliminary guidance document, which is the next deliverable in the project. We hope to learn which alternatives are preferred by the EAC so that we will know which ones should be developed further for the Preliminary Guidance Document. I hope you might be able to have this duplicated and distributed to those attending the meeting.

Thanks. I look forward to seeing you tomorrow.

Tom O'Neill

Briefing for

U. S. Election Assistance Commission

September 26, 2005

Briefing for

U. S. Election Assistance Commission

September 6, 2005

QUESTIONS –TOPICS OF SPECIAL INTEREST

1. **How did states prepare for HAVA's provisional voting requirements?**
2. **How did their preparation and performance vary between states that had previously had some form of Provisional Ballot and those did not?**
3. **How did litigation affect the implementation of Provisional Voting?**
4. **How effective was provisional voting in enfranchising qualified voters?**
5. **Did State and local processes provide for consistent counting of provisional ballots?**
6. **Did local election officials have a clear understanding of how to implement provisional voting?**

1. How did states prepare for HAVA's provisional voting requirements?

Interviews told us how election officials prepared to administer the process.

Most received provisional voting instructions from state government.

The type and amount of instruction received varied widely across the states.

Almost all provided training or written instruction to precinct-level poll workers on how to administer provisional ballots.

- **Only about 1 in 10 made available to poll workers a voter registration database.**
- **Almost equally rare were training and written procedures for poll workers on the counting of provisional ballots.**

Wide variance existed in preparation to give voters a way to find out if their provisional ballots had been counted.

2. How did preparation and performance vary between states that had previously had some form of provisional ballot and those that did not?

18 states were new to provisional voting; 25 others had experience.

Local election officials in the "old" states felt more confident.

9 out of 10 local officials in the "old" states felt that the support received from state government was adequate, compared to 8 in 10 in the "new" states.

"New" state officials felt:

- **Voters did not receive enough information about the jurisdiction in which to cast a provisional ballot in order to be counted.**
- **More funding was needed to educate voters about their rights to cast a provisional ballot.**

2. How did preparation and performance vary between states that had previously had some form of provisional ballot and those that did not?

Difference in performance even more marked:

- Provisional ballots in “old states” = more than 2% of the total vote, 4 times the proportion in “new” states.
- Counting provisional ballots in the final vote, the “old” states averaged nearly double the number of the “new” states.
- In “old” states, 1.48% of the total vote came from provisional ballots, six times more than the 0.23% in the “new” states.

Question 3: How did litigation affect the implementation of Provisional Voting?

Pre-election litigation clarified voters' rights to:

- **Sue in federal court to remedy violations of HAVA**
- **Receive provisional ballots, even though they would not be counted**
- **Be directed to the correct precinct**
- **Most pre-election litigation occurred too late to influence how states implemented provisional voting.**

Question 3: How did litigation affect the implementation of Provisional Voting?

Lawsuits filed shortly after Election Day to alter the outcome of a close election failed, but established principles:

- **States are not required to count provisional votes cast in the wrong precinct**
- **Provisional ballots cast at the correct polling *site* but at the wrong precinct are to be counted (New York)**
- **Provisional voters are to be protected against poll worker or clerical error (New York, Washington)**

Question 3: How did litigation affect the implementation of Provisional Voting?

Litigation is most useful when it:

- **Occurs early in the process**
- **Does not seek to change the outcome of a race**
- **Aims to enhance the accuracy of the provisional voting process**

Question 3: How did litigation affect the implementation of Provisional Voting?

Conclusions

- Litigation is more likely to yield a public benefit if it seeks to assure the accuracy of the provisional voting process, rather undo election results.
- Sensitive questions should not be resolved by the judiciary at a frenzied pace.
- Expect more litigation if states do not begin now to address ambiguities and problems that surfaced in the 2004 election.

Question 3: How did litigation affect the implementation of Provisional Voting?

Policy Implications

Guidance to the states on how to encourage earlier, rather than later, litigation

"Preferred practice" for states to preclude post-election challenges that could have been filed in a pre-election lawsuit.

States can distinguish between the two kinds of suits by providing a streamlined administrative remedial process for voters who believe their provisional ballot rights were mistreated and a more burdensome judicial proceeding to contest an election result.

Focus litigation on the ways state laws are allegedly deficient to:

- **Clarify the rules applicable to provisional voting**
- **Assure that the rights protected by provisional voting laws are enforced**

How effective was provisional voting in enfranchising qualified voters?

Provisional ballots enfranchised 1,2 million voters, or 1.01% of turnout. These voters otherwise would have been turned away at the polls.

The number of voters who could be helped by provisional voting may be about 2.5 – 3 million. Provisional voting might be about 50% effective.

Whatever the precise figure, there is room for improvement.

Legislative activity gives evidence that states were not satisfied with the effectiveness of their provisional voting systems.

Those voting with provisional ballots in states with experience were enfranchised more frequently than those in the "new" states.

Experience factor: mechanical or cultural?

Question 5: Did State and local processes provide for consistent counting of provisional ballots?

Little consistency existed among and within states.

The use of provisional ballots was not distributed evenly across the country.

A few states accounted for most of the ballots cast.

- The 7% of the total vote represented by Alaska's counted provisional ballots was more than 1,000 times greater than Vermont's 0.0058%.
- Share of provisional ballots in the total vote was six times greater in experienced states than in new states.

More rigorous the Voter ID requirements and registration status, the smaller the percentage of provisional ballots that were counted.

"New" states with registration databases counted 20% of the ballots cast.

Those without databases counted more than double that rate (44%).

Question 5: Did State and local processes provide for consistent counting of provisional ballots?

In-precinct versus out-of-precinct states had different outcomes.

States that allowed out-of-precinct ballots counted 56% of the provisional ballots.

States that recognized only ballots cast in the proper precinct counted an average of 42% of provisional ballots cast.

In "old" states, this difference was greater.

52% of ballots cast were counted in states requiring in-district ballots, 70% were counted in those allowing out-of-precinct ballots.

If all states had counted out-of-precinct ballots, perhaps 280,000 more voters would have been enfranchised across the country.

Question 5: Did State and local processes provide for consistent counting of provisional ballots?

In both "new" and "old" states, counties differed by as much as 90% to 100% in the rate at which ballots were cast and counted.

<u>But differences between old and new states persisted:</u>

- **Officials from "old" states counted more ballots, were better prepared to direct voters to their correct precincts with maps, and regarded provisional voting as easy to implement and enabling more people to vote.**
- **Officials from "new" states needed more information for voters about the jurisdiction where provisional ballots must be cast in order to be counted and needed more time to implement provisional voting procedures.**

- **Officials from "new" states felt that provisional voting created unnecessary problems for election officials and poll workers.**

Question 5: Did State and local processes provide for consistent counting of provisional ballots?

Conclusions

States have considerable latitude in how they meet HAVA requirements.

A considerable degree of variation among the states is to be expected.

If that variation stems from differences in political culture among the states, it is likely to persist. If it reflects a learning curve for “new” states, consistency may increase more quickly.

Did local election officials have a clear understanding of how to implement provisional voting?

How do the local officials themselves characterize their understanding of their responsibilities to manage the provisional voting process?

8 out of 10 county-level elections officials reported receiving instructions from their state government

4 out of 10 felt poll workers needed more training to understand their responsibilities.

Second, objectively how well did the process appear to be managed?

Lack of consistency among and within states indicates wide differences in understanding by election officials.

The number of states that have amended statutes on provisional voting to include poll worker training is a sign of dissatisfaction with the level of understanding in 2004.

DISCUSSION

THE 6 QUESTIONS

ALTERNATIVES OUTLINE

DRAFT FOR COMMENT

OUTLINE OF ALTERNATIVES

For Consideration In Drafting Preliminary Guidance on Provisional Voting
September 6, 2005

This outline identifies 7 areas where guidance from EAC could improve the provisional voting process.

EAC's guidance should strike a rational balance among the three competing objectives of ballot access, ballot security, and procedural reliability and practicality. The outline sketches a range of alternatives for the EAC. Based on the EAC's judgment about which alternatives it can embrace, we will develop appropriate recommendations for the guidance document.

Possible Criteria for evaluating alternatives and choosing among alternatives:

1. The electoral system must be able to collect, record, and tally the votes of the electorate with sufficient accuracy to declare a winning candidate whose victory is procedurally legitimate in the eyes of supporters and opponents alike. Second, no well-functioning electoral system would fail to provide or count a ballot cast by a properly registered voter who correctly completed all steps required to receive one. (Century Foundation/10)

2. Margin of Litigation – need a system robust enough to perform well under the pressure of a close election.

3. Enfranchisement rate –the percentage of eligible voters who are able to participate.

4. Voter satisfaction standard – degree to which voters believe the system meets their needs and provides an avenue of participation.

Elements influencing the performance of the provisional voting system

THE PROCESS

A. Registration

B. Pre-Election Information For Voters

C. At The Polling Place

D. Evaluating The Ballot

E. Post-Election Information For Voters

BROADER CONSIDERATIONS

F. Integrity And The Appearance Of Integrity

G. Continuous Assessment Of The Provisional Ballot -- Process And Performance (Quality Improvement Model)

INTRODUCTION
THE IMPORTANCE OF CLARITY AND IDENTIFICATION OF BEST PRACTICES

The guidance document should emphasize above all else the importance of clarity in the rules governing every stage and process of provisional voting. As the Century Foundation's recent report observed, "Close elections increasingly may be settled in part by the evaluating and counting of provisional ballots. . . To avoid post election disputes over provisional ballots—disputes that will diminish public confidence in the accuracy and legitimacy of the result well in advance of the election, states should establish, announce, and publicize clear statewide standards for every aspect of the provisional ballot process, from who is entitled to receive a provisional ballot to which ones are counted."

State efforts to improve the provisional voting process are already underway. Those states, as well as others that have not yet begun to correct shortcomings that became apparent in 2004, can benefit from guidance that includes concrete descriptions of best practices. A best practice approach in the guidance document is likely to advance the adoption of provisional voting practices that should be standard across the country while recognizing diversity among the states.

ALTERNATIVES FOR EACH STEP IN THE PROCESS

A. Registration

Improving the registration system can forestall the need to cast a provisional ballot, and is therefore among the most important possible reforms.

1. Registration rules should be clear and to forestall post-election disputes about their interpretation.

2. If states require identification at the time of registration, the kind of IDs required should be stated precisely, in plain English, and be publicly available in a graphical form that all voters can understand, for example, "You must bring your driver's license. If you don't have a driver's license, then you must bring an ID card with your photograph on it and this ID card must be issued by a government agency. "

3. If there is one place to sign an affirmation of citizenship and age (and/or mental capacity), and that is signed, the failure to check any box that refers to the aforementioned should not be deemed a material omission.

4. States should consider testing a modified system of voter registration. A voter who registers earlier than 60 days before Election Day would be guaranteed that administrators will . That voter will be able to vote by regular ballot. For those who register within 30 days of the election, administrators would still be expected to ensure the orderly processing of the registration, but such voters will not be guaranteed that if there is a problem with their application that they will be able to vote by a regular ballot. This two-tiered registration system could reduce post-election disputes.[1]

---

[1] See: http://moritzlaw.osu.edu/electionlaw/comments/2005/comment0322.html. This suggestion relates directly to California's experience after shortening the deadline for registration to 15 days from 29, which contributed to the state's overwhelming reliance on provisional ballots. Had the election in California been close, the contention over provisional ballots could have been destabilizing.

5. States should issue a receipt with a tracking number to each person submitting a registration form. The tracking number will allow the voter to check on registration status through the use of that numbe. r and a publicly available registration list. The receipt could serve as an "admission ticket" to a regular ballot, even if the voter's name was not on the poll worker's list. [2]
6. States should have clear rules with respect to whether registration forms collected by third parties are processed as mail-in or in-person registrations.
7. Registration forms submitted by third-party groups should be considered mail-in registrations subject to those ID requirements. But if giving a registration form to a third-party group is considered equivalent to giving the form to a Board of Elections, or DMV, official then the law should say so explictly.
8. The re-enfranchisement process should be clear and straightforward. To avoid litigation over the registration status of felons, best practice should be defined as making re-enfranchisement automatic or no more burdensome than the process required for any new registrant.[3]
9. A provisional ballot should seek from the voter all the information necessary to constitute registration and be filed by local officials with the proper office to complete the registration process.

B. Pre-Election Information For Voters

The better voters understand their rights and obligations, the easier the system will be to manage and the more legitimate the appearance of the process.

1. A state website for voters should offer full, clear information on boundaries of precincts, location of polling places, requirements for identification, and other necessary guidance that will facilitate the casting of a regular nallot.
2. This same information should be Included on sample ballots
3. Publish this information shortly before the election in prominent newspaper announcements and, if feasible, through broadcast media.

C. At the Polling Place

Avoiding error at the polling place will allow more voters to cast a regular ballot.

1. The organization of the polling place, particularly the multi-precinct polling place is important. Guidance should provide best practices on the Importance of greeters, maps, and prominently posted voter information about provisional ballots, ID requirements, and relation topics.

---

[2] There could be two different kinds of receipts: one would be simply confirm that an individual submitted a registration form by the required deadline; the other, more robust, would confirm that the voter was officially registered

[3] From The Century Foundation Report

2. The provisional ballot should be of a design or color sufficiently different from a regular ballot to avoid confusion over counting.

3. Offer a best practice on estimating the number of provisional ballots that should be made available at each precinct, so that they don't run out on Election Day

4. Offer a best practice on the handling of provisional ballots between the time they are cast to when they are examined afterward

5. Offer best practices in training and scripting poll workers so that they ask the right questions, offer the right information, and make provisional ballots available appropriately – particularly important when a voter shows up at the wrong precinct.

D. Evaluating the Ballot

The clarity of criteria is critical to a sound evaluation process and to the legitimacy of the system as a whole.

1. The experience in 2004 in North Carolina, Washington, Ohio underline the importance of clarity in the criteria to be used in deciding if a provisional ballot should be counted. Rushed litigation over the evaluation of provisional ballitng could erode the legitimacy of a presidential election. As the Century Foundation report put it, "Whatever procedures the states choose [to determine if a provisional ballot should be counted], the paramount consideration—as with all others concerning provisional voting—is that they be clear and thus not susceptible to post-election manipulation and litigation." Nonetheless, the NY *Panio v. Sutherland* case shows the difficulty of defining the range of administrative errors from which the provisional voters should be held harmless. Even when the standard is "clerical error" judges can differ over what that means exactly. Possibly a state law might be able to clarify a definition by giving examples of clerical errors, but even then the definition is unlikely to be perfect.

2. Recent legislation in Arizona indicates that this guidance should reiterate HAVA's requirement that persons appearing claiming to be registered voters cannot be denied a ballot because they do not have identification with them.

3. Voters who lack ID should have up to three days to provide either the HAVA-specified forms of ID or other documentation that will facilitate the state's ability to verify that the person casting the provisional ballot is the same one who registered by mail. This research has shown that voters seem to feel returning with ID is less onerous that signing an affidavit.

4. More provisional voters are enfranchised in those states that count ballots cast outside the correct precinct. The best practice may be to define "jurisdiction" more broadly than the precinct. Or, more modestly, If a state chooses to require voters to appear at their assigned precinct, where the same polling site serves more than one precinct, a voter's provisional ballot should count as long as the voter appears at the correct polling site.[4]

---

[4] Chances are administrative error accounts for the voter being directed to the wrong precinct under these circumstances.

5. The best practice for election officials to evaluate a provisional ballot includes a check of existing records, including the original registration form, in order to match signatures.

6. Public confidence in the process of evaluating and counting provisional ballots requires that the process be open to the public and conducted by a team of election officials whose decision will be reviewed by a Board of Elections (or similar body) if the decisions was not unanimous.

7. Officials should follow a written procedure, and perhaps a checklist, to identify the reason why a provisional ballot is rejected (e.g., check the applicable box "unregistered voter"; "lack of signature match" "wrong precinct," etc.) Those forms should be disclosed publicly when completed.

8. The standards used for eligibility of provisional voters should be made clear in state law that specifies the "burden of proof" to be met. For example, a provisional ballot will not be rejected unless officials find *by clear and convincing evidence* that voter is ineligible; or provisional ballot will not be counted unless all available evidence shows that voter *more likely than not* is eligible

9. Clear standards are needed for the essential information that must be appear on provisional ballot envelope: name, address, signature, etc. The standards should indicate that a provisional ballot does not count if it lacks this information. The standards should provide voters a reasonable opportunity provide the missing information. (For example, election officials have no duty to inform the voter of the error, but if voters appear at the Board of Elections within 72 hours on their own initiative they can supply the missing info.)

10. Sates that use the information on the provisional ballot to permit voters whohave changed their addresses to update their registrations, should adopt clear procedures on that process and specify how the new information will be communicated between different Boards of Elections

11. The time by which election officials must complete their eligibility evaluations is critical, particularly in presidential elections. The guidance document should specify a range of time periods as a best practice (for example: 7 days, 10 days, 14 days, 21 days).

F. Post-election Information for Voters

Timely information for voters provides a final quality control on the system by giving the voter an opportunity to correct mistakes that may cause a legitimate ballot not to be counted.

1. Recommend best practices to improve the use of websites, phone lines, or mail to inform provisional voters about the evaluation of their ballots. The date by which this occurs is critical if voters are to have a reasonable opportunity to correct errors.

2. Specify the administrative review procedures, if any, that are available to a voter who has been told that her provisional ballot was rejected. May she appeal to a higher administrative authority? if so, under what timetable? What evidence may she offer in an effort to demonstrate eligibility?

G. State Laws Governing Litigation Over Provisional Voting

1. State law could foreclose litigation where the purpose is to change the outcome of the election, but a better option appears below.
2. Provide for expedited, streamlined litigation – administrative decisions regarding the eligibility of provisional ballots can be overturned only if *clearly erroneous* based on documentary evidence or a violation of the clearly specified procedures concerning the processing of such ballots
3. Establish special, streamlined litigation procedures for Election Day complaints that individuals are being denied the right to cast a provisional ballot

BROADER CONSIDERATIONS

H. Integrity and the Appearance Of Integrity

1. Non or bi-partisan bodies to make a public determination of the validity of provisional ballots would increase confidence in the system?
2. Transparency – require the purging process for registration to be public and with an opportunity to for voters to correct an erroneous determination that they should be purged.
3. Transparency – require the evaluation process for provisional ballots to be public.
4. Training poll workers – provide guidance on how to provide information to potential voters on their options if their names do not appear not on the registration list.

H. Continuous Assessment of the Provisional Ballot -- Process and Performance (Quality Improvement Model)

Defining what constitutes a successful provisional voting systemis difficult. The most successful system is probably not the one with the most provisional votes cast (which may indicate problems with the registration system). Nor is the system with the greatest number counted or with the fewest counted (the evaluation process is likely to be flawed).

Defining quality here requires a broad perspective about how well the system works, how open it is to error recognition and correction, and how well provisional voting processes are connected to the registration and voter identification regimes.

The first step to improving quality is to recognize the provisional voting process as a system and the consequent need to take a systems approach to regular evaluation through standardized metrics with explicit goals for performance.[5]

But a clear first step is to recommend to the states the metrics they can establish, collect and monitor to evaluate the quality of the provisional voting process and other aspects of the system. Among them might be:

---

[5] Perhaps the EAC should engage one of the national quality organizations to evaluate the provisional ballot process within the broader context of the electoral system.

DRAFT

1. Standard deviation of % of provisional ballots counted by county to estimate the consistency of the evaluation system within the state.
2. Set targets to reduce the number of provisional ballots cast as a measure of the quality of the registration system.
3. Election complaints by jurisdiction, from precinct to the state level.

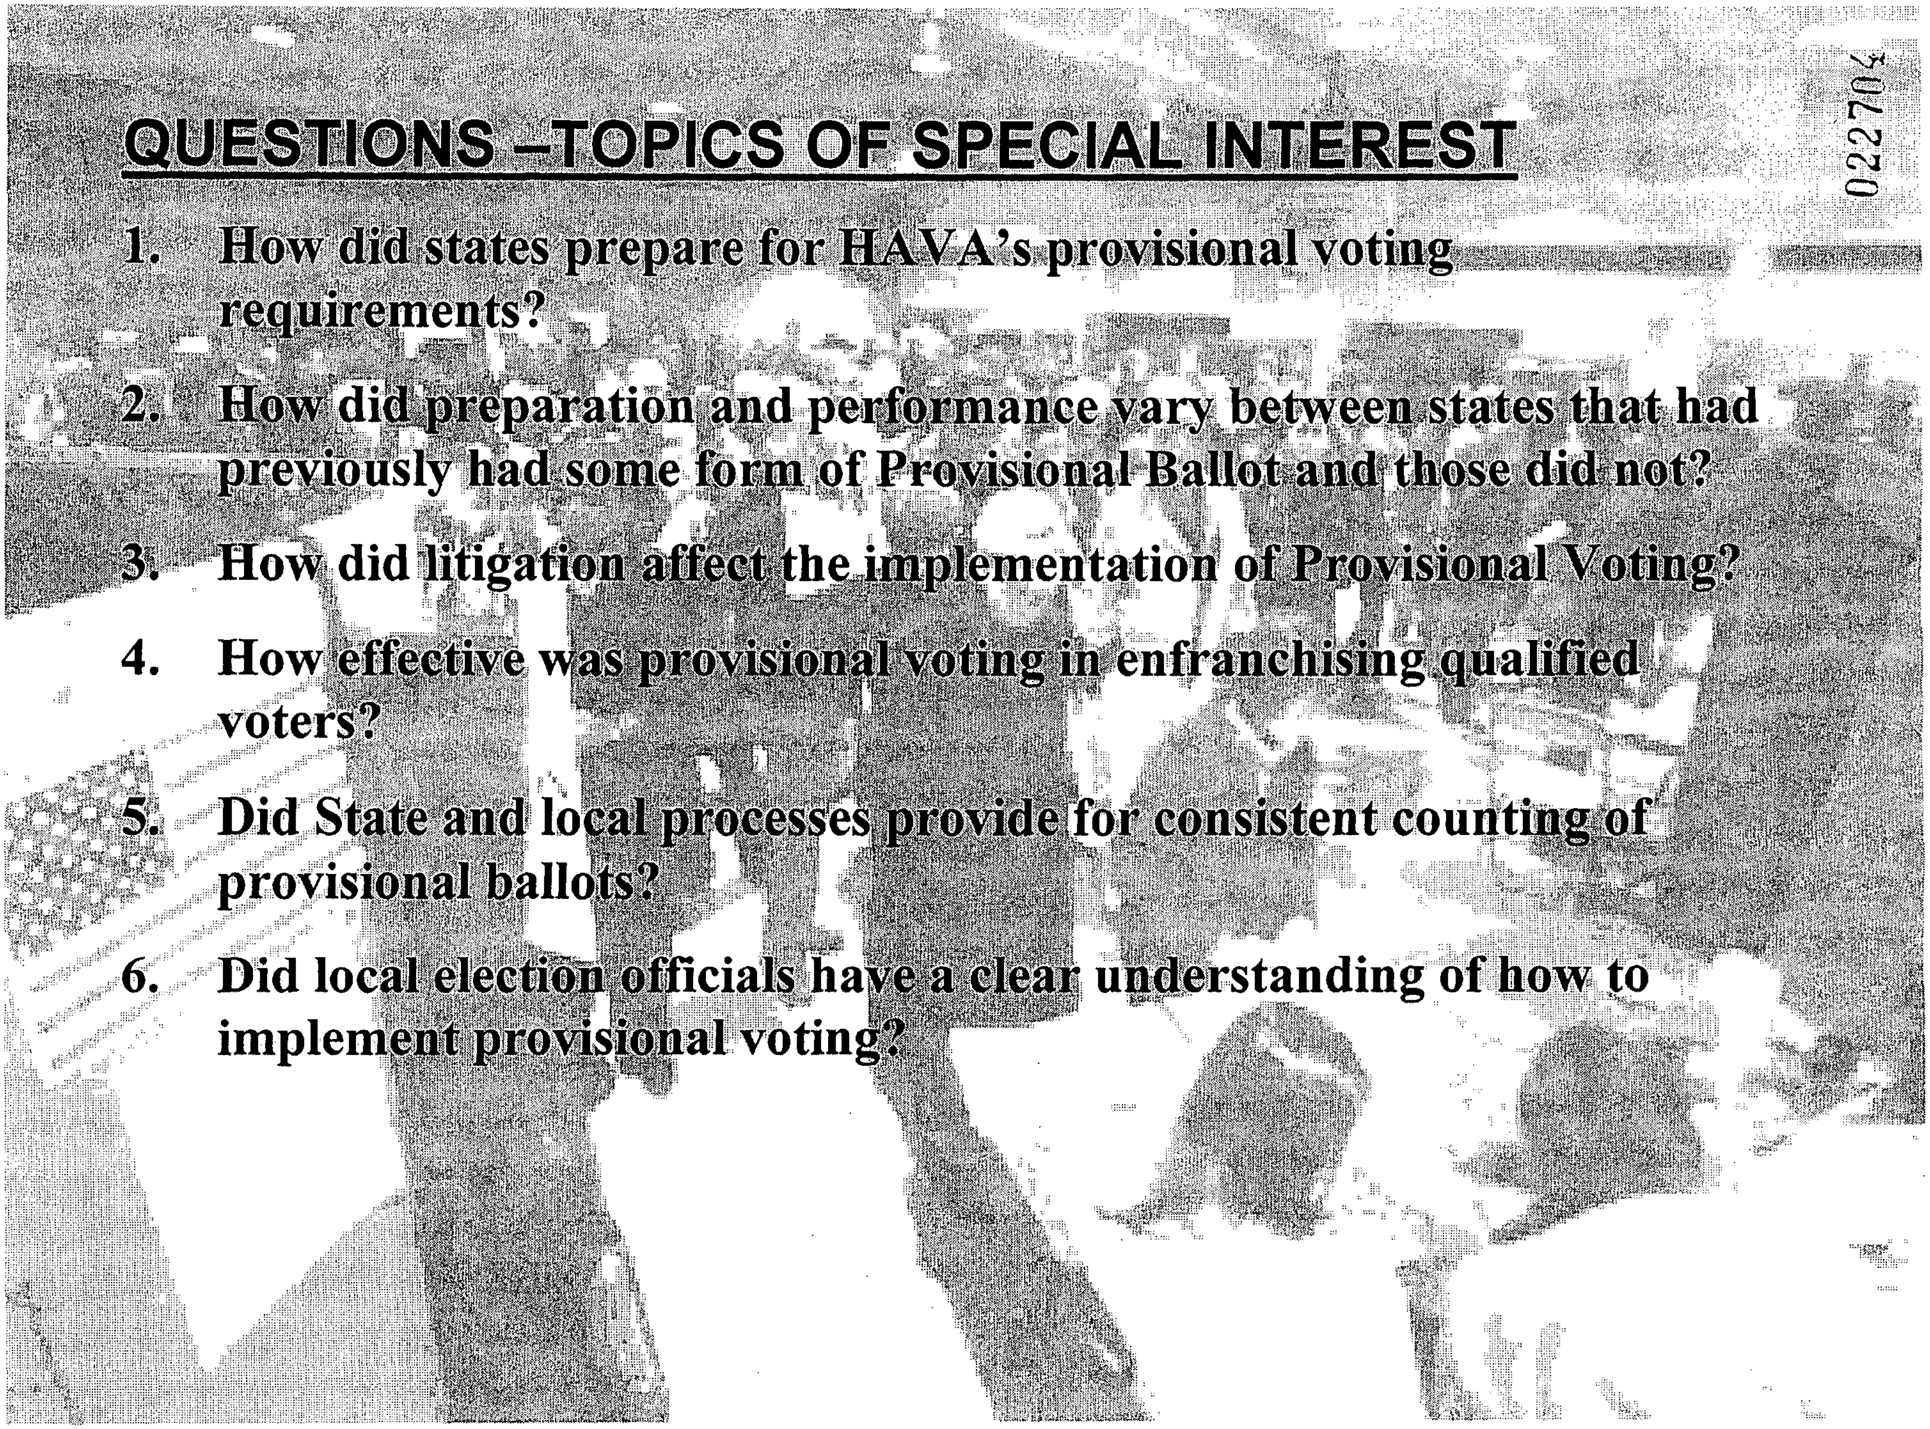
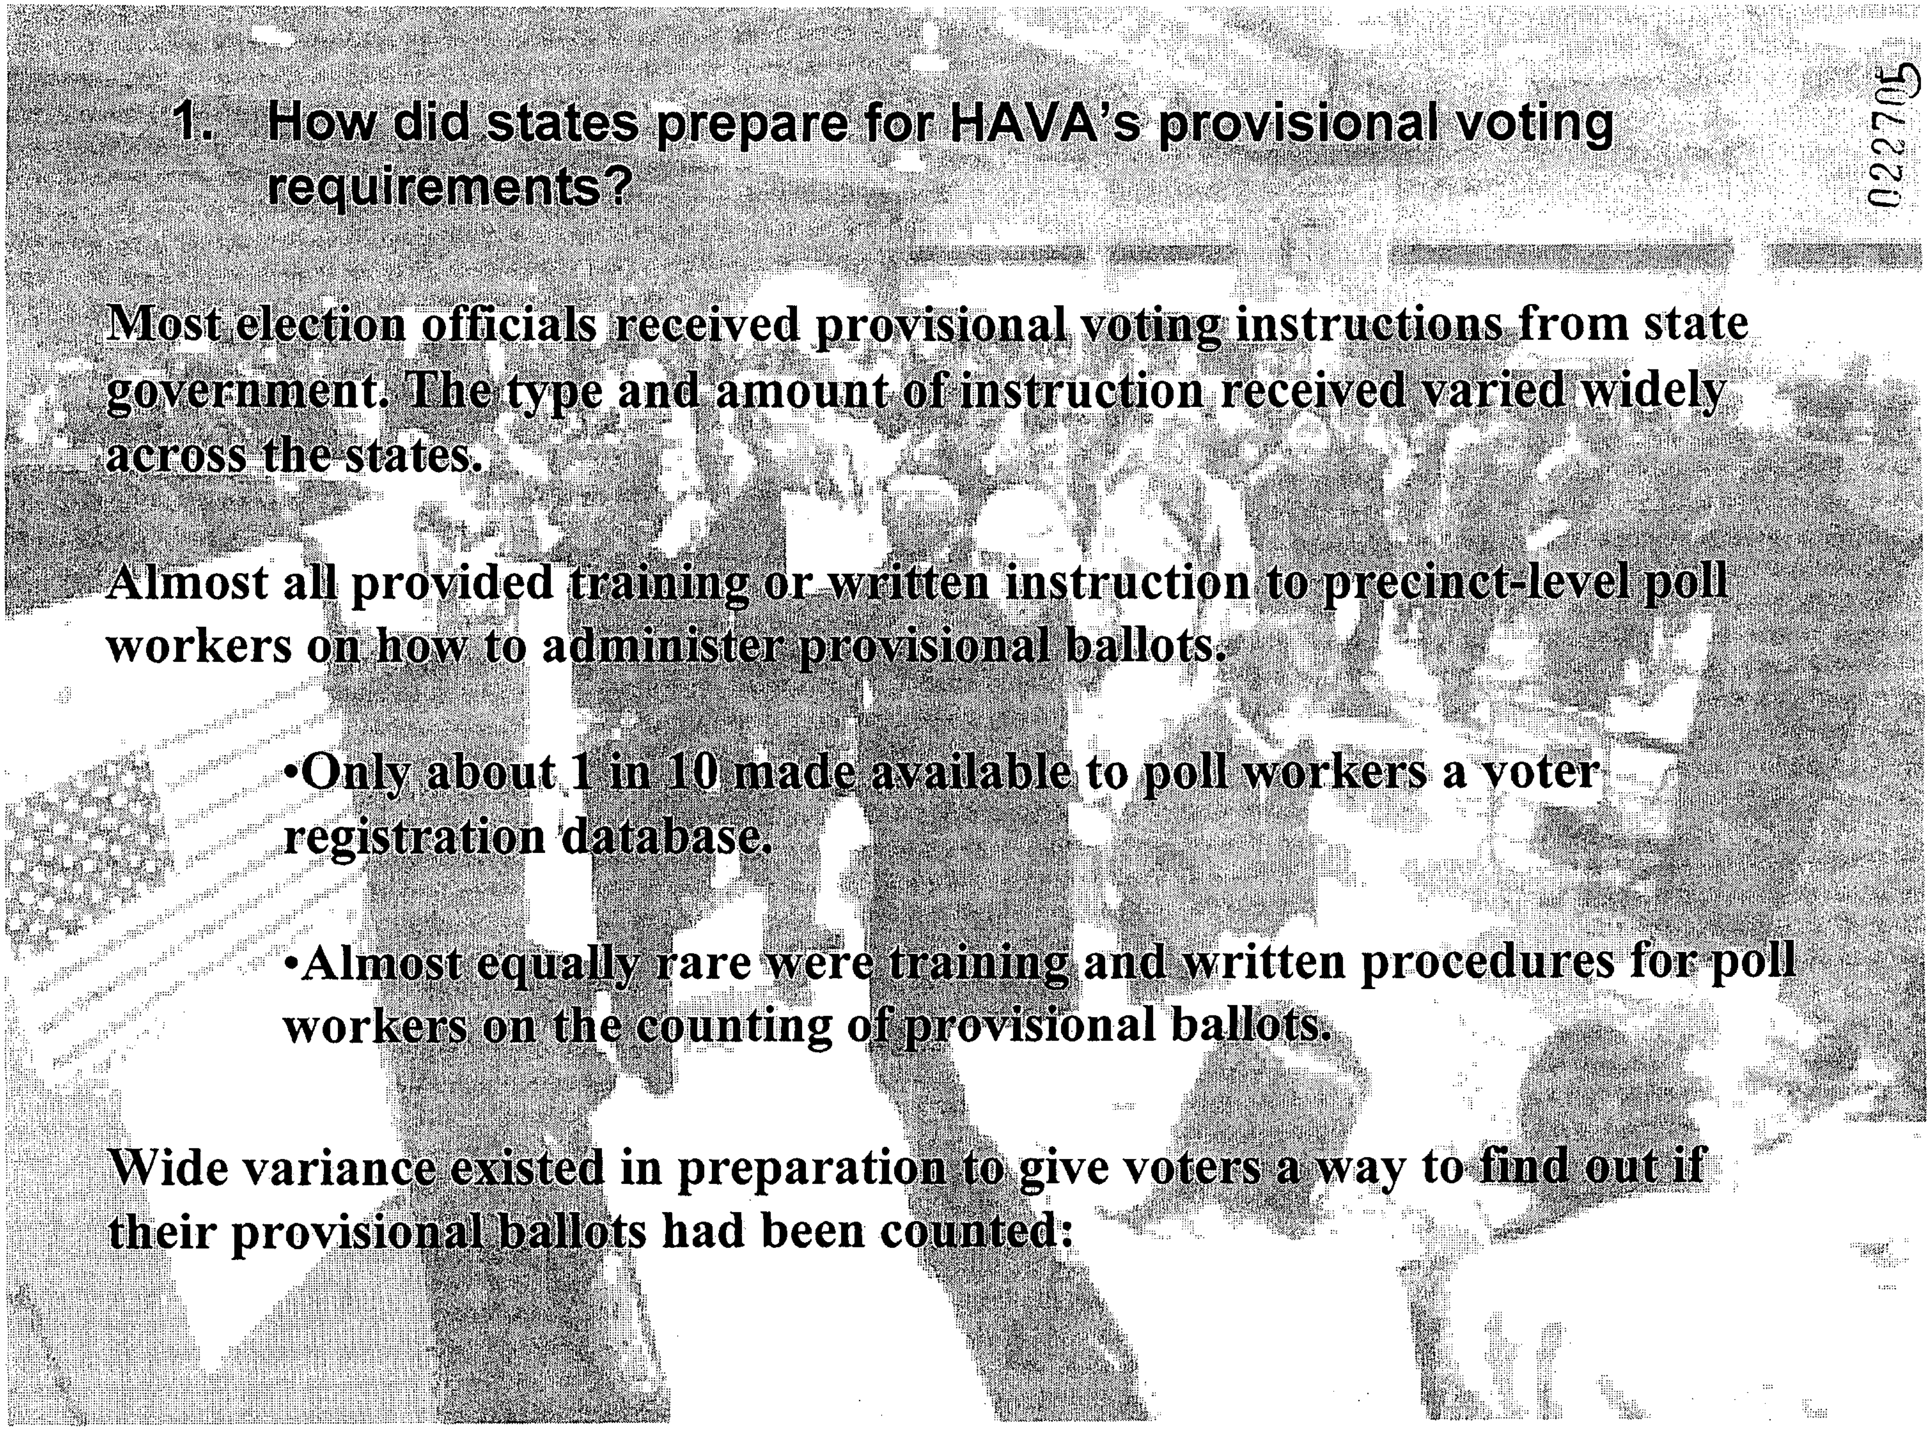
Preliminary Findings

Provisional Voting
&
Alternatives for Guidance Document



QUESTIONS –TOPICS OF SPECIAL INTEREST

1. How did states prepare for HAVA's provisional voting requirements?
2. How did preparation and performance vary between states that had previously had some form of Provisional Ballot and those did not?
3. How did litigation affect the implementation of Provisional Voting?
4. How effective was provisional voting in enfranchising qualified voters?
5. Did State and local processes provide for consistent counting of provisional ballots?
6. Did local election officials have a clear understanding of how to implement provisional voting?



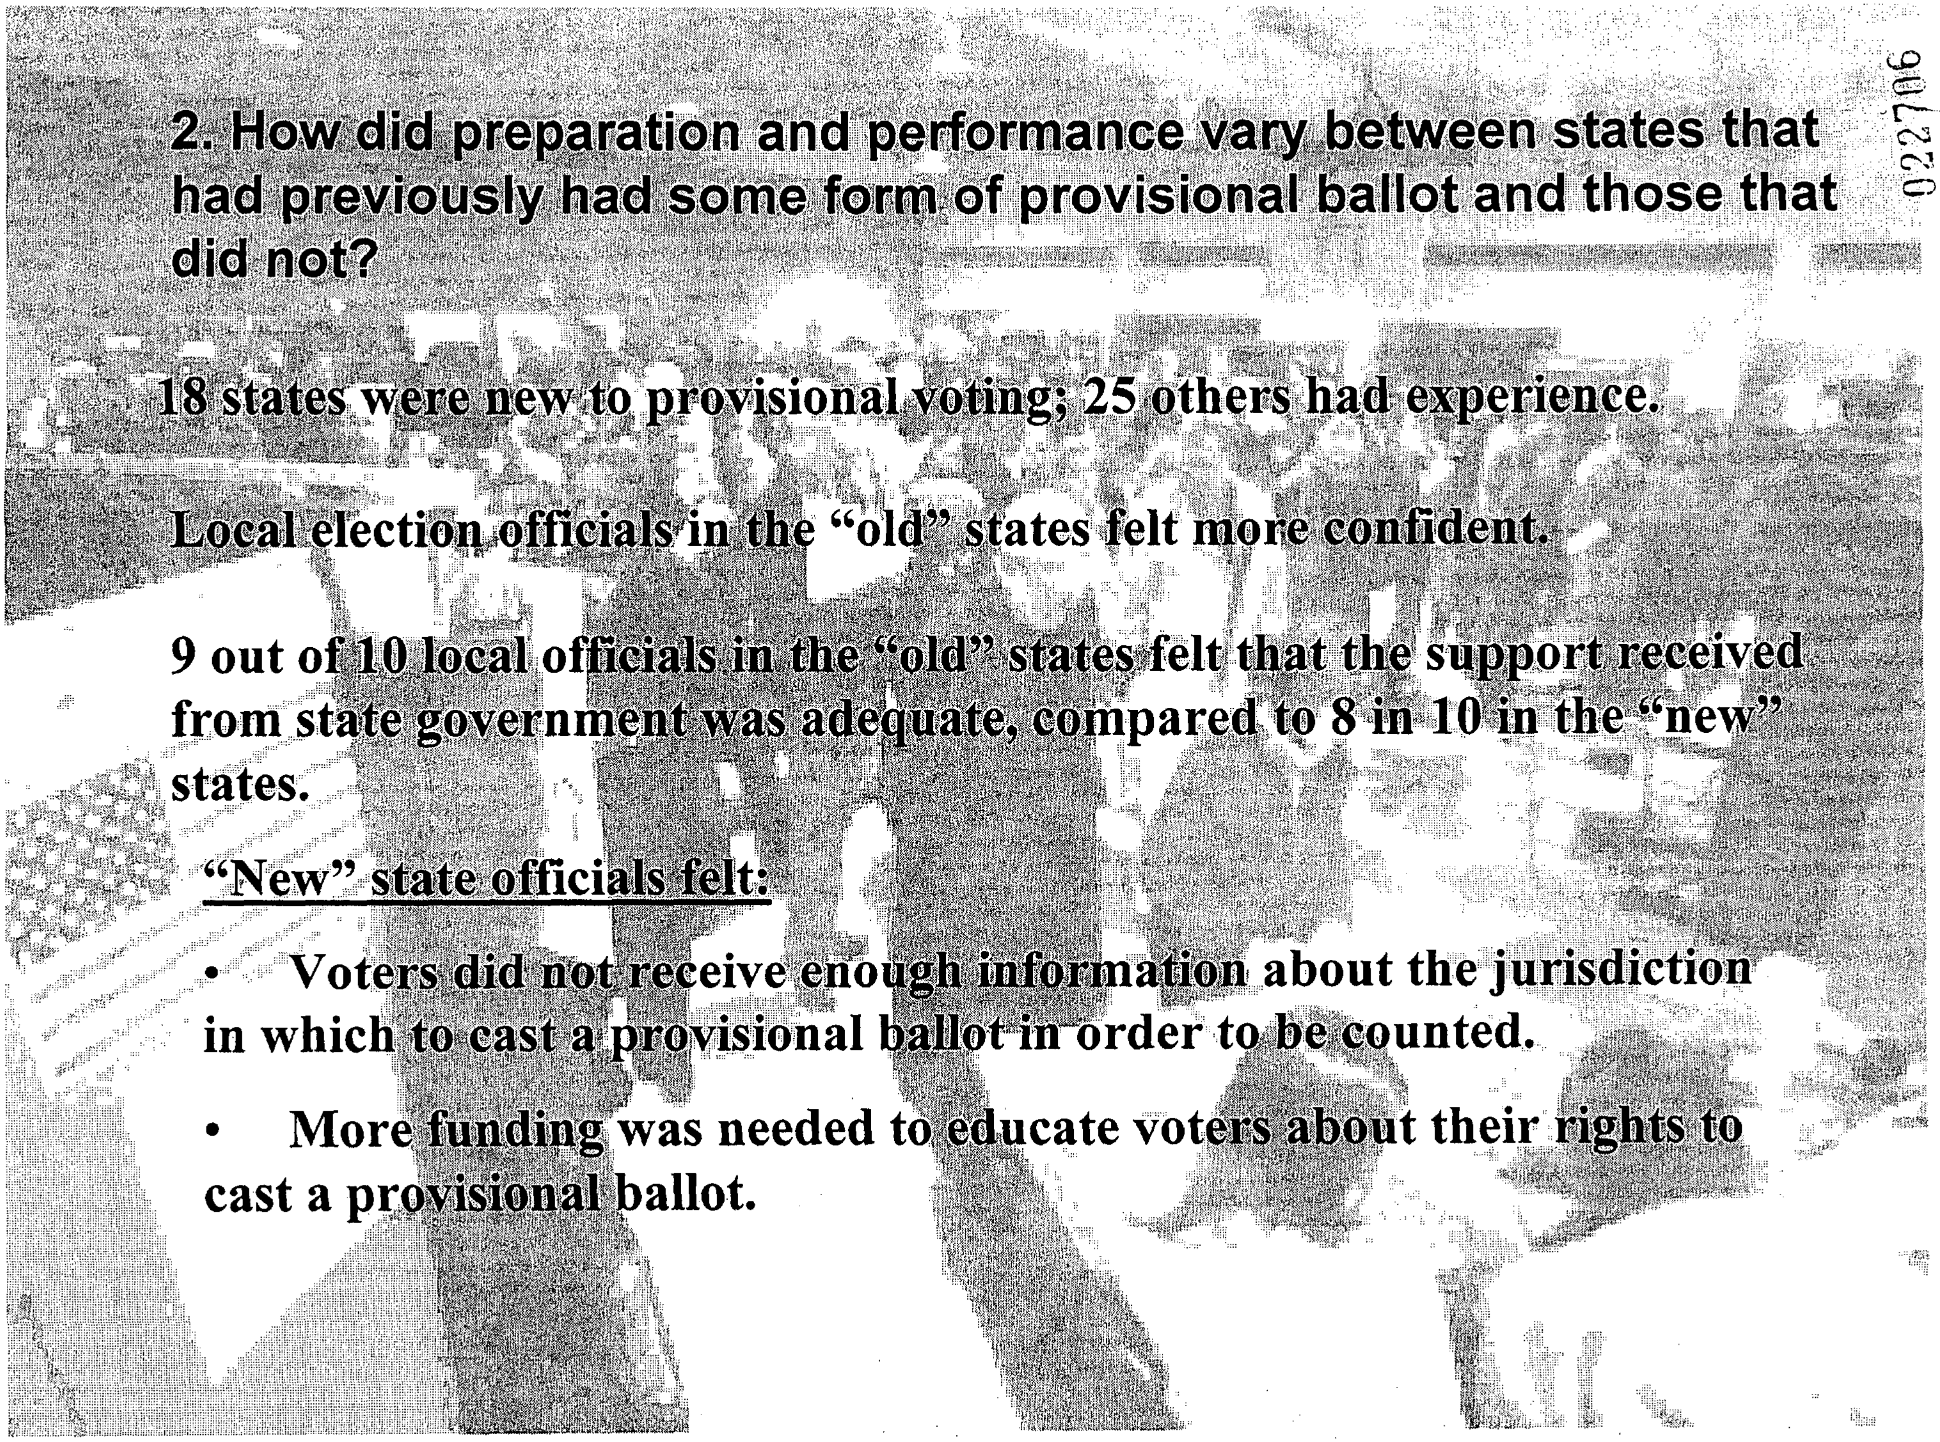
1. How did states prepare for HAVA's provisional voting requirements?

Most election officials received provisional voting instructions from state government. The type and amount of instruction received varied widely across the states.

Almost all provided training or written instruction to precinct-level poll workers on how to administer provisional ballots.

- Only about 1 in 10 made available to poll workers a voter registration database.
- Almost equally rare were training and written procedures for poll workers on the counting of provisional ballots.

Wide variance existed in preparation to give voters a way to find out if their provisional ballots had been counted:



2. How did preparation and performance vary between states that had previously had some form of provisional ballot and those that did not?

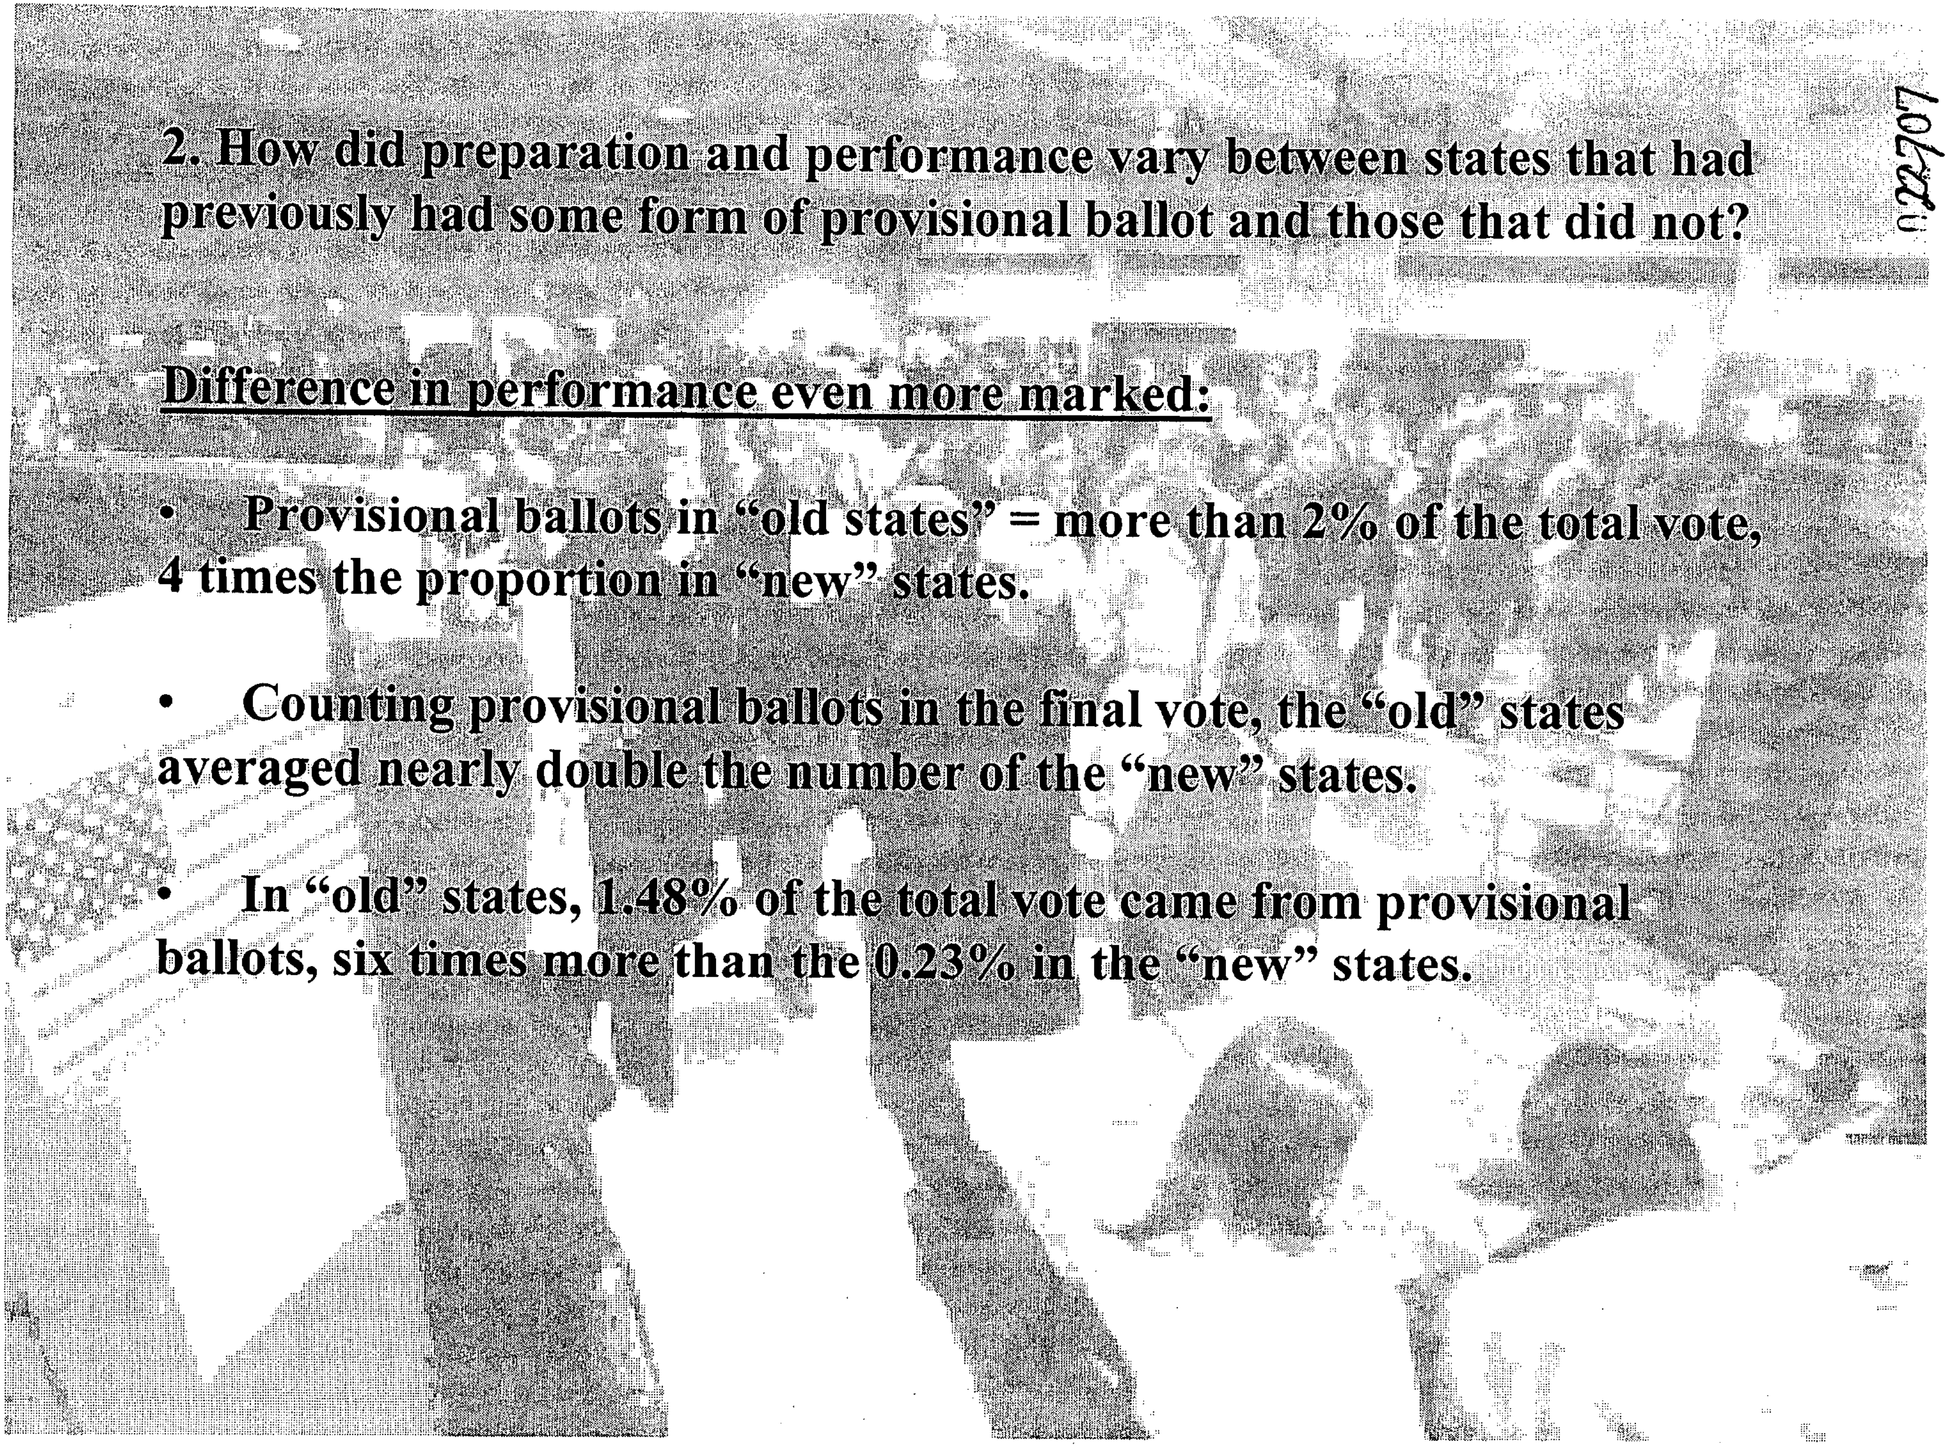
18 states were new to provisional voting; 25 others had experience.

Local election officials in the "old" states felt more confident.

9 out of 10 local officials in the "old" states felt that the support received from state government was adequate, compared to 8 in 10 in the "new" states.

"New" state officials felt:

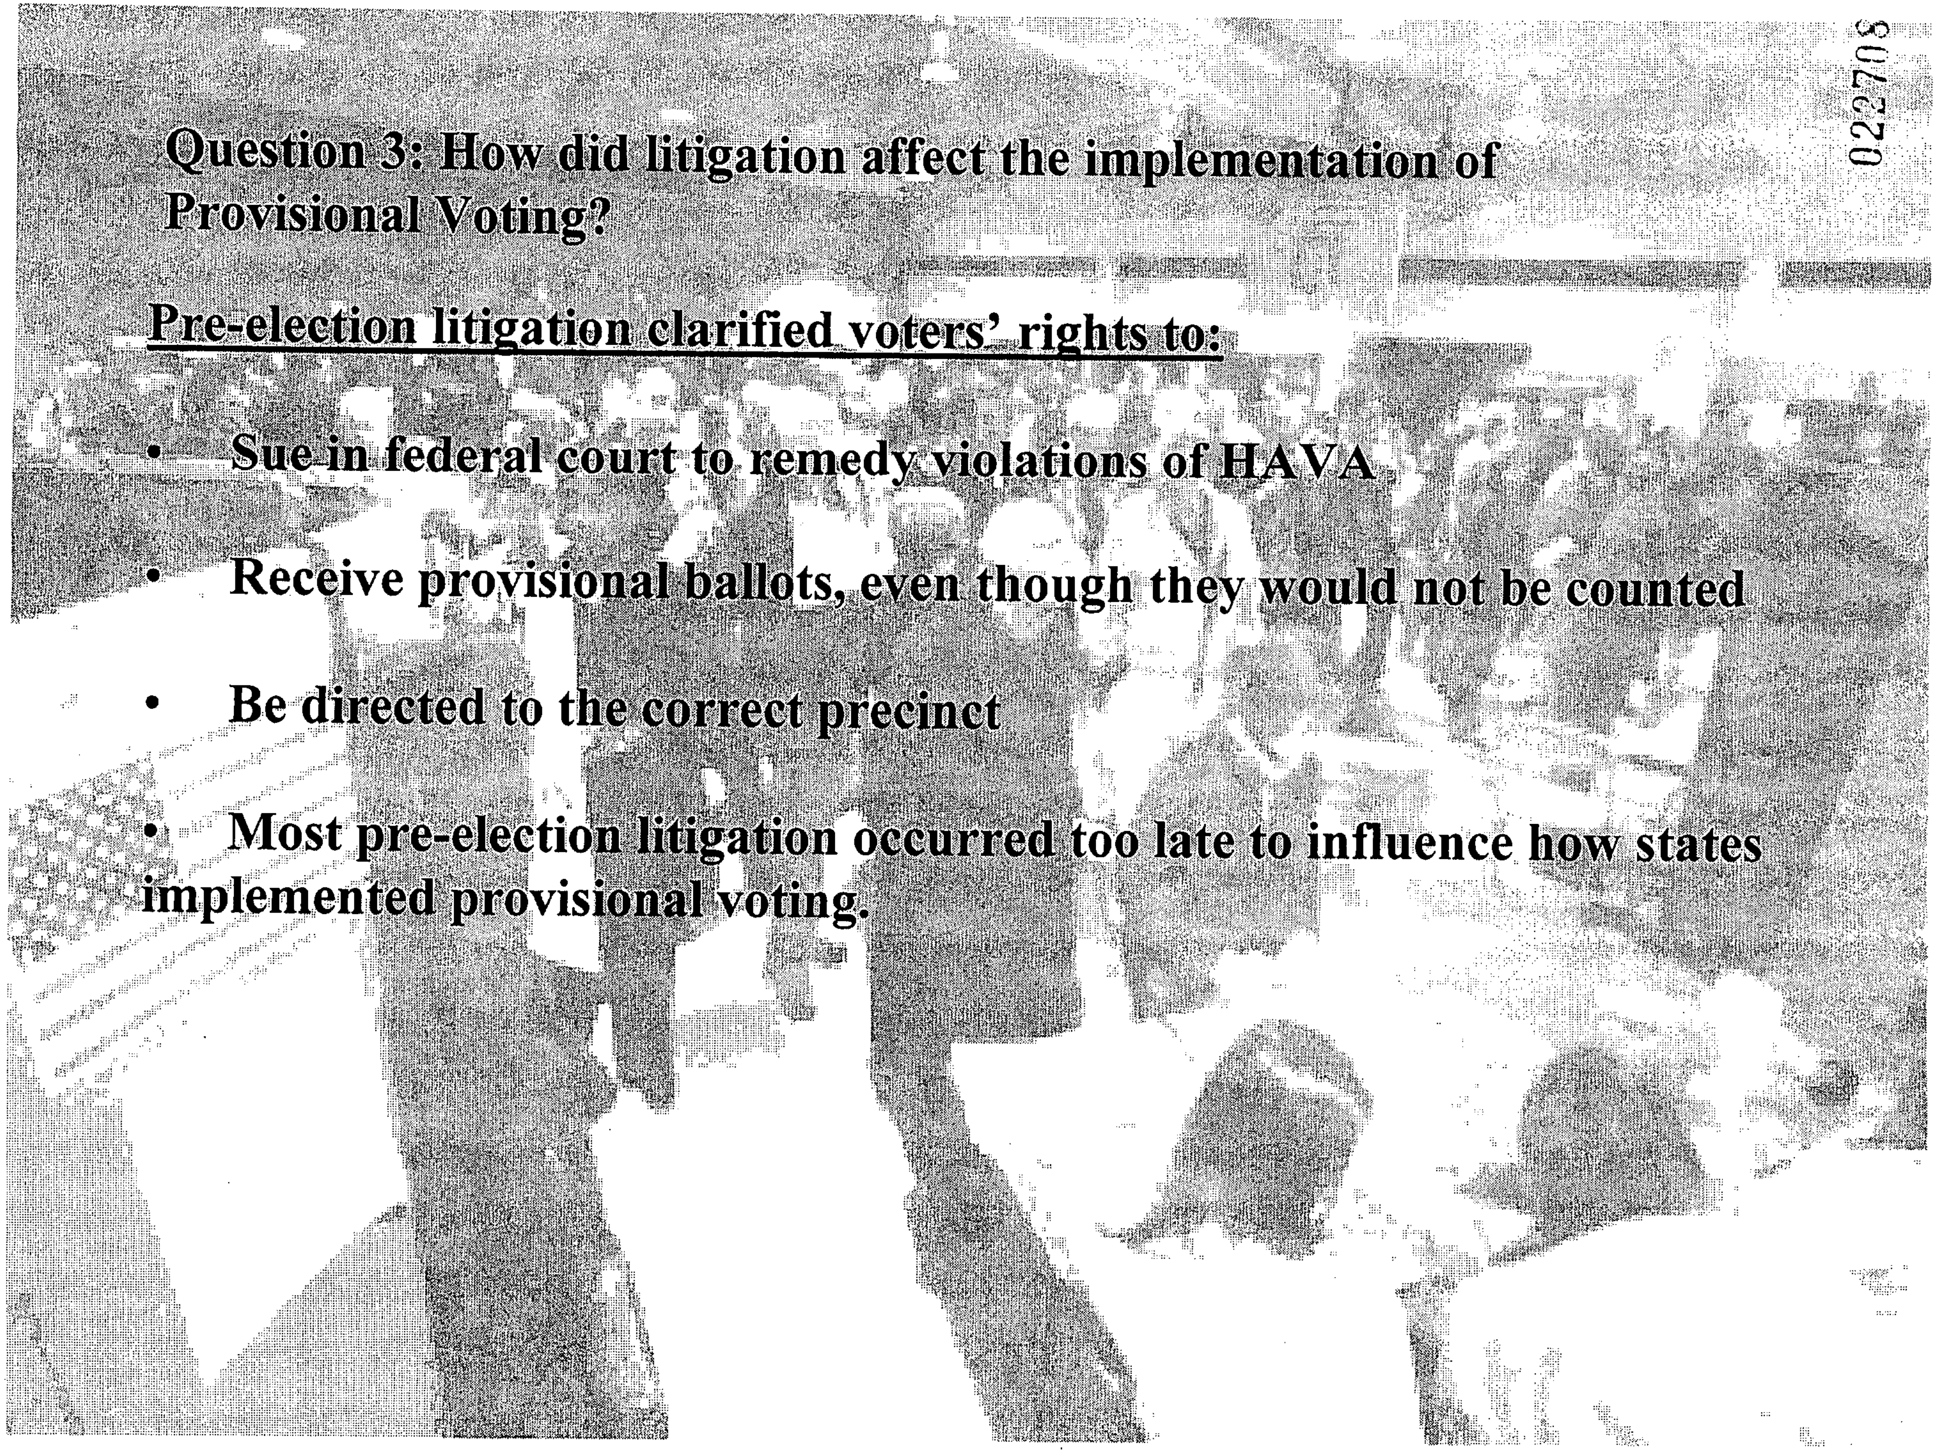
- **Voters did not receive enough information about the jurisdiction in which to cast a provisional ballot in order to be counted.**
- **More funding was needed to educate voters about their rights to cast a provisional ballot.**



2. How did preparation and performance vary between states that had previously had some form of provisional ballot and those that did not?

Difference in performance even more marked:

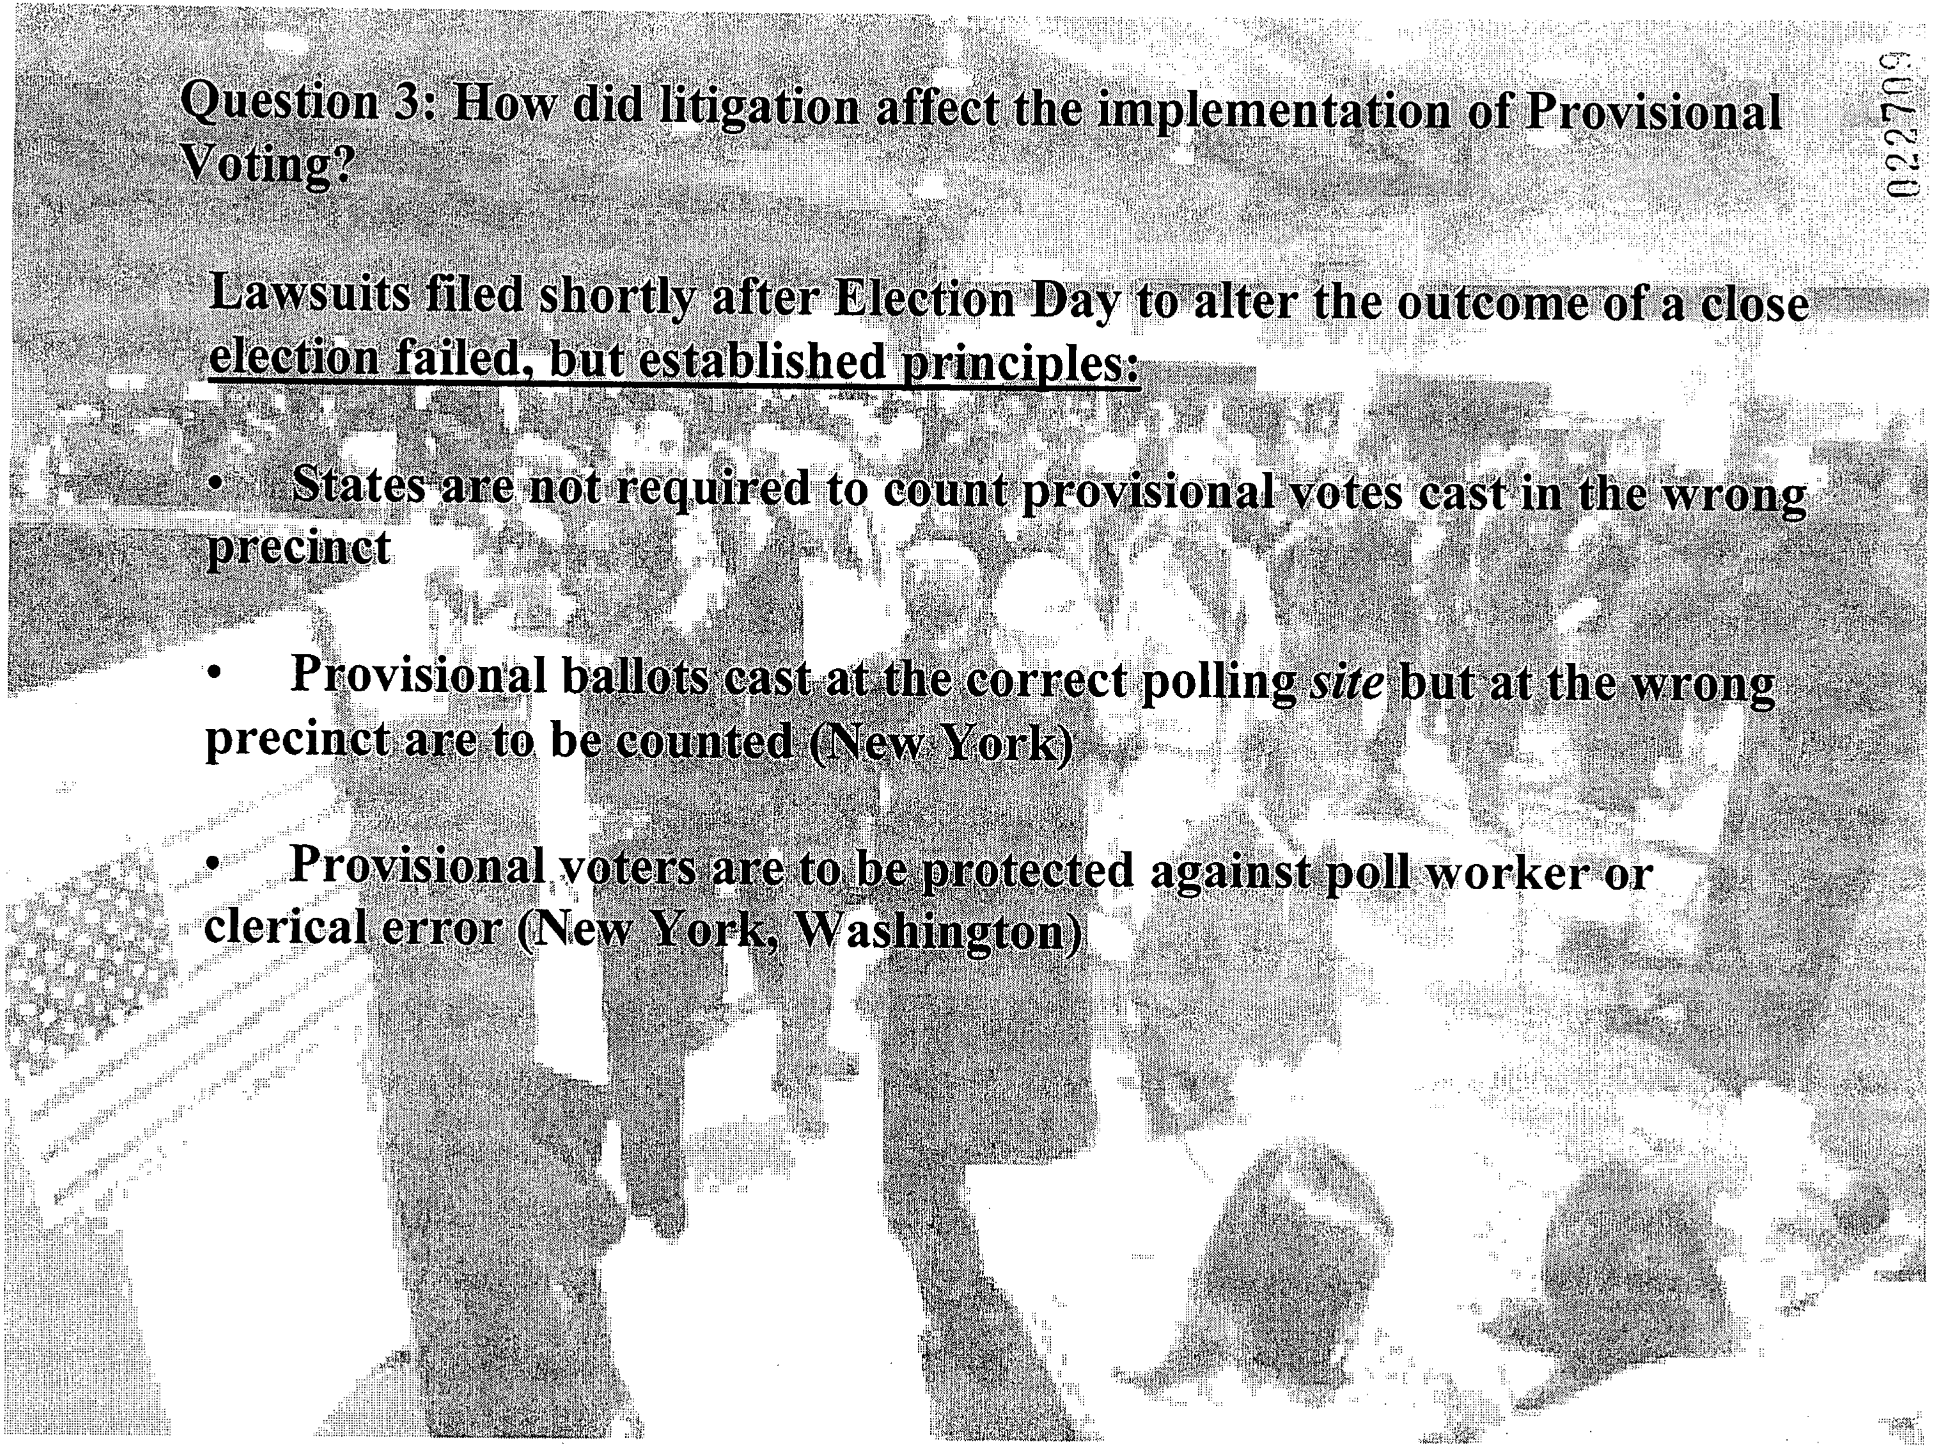
- Provisional ballots in "old states" = more than 2% of the total vote, 4 times the proportion in "new" states.
- Counting provisional ballots in the final vote, the "old" states averaged nearly double the number of the "new" states.
- In "old" states, 1.48% of the total vote came from provisional ballots, six times more than the 0.23% in the "new" states.



Question 3: How did litigation affect the implementation of Provisional Voting?

Pre-election litigation clarified voters' rights to:

- Sue in federal court to remedy violations of HAVA
- Receive provisional ballots, even though they would not be counted
- Be directed to the correct precinct
- Most pre-election litigation occurred too late to influence how states implemented provisional voting.



Question 3: How did litigation affect the implementation of Provisional Voting?

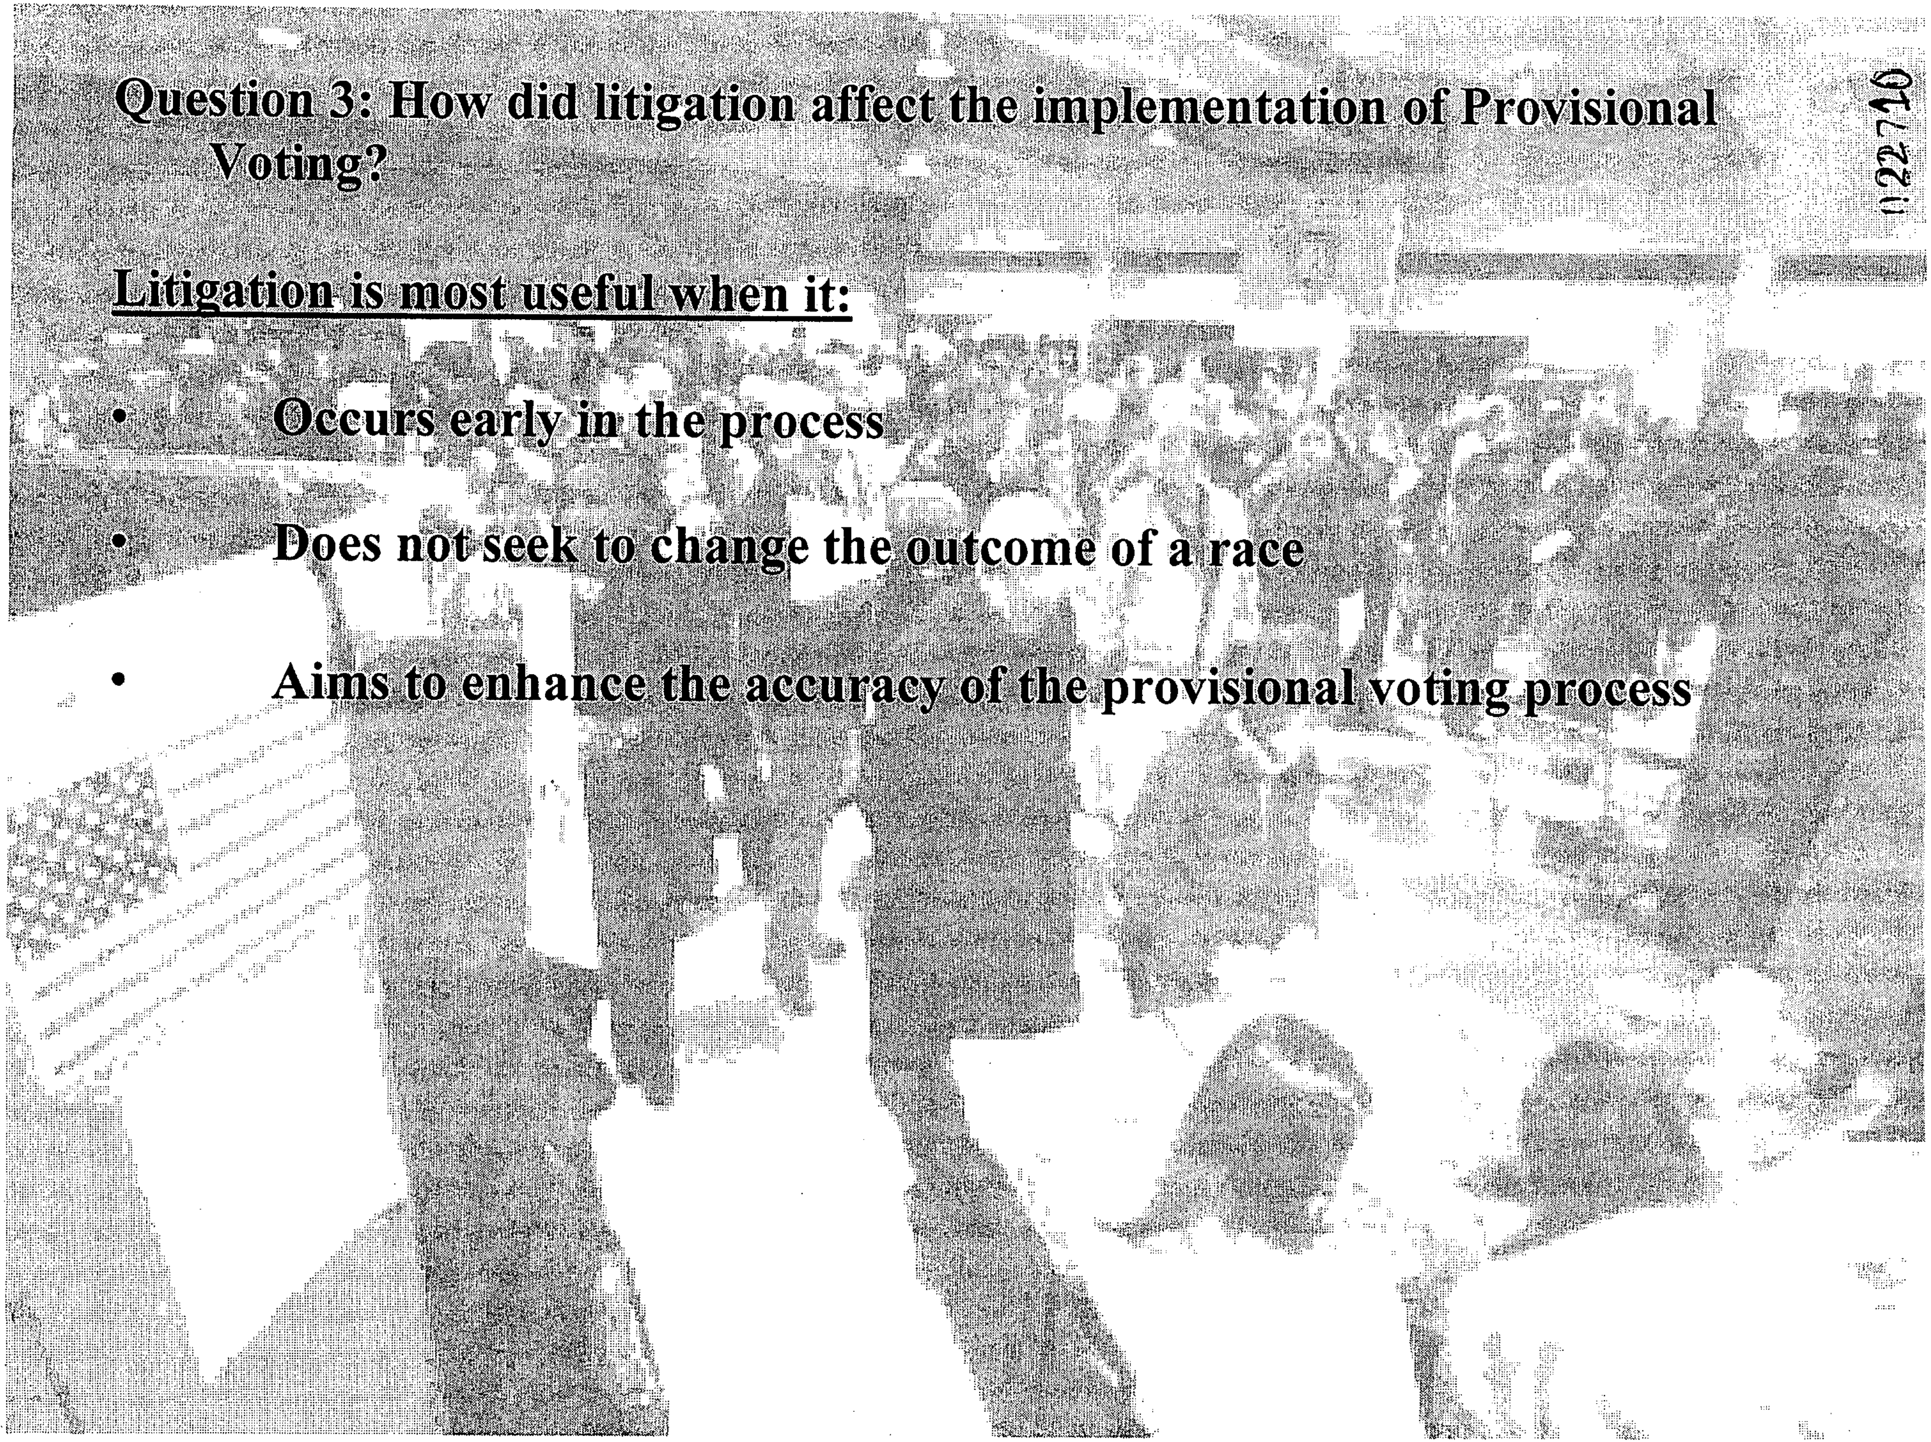
Lawsuits filed shortly after Election Day to alter the outcome of a close <u>election failed, but established principles:</u>

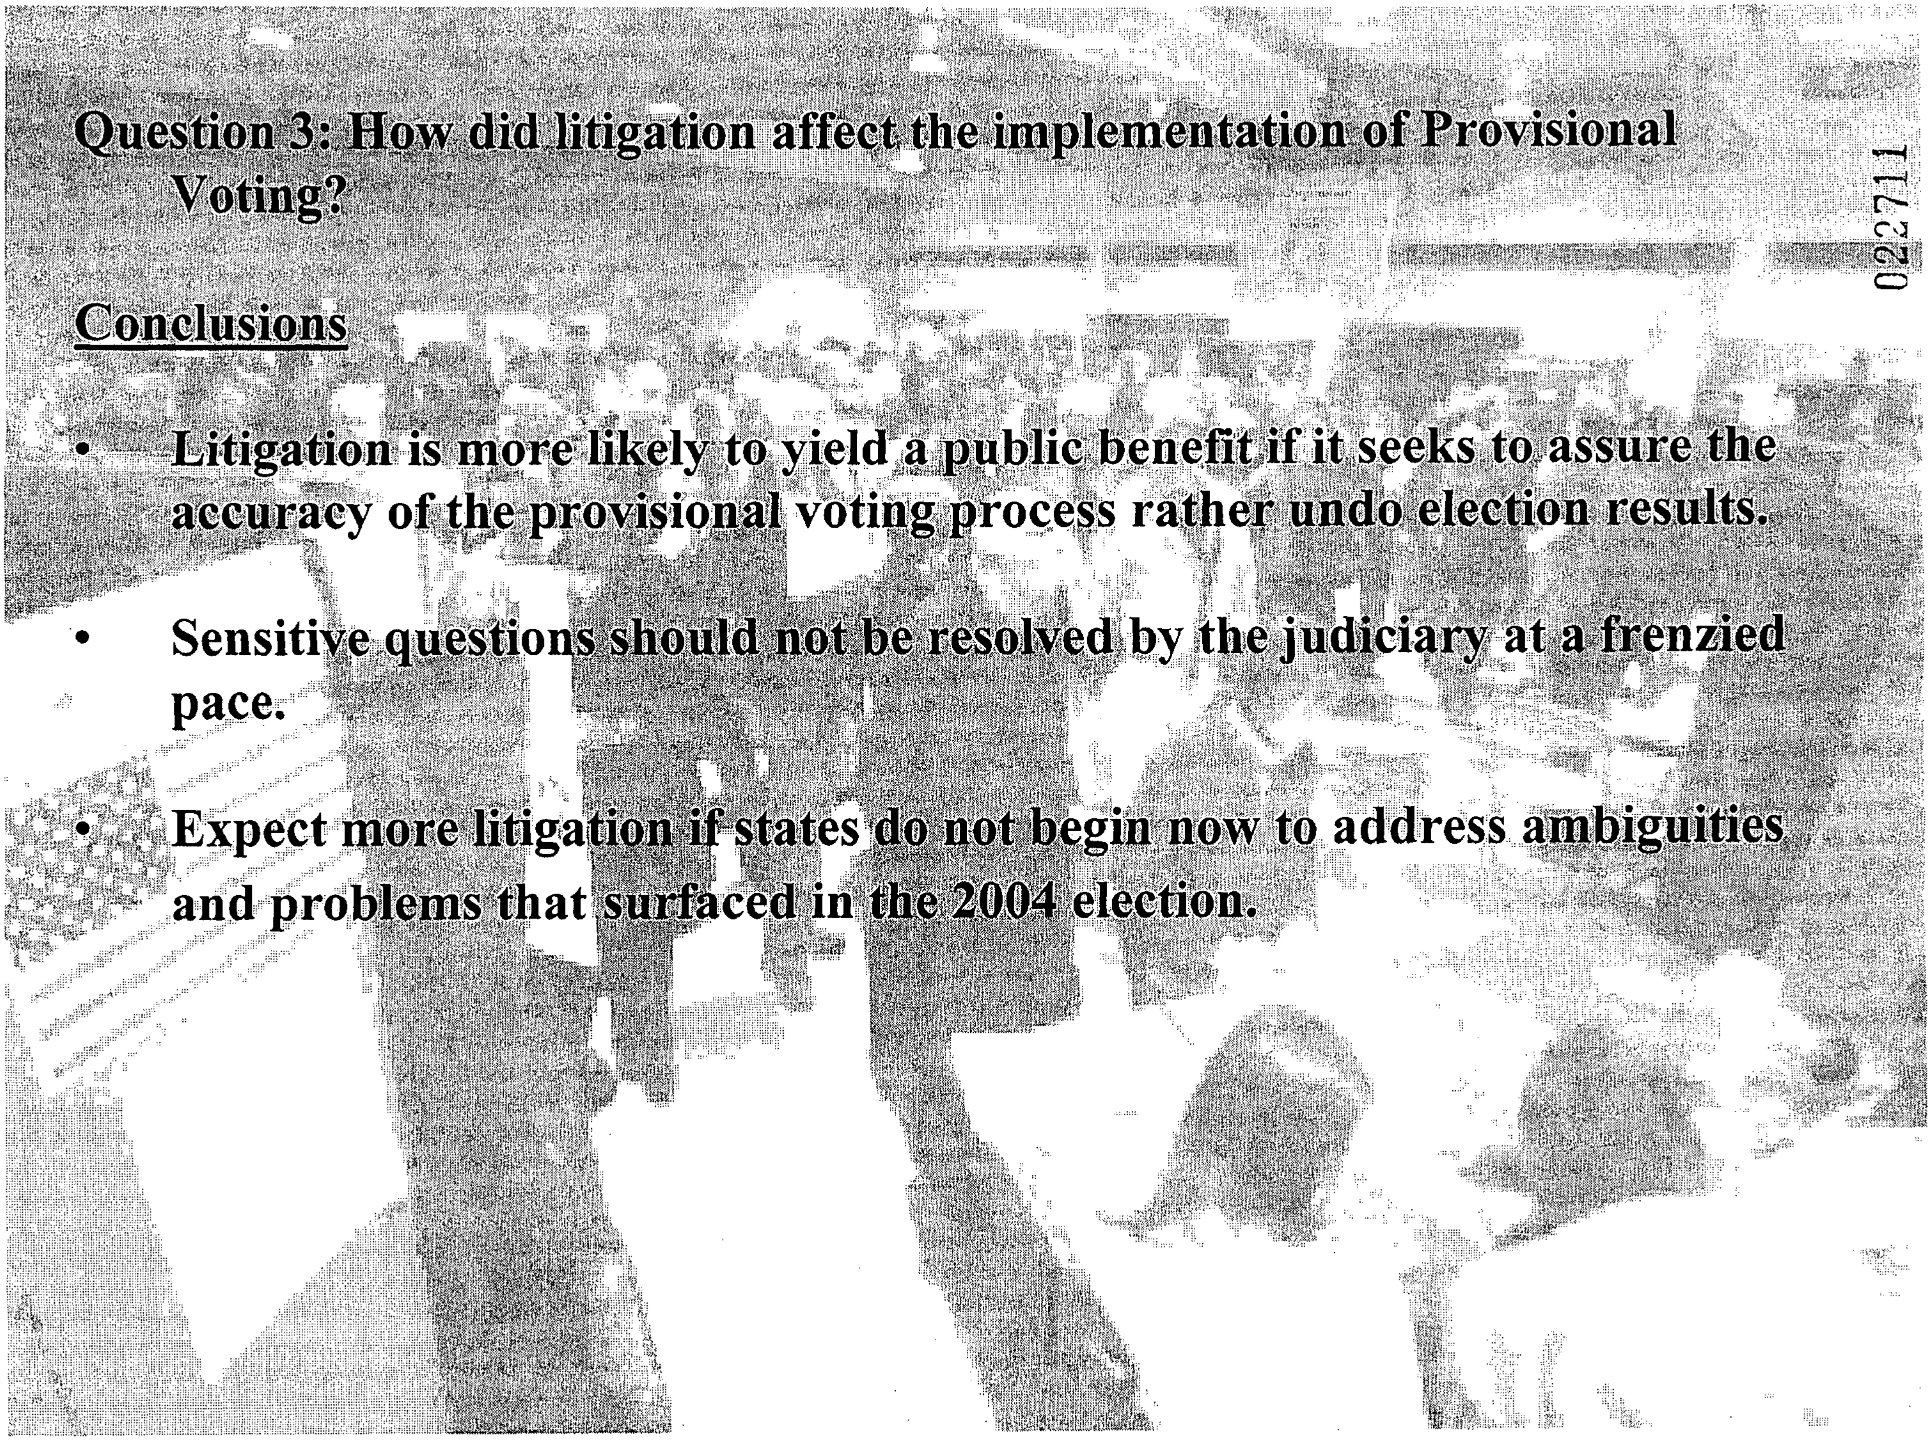
- **States are not required to count provisional votes cast in the wrong precinct**
- **Provisional ballots cast at the correct polling *site* but at the wrong precinct are to be counted (New York)**
- **Provisional voters are to be protected against poll worker or clerical error (New York, Washington)**

Question 3: How did litigation affect the implementation of Provisional Voting?

<u>Litigation is most useful when it:</u>

- Occurs early in the process
- Does not seek to change the outcome of a race
- Aims to enhance the accuracy of the provisional voting process

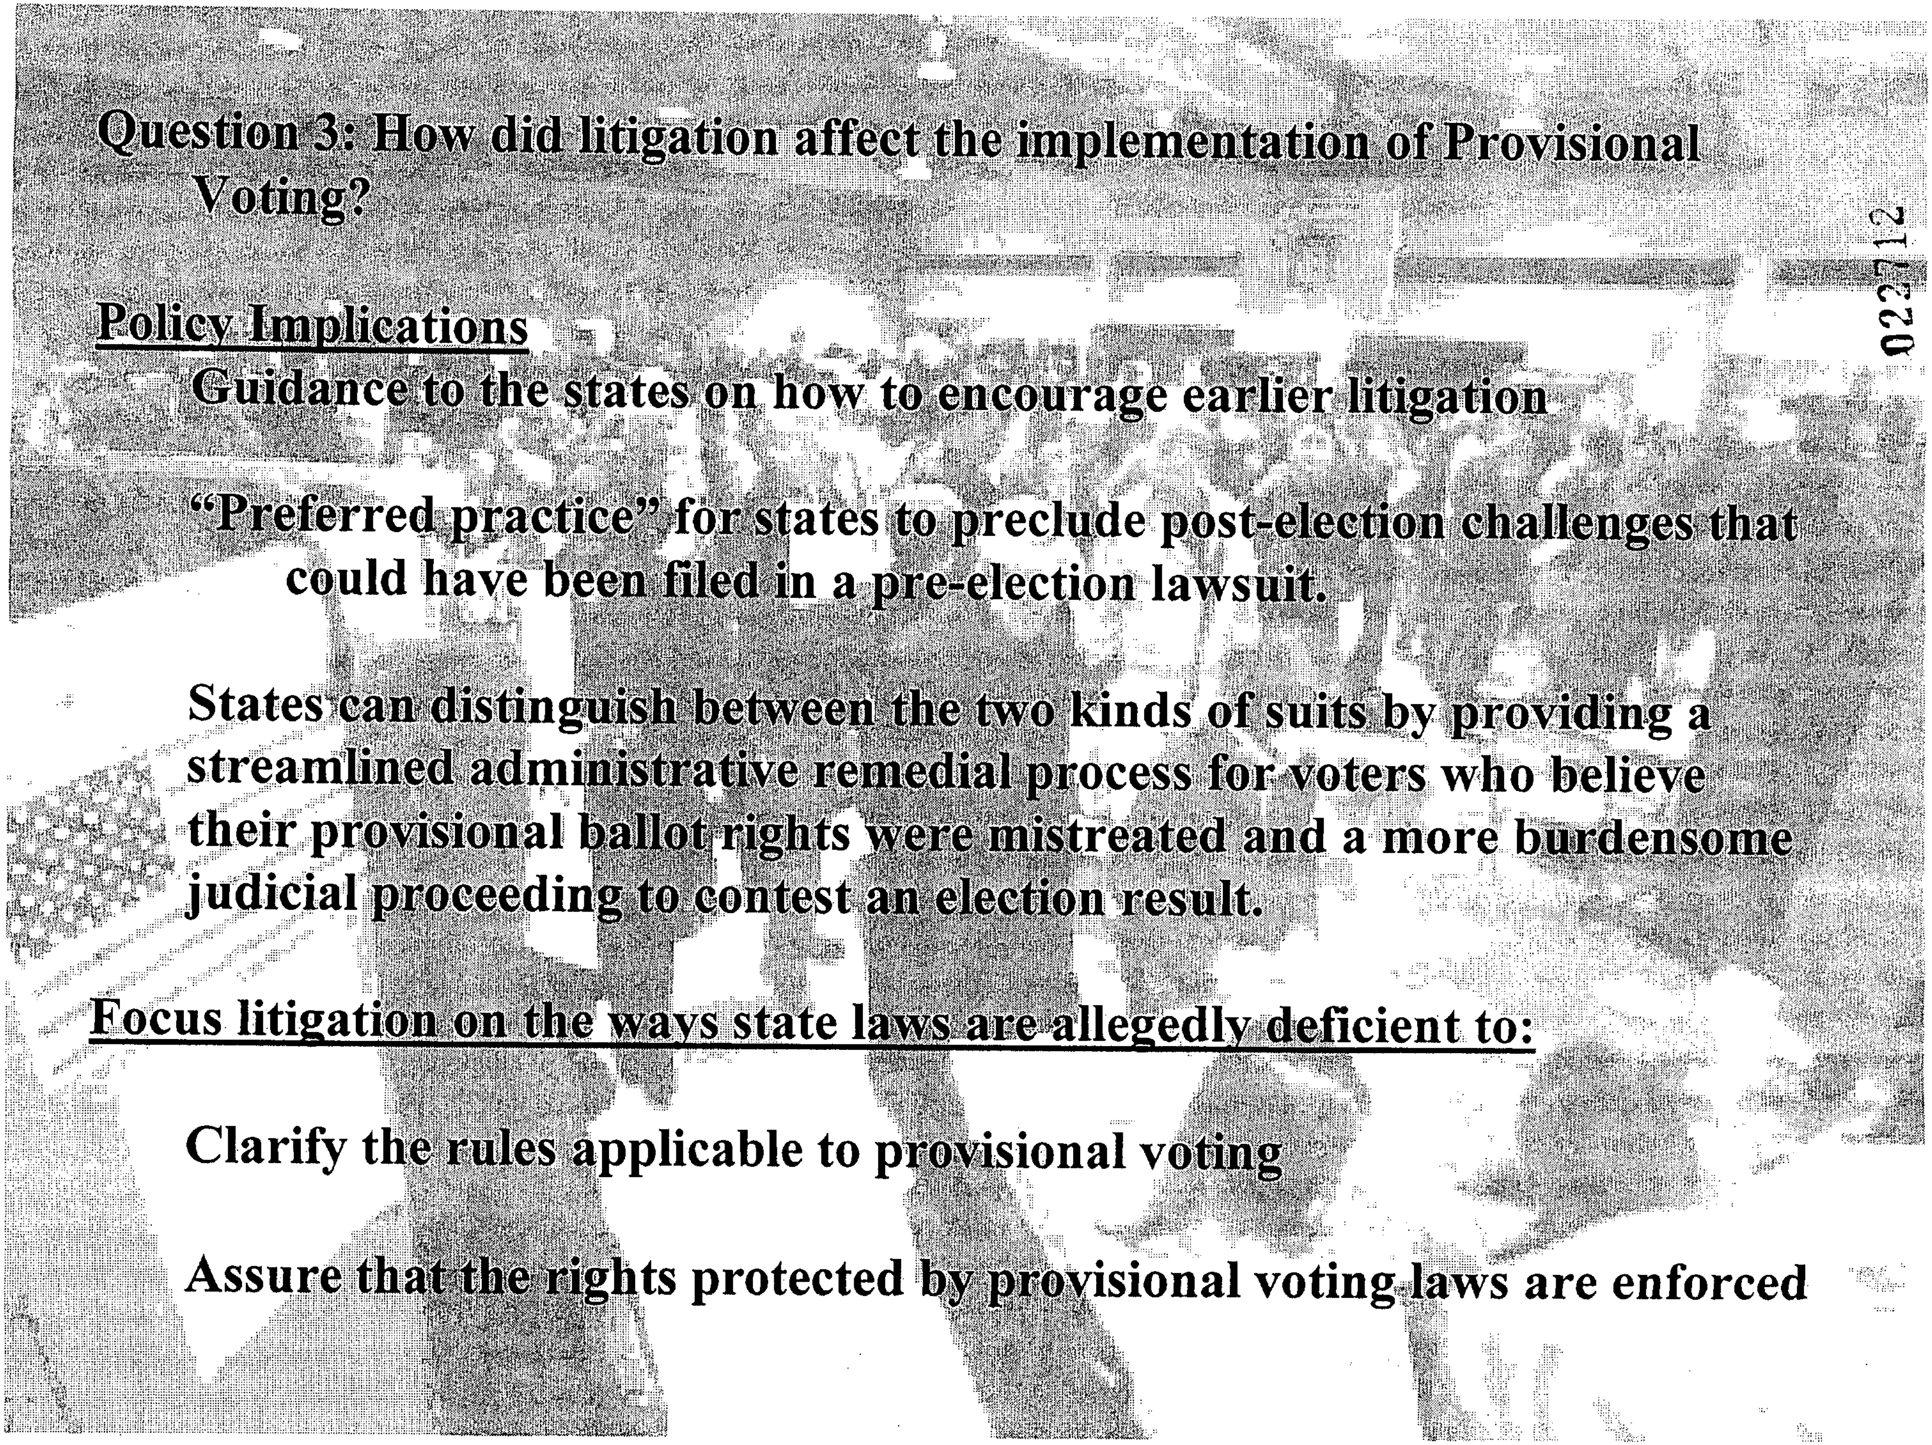




Question 3: How did litigation affect the implementation of Provisional Voting?

Conclusions

- Litigation is more likely to yield a public benefit if it seeks to assure the accuracy of the provisional voting process rather undo election results.
- Sensitive questions should not be resolved by the judiciary at a frenzied pace.
- Expect more litigation if states do not begin now to address ambiguities and problems that surfaced in the 2004 election.



Question 3: How did litigation affect the implementation of Provisional Voting?

Policy Implications

Guidance to the states on how to encourage earlier litigation

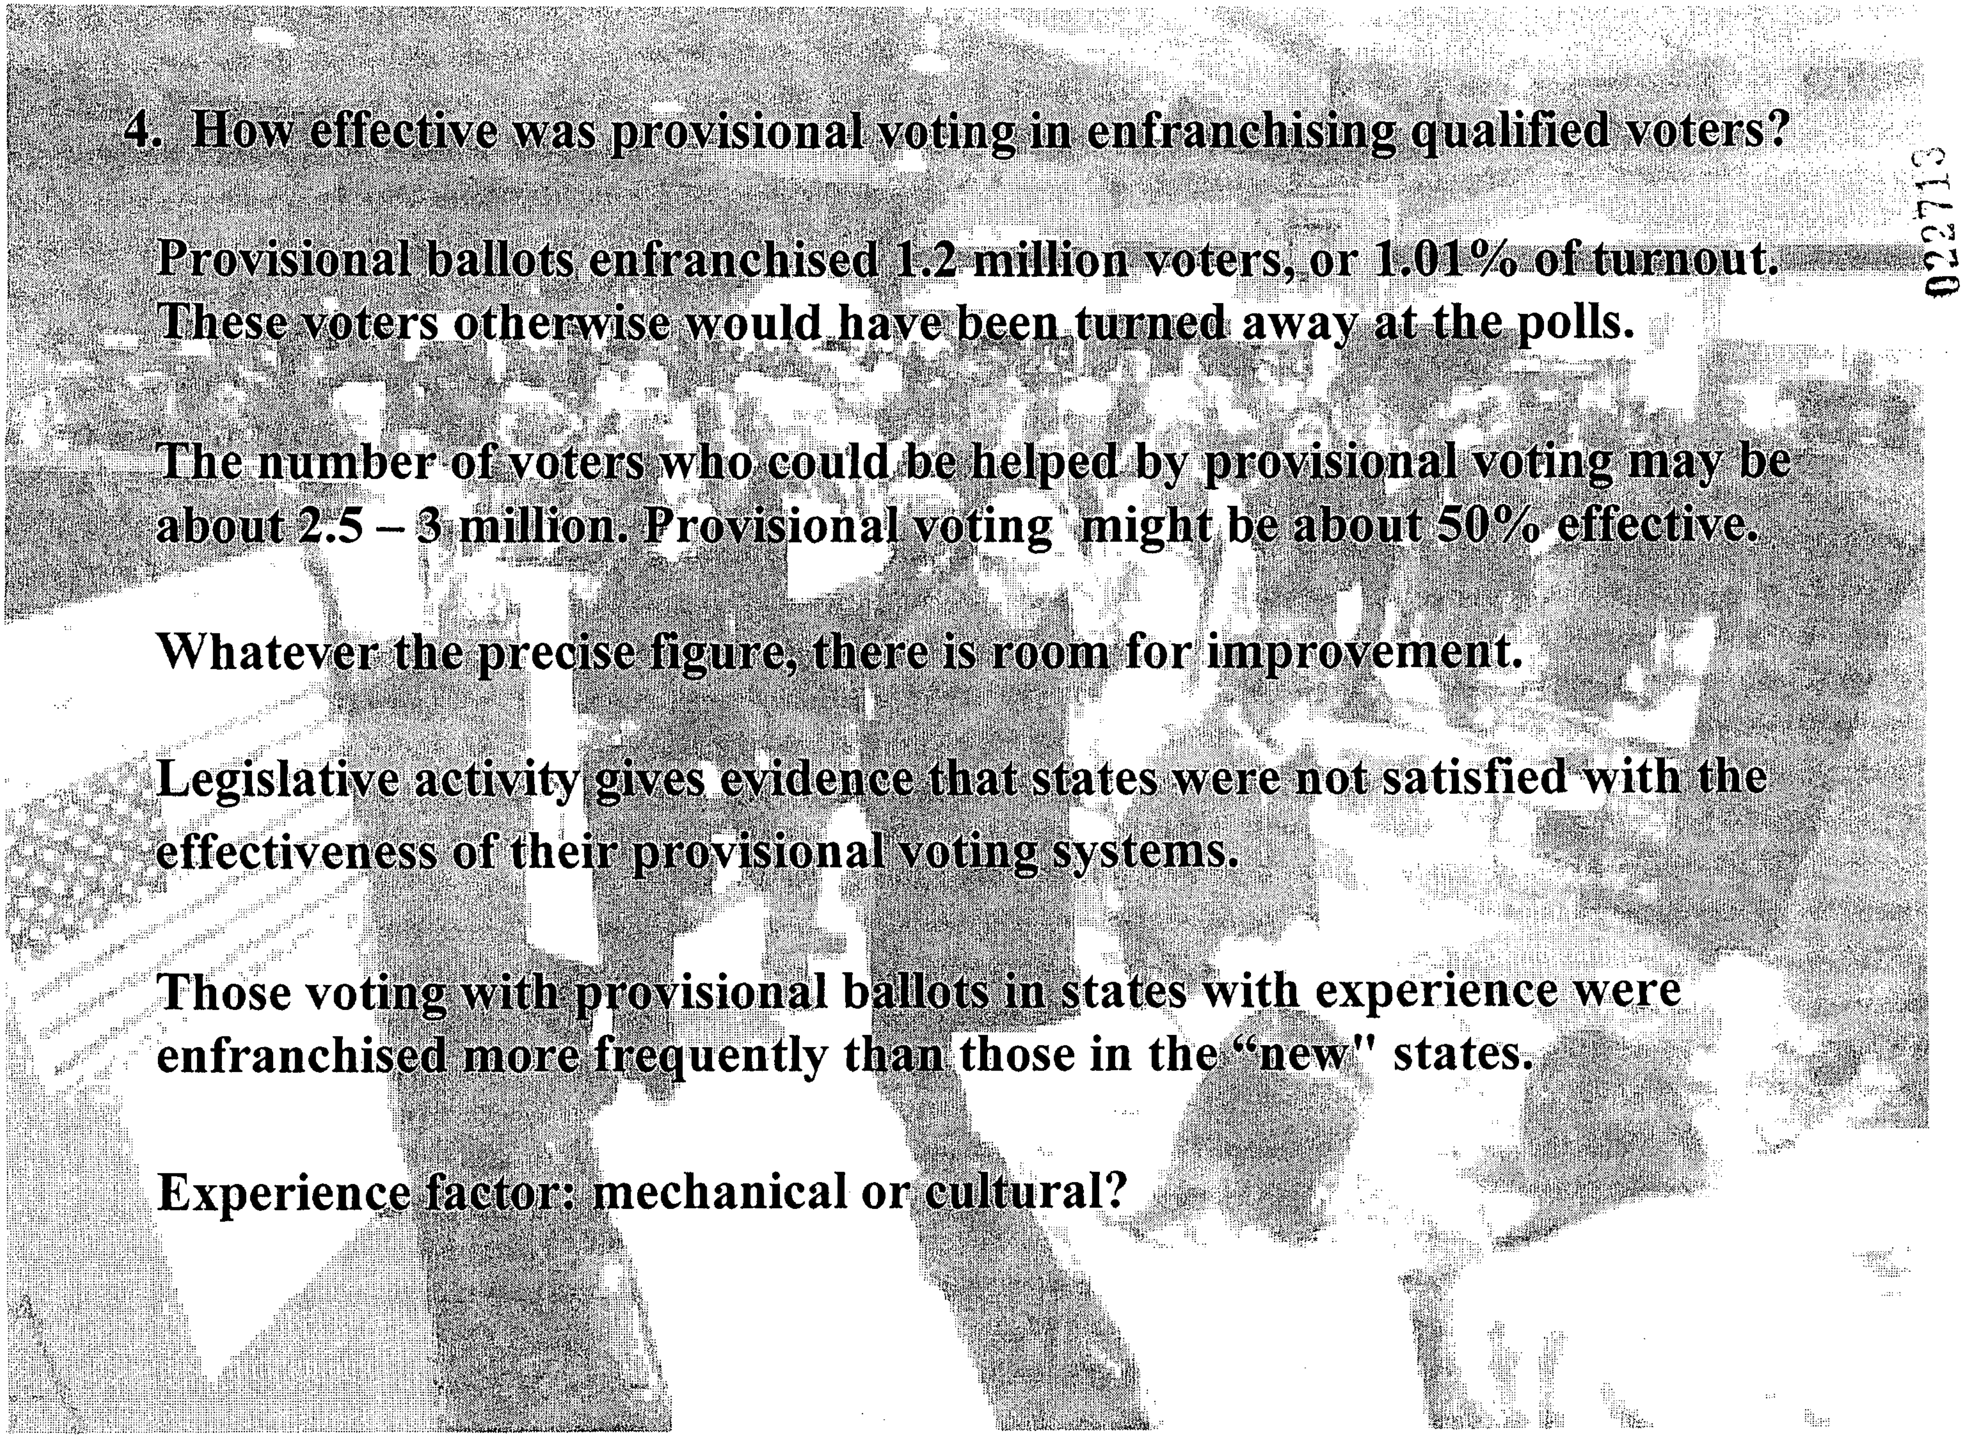
"Preferred practice" for states to preclude post-election challenges that could have been filed in a pre-election lawsuit.

States can distinguish between the two kinds of suits by providing a streamlined administrative remedial process for voters who believe their provisional ballot rights were mistreated and a more burdensome judicial proceeding to contest an election result.

Focus litigation on the ways state laws are allegedly deficient to:

Clarify the rules applicable to provisional voting

Assure that the rights protected by provisional voting laws are enforced



4. How effective was provisional voting in enfranchising qualified voters?

Provisional ballots enfranchised 1.2 million voters, or 1.01% of turnout. These voters otherwise would have been turned away at the polls.

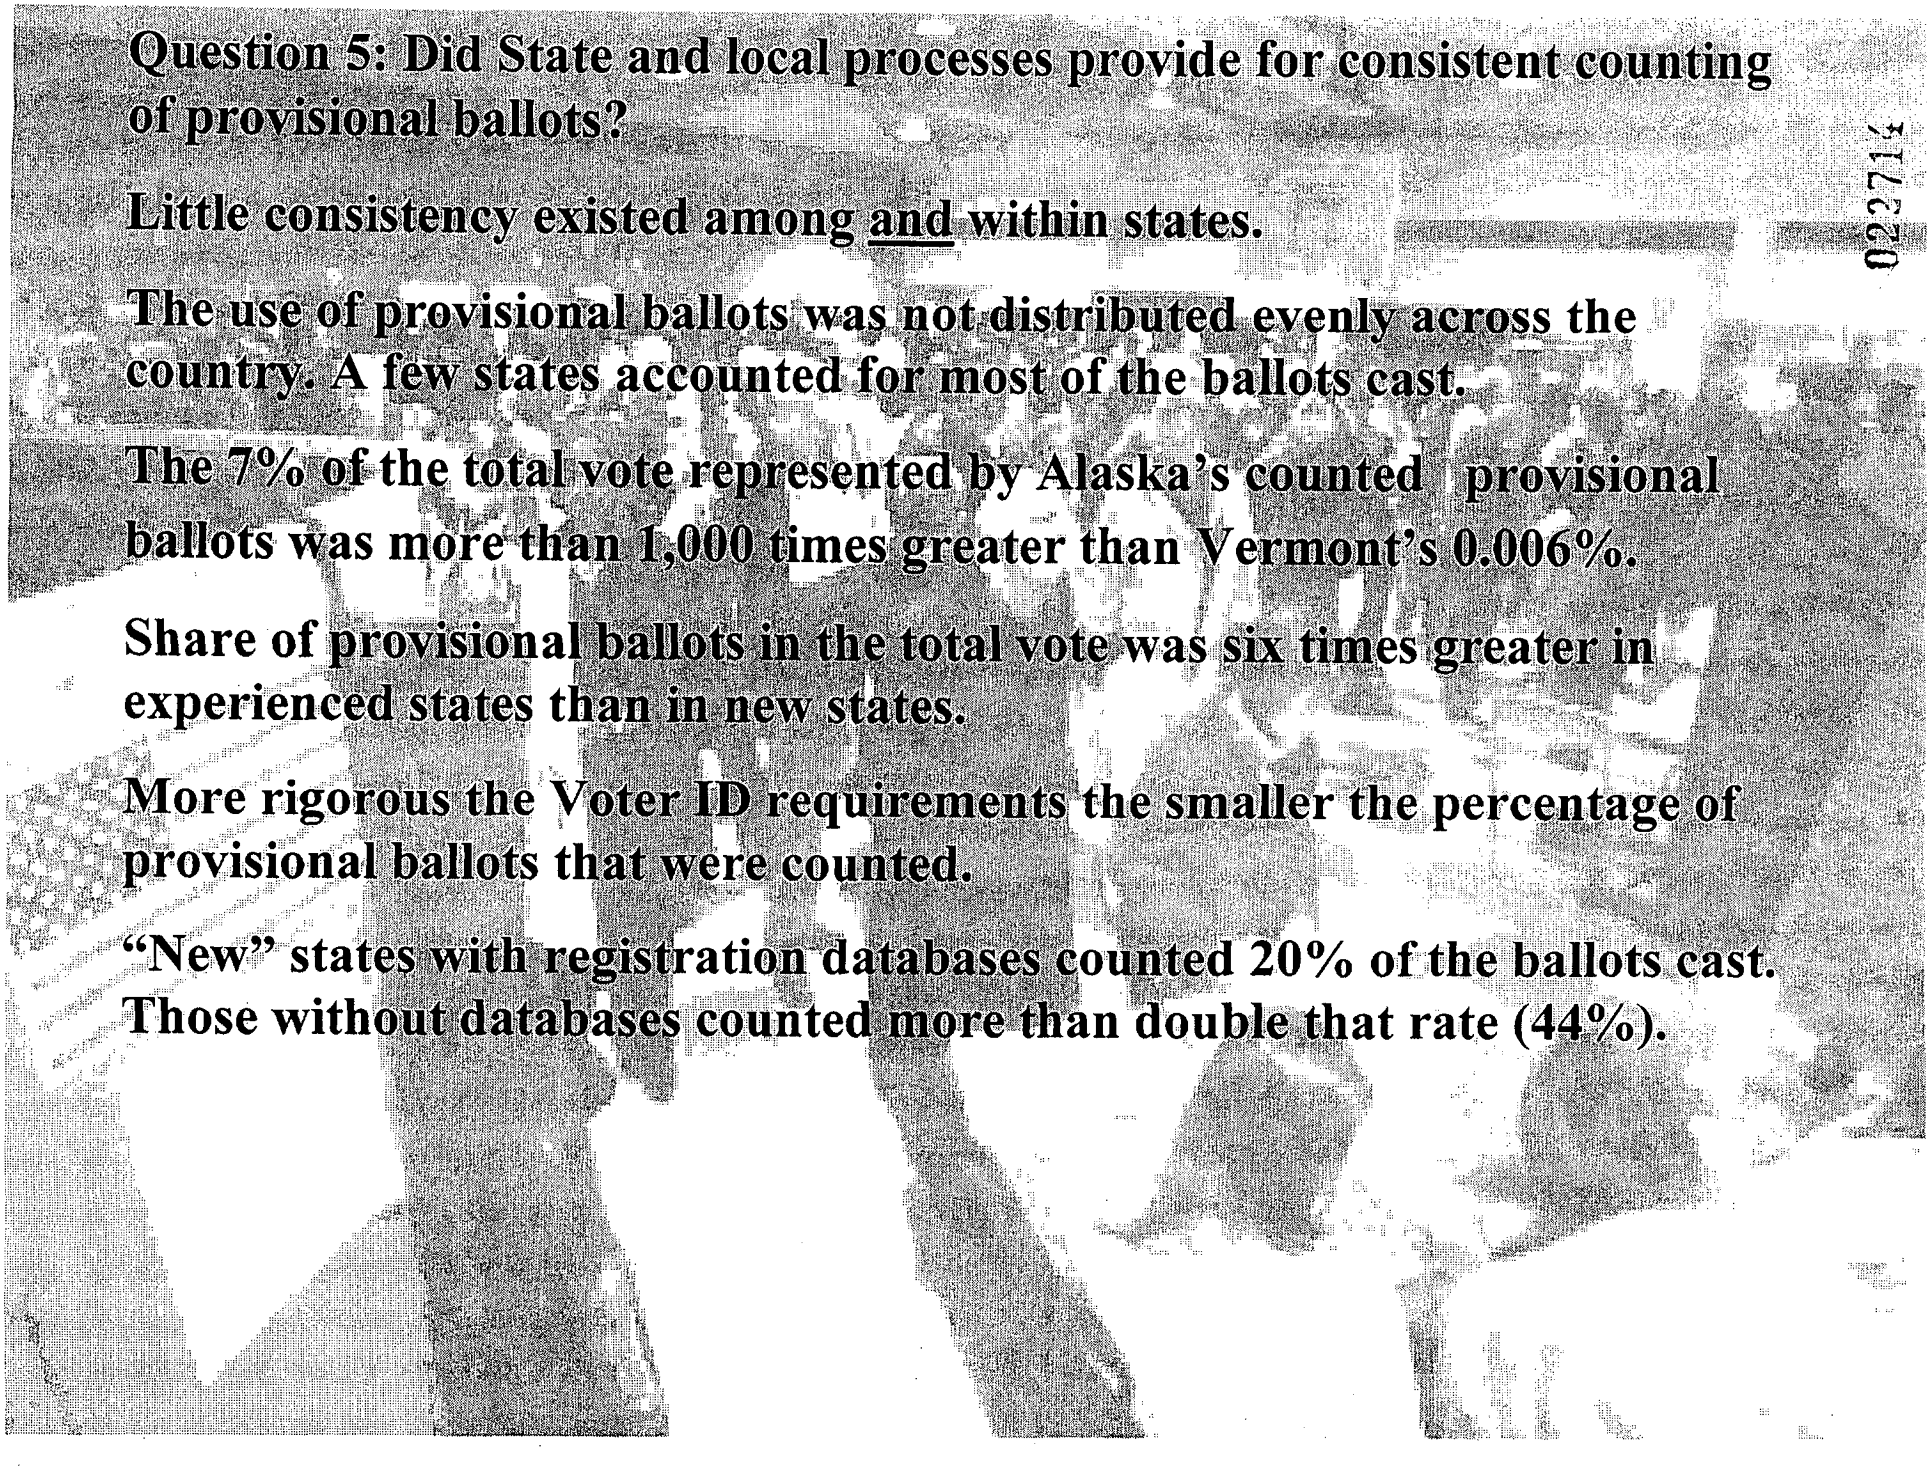
The number of voters who could be helped by provisional voting may be about 2.5 – 3 million. Provisional voting might be about 50% effective.

Whatever the precise figure, there is room for improvement.

Legislative activity gives evidence that states were not satisfied with the effectiveness of their provisional voting systems.

Those voting with provisional ballots in states with experience were enfranchised more frequently than those in the "new" states.

Experience factor: mechanical or cultural?



Question 5: Did State and local processes provide for consistent counting of provisional ballots?

Little consistency existed among and within states.

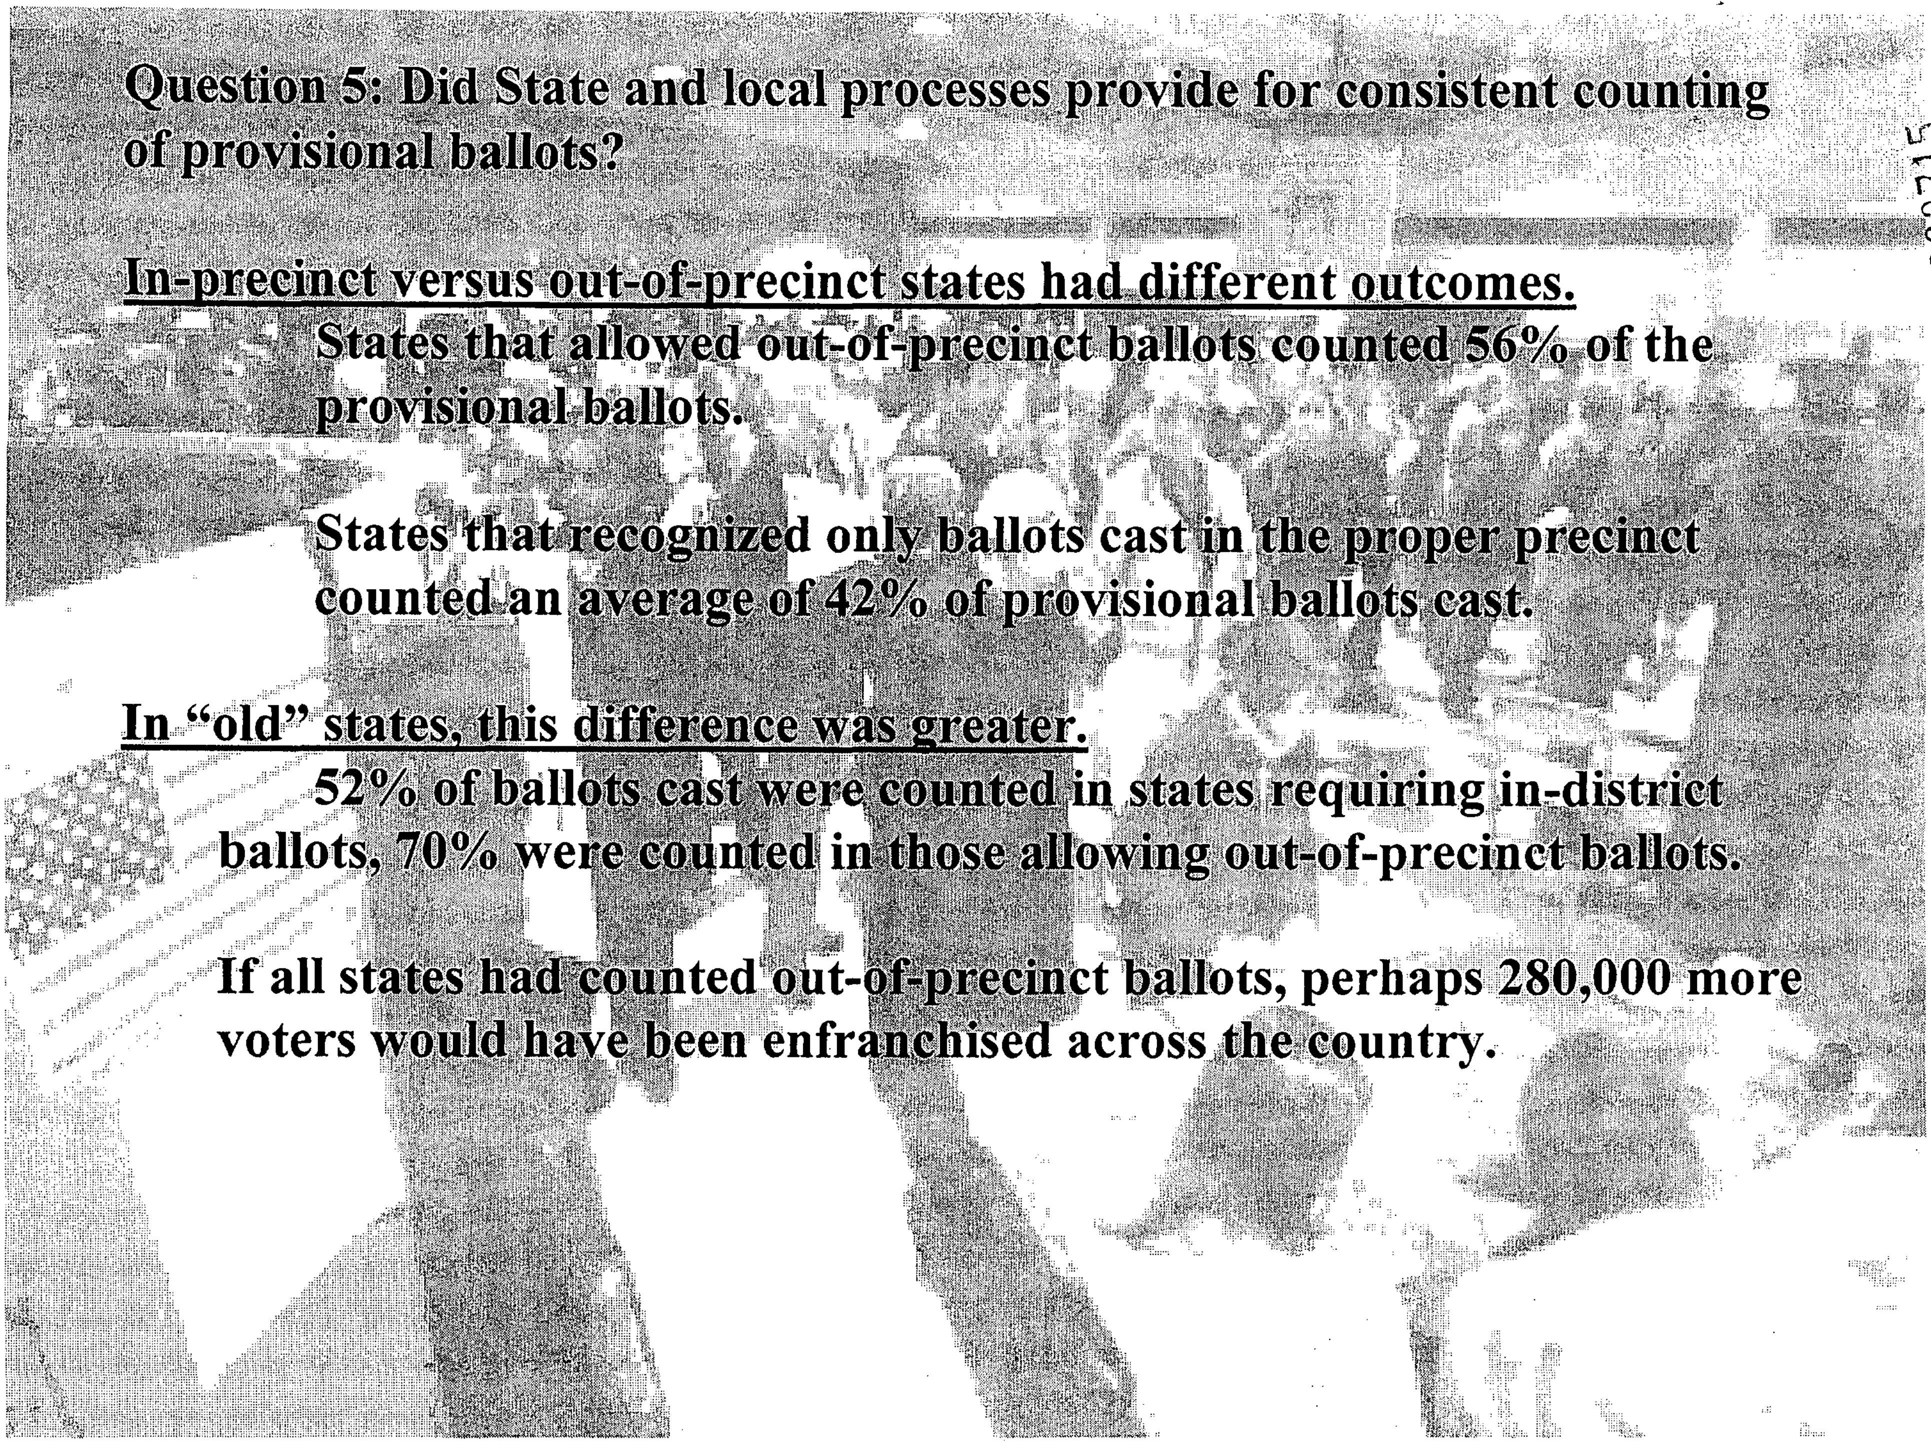
The use of provisional ballots was not distributed evenly across the country. A few states accounted for most of the ballots cast.

The 7% of the total vote represented by Alaska's counted provisional ballots was more than 1,000 times greater than Vermont's 0.006%.

Share of provisional ballots in the total vote was six times greater in experienced states than in new states.

More rigorous the Voter ID requirements the smaller the percentage of provisional ballots that were counted.

"New" states with registration databases counted 20% of the ballots cast. Those without databases counted more than double that rate (44%).



Question 5: Did State and local processes provide for consistent counting of provisional ballots?

In-precinct versus out-of-precinct states had different outcomes.

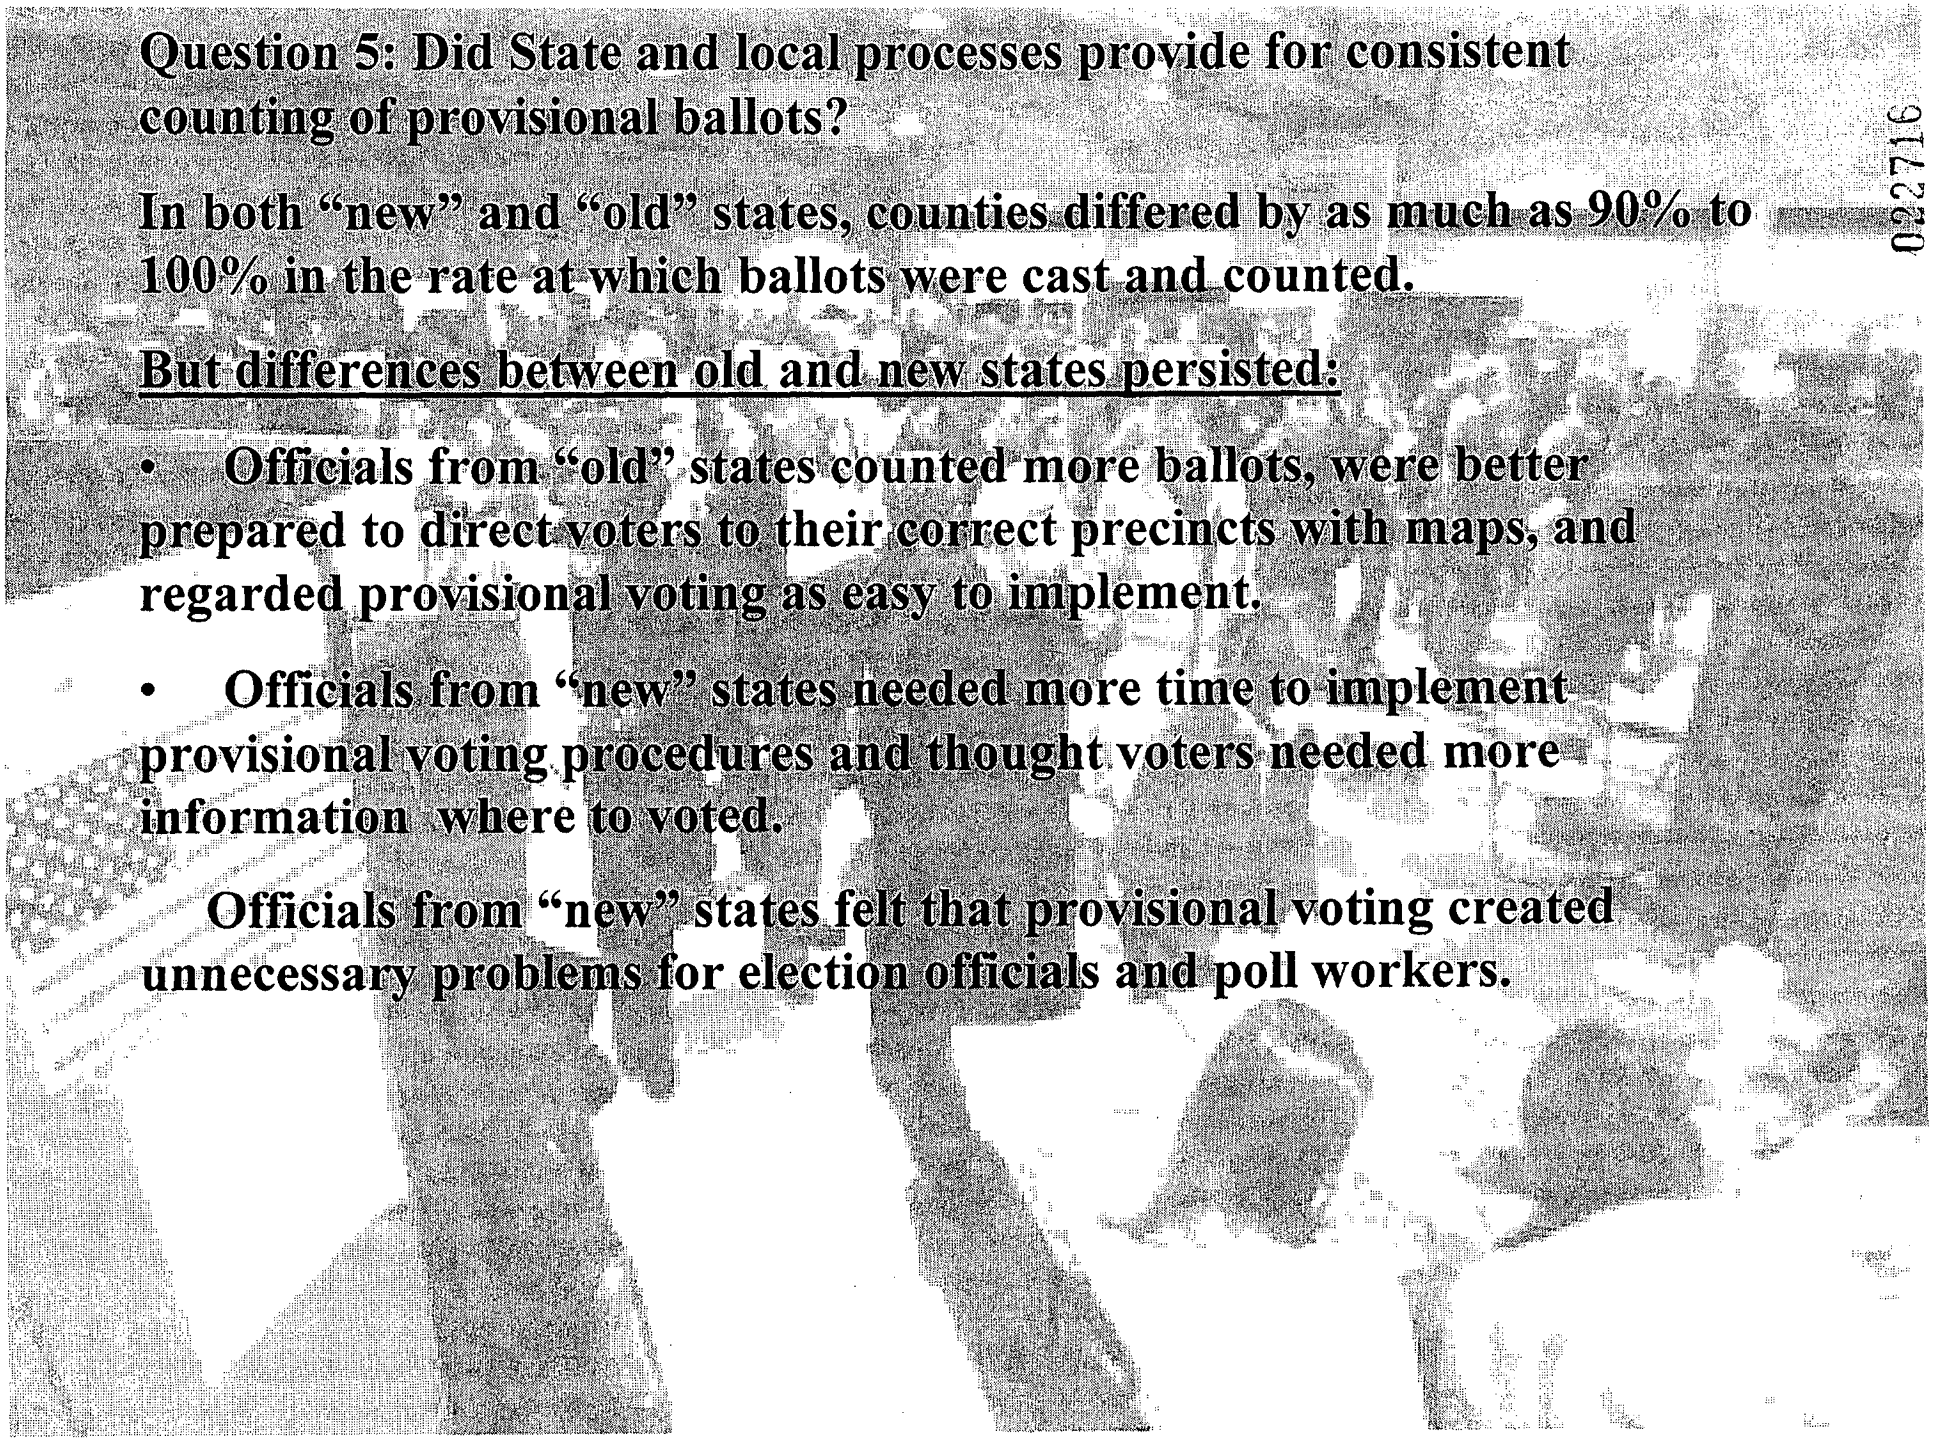
States that allowed out-of-precinct ballots counted 56% of the provisional ballots.

States that recognized only ballots cast in the proper precinct counted an average of 42% of provisional ballots cast.

In "old" states, this difference was greater.

52% of ballots cast were counted in states requiring in-district ballots, 70% were counted in those allowing out-of-precinct ballots.

If all states had counted out-of-precinct ballots, perhaps 280,000 more voters would have been enfranchised across the country.



Question 5: Did State and local processes provide for consistent counting of provisional ballots?

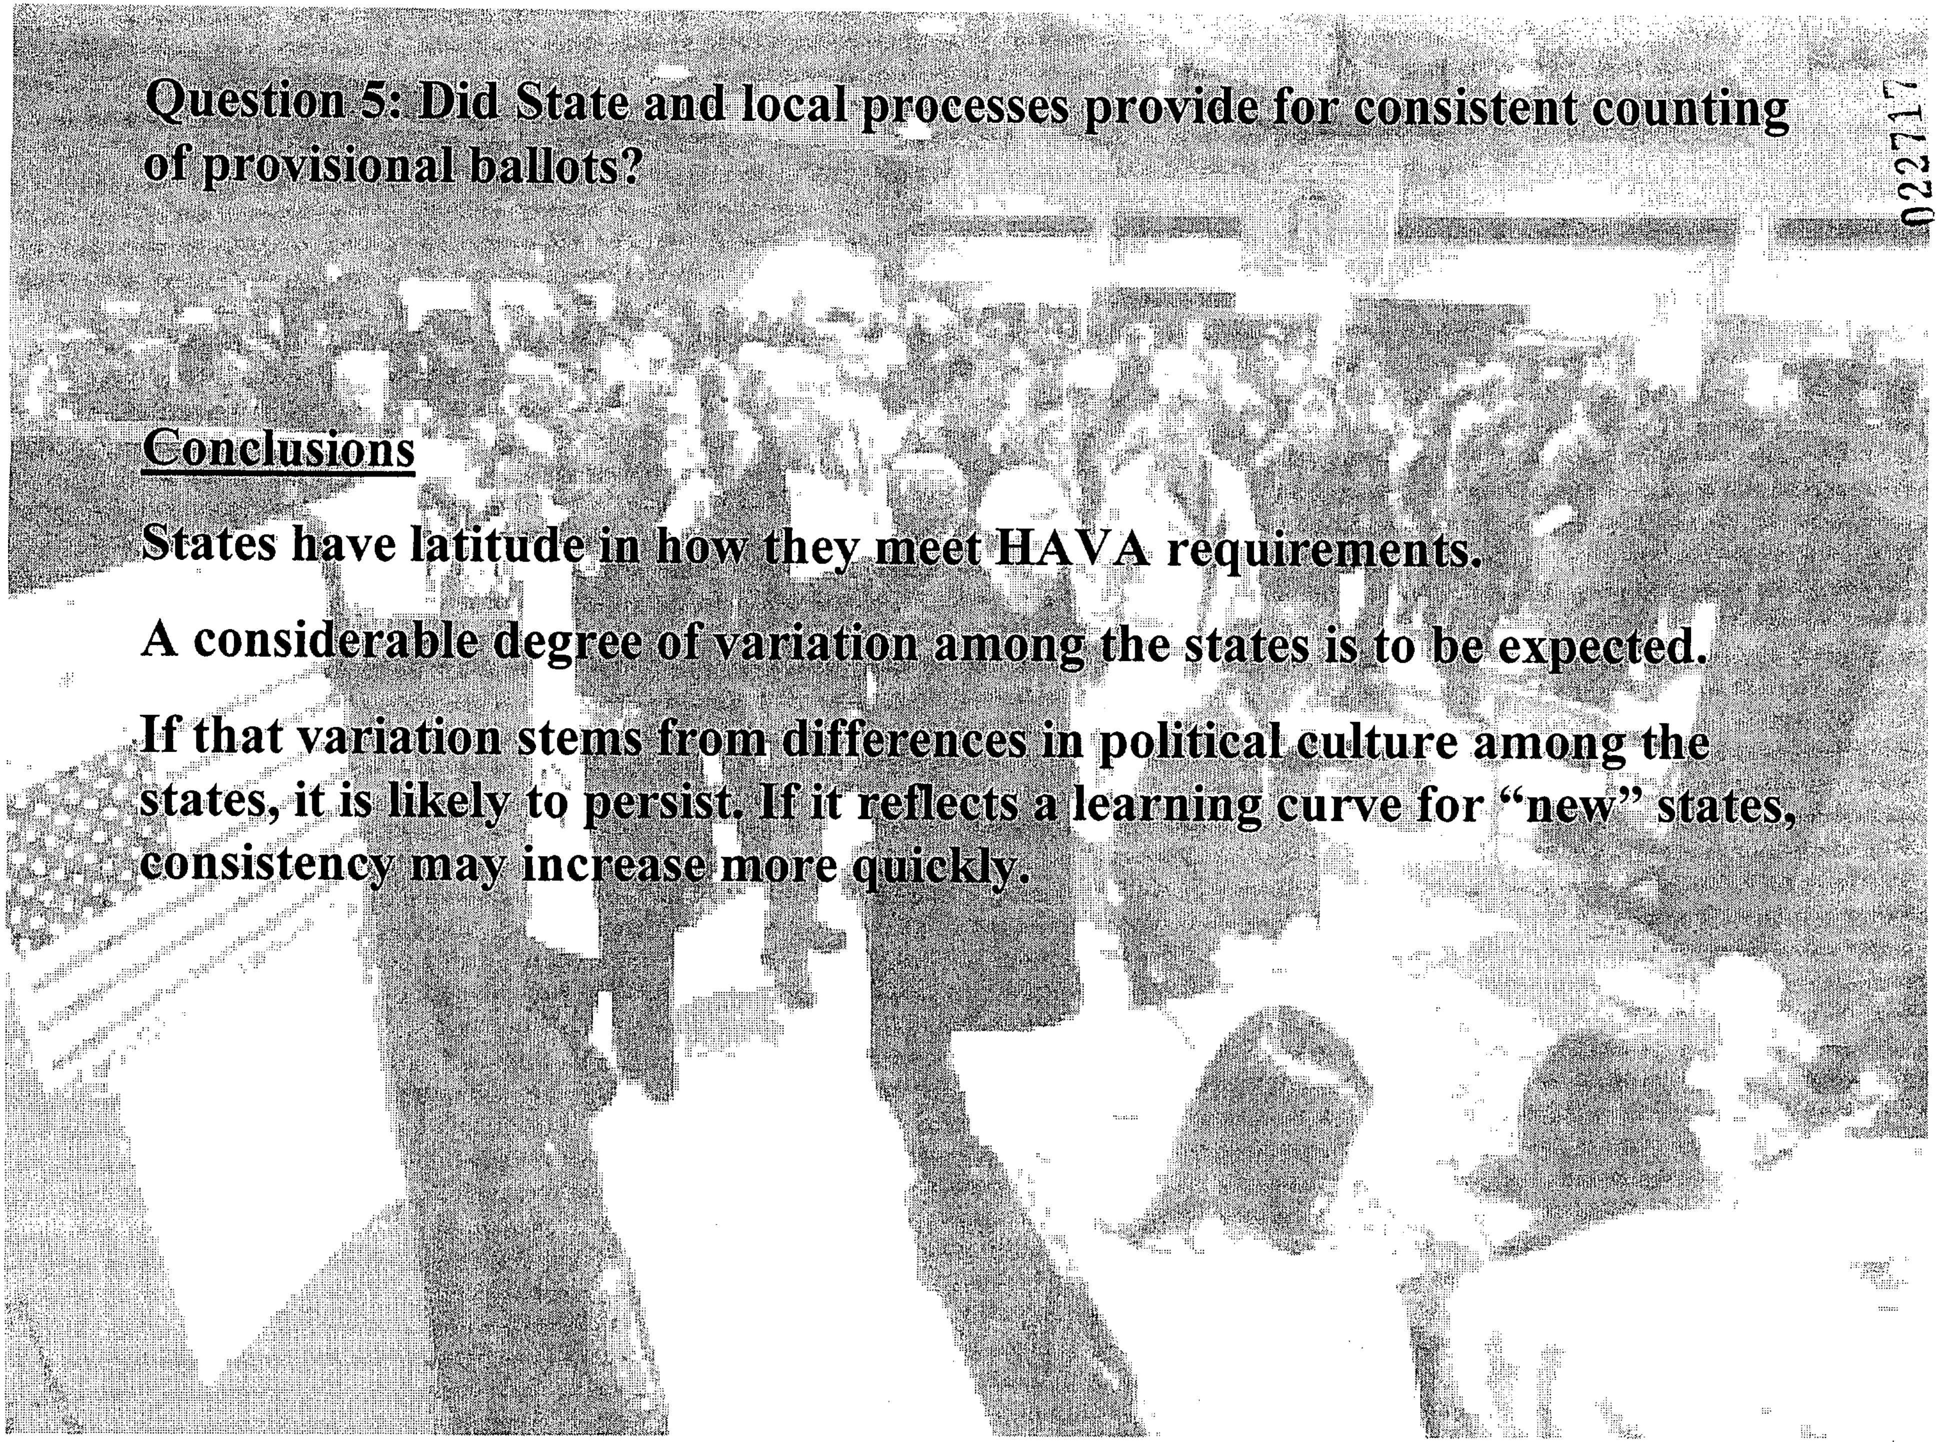
In both "new" and "old" states, counties differed by as much as 90% to 100% in the rate at which ballots were cast and counted.

<u>But differences between old and new states persisted:</u>

- Officials from "old" states counted more ballots, were better prepared to direct voters to their correct precincts with maps, and regarded provisional voting as easy to implement.
- Officials from "new" states needed more time to implement provisional voting procedures and thought voters needed more information where to voted.

Officials from "new" states felt that provisional voting created unnecessary problems for election officials and poll workers.

Question 5: Did State and local processes provide for consistent counting of provisional ballots?

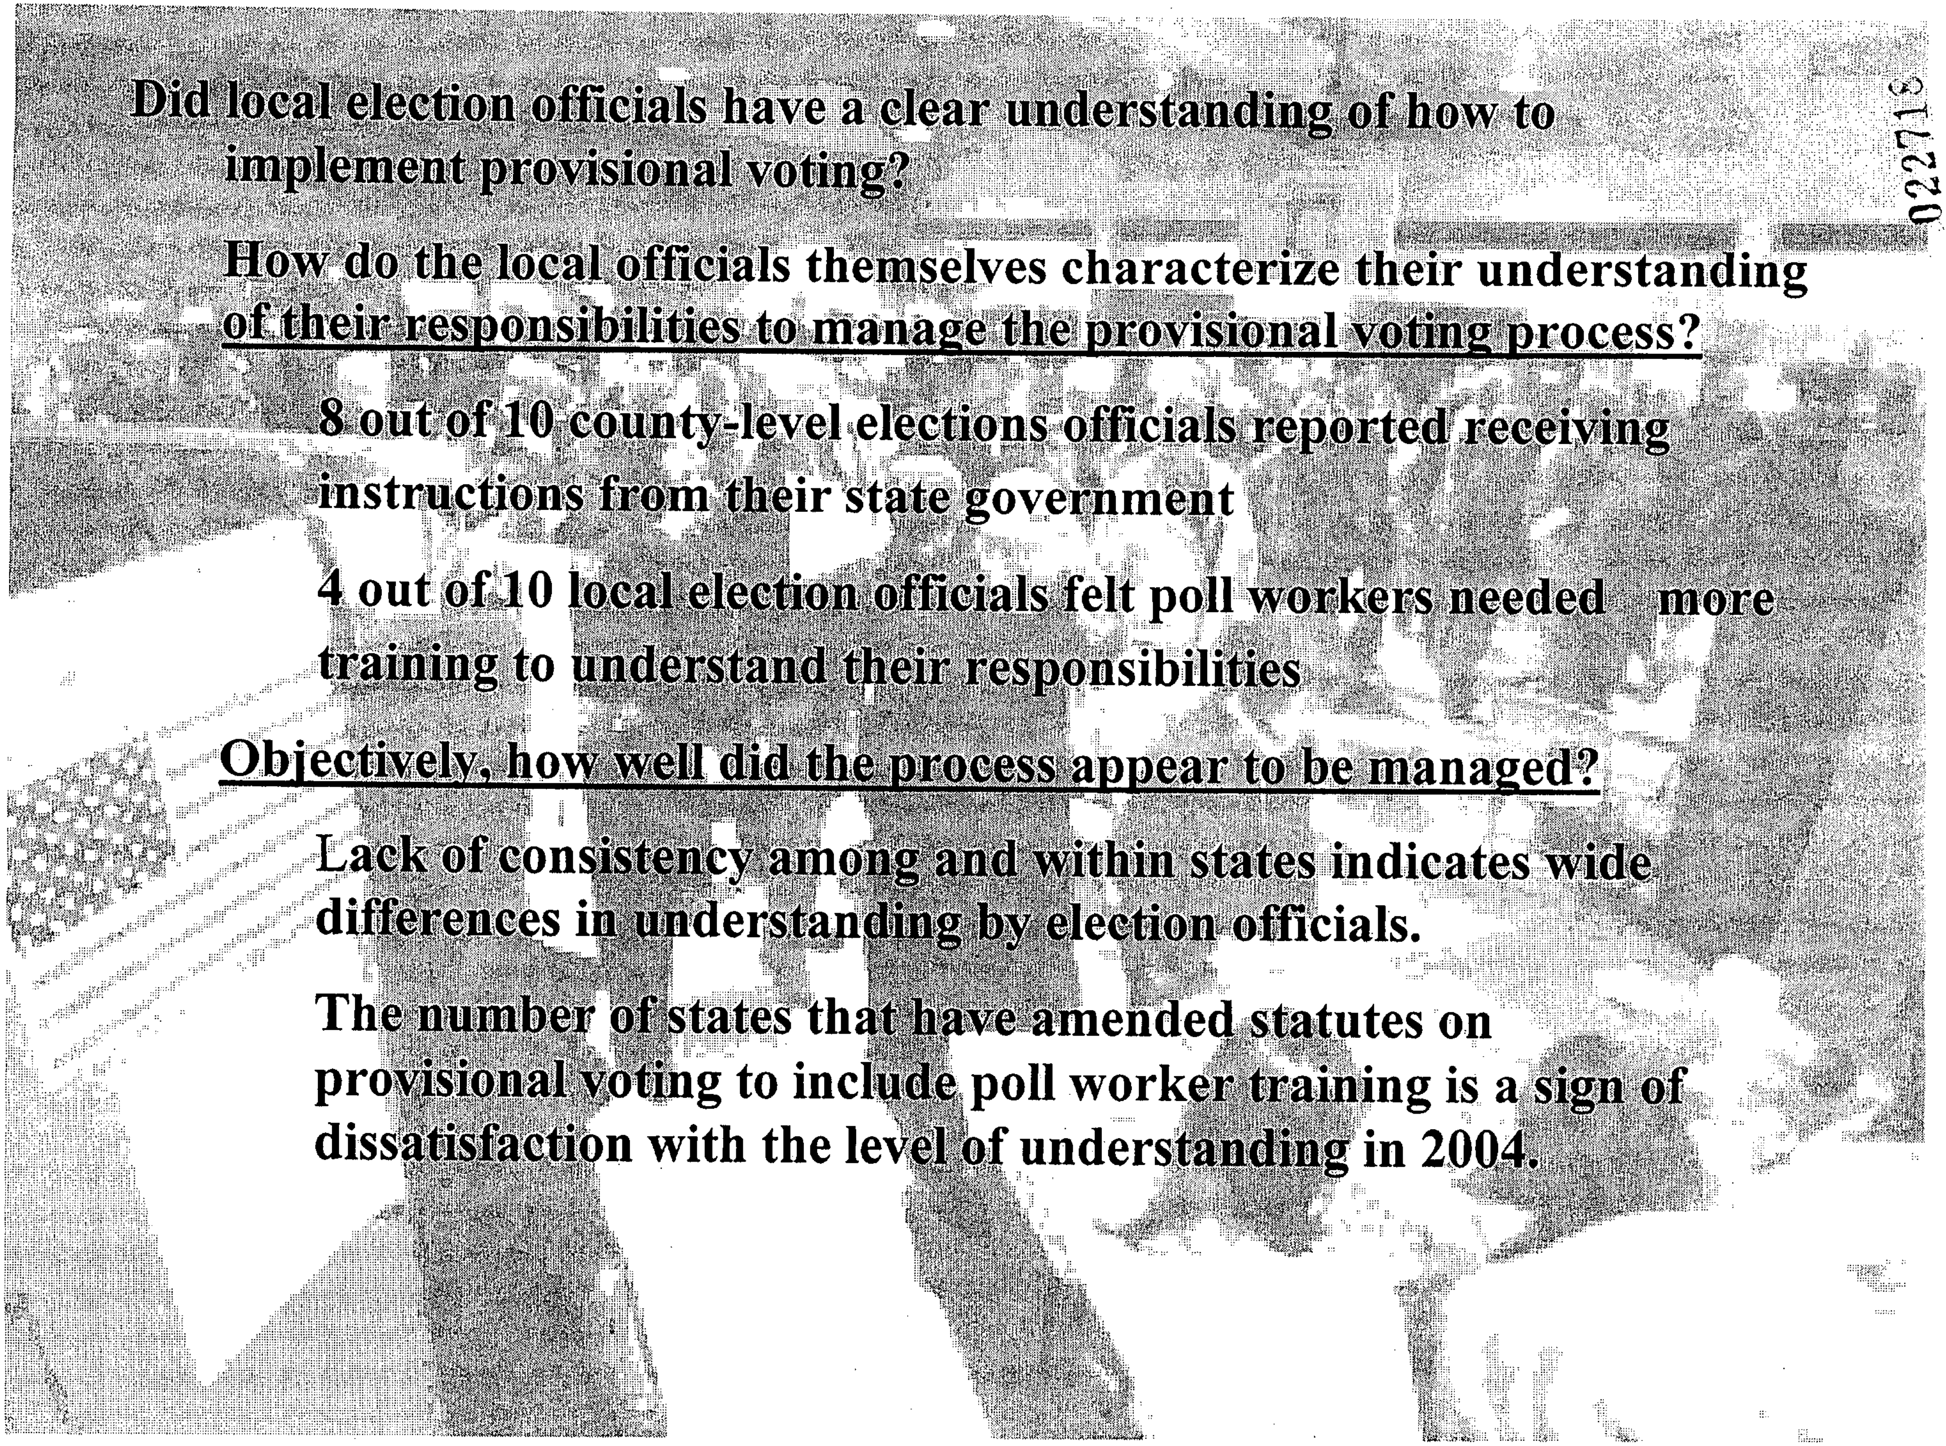


Conclusions

States have latitude in how they meet HAVA requirements.

A considerable degree of variation among the states is to be expected.

If that variation stems from differences in political culture among the states, it is likely to persist. If it reflects a learning curve for "new" states, consistency may increase more quickly.



Did local election officials have a clear understanding of how to implement provisional voting?

<u>How do the local officials themselves characterize their understanding of their responsibilities to manage the provisional voting process?</u>

- 8 out of 10 county-level elections officials reported receiving instructions from their state government
- 4 out of 10 local election officials felt poll workers needed more training to understand their responsibilities

<u>Objectively, how well did the process appear to be managed?</u>

- Lack of consistency among and within states indicates wide differences in understanding by election officials.
- The number of states that have amended statutes on provisional voting to include poll worker training is a sign of dissatisfaction with the level of understanding in 2004.

Subject Revised materials for Sept. 6 Meeting

Karen,

The hard copy of the materials you received on Friday may have been missing the response to Question 4 (the copy I received did not include it). Several other typographical and other errors also became apparent when I reviewed it today. .

Attached is a revised version of the package that corrects those errors. Please rely on this version to prepare for the meeting on Tuesday. I will bring sufficient copies to hand out before the meeting.

Sorry for the errors.

DATE: September 3, 2005

RE: Briefing on Provisional Voting Research

The enclosed draft synthesizes our findings based on the research on provisional voting completed since the start of the project. It is organized as summary answers to the six key questions on topics of particular interest enumerated in the contract.

1) How did states prepare for the HAVA Provisional Voting requirement?
2) How did their preparation and performance vary between states that had previously had some form of Provisional Ballot and those that did not?
3) How did litigation affect the implementation of Provisional Voting?
4) How effective was Provisional Voting in enfranchising qualified voters?
5) Did states and local processes provide for consistent counting of Provisional Ballots?
6) Did local election officials have a clear understanding of how to implement Provisional Voting?

Our discussion on the 6th will revolve around these draft, summary answers. Your comments and reactions to the material will provide direction --a basis for us to complete work on the final report and the preliminary guidance document. We seek the EAC's response and comments to ensure that the research is meeting the needs of Commissioners and staff.

We will also ask for the comments of the Peer Review Group on this draft to provide independent analysis of our approach and methods.

The following materials are enclosed as background for the presentation:

Summary responses to 6 Key Questions regarding Provisional Voting

Appendices:

a) Statistical Review of Provisional Voting in the 2004 Election
b) State Narratives on Provisional Voting
c) Memorandum: Provisional Voting Litigation by Issue
d) Memorandum: Provisional Voting Litigation by State
e) Memorandum: Provisional Voting Litigation

Question 1: How did states prepare for HAVA's provisional voting requirements?

HAVA required all states to develop a process for permitting individuals who state they are registered, eligible to vote and in the proper jurisdiction for voting but are not on the official registration list to do so by provisional ballot. It also directed states to provide a way for provisional voters to find out if their ballots were counted.

For the 25 states that had some form of provisional ballots before HAVA, meeting the requirements meant reviewing and revising, if necessary, their process for provisional voting. The 18 states that were new to provisional voting had to provide for provisional ballots by a new statute or administrative regulation and had to design procedures for pre-election, Election Day and post-Election Day activity. Preparation at the state level is described exhaustively in the collection of state statutes and regulations compiled in this research.

In addition to devising the provisional voting process, states had the responsibility to define "jurisdiction," adopt rules regarding the use of voter identification, and prepare a system to decide which provisional ballots cast should be counted. The states also had the responsibility of providing training or instruction for local election officials who would actually manage the provisional voting process, including training poll workers. Interviews with local election officials, at the county level in most states, provided information to assess how they prepared to administer the process.

Most, but not all, (84 percent) county-level election officials received provisional voting instructions from state government. The type and amount of instruction received varied widely across the states:

- Almost all of those officials received instruction from their state government on how to determine a voter's eligibility to receive a provisional ballot, and they felt the instructions provided were useful.
- Nine out of ten received instruction for providing voters the opportunity to verify if the provisional ballot had been counted as well as instruction establishing guidelines for counting provisional ballots.
- Two out of three received information on using a provisional ballot as an application to update the voter's registration.
- Only about half of those local election officials received instruction on strategies to reduce the need for voters to use provisional ballots.

Although almost all county-level election officials provided training or written instruction to precinct-level poll workers on how to administer provisional ballots, wide disparities existed in other areas of instructions or resources.

- Nine out of ten provided a telephone line for poll workers to speak to an election official with access to a list of eligible voters to determine voters' assigned precinct and polling place.
- Eight in ten furnished local poll workers with access to a list of eligible voters in the jurisdiction.
- Only about 1 in 10 (12 percent) made available to poll workers a statewide voter

registration database.

- Almost equally rare (14%) were training and written procedures for poll workers on the counting of provisional ballots.

Wide variance existed in how the county-level officials prepared to comply with HAVA's requirement to provide voters a way to find out if their provisional ballots had been counted:

- Seven in ten of those officials provided the main telephone number for the local or county election office;
- About half (47 percent) used mail notification;
- Four in ten provided a dedicated toll-free telephone hotline;
- About 1 in 5 (22%) offered this information through a website, and about half that number offered email notification.

Question 2: How did their preparation and performance vary between states that had previously had some form of Provisional Ballot and those did not?

In the 2004 election, 18 states were new to the process of provisional voting, while 25 others had experience with similar methods of "fail-safe voting." Local election officials in the "old" states felt more confident in their ability to administer the provisional voting process:

- Almost three-quarters (74%) of local election officials in the "old" states found implementing the provisional voting system was "easy," but that was true of just over half (56%) of officials in the "new" states.
- About half (49%) of officials in the "new" states felt that more training was needed on how to administer the provisional voting system. Less than 40% of officials in the "old" states felt that way.
- Nine out of ten local officials in the "old" states felt that the support received from state government was adequate, compared to 8 in 10 in the "new" states.

In some functions there was little difference in the preparation for provisional voting by "old" and "new" states. For example, in both subgroups, about half (54%) of county-level officials received from their state governments little information about "strategies to reduce the need for voters to use provisional ballots." But for other functions, training varied widely in both type and amount between the two subgroups:

- More officials in "old" states (7 in 10) than "new" (6 in 10) received state instruction on the design of the provisional ballot.
- By a similar margin, more "old" state officials received instruction about using the provisional ballot as an application to update the voter's registration.

The "new" state officials believed that voters did not receive enough information about the jurisdiction in which to cast a provisional ballot in order to be counted, and they felt that more funding was needed to educate voters about their rights to cast a provisional ballot:

- Four out of ten officials in the "new" states, compared with 3 out of 10 in the "old" stated that more information should have been provided to voters about the jurisdiction in which the ballot had to be cast.
- Also, four out of ten in the "new" states felt that more time was needed compared with just over a quarter (26%) of those in "old" states.

When we move from preparation to performance, the importance of experience becomes sharply clear. In the "old" states, provisional ballots represented over 2% (2.11%) of the total vote. In the "new" states, that number was less than one-fourth of that, 0.47%. How the ballots were then evaluated also showed significant differences between "old" and "New." In ruling ballots legitimate and including them in the final vote, the "old" states averaged nearly double the number of the "new" states, 58% to 32%. In "old" states, 1.48% of the total vote came from provisional ballots, six times more than the 0.23% in the "new" states.

Question 3: How did litigation affect the implementation of Provisional Voting?

SUMMARY: Litigation just before the 2004 election upheld the principle that provisional ballots are available whenever voters believe they are entitled to them, so that their preferences can be recorded, with a subsequent determination whether these preferences count as valid votes. This pre-election litigation also clarified that HAVA does not require states to count provisional votes cast in the wrong precinct. Otherwise, however, this pre-litigation occurred too late to shape significantly the way the states implemented provisional voting.

Lawsuits filed shortly after Election Day, which were designed to alter the outcome of a close election, were uniformly unsuccessful in this goal, although some of them had the ancillary effect of requiring the counting of some provisional ballots that would have been left uncounted. Thus, the experience of the 2004 election shows that litigation can be useful, not to change the outcome of a race, but to enhance the accuracy of the provisional voting process. This kind of accuracy-enhancing litigation is most beneficial the earlier it occurs in the process. The nation can anticipate more litigation before the 2006 and 2008 elections if states leave unaddressed some of the ambiguities and problems that surfaced in the 2004 election.

Although the enactment of HAVA in 2002 and its erratic implementation in the states during the ensuing two years provided ample opportunity for litigation designed to clarify its requirements concerning provisional voting, or otherwise challenge state laws and administrative procedures regarding provisional voting, such litigation did not develop until the eve of the November 2004 general election. By then, it was largely too late for litigation to affect the rules and procedures in place in advance of Election Day.

A flurry of litigation occurred around the country in October 2004 concerning the so-called "wrong precinct issue" – whether provisional ballots cast by voters in a precinct other than their designated one would be counted for statewide races. These lawsuits were largely unsuccessful in their stated goal: most courts, including the U.S. Court of Appeals for the Sixth Circuit (the only federal appeals court to rule on the issue), rejected the contention that HAVA requires the counting of these wrong-precinct provisional ballots.

This litigation was significant nonetheless. First, the Sixth Circuit decision established the precedent that voters have the right to sue in federal court to remedy violations of HAVA. (It just so happened that a state's decision not to count wrong-precinct provisional ballots was not a HAVA violation). Second and significantly, the litigation clarified the right of voters to receive provisional ballots, even though they would not be counted. The decision also defined an ancillary right –the right to be directed to the correct precinct. There voters could cast a regular ballot that would be counted. If they insisted on casting a provisional in the wrong precinct, they would be on notice that it would be a symbolic gesture only. Third, and relatedly, these lawsuits prompted election officials to take better care in instructing precinct officials on how to notify voters about the need to go to the correct precinct in order to cast a countable ballot – although the litigation regrettably came too late to be truly effective in this regard. In many states, on Election Day 2004, the procedures in place for notifying voters about where to go were less than ideal, reflecting less-than-ideal procedures for training poll workers on this point.

To a lesser extent there was also pre-election litigation over the question whether voters who had requested an absentee ballot were entitled to cast a provisional ballot. In both cases (one in Colorado and one, decided on Election Day, in Ohio), the federal courts ruled that HAVA requires that these voters receive a provisional ballot. Afterwards, it is for state officials under state law to determine whether these provisional ballots will be counted, in part by determining whether these provisional voters already have voted an absentee ballot (in which case one would need to be ruled ineligible, in order to avoid double voting). But these decisions confirm the basic premise that provisional ballots are available whenever voters believe they are entitled to them, so that their preferences can be recorded, with a subsequent determination whether these preferences count as valid votes.

After Election Day, there was litigation over provisional ballots in states where the outcome of specific races might turn on whether or not some of the provisional ballots cast were ruled eligible for counting. Moreover, the "placeholder" filing of similar lawsuits in Ohio – in anticipation that provisional ballots might have made a difference in the presidential election in that state – indicates that there would have been more litigation of this type had that race (or others) been closer. Although these placeholder lawsuits fizzled away once it was clear that provisional ballots in Ohio would not affect the result of the presidential election, the litigable issues remain capable of resurrection when they might make a difference in the future. Indeed, the League of Women Voters has already filed a major new lawsuit in Ohio, seeking proactive changes in the provisional voting system in advance of the next election in that state. (This effort to resolve these legal issues well before November 2006 is a salutary one, so that the judiciary does not struggle with complicated, sensitive questions at a frenzied pace, either in the last few weeks before Election Day or the first few weeks immediately after Election Day.)

The efficacy of these post-Election Day lawsuits was mixed. In New York, supporters of a Democratic candidate for a state senate seat prevailed in that state's highest court on the proposition that provisional ballots cast at the correct polling *site* but at the wrong precinct should be counted. (Many polling sites, particularly in urban locations, serve multiple precincts.) The New York high court, however, rejected the contention that provisional ballots at the wrong polling site must be counted. The court also rejected the proposition that a provisional ballot should count if another (regular) vote already had been cast in the name of the provisional voter (even if the provisional voter purported to offer proof that the other vote had been cast by an imposter). Finally, the court accepted the contention that a provisional ballot should count if the ballot's envelope was missing information as a result of a poll worker's clerical error. The upshot of these rulings was that the Democratic candidate reduced the Republican's margin of victory (from 58 to a mere 18 votes), but did not succeed in overturning the election result.

In North Carolina, post-election litigation over provisional ballots ultimately proved inconsequential as the state's legislature took matters into its own hands. The race for the state's Superintendent of Public Instruction turned on whether approximately 11,000 "wrong precinct" provisional ballots would be counted under state law. The state's Supreme Court ruled that they should not count, but the state's legislature disagreed and enacted a new law to supersede the supreme court's ruling. The election was finally resolved on August 23, 2005 – *43 weeks* after Election Day – making it the last settled statewide election from 2004. The length of time it took to resolve this dispute shows the dangers of leaving ambiguous provisions of state law concerning the counting of provisional ballots.

Washington suffered an even more celebrated, if slightly less protracted, dispute over the counting of provisional ballots in statewide race. Here, too, the effort to overturn the result of the race through a lawsuit was unsuccessful. Republicans went to court after their gubernatorial candidate, Dino Rossi, came up 129 votes short in the third (manual) count of the ballots (having come out ahead in the two previous – machine – counts). Among other problems, Republicans were able to show that this third count included 252 provisional ballots cast by individuals who could not be verified as registered voters. But because these provisional ballots had been mingled with regular ballots during the counting process, it no longer could be determined for which candidate these provisional ballots were cast. After a lengthy trial at which the Republicans attempted to show statistically that enough of these ineligible ballots would have been cast for the Democratic candidate to change the result of the election, the trial court rejected such statistical proof as improper under state law, and Rossi decided not to appeal the decision to state's supreme court. The ruling came on June 6, 2005 – 32 weeks after Election Day.

Perhaps Washington's plight was aberrational and uncontrollable: how were election officials supposed to predict – and, more important, how were they supposed to avoid – the problem of poll workers inappropriately feeding provisional ballots through the counting machines as if they were regular ballots? (For future elections, Washington has adopted a series of measure, including color-coding provisional ballots and making sure that their different shape and size prevents them from being read by the machines used to count regular ballots, in an effort to prevent a repeat of this particular problem.) The after-the-fact litigation certainly was unable to put the spilled milk back in the bottle. While the litigation put a spotlight on the failures of the electoral process in Washington in 2004, serving as a catalyst for future reforms, it did nothing to change the outcome of the 2004 election itself, except only to delay the conclusion of the process by more than six months. (The fact that the Democratic candidate, Christine Gregoire, who was certified the winner after the manual recount, was inaugurated as Governor and exercised the powers of the office during those six months evidently affected the willingness of a trial judge to overturn the results of the election.)

One earlier aspect of the litigation over provisional ballots in Washington did prove efficacious – and importantly so. In December 2004, during the recounting process (before certification of Gregoire as winner), it was discovered that 547 provisional ballots in King County had been rejected because they could not be matched with a signature in the county's current electronic database of registered voters, but that county officials had not attempted to match the signatures against original registration forms, older electronic files, or other available records. Upon this discovery, Democrats went to court arguing that state law required that the provisional ballots be verified against these additional records. The Washington Supreme Court unanimously agreed with this argument, vindicating the principle that provisional ballots are designed to protect voters against clerical errors affecting the accuracy of the state's updated registration list.

The state supreme court, however, rejected the Democrats' additional argument that different rates at which counties invalidated provisional ballots because the signature on the ballot did not match the signature on file was sufficient to establish an Equal Protection violation under the principles of *Bush v. Gore*. The different rates could be explained by factors other than the assumption that county officials were applying different standards when conducting signature matches. Since the counties were purporting to apply the same standard, and there was no definitive proof to the contrary, the court found no Equal Protection violation.

The Democrats did win another important procedural ruling early on in the post-election litigation in Washington. They sought – and obtained – public disclosure of the names of all individuals whose provisional ballots were rejected because their signatures did not match county records. This disclosure ultimately uncovered which provisional ballots had been rejected based on insufficient examination of county records.

CONCLUSIONS:

A review of all the litigation over provisional voting in connection with the 2004 election leads to the following tentative conclusions. First and foremost, litigation is more likely to be successful – and yield a public benefit – if its goal is simply to assure the accuracy of the provisional voting process, rather than seeking to undo the result of an election. Of course, as a practical reality, most litigation that actually occurs is likely to be motivated by a desire to affect the outcome of an election, rather than the altruistic, public-spirited motive of improving the accuracy of the process. For this reason, in the future, it will be useful for states to distinguish between (a) streamlined administrative remedial processes, which will enable individual voters to seek redress in the event they believe their provisional ballot rights were mistreated, and (b) a more burdensome judicial proceeding for the purpose of contesting an election result. In the meantime, in some states that have been the focus of widespread national attention because of past problems (for example, Florida and Ohio), citizen groups like the League of Women Voters may have sufficient resources and incentives to bring system-wide litigation that seeks structural reform of the provisional voting process.

Second, and related, the earlier that litigation occurs in the electoral process, the more likely it is to secure rights protected under provisional voting laws. If nothing else, early litigation (even when ruled unmeritorious) has the effect of clarifying the rules in advance. It can put people on notice of what rights they do and do not have. The EAC might be in a position to give guidance to states on how to encourage earlier, rather than later, litigation over provisional ballots. For example, EAC could consider whether it would be a "preferred practice" for states to preclude any post-election challenges that could have been filed in a pre-election lawsuit.

Third, the more narrow and specific the complaint (and thus the more narrow and specific the remedy sought by a lawsuit), the more receptive the court will be. It is easier for a court to order disclosure and the checking of additional records than it is for a court to sustain an amorphous Equal Protection claim about disparities in the signature verification process. Although it is too early to say that all Equal Protection challenges to the counting of provisional ballots will be unsuccessful, the speed with which the Washington Supreme Court rejected the Equal Protection claim over the signature matching process indicates that future Equal Protections claims will need to be much more specific about the disparities they allege in order to have a chance of success.

In sum, if litigation is to occur over provisional voting in 2006 or 2008, it would be better if the litigation were to occur as early as possible before Election Day, focused specifically on the ways state laws are allegedly deficient and should be remedied. Such litigation can have the virtue of clarifying the rules applicable to provisional voting and, where necessary, assuring that the rights protected by provisional voting laws are indeed enforced. Such pre-election lawsuits, of course, do not ask the court to change which candidate wins the election, and one lesson of the 2004 experience is that litigation is least valuable when it seeks that kind of outcome-altering decree.

Question 4: How effective was provisional voting in enfranchising qualified voters?

Answering this question poses a considerable challenge. To evaluate the decisions of local election officials' decisions on how to inform voters about the possibility of provisional voting and then whether to count a provisional ballot demands information about the eligibility or registration status of each provisional voter. That information is not available.

What is known, with reasonable confidence, is the number of provisional ballots cast and provisional ballots counted. Nationwide, 1,933,863 provisional ballots were cast, 1.6% of the total turnout. Of those ballots, 63.7% were subsequently verified and included in the final vote tally. Provisional ballots enfranchised 1,231,429 citizens, or 1.01% of the total turnout in 2004. These ballots were cast by voters who otherwise would have been turned away at the polls.

Not knowing the total number of registered voters who might have voted but could not makes estimating the effectiveness of provisional voting quantitatively impossible. The Cal Tech – MIT Voting Technology Project, however, estimated that 4 – 6 million votes are lost in presidential elections due to the causes shown in the table below. The estimate is a rough approximation, but it may provide data good enough for at least a rough assessment of the size of the pool of potential voters who might have been helped by the provisional ballot process.

Votes Lost (Millions)	*Cause*
1.5 – 2	Faulty equipment and confusing ballots
1.5 – 3	Registration mix-ups
<1	Polling place operations
?	Absentee ballot administration

Registration mix-ups (e.g., name not on list) and polling place operations (e.g., directed to wrong precinct) are the causes most likely to be remedied by provisional voting. Thus a rough-and-ready estimate of the universe of voters who could be helped by provisional voting might be 2.5 – 3 million voters. A very rough estimate of the effectiveness of provisional voting in 2004, then, might be 40% to 50% (ballots counted/votes lost)*. Whatever the precise figure, it seems reasonable to conclude that there is considerable room for improvement in the administration of provisional voting.

---

* Another interpretation of the data should be considered as well. The category of "registration mix-ups" was developed as a measure of the states' registration systems as included in the Census Bureau's Current Population Survey. The CPS after each election asks people if they were registered and if they voted. It gives breakdowns of reasons why people did not vote. Survey responders tend to deflect blame when answering questions about voting. In the narrow context of provisional ballots, 'registration problems' would cover only voters who went to the polls where the determination that they were not registered was wrong or were registered, but in the wrong precinct. If they were in the wrong precinct, provisional voting can help them in only 17 states. In 2004, only 6.8% of those not voting and registered blamed registration problems, while 6.9% reported so in 2000. Thus the arrival of provisional voting in the 18 "News" increased the number voting by only 0.1%.

Several states came to just that conclusion. Legislative activity is evidence that states were less than satisfied with the effectiveness of their processes. State legislation adopted since the election points to areas of concern.

- Not enough time to examine and count the provisional ballots. Florida, Indiana, Virginia, and Washington all have clarified or extended the timeline to evaluate the ballots. But taking more time can prove a problem, particularly in presidential elections with the looming deadline to certify the vote for the Electoral College.

- Lack of uniform rules for counting ballots and effective training of the election officials in interpreting and applying those rules to determine the validity of ballots. Colorado, New Mexico, North Carolina, and Washington have all passed legislation focused on improving the efficacy and consistency of the voting and counting process.

Another indication of lack of effectiveness is legal challenges to the process. Voters or other parties have sought court review of local officials' decisions, and those are described in the answer to Question 3.

Aggregate data from the states indicates that some states were more effective than others in enfranchising voters through the provisional ballot. In states that used a provisional ballot before HAVA ("old" states), a higher proportion of voters were enfranchised by provisional ballots than in "new" states. In the 25 states that had some experience with provisional voting before HAVA, a higher portion to the total vote was cast as provisional ballots and a greater percentage of the provisional ballots cast were counted than in the 18 new to provisional balloting.

A reasonable assumption is that potential voters in both the old states and new states encountered similar problems that made it impossible to cast a regular ballot. But they had different provisional systems to navigate, and consequently they experienced different outcomes. Those voting with provisional ballots in states with experience were enfranchised more frequently than those in the new states. This provides more evidence that there is room for improvement.

If experience with provisional voting does turn out to be the key variable in performance, that is good news. As states gain experience with provisional ballots their management of the process could become more consistent and more effective over subsequent elections. Further guidance from the EAC on best practices and more consistent management could sharpen the lessons learned from that experience.

But the optimistic conclusion that experience will make all the difference may be unwarranted. Only if the performance of the "new" states was the result of administrative problems stemming from inexperience will improvement be automatic. The other possibility is that the "new" states have a political culture different from the "old" states. That is, underlying characteristics of the "new" states political system may be the reason they had not adopted some form of provisional voting as the "old" states did.

The "new" states may strike a different balance among the competing objectives of ballot access, ballot security and practical administration. They may ascribe more responsibility to the individual voter to take such actions as registering early, finding out where the right precinct is, re-registering after changing address. Or they may value keeping control at the local level, rather than ceding some authority to state or federal directives. If the inconsistent performance in the "new" states arises out of this kind of political culture, improving effectiveness in the use of the provisional ballot will he harder and take longer to achieve.

Question 5: Did State and local processes provide for consistent counting of provisional ballots?

HAVA gave states broad latitude in how to implement provisional voting, including who beyond the required categories of voters should receive provisional ballots and how to determine which provisional ballots should be counted. Little consistency existed among and within states in the way provisional ballots were used in 2004.

The use of provisional ballots was not distributed evenly across the country. Indeed, 6 states (California, New York, Ohio, Arizona, Washington, and North Carolina) accounted for more than two-thirds of all the provisional ballots cast in the 2004 election. Wide variation was found across the nation, even when overall state size and turnout was taken into account.

- In Alaska, provisional votes accounted for 7% of all votes cast on Election Day. In 22 other states provisional ballots made up less than 0.5% of votes on Election Day.
- The portion of provisional ballots cast that were actually counted also displayed wide variation, ranging from 96% in Alaska to 6% in Delaware.
- The range of ultimate inclusion of provisional ballots in final vote tallies was immense: The 7% of the total vote represented by Alaska's counted provisional ballots was more than 1,000 times greater than Vermont's 0.0058%.

The greatest source of this variation was the state's experience or lack of experience with provisional voting. In experienced states, a higher proportion of voters cast provisional ballots and a higher percentage of provisional ballots was counted than in "new" states. In the 25 states that had some experience with provisional voting before HAVA, a higher portion to the total vote was cast as provisional ballots and a greater percentage of the provisional ballots cast were counted than in the 18 new to provisional balloting.

- The 25 experienced states averaged about 2% (2.17%) of the total vote cast as provisional ballots. This was 4 times the rate as in states new to provisional, which averaged less than half a percent (0.47%).
- The experienced states counted an average of 58% of the provisional ballots cast, nearly double the proportion of the new states, which counted just 33%, of cast provisional ballots.
- The combined effect of these two differences was significant. In experienced states 1.53% of the total vote came from counted provisional ballots. In new states provisional ballots accounted for only 0.23% of the total vote.
- In short, the share of provisional ballots in the total vote was six times greater in experienced states than in new states.

Other influences on the variation among the states included:

- The more rigorous the verification requirements of the voter's identity and registration status, the smaller the percentage of provisional ballots that were counted.
- In the 4 states that simply matched signatures nearly 3.5% of the total turnout consisted of provisional ballots, and just under three-fourths of those ballots (73%) were counted.

  - In the 14 States that required voters to provide such additional information as address or date of birth just over 1.5% of the total turnout consisted of provisional ballots, and 55% of those ballots were certified
  - In the 14 states that required an affidavit just over one-half of a percent (0.6%) of turnout came from provisional ballots, and less than one-third of those (30%) were counted.
  - In the 10 states that required voters to return later with identifying documents just under 1.5% of the total turnout came from provisional ballots, and more than half (52%) of these were certified. Voters apparently found this requirement less onerous than the affidavit, even though it required a separate trip to a government office.

- Voter registration databases provided information that reduced the number of provisional ballots counted. In states using provisional voting for the first time, states with registered-voter databases counted only 20% of the ballots that were cast. States without such databases counted more than double that rate (44%).

- States that allowed out-of-precinct ballots counted 56% of the provisional ballots. States that recognized only ballots cast in the proper precinct counted an average of 42% of provisional ballots cast.

  - In experienced states, this was even more pronounced. 52% of ballots cast were counted in states requiring in-district ballots, while 70% were counted in those allowing out-of-precinct ballots.
  - If all states had counted out-of-precinct ballots, perhaps 280,000 more voters would have been enfranchised across the country.

High-Low rating of Percent of PV Ballots Cast as part of Turnout

Count

		High-Low rating of Percent of PV Ballots Cast that were Counted		
		Less than 50% Counted	More than 50% Counted	Total
High-Low rating of Percent of PV Ballots Cast as part of Turnout	Less than 1% of Total Turnout was PV	21	5	26
	More than 1% of Total Turnout was PV	1	16	17[*]
Total		22	21	43

As the table above shows, the nation can be divided into two groups of states: those that made significant use of provisional ballots (more than 1% of total turnout was cast as provisional ballots) and those that did not. The difference in how these two groups evaluated those ballots

---

[*] These states are: Alaska, Arizona, California, Colorado, District of Columbia, Iowa, Kansas, New York, Washington, Utah, Ohio, North Carolina, Nebraska, Maryland, New Mexico, New Jersey, and West Virginia.

that were cast was striking. In states where high levels of provisional ballots were cast, high levels were also counted. In states where low levels of provisional ballots were cast, low levels were typically counted.

The table shows the relationship between use of provisional ballots in the states and the determination by the state that a provisional ballot should be counted. The relationship is strong (Yule's Q = 0.97), clear, and significant. In 26 states less than 1% of voters cast a provisional ballot. In 21 of those states, less than half the ballots cast were counted. In 17 states, more than 1% of voters case a provisional ballot, and in 16 of those states more than half the ballots were counted.

No ready conclusions can be drawn about why these results occur. The data could suggest that states where high levels of ballots were cast were overwhelmed by the sheer volume of them, resulting in insufficient critique of each ballot, or conversely that they were simply more experienced in making evaluations and were better able to identify legitimate ballots. It is possible that states with few ballots cast did not invest the time and effort to properly evaluate them, because their were so few of them, or it is possible that they were better able to dedicate the time to such an investigation and properly weeded out invalid ballots. Further research is required to better ascertain the reasons for these disparities.

Variation within states

Even within states consistency was hard to find. Counties differed widely in the rate at which ballots were cast and counted, suggesting that other factors beyond statewide regulations or administrative requirements were at play. This was true in both new and old states.

Election Line, for example, found that:

- In Ohio some counties counted provisional ballots not cast in the assigned precinct even though the state's policy was to count only those ballots cast in the correct precinct.
- Some counties in Washington tracked down voters who would otherwise have had their provisional ballots rejected because they had failed to complete part of their registration form, gave them the chance to correct those omissions, and then counted the provisional ballot. This would probably not have come to light except for the sharp examination caused by the very close election for governor.

Of the 20 States for which we have gathered county-level provisional ballot data, the rate of counting these ballots frequently varied by as much as 90% to 100% among counties in the same state. This suggests that additional factors outside of the statewide factors analyzed here also influence the use of provisional ballots.

Election Official's Perceptions

In addition to the statistical differences among states' handling of provisional voting, there were also differences in how election officials prepared for and evaluated the use of provisional ballots. The survey conducted by the Eagleton Institute at Rutgers University found that county election officials reported different perceptions of provisional balloting, depending upon whether they came from "old" or "new" States. Both groups reported gaining help from state election offices on how to implement provisional balloting, but in different ways.

- Officials from "new" states reported receiving more guidance on how to evaluate ballots once cast, while officials from "old" states reported receiving more guidance on how to design ballots. Both groups regarded the guidance they received as being helpful.
- Officials from "old" states were more likely to report that they counted more ballots, were better prepared to direct voters to their correct precincts with maps, and regarded provisional voting as easy to implement and enabling more people to vote.
- Officials from "new" states were more likely to report that more information should have been provided to voters about the jurisdiction where provisional ballots must be cast in order to be counted and that more time was needed to implement provisional voting procedures.
- Officials from "old" states were more likely to report that provisional voting sped up and improved polling place operations and that it helped officials to maintain more accurate registration databases.
- Officials from "new" states were more likely to agree that provisional voting created unnecessary problems for election officials and poll workers.

This data can be interpreted either of two ways. First, experience and familiarity with provisional voting may be the key factor in the degree to which provisional voting is used and in how election officials perceived provisional balloting. Those officials who were more familiar and experienced with the system had more positive reactions to provisional voting and its worth. Eight out of ten officials from experienced states reported that "there is a need to offer voters the opportunity to cast provisional ballots", while only 6 out of 10 from new states did so.

But another way of explaining the difference is less rosy for provisional ballots. It may be that the states new to provisional balloting have a political culture somewhat different from the states that had offered a provisional ballot before HAVA. The new states may have a history of striking a different balance among the competing voting objectives of access, security, and administrative practicality. Officials in those states may believe that the fail safe offered by provisional voting broadens access at the expense of security and burdens election administrators beyond any perceived benefit. Further survey research could help resolve this question.

Conclusion

States that previously had some form of provisional ballots and those that did not had different experiences in 2004. Those states that had used a provisional ballot before HAVA had more ballots cast, found higher levels of those ballots to be legitimate, and had much higher levels of provisional ballots in their final vote tallies. Election officials in those states also felt that provisional ballots were easier to administer and more worthwhile than did their counterparts in states new to provisional voting. The strongest influence noted in this study was simply that of experience with the process.

If the difference is mostly one of experience, in subsequent elections, officials will be more prepared for and comfortable with the implementation of provisional ballots. This should lead to greater consistency among the states and more positive ratings of it as a system. If, on the other hand, the different experiences with provisional ballots reflect different political cultures among the states, consistency among the states will prove more difficult to achieve.

Other factors, such as verification laws and requirements for whether out-of-precinct ballots may be counted, will continue to cause variance across the country. But as voters and election officials become more familiar with the system, that variance may stabilize. In sum, provisional balloting was applied inconsistently in 2004, returning a wide range of results. Since the states have considerable latitude in how they meet HAVA's requirements for provisional voting, a considerable degree of variation among the states is to be expected in the future. If that variation stems from differences in political culture among the states, it is likely to persist.

Question 6: Did local election officials have a clear understanding of how to implement provisional voting?

This question demands two different kinds of answers. First, how do the local officials themselves characterize their understanding of their responsibilities to manage the provisional voting process? Second, objectively how well did the process appear to be managed?

While essentially all (98%) county-level local elections officials considered the instructions they received from their state governments to be "useful" or "very useful," the crucial question is how well did the process work on Election Day? The lack of consistency among and within states in the use of provisional ballots and evaluating those ballots indicates considerable variation in the understanding of the process by election officials.

Four out of ten local election officials felt poll workers needed more training to understand their responsibilities. One sign of dissatisfaction with the functioning of the provisional voting process is the number of states that have amended their statutes on provisional voting to include specific language about poll worker training. Among these states are Colorado, Indiana, New Mexico and Washington.

Statutes, of course, reflect only part of the story. For example, Alabama – a state new to provisional voting – undertook a concerted training effort on how to handle and count provisional ballots. It also created a notification system whereby voters could verify if their vote counted within 10 days of casting their ballots. These steps were not dictated by statute, but reflected the initiative of f local elections officials. Their leadership indicates a good understanding of their responsibilities under HAVA and the state statute.

More than 8 out of 10 county-level elections officials reported receiving instructions from their state government regarding the implementation of provisional voting. Topics covered in those instructions from the states included:

- How to administer the provisional voting system
- Who is eligible to vote using a provisional ballot
- How individuals vote using a provisional ballot
- The jurisdiction where individuals can vote by provisional ballot
- Whether the provisional ballot could be used as an application to update the voter's registration
- How to train poll workers to process provisional ballots
- How to provide voters with the opportunity to verify if their provisional ballot was counted
- Guidelines for determining which provisional ballots are to be counted
- Strategies to reduce the need for voters to use provisional ballots
- How to design the structure of the provisional ballot

Those local election officials believe the most effective efforts to improve the provisional voting process would be to reduce the use of provisional ballots as a failsafe by improving technology –

such as registration databases – available to voters and poll workers. Reflecting their understanding of the provisional voting process, local elections officials call for:

- State-sponsored websites where voters can verify their registration status before Election Day.
- Access by poll-workers to statewide voter registration databases at polling place.

While local election officials report that the instructions they received were "useful," the quality of the information they receive is not the only influence on their performance. They recognize that timing is critically important. They understand that they must receive clear instructions from their state election agencies early enough to absorb, understand, and pass it along as operational instructions to poll workers and voters.

Subject EAC Briefing Materials - Tues. 9/6

Hi Karen,

Attached please find a summary of answers to the questions guiding our Provisional Voting analysis in preparation for our meeting with the EAC on Tuesday, Sept. 9th. Please distribute this document in advance of the briefing to your colleagues who will be attending. There are several appendix documents that have been fedex'ed to you for delivery by tomorrow at noon. These documents form a large part of our original research, and are referred to in our summary responses to the 6 guiding questions. I am sending 3 copies of the appendix documents for you and your colleagues. Additionally, Mr. O'Neill will be bringing you a CD-rom with all of the enclosure documents for your convenience.

If you have any questions, please do not hesitate to call or email me. Enjoy the holiday weekend.

Best,
Lauren Vincelli

EAGLETON INSTITUTE OF POLITICS

BREIFING FOR THE EAC

PRELIMINARY FINDINGS ON PROVISIONAL VOTING

September 1, 2005

Prepared by:
Eagleton Institute of Politics at Rutgers, The State University of New Jersey
Moritz College of Law at the Ohio State University

MEMORANDUM

TO: Commissioners and Staff of the EAC

FROM: Tom O'Neill, Eagleton Institute of Politics

DATE: September 6, 2005

RE: Briefing on Provisional Voting Research

The enclosed draft synthesizes our findings to date based on the research on provisional voting completed since the start of the project. It is organized as summary answers to the six key questions on topics of particular interest enumerated in the contract.

1) How did states prepare for the HAVA Provisional Voting requirement?
2) How did their preparation and performance vary between states that had previously had some form of Provisional Ballot and those that did not?
3) How did litigation affect the implementation of Provisional Voting?
4) How effective was Provisional Voting in enfranchising qualified voters?
5) Did states and local processes provide for consistent counting of Provisional Ballots?
6) Did local election officials have a clear understanding of how to implement Provisional Voting?

Our discussion on the 6th will revolve around these draft, summary answers. Your comments and reactions to the material will provide direction a basis for us to complete work on the final report and the preliminary guidance document. We seek the EAC's response and comments to ensure that the research is meeting the needs of Commissioners and staff.

We will also ask for the comments of the Peer Review Group on this draft to provide independent analysis of our approach and methods.

The following materials are enclosed as background for the presentation:

Summary responses to 6 Key Questions regarding Provisional Voting

Appendices:
a) Statistical Review of Provisional Voting in the 2004 Election
b) State Narratives on Provisional Voting
c) Memorandum: Provisional Voting Litigation by Issue
d) Memorandum: Provisional Voting Litigation by State
e) Memorandum: Provisional Voting Litigation

Question 1: How did states prepare for HAVA provisional voting requirements?

HAVA required all states to develop a process for permitting individuals who state they are registered, eligible to vote and in the proper jurisdiction for voting but are not on the official registration list to do so by provisional ballot. It also directed states to provide a way for provisional voters to find out if their ballots were counted.

For the 25 states that had some form of provisional ballots before HAVA, meeting the requirements meant reviewing and revising, if necessary, their process for provisional voting. The 18 states that were new to provisional voting had to provide for provisional ballots by a new statute or administrative regulation and had to design procedures for pre-election, election day and post-election day activity. Preparation at the state level is described exhaustively in the collection of state statutes and regulations compiled in this research.

In addition to devising the provisional voting process, states had the responsibility to define "jurisdiction," adopt rules regarding the use of voter identification, and prepare a system to decide which provisional ballots cast should be counted. The states also had the responsibility of providing training or instruction for local election officials who would actually manage the provisional voting process and the local and intermediary level of government. Interviews with local election officials, at the county level in most states, provided information to assess how they prepared to administer the process.

Most, but not all, (84 percent) county-level election officials received provisional voting instructions from state government. The type and amount of instruction received varied widely across the states:

- Almost all officials received instruction from their state government on how to determine a voter's eligibility to receive a provisional ballot and felt the instructions provided were useful.
- Nine out of ten received instruction for providing voters the opportunity to verify if the provisional ballot was counted as well as instruction for establishing guidelines for counting provisional ballots.
- Two out of three received information on using a provisional ballot as an application to update the voter's registration.
- Only about half of local election officials received instruction on strategies to reduce the need for voters to use provisional ballots.

Although almost all county-level election officials provided training or written instruction to precinct-level poll workers on how to administer provisional ballots, wide disparities existed in other areas of instructions or resources.

- Nine out of ten provided a telephone line for poll workers to speak to an election official with access to a list of eligible voters to determine voters' assigned precinct and polling place.
- Eight in ten furnished local poll workers with access to a list of eligible voters in the

jurisdiction.

- Only about 1 in 10 (12 percent) made available to poll workers a statewide voter registration database.
- Almost equally rare (14%) was training and written procedures for poll workers on the counting of provisional ballots.

Wide variance existed in how the county-level officials prepared to comply with HAVA's requirement of providing that voters have a way to find out if their provisional ballots counted:

- Seven in ten of those officials provided the main telephone number for the local or county election office;
- About half (47 percent) used mail notification;
- Four in ten provided a dedicated toll-free telephone hotline;
- About 1 in 5 (22%) offered this information through a website, and about half that number offered email notification.

Question 2: How did their preparation and performance vary between states that had previously had some form of Provisional Ballot and those did not?

In the 2004 election, 18 states were new to the process of provisional voting, while 25 others had experience with similar methods of "fail-safe voting." Local election officials in the "Old" states felt more confident in their ability to administer the provisional voting process:

- Almost three-quarters (74%) of local election officials in the "Old" states found implementing the provisional voting system was "easy," but that was true of just over half (56%) of officials in the "New" states.
- About half (49%) of officials in the "New" states felt that more training was needed on how to administer the provisional voting system. Less than 40% of officials in the "Old" states felt that way.
- Nine out of ten local officials in the "Old" states felt that the support received from state government was adequate, compared to 8 in 10 in the "New" states.

In some functions there was little difference in the preparation for provisional voting by "Old" and "New" states. For example, in both subgroups, about half (54%) of county-level officials received from their state governments little information about "strategies to reduce the need for voters to use provisional ballots." But for other functions, training varied widely in the type and amount between the two types of states:

- More officials in "Old" states (7 in 10) than "New" (6 in 10) received state instruction on the design of the provisional ballot.
- By a similar margin, more "Old" state officials received instruction about using the provisional ballot as an application to update the voter's registration.

The "New" state officials believed that voters did not receive enough information about the jurisdiction in which to cast a provisional ballot in order to be counted, and they felt that more funding was needed to educate voters about their rights to cast a provisional ballot:

- Four out of ten officials in the "New" states, compared with 3 out of 10 in the "Old" stated that more information should have been provided to voters about the jurisdiction in which the ballot had to be cast.
- Also, four out of ten in the "New" states felt that more time was needed compared with just over a quarter (26%) of those in "Old" states.

When we move from preparation to performance, the importance of experience becomes sharply clear. In the "Old" states, provisional ballots represented over 2% (2.11%) of the total vote. In the "New" states, that number was less than one-fourth of that, 0.47%. How the ballots were then evaluated also showed significant differences between "Old" and "New." In ruling ballots legitimate and including them in the final vote, the "Old" states averaged nearly double the number of the "New" states, 58% to 32%. In "Old" states, 1.48% of the total vote came from provisional ballots, six times more than the 0.23% in the "New" states.

Question 3: How did litigation affect the implementation of Provisional Voting?

> SUMMARY: Litigation just before the 2004 election upheld the principle that provisional ballots are available whenever voters believe they are entitled to them, so that their preferences can be recorded, with a subsequent determination whether these preferences count as valid votes. This pre-election litigation also clarified that HAVA does not require states to count provisional votes cast in the wrong precinct. Otherwise, however, this pre-litigation occurred too late to significantly shape the way the states implemented provisional voting.
>
> Lawsuits filed shortly after Election Day, which were designed to alter the outcome of a close election, were uniformly unsuccessful in this goal, although some of them had the ancillary effect of requiring the counting of some provisional ballots that would have been left uncounted. Thus, the experience of the 2004 election shows that litigation can be useful, not to change the outcome of a race, but to enhance the accuracy of the provisional voting process. This kind of accuracy-enhancing litigation is most beneficial the earlier it occurs in the process, and the nation can anticipate more of it in advance of the 2006 and 2008 elections if states leave unaddressed some of the ambiguities and problems that surfaced in the 2004 election.

Although the enactment of HAVA in 2002 and its erratic implementation in the states during the ensuing two years provided ample opportunity for litigation designed to clarify its requirements concerning provisional voting, or otherwise challenge state laws and administrative procedures regarding provisional voting, such litigation did not develop until the eve of the November 2004 general election. By then, it was largely too late for litigation to affect the rules and procedures in place in advance of Election Day.

A flurry of litigation occurred around the country in October 2004 concerning the so-called "wrong precinct issue" – whether provisional ballots cast by voters in a precinct other than their designated one would be counted for statewide races. These lawsuits were largely unsuccessful in their stated goal: most courts, including the U.S. Court of Appeals for the Sixth Circuit (the only federal appeals court to rule on the issue), rejected the contention that HAVA requires the counting of these wrong-precinct provisional ballots.

This litigation was significant nonetheless. First, the Sixth Circuit decision established the precedent that voters have the right to sue in federal court to remedy violations of HAVA. (It just so happened that a state's decision not to count wrong-precinct provisional ballots was not a HAVA violation). Second and significantly, the litigation clarified the right of voters to receive provisional ballots, even though they would not be counted. The decision also defined an ancillary right –the right to be directed to the correct precinct. There voters could cast a regular ballot that would be counted. If they insisted on casting a provisional in the wrong precinct, they would be on notice that it would be a symbolic gesture only. Third, and relatedly, these lawsuits prompted election officials to take better care in instructing precinct officials on how to notify voters about the need to go to the correct precinct in order to cast a countable ballot – although the litigation regrettably came too late to be truly effective in this regard. In many states, on Election Day 2004, the procedures in place for notifying voters about where to go were less than ideal, reflecting less-than-ideal procedures for training poll workers on this point.

To a lesser extent there was also pre-election litigation over the question whether voters who had requested an absentee ballot were entitled to cast a provisional ballot. In both cases (one in Colorado and one, decided on Election Day, in Ohio), the federal courts ruled that HAVA requires that these voters receive a provisional ballot. Afterwards, it is for state officials under state law to determine whether these provisional ballots will be counted, in part by determining whether these provisional voters already have voted an absentee ballot (in which case one would need to be ruled ineligible, in order to avoid double voting). But these decisions confirm the basic premise that provisional ballots are available whenever voters believe they are entitled to them, so that their preferences can be recorded, with a subsequent determination whether these preferences count as valid votes.

After Election Day, there was litigation over provisional ballots in states where the outcome of specific races might turn on whether or not some of the provisional ballots cast were ruled eligible for counting. Moreover, the "placeholder" filing of similar lawsuits in Ohio – in anticipation that provisional ballots might have made a difference in the presidential election in that state – indicates that there would have been more litigation of this type had that race (or others) been closer. Although these placeholder lawsuits fizzled away once it was clear that provisional ballots in Ohio would not affect the result of the presidential election, the litigable issues remain capable of resurrection when they might make a difference in the future. Indeed, the League of Women Voters has already filed a major new lawsuit in Ohio, seeking proactive changes in the provisional voting system in advance of the next election in that state. (This effort to resolve these legal issues well before November 2006 is a salutary one, so that the judiciary does not struggle with complicated, sensitive questions at a frenzied pace, either in the last few weeks before Election Day or the first few weeks immediately after Election Day.)

The efficacy of these post-Election Day lawsuits was mixed. In New York, supporters of a Democratic candidate for a state senate seat prevailed in that state's highest court on the proposition that provisional ballots cast at the correct polling *site* but at the wrong precinct should be counted. (Many polling sites, particularly in urban locations, serve multiple precincts.) The New York high court, however, rejected the contention that provisional ballots at the wrong polling site must be counted. The court also rejected the proposition that a provisional ballot should count if another (regular) vote already had been cast in the name of the provisional voter (even if the provisional voter purported to offer proof that the other vote had been cast by an imposter). Finally, the court accepted the contention that a provisional ballot should count if the ballot's envelope was missing information as a result of a poll worker's clerical error. The upshot of these rulings was that the Democratic candidate reduced the Republican's margin of victory (from 58 to a mere 18 votes), but did not succeed in overturning the election result.

In North Carolina, post-election litigation over provisional ballots ultimately proved inconsequential as the state's legislature took matters into its own hands. The race for the state's Superintendent of Public Instruction turned on whether approximately 11,000 "wrong precinct" provisional ballots would be counted under state law. The state's Supreme Court ruled that they should not count, but the state's legislature disagreed and enacted a new law to supersede the supreme court's ruling. The election was finally resolved on August 23, 2005 – *43 weeks* after Election Day – making it the last settled statewide election from 2004. The length of time it took to resolve this dispute shows the dangers of leaving ambiguous provisions of state law concerning the counting of provisional ballots.

Washington suffered an even more celebrated, if slightly less protracted, dispute over the counting of provisional ballots in statewide race. Here, too, the effort to overturn the result of the race through a lawsuit was unsuccessful. Republicans went to court after their gubernatorial candidate, Dino Rossi, came up 129 votes short in the third (manual) count of the ballots (having come out ahead in the two previous – machine – counts). Among other problems, Republicans were able to show that this third count included 252 provisional ballots cast by individuals who could not be verified as registered voters. But because these provisional ballots had been mingled with regular ballots during the counting process, it no longer could be determined for which candidate these provisional ballots were cast. After a lengthy trial at which the Republicans attempted to show statistically that enough of these ineligible ballots would have been cast for the Democratic candidate to change the result of the election, the trial court rejected such statistical proof as improper under state law, and Rossi decided not to appeal the decision to state's supreme court. The ruling came on June 6, 2005 – 32 weeks after Election Day.

Perhaps Washington's plight was aberrational and uncontrollable: how were election officials supposed to predict – and, more important, how were they supposed to avoid – the problem of poll workers inappropriately feeding provisional ballots through the counting machines as if they were regular ballots? (For future elections, Washington has adopted a series of measure, including color-coding provisional ballots and making sure that their different shape and size prevents them from being read by the machines used to count regular ballots, in an effort to prevent a repeat of this particular problem.) The after-the-fact litigation certainly was unable to put the spilled milk back in the bottle. While the litigation put a spotlight on the failures of the electoral process in Washington in 2004, serving as a catalyst for future reforms, it did nothing to change the outcome of the 2004 election itself, except only to delay the conclusion of the process by more than six months. (The fact that the Democratic candidate, Christine Gregoire, who was certified the winner after the manual recount, was inaugurated as Governor and exercised the powers of the office during those six months evidently affected the willingness of a trial judge to overturn the results of the election.)

One earlier aspect of the litigation over provisional ballots in Washington did prove efficacious – and importantly so. In December 2004, during the recounting process (before certification of Gregoire as winner), it was discovered that 547 provisional ballots in King County has been rejected because they could not be matched with a signature in the county's current electronic database of registered voters, but that county officials had not attempted to match the signatures against original registration forms, older electronic files, or other available records. Upon this discovery, Democrats went to court arguing that state law required that the provisional ballots be verified against these additional records. The Washington Supreme Court unanimously agreed with this argument, vindicating the principle that provisional ballots are designed to protect voters against clerical errors affecting the accuracy of the state's updated registration list.

The state supreme court, however, rejected the Democrats' additional argument that different rates at which counties invalidated provisional ballots because the signature on the ballot did not match the signature on file was sufficient to establish an Equal Protection violation under the principles of *Bush v. Gore*. The different rates could be explained by factors other than the assumption that county officials were applying different standards when conducting signature matches. Since the counties were purporting to apply the same standard, and there was no definitive proof to the contrary, the court found no Equal Protection violation.

The Democrats did win another important procedural ruling early on in the post-election litigation in Washington. They sought – and obtained – public disclosure of the names of all individuals whose provisional ballots were rejected because their signatures did not match county records. This disclosure ultimately uncovered which provisional ballots had been rejected based on insufficient examination of county records.

CONCLUSIONS:

A review of all the litigation over provisional voting in connection with the 2004 election leads to the following tentative conclusions. First and foremost, litigation is more likely to be successful – and yield a public benefit – if its goal is simply to assure the accuracy of the provisional voting process, rather than seeking to undo the result of an election. Of course, as a practical reality, most litigation that actually occurs is likely to be motivated by a desire to affect the outcome of an election, rather than the altruistic, public-spirited motive of improving the accuracy of the process. For this reason, in the future, it will be useful for states to distinguish between (a) streamlined administrative remedial processes, which will enable individual voters to seek redress in the event they believe their provisional ballot rights were mistreated, and (b) a more burdensome judicial proceeding for the purpose of contesting an election result. In the meantime, in some states that have been the focus of widespread national attention because of past problems (for example, Florida and Ohio), citizen groups like the League of Women Voters may have sufficient resources and incentives to bring system-wide litigation that seeks structural reform of the provisional voting process.

Second, and related, the earlier that litigation occurs in the electoral process, the more likely it is to secure rights protected under provisional voting laws. If nothing else, early litigation (even when ruled unmeritorious) has the effect of clarifying the rules in advance. It can put people on notice of what rights they do and do not have. The EAC might be in a position to give guidance to states on how to encourage earlier, rather than later, litigation over provisional ballots. For example, EAC could consider whether it would be a "preferred practice" for states to preclude any post-election challenges that could have been filed in a pre-election lawsuit. [Tom: I'm not sure whether to include these last two sentences, but they are responsive to your question.]

Third, the more narrow and specific the complaint (and thus the more narrow and specific the remedy sought by a lawsuit), the more receptive the court will be. It is easier for a court to order disclosure and the checking of additional records than it is for a court to sustain an amorphous Equal Protection claim about disparities in the signature verification process. Although it is too early to say that all Equal Protection challenges to the counting of provisional ballots will be unsuccessful, the speed with which the Washington Supreme Court rejected the Equal Protection claim over the signature matching process indicates that future Equal Protections claims will need to be much more specific about the disparities they allege in order to have a chance of success.

In sum, if litigation is to occur over provisional voting in 2006 or 2008, it would be better if the litigation were to occur as early as possible before Election Day, focused specifically on the ways state laws are allegedly deficient and should be remedied. Such litigation can have the virtue of clarifying the rules applicable to provisional voting and, where necessary, assuring that the rights protected by provisional voting laws are indeed enforced. Such pre-election lawsuits, of course, do not ask the court to change which candidate wins the election, and one lesson of the 2004 experience is that litigation is least valuable when it seeks that kind of outcome-altering decree.

Question 4: How effective was provisional voting in enfranchising qualified voters?

Providing an answer to this question poses a considerable challenge. To evaluate the decisions of local election officials' decisions on how to inform voters about the possibility of provisional voting and then whether to count a provisional ballot demands information about the eligibility or registration status of each provisional voter. That information is not available.

What is known, with reasonable confidence, is the number of provisional ballots cast and provisional ballots counted. Provisional ballots enfranchised 1,231,429 citizens, or 1.01% of the total turnout in 2004. Nationwide, 1,933,863 provisional ballots were cast, 1.6% of the total turnout. Of those ballots, 63.7% were subsequently verified and included in the final vote tally. These ballots were cast by voters who otherwise would have been turned away at the polls.

Not knowing the total number of registered voters who might have voted but could not makes estimating the effectiveness of provisional voting quantitatively impossible. The Cal Tech – MIT Voting Technology Project, however, estimated that 4 – 6 million votes are lost in presidential elections due to the causes shown in the table below. The estimate is a rough approximation, but may provide data that begins to assess the order of magnitude of the pool of potential voters who might have been helped by the provisional ballot process.

Votes Lost (Millions)	**Cause**
1.5 – 2	Faulty equipment and confusing ballots
1.5 – 3	Registration mix-ups
<1	Polling place operations
?	Absentee ballot administration

Registration mix-ups (e.g., name not on list) and polling place operations (e.g., directed to wrong precinct) are the causes most likely to be remedied by provisional voting. Thus a rough-and-ready estimate of the universe of voters who could be helped by provisional voting might be 2.5 – 3 million voters. A very rough estimate of the effectiveness of provisional voting in 2004, then, might be 40% to 50% (ballots counted/votes lost)*. Whatever the precise figure, concluding that

---

* Since this tentative conclusion is based on imprecise estimates, caution suggests another interpretation of the data be considered as well. The category of "registration mix-ups" was developed as a measure of the states' registration systems as included in the Census Bureau's Current Population Survey. The CPS after each asks people if they were registered and if they voted. It gives breakdowns of reasons why people did not vote.

Survey respondents tend to deflect blame when answering questions about voting. In the narrow context of provisional ballots, 'registration problems' would cover only voters who went to the polls where the determination that they were not registered was wrong or were registered, but in the wrong precinct. If they were in the wrong precinct, provisional voting can help them in only 17 states.

In 2004, only 6.8% of those not voting and registered blamed registration problems, while 6.9% reported so in 2000. Thus the arrival of provisional voting in the 18 "News" increased the number voting by only 0.1%. We prefer the conclusion in the text, but this alternate interpretation may well be correct.

there is considerable room for improvement seems reasonable.

Several states came to just that conclusion. Legislative activity suggests that the states were less than satisfied with the effectiveness of their processes. State legislation adopted since the election points to areas of concern.

- Not enough time to examine and count the provisional ballots: Florida, Indiana, Virginia, and Washington all have clarified or extended the timeline to evaluate the ballots. But taking more time can prove a problem, particularly in presidential elections with the looming deadline to certify the vote for the Electoral College.

- Lack of uniform rules for counting ballots and effective training of the election officials in interpreting and applying those rules to determine the validity of ballots. Colorado, New Mexico, North Carolina, and Washington have all passed legislation focused on improving the efficacy and consistency of the voting and counting process.

Another indication of lack of effectiveness is legal challenges to the process. Voters or other parties have sought court review of local officials' decisions.

- In Washington State a long legal battle over the gubernatorial election resulted in calls for reform in the way provisional ballots are evaluated. But much of the furor was over provisional ballots that possibly should not have been counted rather than over ballots that were rejected in error.

- In North Carolina's much-disputed election for Superintendent of Public Instruction, the most contentious debate concerning provisional ballots hinged on the issue of ballots cast outside the correct precinct rather than the qualifications of the voter to cast the ballot.

In general, the courts have been clear that a voter's ballot should not be rejected when the invalidity was caused by a ministerial error by election officials. In New York, the court place upon election officials a duty to direct voters to the correct district once they are inside the correct polling place, but the voter has the obligation to arrive at the correct polling place.

The courts have also held that states cannot categorically deny provisional ballots to voters, a holding that broadens the concept of provisional voting beyond the fail-safe concept. Unfortunately, these decisions could operate to decrease the chance that a ballot will actually be counted. Even if a precinct worker determines that a potential voter is seeking to vote in the wrong precinct, the voter cannot be denied a provisional ballot and simply directed to the correct polling place. If the voter demands a provisional ballot, it must be provided, even if it will not be counted if cast in the wrong precinct. Clearer instructions to poll worker and voters could ameliorate the unintended consequences of these court decisions.

Ultimately, second-guessing the determinations of election officials on counting ballots is likely to be fruitless outside of a court hearing on particular ballots and specific decisions. Aggregate data from the states, however, indicates that some states were more effective than others in enfranchising voters through the provisional ballot.

In states that used a provisional ballot before HAVA ("Old" states), a higher proportion of voters were enfranchised by provisional ballots than in "New" states. In the 25 states that had some experience with provisional voting before HAVA, a higher portion to the total vote was cast as provisional ballots and a greater percentage of the provisional ballots cast were counted than in the 18 new to provisional balloting.

A reasonable assumption is that potential voters in both the old states and new states encountered similar problems that made it impossible to cast a regular ballot. But they had different provisional systems to navigate, and consequently they experienced different outcomes. Those voting with provisional ballots in states with experience were enfranchised more frequently than those in the new states. This provides more evidence that there is considerable room for improvement.

If experience with provisional voting does turn out to be the key variable in performance, that is good news. As states gain experience with provisional ballots their management of the process could become more consistent and more effective over subsequent elections. Further guidance from the EAC on best practices and more consistent management could sharpen the lessons learned from that experience.

But the optimistic conclusion that experience will make all the difference may be unwarranted. Only if the performance of the "New" states was the result of administrative problems stemming from inexperience will improvement be automatic. The other possibility is that the "New" states have a political culture different from the "Old" states. That is, underlying characteristics of the "New" states political system may be the reason they had not adopted some form of provisional voting as the "Old" states did.

The "New" states may strike a different balance among the competing objectives of ballot access, ballot security and practical administration. They may ascribe more responsibility to the individual voter to take such actions as registering early, finding out where the right precinct is, re-registering after changing address. Or they may value keeping control at the local level, rather than ceding some authority to state or federal directives. If the inconsistent performance in the "New" states arises out of this kind of political culture, improving effectiveness in the use of the provisional ballot will he harder and take longer to achieve.

Question 5: Did State and local processes provide for consistent counting of provisional ballots?

HAVA was designed to provide registered voters who found themselves absent from the voters' list at polling places a way to exercise their right to vote. It requires that certain voters be given provisional ballots and that those ballots be counted if they are later determined eligible under state law. The act gave states broad latitude in how to implement provisional voting, including who beyond the required categories of voters should receive provisional ballots and how to determine if provisional ballots that are cast should be counted.

There was considerable variation in how provisional ballots were distributed and counted in the 2004 election. Little consistency existed among and within states in the way provisional ballots were used.

The use of provisional ballots was not distributed evenly across the country. Indeed, 6 states (California, New York, Ohio, Arizona, Washington, and North Carolina) accounted for more than two-thirds of all the provisional ballots cast in the 2004 election. Wide variation was found across the nation, even when overall state size and turnout was taken into account.

- In Alaska, provisional votes accounted for 7% of all votes cast on Election Day. In 22 other states provisional ballots made up less than 0.5% of votes on Election Day.
- The portion of provisional ballots cast that were actually counted also displayed wide variation, ranging from 96% in Alaska to 6% in Delaware.
- The range of ultimate inclusion of provisional ballots in final vote tallies was immense: The 7% of the total vote represented by Alaska's counted provisional ballots was more than 1,000 times greater than Vermont's 0.0058%.

The greatest source of this variation was the state's experience or lack of experience with provisional voting. In experienced states, a higher proportion of voters cast provisional ballots and a higher percentage of provisional ballots were counted than in states implementing provisional voting for the first time.

In the 25 states that had some experience with provisional voting before HAVA, a higher portion to the total vote was cast as provisional ballots and a greater percentage of the provisional ballots cast were counted than in the 18 new to provisional balloting.

- The 25 experienced states averaged about 2% (2.17%) of the total vote cast as provisional ballots. This was 4 times the rate as in states new to provisional, which averaged less than half a percent (0.47%).
- The experienced states counted an average of 58% of the provisional ballots cast, nearly double the proportion of the new states, which counted just 33%, of cast provisional ballots.

- The combined effect of these two differences was significant. In experienced states 1.53% of the total vote came from counted provisional ballots. In new states provisional ballots accounted for only 0.23% of the total vote.
- In short, the share of provisional ballots in the total vote was six times greater in experienced states than in new states.

Other influences on the variation among the states included:

- The more rigorous the verification requirements of the voter's identity and registration status, the smaller the percentage of provisional ballots that were counted.

  - In the 4 states that simply matched signatures nearly 3.5% of the total turnout consisted of provisional ballots, and just under three-fourths of those ballots (73%) were counted.
  - In the 14 States that required voters to provide such additional information as address or date of birth just over 1.5% of the total turnout consisted of provisional ballots, and 55% of those ballots were certified
  - In the 14 states that required an affidavit just over one-half of a percent (0.6%) of turnout came from provisional ballots, and less than one-third of those (30%) were counted.
  - In the 10 states that required voters to return later with identifying documents just under 1.5% of the total turnout came from provisional ballots, and more than half (52%) of these were certified. Voters apparently found this requirement less onerous than the affidavit, even though it required a separate trip to a government office.

- Voter registration databases provided information that reduced the number of provisional ballots counted. In states using provisional voting for the first time, states with registered-voter databases counted only 20% of the ballots that were cast. States without such databases counted more than double that rate (44%).

- States that allowed out-of-precinct ballots counted 56% of the provisional ballots. States that recognized only ballots cast in the proper precinct counted an average of 42% of provisional ballots cast.

  - In experienced states, this was even more pronounced. 52% of ballots cast were counted in states requiring in-district ballots, while 70% were counted in those allowing out-of-precinct ballots.
  - If all states counted out-of-precinct ballots, perhaps 280,000 more voters would have been enfranchised across the country.

A final word about the variation among the states:

High-Low rating of Percent of PV Ballots Cast as part of Turnout
* High-Low rating of Percent of PV Ballots Cast that were Counted Cross-tabulation

Count

		High-Low rating of Percent of PV Ballots Cast that were Counted		
		Less than 50% Counted	More than 50% Counted	Total
High-Low rating of Percent of PV Ballots Cast as part of Turnout	Less than 1% of Total Turnout was PV	21	5	26
	More than 1% of Total Turnout was PV	1	16	17[*]
Total		22	21	43

As the table above shows, the nation can be divided into two groups of states: those that made significant use of provisional ballots (more than 1% of total turnout was cast as provisional ballots) and those that did not. The difference in how these two groups evaluated those ballots that were cast was striking. In states where high levels of provisional ballots were cast, high levels were also counted. In states where low levels of provisional ballots were cast, low levels were typically counted.

The table shows the relationship between use of provisional ballots in the states and the determination by the state that a provisional ballot should be counted. The relationship is strong (Yule's Q = 0.97), clear, and significant. In 26 states less than 1% of voters cast a provisional ballot. In 21 of those states, less than half the ballots cast were counted. In 17 states, more than 1% of voters case a provisional ballot, and in 16 of those states more than half the ballots were counted.

No ready conclusions can be drawn about why these results occur. The data could suggest that states where high levels of ballots were cast were overwhelmed by the sheer volume of them, resulting in insufficient critique of each ballot, or conversely that they were simply more experienced in making evaluations and were better able to identify legitimate ballots. It is possible that states with few ballots cast did not invest the time and effort to properly evaluate them, because their were so few of them, or it is possible that they were better able to dedicate the time to such an investigation and properly weeded out invalid ballots. Further research is required to better ascertain the reasons for these disparities.

Variation within states

---

[*] These states are: Alaska, Arizona, California, Colorado, District of Columbia, Iowa, Kansas, New York, Washington, Utah, Ohio, North Carolina, Nebraska, Maryland, New Mexico, New Jersey, and West Virginia.

Even within states consistency was hard to find. Counties differed widely in the rate at which ballots were cast and counted, suggesting that other factors beyond statewide regulations or administrative requirements were at play. This was true in both new and old states.

Election Line, for example, found that:

- In Ohio some counties counted provisional ballots not cast in the assigned precinct even though the state's policy was to count only those ballots cast in the correct precinct.
- Some counties in Washington tracked down voters who would otherwise have had their provisional ballots rejected because they had failed to complete part of their registration form, gave them the chance to correct those omissions, and then counted the provisional ballot. This would probably not have come to light except for the sharp examination caused by the very close election for governor.

Of the 20 States for which we have gathered county-level provisional ballot data, the rate of counting these ballots frequently varied by as much as 90% to 100% among counties in the same state. This suggests that additional factors outside of the statewide factors analyzed here also impact the use of provisional ballots.

Election Official's Perceptions

In addition to the statistical differences among how states handled provisional voting, there were also differences in how election officials prepared for and evaluated the use of provisional ballots. A survey conducted by the Eagleton Institute at Rutgers University found that county election officials reported different perceptions of provisional balloting, depending upon whether they came from "Old" or "New" States. Both groups reported gaining help from state election offices on how to implement provisional balloting, but in different ways.

- Officials from "new" states reported receiving more guidance on how to evaluate ballots once cast, while officials from "old" states reported receiving more guidance on how to design ballots. Both groups regarded the guidance they received as being helpful.
- Officials from "old" states were more likely to report that they counted more ballots, were better prepared to direct voters to their correct precincts with maps, and regarded provisional voting as easy to implement and enabling more people to vote.
- Officials from "new" states were more likely to report that more information should have been provided to voters about the jurisdiction where provisional ballots must be cast in order to be counted and that more time was needed to implement provisional voting procedures.
- Officials from "old" states were more likely to report that provisional voting sped up and improved polling place operations and that it helped officials to maintain more accurate registration databases.
- Officials from "new" states were more likely to agree that provisional voting created unnecessary problems for election officials and poll workers.

This data can be interpreted either of two ways. First, experience and familiarity with provisional voting may be the key factor in the degree to which provisional voting is used and in how election officials perceived provisional balloting. Those officials who were more familiar and experienced with the system had more positive reactions to provisional voting and its worth. 81% of officials from experienced states reported that "there is a need to offer voters the opportunity to cast provisional ballots", while only 62% from new states did so.

But another way of explaining the difference is less rosy for provisional ballots. It may be that the states new to provisional balloting have a political culture somewhat different from the states that had offered a provisional ballot before HAVA. The new states may have a history of striking a different balance among the competing voting objectives of access, security, and administrative practicality. Officials in those states may believe that the fail safe offered by provisional voting broadens access at the expense of security and burdens election administrators beyond any perceived benefit. Further survey research could help resolve this question.

Conclusion

States that had previously had some form of provisional ballots and those that did not had different experiences in 2004. Those states that had used a provisional ballot before HAVA states had more ballots cast, found higher levels of those ballots to be legitimate, and had much higher levels of provisional ballots in their final vote tallies. Election officials in those states also felt that provisional ballots were easier to administer and more worthwhile than did their counterparts in states new to provisional voting. The strongest influence noted in this study was simply that of experience with the process.

If the difference is mostly one of experience, in subsequent elections, officials will be more prepared for and comfortable with the implementation of provisional ballots. This should lead to greater consistency among the states and more positive ratings of it as a system. If, on the other hand, the different experiences with provisional ballots reflects different political cultures among the states, consistency among the states may take longer to increase.

Other factors, such as verification laws and requirements for whether out-of-precinct ballots may be counted, will continue to cause variance across the country, but as voters and election officials become more familiar with the system, that variance may stabilize. In sum, provisional balloting was applied inconsistently in 2004, returning a wide range of results. Since the states have considerable latitude in how they meet HAVA's requirements for provisional voting, a considerable degree of variation among the states is to be expected in the future. If that variation stems from differences in political culture among the states, it is likely to persist.

Question 6: Did local election officials have a clear understanding of how to implement provisional voting?

This question demands two different kinds of answers. First, how do the local officials themselves characterize their understanding of their responsibilities to manage the provisional voting process? Second, objectively how well did the process appear to be managed?

While essentially all (98%) county-level local elections officials considered the instructions they received from their state governments to be "useful" or "very useful," the crucial question is how well did the process work on election day? The lack of consistency among and within states in the use of provisional ballots and evaluating those ballots indicates considerable variation in the understanding of the process by election officials.

Four out of ten local election officials felt poll workers needed more training to understand their responsibilities. One sign of dissatisfaction with the functioning of the provisional voting process is the number of states that have amended their statutes on provisional voting to include specific language about poll worker training. Among these states are Colorado, Indiana, New Mexico and Washington.

Statutes, of course, reflect only part of the story. For example, Alabama – a state new to provisional voting – undertook a concerted training effort on how to handle and count provisional ballots. It also created a notification system whereby voters could verify if their vote counted within 10 days of casting their ballots. These steps were not dictated by statute, but reflected the initiative of f local elections officials. Their leadership indicates a good understanding of their responsibilities under HAVA and the state statute.

More than 8 out of 10 county-level elections officials reported receiving instructions from their state government regarding the implementation of provisional voting. Topics covered in those instructions from the states included:

- How to administer the provisional voting system
- Who is eligible to vote using a provisional ballot
- How individuals vote using a provisional ballot
- The jurisdiction where individuals can vote by provisional ballot
- Whether the provisional ballot could be used as an application to update the voter's registration
- How to train poll workers to process provisional ballots
- How to provide voters with the opportunity to verify if their provisional ballot was counted
- Guidelines for determining which provisional ballots are to be counted
- Strategies to reduce the need for voters to use provisional ballots
- How to design the structure of the provisional ballot

Those local election officials believe the most effective efforts to improve the provisional voting process would be to reduce the use of provisional ballots as a failsafe by improving technology – such as registration databases – available to voters and poll workers. Reflecting their understanding of the provisional voting process, local elections officials call for:

- State-sponsored websites where voters can verify their registration status before Election Day.
- Access by poll-workers to statewide voter registration databases at polling place.

While local election officials report that the instructions they received were "useful," the quality of the information they receive is not the only influence on their performance. They recognize that timing is critically important. They understand that they must receive clear instructions from their state election agencies early enough to absorb, understand, and pass it along as operational instructions to poll workers and voters.

Karen,

Attached is a report on the status of recruitment of members of the Peer Review Group. We extended 9 invitations. We have four confirmed members, one reluctant turn-down, one who has yet to respond to an initial inquiry, and are awaiting confirmation from 3 others who initially agreed. Please let me know if you need additional information.

Subject Fw: Survey Cover Letter and Questionnaire

This is an important e-mail (for audit purposes) related to the large survey of election officials which Eagleton did.

By law, the EAC could not do this survey without going through a lengthy OMB approval process. Eagleton was free to do this survey as long as it was for their clarification purposes and they did not seek our advice on the survey.

Subject: Re: Survey Cover Letter and Questionnaire

Tom-

A review of the EAC's Statement of Work for Research Assistance to develop Voluntary Guidance on

Provisional Voting and Voting Identification procedures, does not require that a survey of the elections community, regarding their experiences with provisional voting or voter identification be conducted. Therefore, the EAC is not required to review or approve such a survey.

Should Eagleton elect to conduct such a survey to further educate and inform their work on these topics, they may conduct such a survey on their behalf only.

Regards-

Subject Survey Cover Letter and Questionnaire

Karen,

Attached are the two documents we just discussed. The cover letter will go to 2800+ election officials around the country. It alerts the recipients that they may be called to participate in a survey as a part of our research for the EAC. The survey will, in fact, interview only 400 of the local election officials, but notifying them all is necessary because the selection of those called will be random, and, if the surveyors cannot reach the first county drawn for the sample, they will move on to the next. The need to have your review of the letter is the most urgent. Unless it goes to SBRI, the survey firm that will make the actual calls, today, we will fall behind an already tight schedule.

The questionnaire would also benefit from your review. As you know, question wording is an art. A good question elicits the information sought without biasing the response. Your review, however, can help ensure that the survey elicits information that EAC will find useful. We will rely on the results to draw conclusions about provisional voting as experienced by county-level election officials. It inquires about the quality and timeliness of information and training they may have received from state-level officials and about the information and training that they, in turn, passed on to poll workers. I don't believe this information is available anywhere else. We are over-sampling officials in states that did not offer provisional ballots before 2004 so that we can draw some inferences about the difference between their experience and the experience of officials for whom provisional voting was more familiar. These inferences may provide helpful in shaping the guidance the EAC offers the states for the 2006 election.

Your comments on the questionnaire are also needed urgently, but I believe we can hold SBRI at bay on this document until tomorrow.

As I mentioned, my computer died on Monday, so I have only sporadic access to email. I will have access until about 2 today and then won't be back on-line until early evening. You can always reach me by phone at 908-794-1030. If you would like to send a fax, that number is 609-737-8674.

Thanks,

Tom RevisedFinal cover letter 070607.doc

EAGLETON INSTITUTE OF POLITICS
—— CENTER FOR PUBLIC INTEREST POLLING ——

PROVISIONAL VOTING SURVEY

Sample: Local Elections Officials
National sample: 400 telephone interviews

Draft Version: June 28, 2005

Initial Screener

Hello, my name is ________________ and I'm calling on behalf of the Eagleton Institute of Politics at Rutgers University. Rutgers University is conducting a survey for the U.S. Election Assistance Commission (EAC), a federal government commission, to study provisional voting based on experiences from the 2004 election. May I please speak to the individual who was responsible for supervising the election at the county, borough, municipality, or parish level?

[IF UNSURE WHO THIS INDIVIDUAL IS:]

In particular, may I please speak to the individual who was responsible for overseeing voting procedures for the 2004 election at the county, borough, municipality, or parish level such as the Registrar of Elections, County Clerk, Commissioner of Elections, Administrator of Elections, or Clerk of Court?

Consent

Hello, my name is ________________ and I'm calling on behalf of the Eagleton Institute of Politics at Rutgers University. Rutgers University is conducting a survey for the U.S. Election Assistance Commission (EAC), a federal government commission, to study provisional voting based on experiences from the 2004 election. We recently sent you a letter requesting your participation in the confidential survey we are conducting with county elections officials as part of a national contract with the Elections Assistance Commission (EAC). We would very much like to include your opinions and would really appreciate it if you could assist us by providing as much information as you can to the best of your knowledge. The information you will be sharing today will be used to provide provisional voting policy recommendations. This information will be maintained at a secure site and your name will not be identified in the report. So, please do not hesitate to share all the information you have.

You were randomly selected for the survey from a nationally representative list of election officials. We are not selling anything, and not asking for money. All your answers are completely confidential.

The survey should take no more than 10 or 15 minutes to complete.

IF NECESSARY: If you should have any questions about the study, you may contact the Research Project Coordinator, April Rapp, at the Eagleton Center for Public Interest Polling at 732-932-9384 ext. 261.

IF RESPONDENT DECLINES TO PARTICIPATE, ADDITIONAL PRODDING NEEDED:
–Your participation is very important because only 400 election officials have been randomly selected for this survey and your views will be used to provide provisional voting policy recommendations. We would be happy to fax you a letter outlining the study objectives. [If yes, can I please have your fax number?] (RECORD FAX NUMBER)

Screener

1. On Election Day, November 2nd, 2004 was it your responsibility to supervise the election at the county, borough, municipality, or parish level?

1.	Yes	(GOTO Q2)
2.	No	(GOTO Q1a)
97.	[Don't Know]	(TERMINATE)
99.	[Refused]	(TERMINATE)

1a. May I please have the name and phone number of the individual who was responsible for supervising the 2004 election at the county, borough, municipality, or parish level?

[RECORD NAME/PHONE NUMBER OF REFERRAL] (THANK AND TERMINATE)

Jurisdiction

2. Which of the following best characterizes your job title on Election Day, November 2nd, 2004?

(READ AND ROTATE)

1. Registrar of Elections
2. County Clerk
3. Commissioner of Elections
4. Administrator of Elections
5. Clerk of Court
6. [Other] (specify) (VOL)
97. [Don't Know] (VOL)
99. [Refused] (VOL)

3. Is your jurisdiction characterized as a county, borough, municipality, parish, or something else?

(READ AND ROTATE)

1. County
2. Borough
3. Municipality
4. Parish
5. Something else (specify)
97. [Don't Know] (VOL)
99. [Refused] (VOL)

General: Provisional Voting

Now, I would like to ask you some questions about provisional voting.

4. When was provisional voting implemented in your state? (READ LIST)

1. In 2004 before Election Day
2. Sometime during 2003
3. Sometime during 2002
4. At some point before 2002
97. [Don't Know] (VOL)
99. [Refused] (VOL)

5. What's your best estimate of the total number of provisional ballots cast in the 2004 election in your jurisdiction, whether they were ultimately counted or not? Your best estimate is fine.

   1. Less than 100
   2. Between 100 to just under 500
   3. Between 500 to just under 1000
   4. 1000 or more
   97. [Don't Know] (VOL)
   99. [Refused] (VOL)

(ASK ONLY IF Q5=1-4)

6. In your opinion, how many of these provisional ballots were counted – a lot, some, very few, or none at all?

   1. A lot
   2. Some
   3. Very few
   4. None at all
   97. [Don't Know] (VOL)
   99. [Refused] (VOL)

7. In your opinion, which of the following, if any, created the <u>most</u> need for the use of provisional ballots in your jurisdiction on Election Day, 2004?

   (READ AND ROTATE)

   1. Individual's name not listed on the voter registration rolls
   2. <u>First time</u> voters couldn't provide the proper identification
   3. Voters eligibility challenged
   4. Registered voters could not provide the proper identification
   5. Other (specify) (VOL)
   97. [Don't Know] (VOL)
   99. [Refused] (VOL)

8. In your opinion, which of the following, if any, prevented provisional ballots from being validated and ultimately counted in the 2004 Election?

(READ AND ROTATE)

1. Individual failed to provide the identification required to validate the provisional ballot
2. Signature on the provisional ballot did not match the signature on the registration form
3. Provisional ballot cast in the incorrect voting precinct
4. Individual was not registered
5. Other (specify) (VOL)
97. [Don't Know] (VOL)
99. [Refused] (VOL)

Pre-Election Experience: Instructions and Information Received (Content and Quality)

9. Were provisional voting instructions provided by the state government in the 2004 Election – as a matter of law, administrative procedure, or did the state not provide instructions for provisional voting?

1. State law
2. Administrative procedure
3. State did not provide instructions for provisional voting (GOTO Q.23)
4. Other: (specify) (VOL) (GOTO Q.23)
5. None of the above (VOL) (GOTO Q.23)
97. [Don't Know] (VOL) (GOTO Q.23)
99. [Refused] (VOL) (GOTO Q.23)

(ASK ONLY IF Q9=1-2)

STATE GOVERNMENT INSTRUCTIONS AND INFORMATION

10. Which of the following provisional voting instructions, if any, did you receive from the state government?

(ACCEPT MULTIPLE RESPONSES; ROTATE LIST; PAUSE AFTER EACH RESPONSE)

1. How to administer provisional voting
2. Who is eligible to vote using a provisional ballot
3. How individuals vote using a provisional ballot
4. The location where individuals can vote by provisional ballot
5. If the provisional ballot is used as an application to change the voter's registration
6. How to verify the voter's eligibility to cast a provisional ballot
7. Poll worker training
8. How to provide voters with the opportunity to verify if their provisional ballot was counted
9. What voter identification is required to cast a provisional ballot
10. Guidelines for which provisional ballots are to be counted
11. Strategies to reduce the need for voters to use provisional ballots
12. Other (specify) (VOL)
13. All of the above (VOL)
14. None of the above (VOL)
97. [Don't Know] (VOL)
99. [Refused] (VOL)

(ASK ONLY IF Q10=1)

11. You said that you received provisional voting instructions from the state government. Please tell me how useful the instructions on how to administer provisional voting -- very useful, somewhat useful, not very useful, or not useful at all?

1. Very useful
2. Somewhat useful
3. Not very useful
4. Not useful at all
97. [Don't know] (VOL)
99. [Refused] (VOL)

(ASK ONLY IF Q10=2)

12. You said that you received provisional voting instructions from the state government. Please tell me how useful the instructions were for determining who is eligible to vote using a provisional ballot -- very useful, somewhat useful, not very useful, or not useful at all?

1. Very useful
2. Somewhat useful
3. Not very useful
4. Not useful at all
97. [Don't know] (VOL)
99. [Refused] (VOL)

(ASK ONLY IF Q10=3)

13. You said that you received provisional voting instructions from the state government. Please tell me how useful the instructions on how individuals vote using a provisional ballot -- very useful, somewhat useful, not very useful, or not useful at all?

1. Very useful
2. Somewhat useful
3. Not very useful
4. Not useful at all
97. [Don't know] (VOL)
99. [Refused] (VOL)

(ASK ONLY IF Q10=4)

14. You said that you received provisional voting instructions from the state government. Please tell me how useful the instructions were on the location where individuals can vote by provisional ballot -- very useful, somewhat useful, not very useful, or not useful at all?

1. Very useful
2. Somewhat useful
3. Not very useful
4. Not useful at all
97. [Don't know] (VOL)
99. [Refused] (VOL)

(ASK ONLY IF Q10=5)

15. You said that you received provisional voting instructions from the state government. Please tell me how useful the instructions were for <u>if the provisional ballot is used as an application to change the voter's registration</u> -- very useful, somewhat useful, not very useful, or not useful at all?

    1. Very useful
    2. Somewhat useful
    3. Not very useful
    4. Not useful at all
    97. [Don't know] (VOL)
    99. [Refused] (VOL)

(ASK ONLY IF Q10=6)

16. You said that you received provisional voting instructions from the state government. Please tell me how useful the instructions were on <u>how to verify the voter's eligibility to cast a provisional ballot</u> -- very useful, somewhat useful, not very useful, or not useful at all?

    1. Very useful
    2. Somewhat useful
    3. Not very useful
    4. Not useful at all
    97. [Don't know] (VOL)
    99. [Refused] (VOL)

(ASK ONLY IF Q10=7)

17. You said that you received provisional voting instructions from the state government. Please tell me how useful the instructions were on <u>poll worker training</u> -- very useful, somewhat useful, not very useful, or not useful at all?

    1. Very useful
    2. Somewhat useful
    3. Not very useful
    4. Not useful at all
    97. [Don't know] (VOL)
    99. [Refused] (VOL)

(ASK ONLY IF Q10=8)

18. You said that you received provisional voting instructions from the state government. Please tell me how useful the instructions were on how to provide voters with the opportunity to verify if their provisional ballot was counted -- very useful, somewhat useful, not very useful, or not useful at all?

    1. Very useful
    2. Somewhat useful
    3. Not very useful
    4. Not useful at all
    97. [Don't know] (VOL)
    99. [Refused] (VOL)

(ASK ONLY IF Q10=9)

19. You said that you received provisional voting instructions from the state government. Please tell me how useful the instructions were for what voter identification is required to cast a provisional ballot -- very useful, somewhat useful, not very useful, or not useful at all?

    1. Very useful
    2. Somewhat useful
    3. Not very useful
    4. Not useful at all
    97. [Don't know] (VOL)
    99. [Refused] (VOL)

(ASK ONLY IF Q10=10)

20. You said that you received provisional voting instructions from the state government. Please tell me how useful the instructions were for establishing guidelines by which provisional ballots are to be counted -- very useful, somewhat useful, not very useful, or not useful at all?

    1. Very useful
    2. Somewhat useful
    3. Not very useful
    4. Not useful at all
    97. [Don't know] (VOL)
    99. [Refused] (VOL)

(ASK ONLY IF Q10=11)

21. You said that you received provisional voting instructions from the state government. Please tell me how useful the instructions were for establishing strategies to reduce the need for voters to use provisional ballots -- very useful, somewhat useful, not very useful, or not useful at all?

1. Very useful
2. Somewhat useful
3. Not very useful
4. Not useful at all
97. [Don't know] (VOL)
99. [Refused] (VOL)

(ASK ONLY IF Q22=1-11)

22. Thinking generally, how useful were the provisional voting instructions you received from the state government -- very useful, somewhat useful, not very useful, or not useful at all?

1. Very useful
2. Somewhat useful
3. Not very useful
4. Not useful at all
97. [Don't know] (VOL)
99. [Refused] (VOL)

Implementation of Instructions and Distribution of Information to Election Employees

Now I'm going to ask you some questions about poll worker training.

23. Please tell me how the provisional voting instructions and information you received were provided to poll workers. If you don't know how the information was provided to poll workers, just tell me and we'll move on.

(ACCEPT MULTIPLE RESPONSES; READ EACH ITEM AND ROTATE LIST)

1. Sent a letter
2. Sent an email
3. Held a meeting
4. Conducted an internal informational session or workshop
5. Hired a third-party or independent firm to conduct a training course
6. Other (specify) (VOL)
7. None of the above (VOL)
97. [Don't know] (VOL)

99. [Refused] (VOL)

24. Please tell me which of the following, if any, was provided in your jurisdiction for the 2004 Election to help poll workers determine voters' assigned precinct and polling place?

(ACCEPT MULTIPLE RESPONSES; READ EACH ITEM AND ROTATE LIST)

1. Access to a list of eligible voters in the jurisdiction
2. Telephone line for poll workers to speak immediately to an election official with access to the list of eligible voters in the jurisdiction
3. Maps of adjacent precincts for poll workers to help voters locate their residence and corresponding polling place
4. Additional staff such as "greeters" at polling places to direct voters to the correct polling location
5. Other (specify) (VOL)
6. None of the above (VOL)
97. [Don't know] (VOL)
99. [Refused] (VOL)

When implementing provisional voting in your jurisdiction, please tell me how successfully you think the following activities were performed:

(READ AND ROTATE Q.25 – Q.32)

[PROBE: Would you say that is very successfully, somewhat successfully, not very successfully, or not successfully at all?]

1. Very successfully
2. Somewhat successfully
3. Not very successfully
4. Not successfully at all
97. [Don't Know] (VOL)
99. [Refused] (VOL)

25. Provide <u>training</u> to poll workers on how to <u>administer</u> provisional ballots.

26. Provide <u>written</u> procedures to poll workers on how to <u>administer</u> provisional ballots.

27. Provide poll workers with <u>written</u> procedures on the <u>casting</u> of provisional ballots.

28. Provide poll workers with <u>written</u> procedures on the <u>counting</u> of provisional ballots.

29. Provide poll worker <u>training</u> for the <u>casting</u> of provisional ballots.

30. Provide poll worker <u>training</u> for the <u>counting</u> of provisional ballots.

31. Make information available to help poll workers determine voters' assigned precinct or polling place.

32. Provide training to help poll workers determine voters' assigned precinct or polling place.

Post-Election Experience: Counting Ballots

33. After the 2004 Election, which of the following, if any, did your jurisdiction offer voters to determine if their provisional ballot was counted?

(ACCEPT MULTIPLE RESPONSES; READ AND ROTATE LIST)

1. Notification by mail
2. Dedicated Telephone Hotline
3. Email notification
4. Website confirmation
5. Telephone local or county election office
6. All of the above (VOL)
7. None of the above (VOL)
8. Other (specify) (VOL)
97. [Don't Know] (VOL)
99. [Refused] (VOL)

34. How confident are you that provisional ballots were properly distributed to voters?

1. Very confident
2. Somewhat confident
3. Not very confident
4. Not at all confident
97. [Don't Know]
99. [Refused]

35. How confident are you that provisional ballots were accurately validated?

1. Very confident
2. Somewhat confident
3. Not very confident
4. Not at all confident
97. [Don't Know] (VOL)
99. [Refused] (VOL)

36. How confident are you that validated provisional ballots were counted?

1. Very confident
2. Somewhat confident
3. Not very confident
4. Not at all confident
97. [Don't Know] (VOL)
99. [Refused] (VOL)

General Perceptions

37. Now I am going to read you a list of items, please tell me which one you believe presented the biggest challenge in implementing provisional voting for the 2004 Election. (POSSIBLY BIGGEST PROBLEM)

(RANDOMLY ROTATE 1-5).

1. Training of poll workers
2. Length of time provided to implement provisional voting
3. Clarity of instruction received from your State Government
4. Adequacy of instruction received from your State Government
5. Available staff at the polling place
6. Other (specify): (VOL)
7. All of the above (VOL)
8. None of the above (VOL)
97. [Don't Know] (VOL)
99. [Refused] (VOL)

Please tell me how much you agree or disagree with the following statements about provisional voting in your jurisdiction for the 2004 Election.

(READ AND ROTATE Q.38 –Q.49)

[IF AGREE OR DISAGREE, ASK:] Would you say you agree/disagree strongly or agree/disagree somewhat?

1. Agree strongly
2. Agree somewhat
3. Neither agree nor disagree
4. Disagree somewhat
5. Disagree strongly
97. [Don't Know] (VOL)
99. [Refused] (VOL)

38. More training was needed on how to administer provisional ballots.

39. More funding was needed to educate voters of their rights to cast a provisional ballot.

40. More information should have been provided to voters about where provisional ballots must be cast in order to be counted.

41. More information was needed for poll workers to determine the voter's assigned precinct and polling place.

42. More time was needed to implement provisional voting procedures.

43. The lack of training created problems implementing the provisional voting requirements.

44. The provisional voting system was easy to implement.

45. The provisional voting system in my polling jurisdiction was a success.

46. I feel that voters in my jurisdiction were provided adequate information to successfully cast a provisional ballot.

47. Adequate support was provided to me to assist in the implementation of provisional voting.

48. I feel that voters in my jurisdiction were provided adequate information to validate if their provisional ballots were counted.

49. The lack of information created problems implementing the provisional voting requirements.

Recommendations for the Future

50. Now I am going to read you a list of items, please tell me which one you believe is the most important change needed in the implementation of provisional voting.

(RANDOMLY ROTATE 1-6)

1. More funding for poll worker training
2. More time for poll worker training
3. Better instruction from the Federal Government
4. Better instruction from the State Government
5. More instruction from the Federal Government
6. More instruction from the State Government
7. Other: specify (VOL)
8. All of the above (VOL)
9. None of the above (VOL)
97. [Don't Know] (VOL)
99. [Refused] (VOL)

Please tell me how much you agree or disagree with the following statements about provisional voting.

(READ AND ROTATE Q.51–Q.61)

[IF AGREE OR DISAGREE, ASK:] Would you say you agree/disagree strongly or agree/disagree somewhat?

1. Agree strongly
2. Agree somewhat
3. Neither agree nor disagree
4. Disagree somewhat
5. Disagree strongly
97. [Don't Know] (VOL)
99. [Refused] (VOL)

51. Statewide voter registration database would decrease the need for voters to cast provisional ballots.

52. State sponsored website designed for individuals to check registration status online would decrease the need for voters to cast provisional ballots.

53. Provisional voting protects the rights of voters by ensuring that people who are eligible to vote are allowed to do so and have their ballots counted.

54. Provisional voting speeds up and improves polling place operation on Election Day by resolving disputes between voters and poll workers.

55. Provisional voting helps election officials maintain more accurate registration databases.

56. Provisional voting causes delays in the final vote tally while voter eligibility is being verified.

57. Provisional voting may prevent voters from keeping their registration current.

58. Provisional voting compromises voter anonymity.

59. Provisional voting creates the opportunity for voter fraud.

60. Provisional voting creates unnecessary problems for election officials and poll workers.

61. Provisional voting can be avoided by the adoption of different registration procedures.

62. Which of the following do you think would be the most effective in increasing the number of provisional ballots validated and ultimately counted in an election?

(READ AND ROTATE)

1. In-precinct provisional voting only
2. Provisional voting from a central location rather than polling places
3. In-jurisdiction provisional voting only
4. Provide voters whose ballot was rejected because they failed to complete part of their voter registration form with a "second chance"
5. Provide poll workers access to a list of eligible voters in the jurisdiction
6. Provide a dedicated telephone line for poll workers to speak immediately to an election official with access to the list of eligible voters in the jurisdiction
7. Provide "greeters" at polling places to direct voters to the correct polling location
8. Other (specify) (VOL)
9. All of the above (VOL)
10. None of the above (VOL)
97. [Don't Know] (VOL)
99. [Refused] (VOL)

63. Which of the following do you think would be the most effective in reducing the number of provisional ballots cast in an election?

(READ AND ROTATE)

1. Statewide voter registration database available at polling places
2. Use the provisional ballot application as a request to change the voter's registration
3. Provide additional staff such as "greeters" at polling places to direct voters to the correct polling location
4. State sponsored website dedicated to enabling individuals to check registration status online
5. Provide poll workers access to a list of eligible voters in the jurisdiction
6. Provide a dedicated telephone line for poll workers to speak immediately to an election official with access to the list of eligible voters in the jurisdiction
7. Other (specify) (VOL)
8. All of the above (VOL)
9. None of the above (VOL)
97. [Don't Know] (VOL)
99. [Refused] (VOL)

Demographics (ASK ALL)

I only have a few more questions for statistical purposes....

D1. As election official were you hired, appointed, or elected to the position?

1. Hired
2. Appointed
3. Elected
4. Other/Specify (VOL)
97. [Don't know] (VOL)
99. [Refused] (VOL)

D2. For how many years have you served as the election official? [CODE IN WHOLE NUMBERS – IF LESS THAN 1 YEAR RECORD AS "LESS THAN ONE YEAR"]

D3. For statistical purposes only, could you please tell me your ethnic or racial background?

1. White/Caucasian
2. Hispanic/Latino
3. African-American/Black
4. Asian American/Asian
5. Native American
6. Other/Specify (VOL)
97. [Don't know] (VOL)
99. [Refused] (VOL)

D4. Interviewer please record gender.

1. Female
2. Male

That completes our survey. Thank you very much for your time and cooperation.

DATE

NAME
TITLE
ADDRESS
CITY STATE ZIP

Dear NAME,

The U.S. Election Assistance Commission (EAC) has awarded Rutgers, The State University of New Jersey, a contract to study county elections officials' experiences with provisional voting in the 2004 national election. This research will address key issues related to provisional voting in the context of effective election administration, voter access, and ballot security. The study's findings will be used to provide recommendations for the EAC to consider in the development of its guidance to the states in 2006.

The EAC was established by the Help America Vote Act (HAVA) of 2002. It is an independent, bipartisan agency that provides federal funds to states to upgrade voting systems and improve election administration. The EAC publishes voluntary guidelines for the states and serves as a national clearinghouse of information regarding election administration.

Participants in this study will be randomly selected and asked to share their experiences administering the provisional voting process in the 2004 election. The study will be conducted July 18th through August 5th. During that period a survey researcher <u>may</u> call you if you are, in fact, chosen at random from a national list of election officials. The researcher will ask you questions about your experience with provisional voting, your evaluation of the process, and your recommendations to improve it. The survey will take approximately 10-15 minutes. All of your answers will be completely confidential, and no statement or comment you make will be ascribed to you in our report of findings.

At the contract's conclusion, we will present a report to the EAC including analysis of provisional voting procedures as well as recommendations for future practices and procedures. The guidance document based on our research will be published by the EAC in the Federal Register for public review and comment, and the EAC will hold a hearing on the guidance document this fall before adopting it.

Your participation in the study will be important in assuring that it reflects the views of election officials who have direct experience with provisional voting. Thank you for your time.

Sincerely,

[scanned signature]

Subject July 12 and Peer Review Group

Karen:

The Eagleton project team usually meets on Tuesdays from 9:30 -- 11. At tomorrow's meeting I'll confirm with the group that we will meet on July 12, if that will fit your schedule. If that is a bad time for you, we have moved our meeting time before and can do so again if we can align participants' calendars. This week for the first time, Laura Williams --representing Moritz-- will join the session by telephone. For the meeting on the 12th I'll try to arrange for Ned Foley and Dan Tokaji to participate as well.

On the Peer Review Group
Your request to include the election officials on the group caused us to think anew about its purpose and composition. We agreed that election officials would add a useful dose of real world experience to the research. One of them could be Peter Veniero, who as AG (where he served before appointment to our Supreme Court) was New Jersey's chief election official. We would like Tom Wilkey to suggest a couple of former, senior election officials who could contribute to the PRG's work. While the PRG needs the experience of election administrators, we believe that perspective can be conveyed best by a senior, former official who is not appointed to represent a group of such officials --only to represent him or herself. We believe the group's advice would be most useful if came from people with the perspective provided by now being some distance from the daily fray.

This analysis emerged from a Friday conference call in which Ingrid Reed, Ned Foley, Laura Williams and I rethought the composition of the PRG. We concluded that the group should not, after all, include members from organizations that have taken advocacy positions on the issues we are researching. We agreed that the PRG should focus on methodologies and research findings rather than debate policy outcomes. PRG members should be free to represent themselves, rather than argue from an existing institutional position on policy. The PRG is not an advisory committee or a group of stakeholders to vet and take some ownership of policy recommendations. We'll consult the stakeholders separately, beginning with the list of groups in the proposal.

To replace those from advocacy organizations, we believe it would be preferable to add more members(from academia and the law, such as Pam Karlan, Guy-Uriel Charles, or Dan Lowenstein, whose CVs are summarized on the attachment. Finally, I will draft a mission statement for the PRG. Attached is a revised list of proposed PRG members, showing 2 slots to be filled by senior, former election officials.

Hope you have received the Gantt chart by now and that it fits your needs.

Ingrid Reed and I will attend the meeting in New York on Thursday and look forward to seeing you there.

Tom

Tom-

I'd like to schedule a conference call among EAC and Eagleton staff for sometime the early part of the week of July 11. Please let me know dates and times on your end and I'll coordinate with staff here.

During the call we can review your monthly report and cover any problems, challenges, needs, etc. that the Eagleton team may have.

Thanks

Subject: Re: Peer Review Group

Tom-

I will be back to you early next week with EAC's feedback on this.

Our initial reaction is that the group needs to include some local and/or state-level election officials, who have first-hand experience with these issues.

We will get you additional names and reactions by mid-week next week.

Thanks
K

Subject Peer Review Group

Karen,

As you probably recall, one of the features of our proposal was the creation of a Peer Review Group to look over our findings, conclusions and draft reports before we prepare final drafts for the EAC's review. The EAC asked that before recruiting members of the PRG twe submit names for EAC's review. The aim, course, is to assemble a panel that is experienced, informed, and balanced.

Attached is a list of potential PRG members drawn from academia, the law, and non-profit organizations with interests in this area. Please look it over.

We may conclude that the PRG should also include two or three former government officials now in academia or related fields. We have a conference call with our partners at Moritz planned for tomorrow or Friday to decide a) if former officials should be included in the PRG and b)if so, who they should be. I'll keep you informed of our thinking as it develops.

PROPOSED MEMBERS OF PEER REVIEW GROUP.doc

PROPOSED MEMBERS OF PEER REVIEW GROUP

R. Michael Alvarez, Ph.D.
Professor of Political Science
California Institute of Technology
rma@hss.caltech.edu
626-395-4422
Alvarez has taught political science at Caltech since 1992. He received his B.A. in political science from Carleton College; his M.A. and Ph.D. from Duke University. Alvarez focuses on the study of electoral politics. He has published many articles on electoral behavior and public opinion. Support for his research has come from the National Science Foundation, The IBM Corporation, the Carnegie Corporation, of New York, and the Knight Foundation. Alvarez edits the Analytical Methods for Social Research book series and is on the editorial boards of a number of academic journals. He is Co-Director of the Caltech-MIT Voting Technology Project

Deborah Goldberg, Ph.D
Program Director, Democracy Program
Brennan Center for Justice at NYU School of Law
161 Avenue Of The Americas, 12th Floor
New York, NY 10013
212-998-6730
Goldberg supervises the Democracy Program's litigation, scholarship, and public education. She was the principal author of *Writing Reform: A Guide to Drafting State & Local Campaign Finance Laws*, and was lead counsel to the intervenor in the Supreme Court case *Nixon v. Shrink Missouri Government PAC*. She serves on the Steering Committee of a coalition to restore voting rights to persons with past felony convictions. Goldberg is a graduate of Harvard Law School. Before joining the Brennan Center, she was in private practice. She holds a Ph.D. in philosophy and taught ethics at Columbia University.

Martha E. Kropf, Ph.D.
Assistant Professor of Political Science
University of Missouri-Kansas City
816-235-5948; KropfM@umkc.edu
Kropf has been on the faculty at Missouri since 1999. She received her BA Summa Cum Laude, Phi Beta Kappa from Kansas State University and her PhD in Political Science from American University. Her work concentrates on Research Methods, Urban Politics, American Government, and Political Behavior. Before joining the faculty at Missouri, she was Project Coordinator at the University of Maryland Survey Research Center. She has published recent on undervoting in presidential elections, and on invalidated ballots in the 1996 presidential election, and on the incremental process of election reform in Missouri.

Wade Henderson, Esq.
Executive Director
Leadership Conference on Civil Rights
1629 K Street, NW, 10th Floor
Washington, DC 20006
Wade Henderson is the Executive Director of the LCCR and Counsel to the Leadership Conference on Civil Rights Education Fund (LCCREF), and leads the organizations' work on issues involving nationwide election reform. He is a graduate of Howard University and the Rutgers University School of Law. During its over 50 years of existence, LCCR has worked to redefine civil rights issues in broad and inclusive ways. Today, it includes over 180 national organizations. Previously Henderson served as Washington Bureau Director of the NAACP. He began his career as a legislative counsel of the ACLU.

DRAFT FOR APPROVAL

EDITOR'S NOTE: ATTENTION POLITICAL, ASSIGNMENT EDITORS

EAGLETON INSTITUTE OF POLITICS WINS $560,000 CONTRACT FROM U.S. ELECTION ASSISTANCE COMMISSION

Rutgers Institute to Study Provisional Voting, Voter Identification Procedures

NEW BRUNSWICK/PISCATAWAY, N.J. – The U.S. Election Assistance Commission (EAC) has awarded the Eagleton Institute of Politics at Rutgers, The State University of New Jersey, a $560,000 contract to study provisional voting and voter identification procedures based on experiences from the 2004 election.

Under the national contract, the institute will develop recommendations for EAC to consider in the development of its guidance to the states for the 2006 elections, according to Eagleton Director Ruth B. Mandel, the study's principal investigator. She added that the Moritz College of Law at Ohio State University, Eagleton's partner in the contract application, will be responsible for the legal analysis of the competitively bid, seven-month project.

Eagleton already is home to an extensive civic education and political participation program, with several projects aimed at increasing voter turnout, political participation and Americans' involvement in civic life.

EAC was established by the Help America Vote Act (HAVA) of 2002. It is an independent, bipartisan agency and provides federal funds to states to upgrade voting systems and improve election administration. It publishes voluntary guidelines for the states and serves as a national clearinghouse of information regarding election administration.

The Eagleton project team, led by Mandel, includes Ingrid W. Reed, John Weingart and consultant Thomas O'Neill, retired president of the Partnership for New Jersey, who will serve as project director. The project will address key questions related to provisional voting and voter identification in the context of effective election administration, voter access and ballot security.

Eagleton will examine the nation's experience with provisional voting and voter identification requirements and practices in 2004 through extensive research including a survey of local election officials across the country. In addition, the work will be informed by scrutiny from a panel of peer reviewers as well as by comments offered at public hearings to be held in conjunction with the project.

At the contract's conclusion, the team will present a narrative on both topics, indexed databases of major articles on provisional voting and voter identification requirements, summaries of case law on each subject, analyses of provisional voting procedures from around the country and of voter participation and vote fraud under various voter ID requirements, and a report of potential alternatives to existing practices and procedures.

Subject Eagleton draft press release

Commissioners,
Below is a draft of a press release Eagleton wants to distribute regarding the EAC contract. (It's also attached.) Please let me know if you have edits/changes. Also, take a close look at the language regarding the scope for the voter ID study to make sure it is acceptable.

DRAFT FOR APPROVAL

EAGLETON INSTITUTE OF POLITICS WINS $560,000 CONTRACT FROM U.S. ELECTION ASSISTANCE COMMISSION

Rutgers Institute to Study Provisional Voting, Voter Identification Procedures

NEW BRUNSWICK/PISCATAWAY, N.J. – The U.S. Election Assistance Commission (EAC) has awarded the Eagleton Institute of Politics at Rutgers, The State University of New Jersey, a $560,000 contract to study provisional voting and voter identification procedures based on experiences from the 2004 election.

Under the national contract, the institute will develop recommendations for EAC to issue as guidance to the states to use in 2006, according to Eagleton Director Ruth B. Mandel, the study's principal investigator. She added that the Moritz College of Law at Ohio State University, Eagleton's partner in the contract application, will be responsible for the legal analysis of the competitively bid, seven-month project.

Eagleton already is home to an extensive civic education and political participation program, with several projects aimed at increasing voter turnout, political participation and Americans' involvement in civic life.

EAC was established by the Help America Vote Act (HAVA) of 2002. It is an independent, bipartisan agency and provides federal funds to states to upgrade voting systems and improve election administration. It publishes voluntary guidelines for the states and serves as a national clearinghouse of information regarding election administration.

The Eagleton project team, led by Mandel, includes Ingrid W. Reed, John Weingart and consultant Thomas O'Neill, retired president of the Partnership for New Jersey, who will serve as project director. The project will address key questions related to provisional voting and voter identification in the context of effective election administration, voter access and ballot security. Questions include:

- Did the states have in place clear and uniform written procedures, guidelines and instructions to govern the casting and counting of provisional ballots?

- Did local procedures reflect the state's uniform procedures?
- Did all states and election jurisdictions make these procedures available to the public, political parties and candidates before the election?

- To what extent were poll workers appropriately trained on how to administer provisional ballots, including establishing the identity of the potential voter seeking a provisional ballot?

- How were federal funds under the Help America Vote Act used to educate voters about their rights to cast a provisional ballot and where such provisional ballots must be cast to be counted?

- In states where a provisional ballot had to be cast at the voter's assigned polling place or precinct, was information available to poll workers to allow them to determine the voter's assigned precinct and polling place?

- Did states have mechanisms in place to inform voters casting provisional ballots whether their vote was counted and whether they are now registered for subsequent elections?

Eagleton will address these questions by examining the nation's experience with provisional voting and voter identification requirements and practices in 2004 through extensive research including a survey of local election officials across the country. In addition, the work will be informed by scrutiny from a panel of peer reviewers as well as by comments offered at public hearings to be held in conjunction with the project.

At the contract's conclusion, the team will present a narrative on both topics, indexed databases of major articles on provisional voting and voter identification requirements, summaries of case law on each subject, analyses of provisional voting procedures from around the country and of voter participation and vote fraud under various voter ID requirements, and a report of alternatives to existing practices and procedures.

Subject June 30 Hearing Panelists

Julie:

Thanks for you call. Our conversation helped me crystallize further the recommendations we will make to the Commission about the material to be covered at the hearing.

I believe we will recommend two panels of 3 or 4 people each for the June 30 hearing. One will cover the relatively narrow HAVA Voter ID requirements with presentations by 2 state-level voting administrators with contrasting experiences. The contrast between Michigan and Pennsylvania might prove especially instructive because it would demonstrate the relationship between the quality of the data base and requirements for voter identification. Since the hearing is being held in Manhattan, perhaps inviting a speaker from New York instead of Pennsylvania would make sense. I'd appreciate your thoughts on that.

Two other speakers could address the issue of broader Voter ID requirements to reduce vote fraud by requiring some form of identification for each voter at the polling place. The experience in Mississippi over the past 5 years has been particularly dramatic, as illustrated by the attached news article from the local press last year. As we discussed, inviting the 2 legislators profiled in the article might make for powerful testimony.

The final 2 speakers we believe should be academics who have studied the relationship between Voter ID regimes, voter participation and vote fraud and who have conflicting evidence and conclusions to offer. We have found at least two university based researchers who can present the view that stricter Voter ID requirement do not reduce vote fraud and do dampen participation. We have not yet identified a researcher from the other end of the spectrum, but we are looking actively. Your suggestions would be most welcome.

Below is our current list of possibilities for your review.

Tom

JUNE 30 HEARING
POSSIBLE PANELISTS OR TOPICS

Possible States to be represented by one or more panelists

Mississippi
Debate over voter id issues has been dramatic. The resonance of Mississippi on voting issues would lend interest to the testimony. Voter id legislation was not approved in the current legislative session and has been a source of contention at least since 1999.

Michigan
Strong database state; lax Voter ID requirements don't seem to present as much of a problem (although one hears rumors about Detroit); interesting contrast to NY. With Pennsylvania would present contrasts in the importance of the Statewide Voter Data Base

New York
Had a significant problem with provisional ballots, suggesting that their relatively lax ID rules might be problematic; also Tom Wilkey will have good contacts there. The hearing is there.

Pennsylvania
Relatively lax ID rules and apparently quite a few problems with provisional ballots in 2004. Had start up problems with its data base and would offer comparisons between counties where the data base was well established and those where is new. Should be weighed against New York for inclusion as a contrast with Michigan

Wisconsin
Governor Doyle vetoed the legislature's first attempt at tightening voter ID requirements, and instead offered a package to recruit and train more qualified poll workers and calls for improvements in voter registration procedures.

Academics on Voter ID, Turnout, and Vote Fraud

Spencer Overton
Professor, GWU Law School. Has written op-eds arguing that the empirical research is insufficient to support the need for more ID to reduce fraud. He is working on a book on the topic.

John Fortier
Research Fellow at the American Enterprise Institute. Recommended by Norm Ornstein. Google revealed no publications on this topic by Fortier.

Lorraine C. Minnite
Assistant Professor of Political Science, Barnard College. Lead researcher of the Demos election fraud study and researcher in immigrant voting patterns. Found that the incidence of fraud perpetrated by individual voters in the United States was very low and had a minimal impact on election outcomes.

Guy-UrielCharles
Associate Professor of Law, Center for the Study of Political Psychology University of Minnesota. His areas of interest incoude Election Law and Election Law Disputes and African American Voting Concerns. He is a member of the National Research Commission on Elections and Voting of the Social Science Research Council

Subject Arrangements for June 30 Meeting

Julie,

Karen Lynn-Dyson suggested I consult directly with you about arrangements for the Commission's June 30 meeting in New York. As I understood our discussions in Washington last week, as your consultants we will be responsible for organizing the portion of the meeting that will cover the Voter Identification issue, while EAC staff will organize the regular meeting of the Commissioners. Is that understanding correct?

Because time is short, we know we must move quickly on the arrangements.

1. Does the EAC have a preference for a venue for the meeting? Have any arrangements --preliminary or otherwise-- been made to secure that facility? If not, I assume EAC would prefer a public building or an academic setting such as the auditorium you used at the law school in Columbus.

2. Has the EAC made arrangements for a transcriber to record the meeting of the Commissioners? If so, is it the EAC's intention that we will use the same transcriber for the panel? If not, should we arrange for a transcriber for the entire day? Are there federal rules on payments for transcription services that we should follow?

3. Will EAC support staff attend the hearing to sign in those attending, issue name tags, etc., or are these duties that we should be prepared to carry out?

4. Will the EAC issue the news release about the meeting and the panel?

5. What do federal regulation indicate that I may offer speakers we bring in from

these states in terms of travel, accommodations, meals, etc? Will speakers have to pay for their travel and accommodations and then request reimbursement or can we pay their bills directly?

These are the states we are currently evaluating for the Voter ID presentations: Arizona, California, Mississippi, .Michigan, New York, Pennsylvania, and Wisconsin. We may pick 4 of these, or fewer if we determine that one state should have two panelists representing different viewpoints: Karen tells me you have been working with several of these, and your counsel would sharpen the judgment we bring to bear on our selection. I am particularly interested in the Mississippi experience and would like to discuss that with you. . .perhaps by phone. The project team is aiming to agree on a panel of speakers to submit to the the EAC early next week. Panelists should receive their invitations at least two weeks in advance (more would be better), especially if we want to get onto their schedules.

I will be in a meeting tomorrow from 10:30 -- 1:00 p.m. but will be available the rest of the day for a phone conversation. My cell phone --on which you can always reach me-- [redacted]

Commissioners -

We have tentatively scheduled May 26 at 2:30 for a kickoff meeting here with Eagleton Institute. What will happen at this meeting is Eagleton will introduce their key people and make a brief presentation on their approach to performing the provisional voting and voter ID studies. It will be an opportunity to ask questions, raise any concerns, and/or provide guidance as they begin this work. Please advise if you wish to attend this meeting. I expect it will last about an hour.

U. S. ELECTION ASSISTANCE COMMISSION
OFFICE OF THE EXECUTIVE DIRECTOR
1225 New York Avenue, NW, Suite 1100
Washington, DC. 20005

June 15, 2006

Mr. John Weingart, Associate Director
Eagleton Institute of Politics
Rutgers University
191 Ryders Lane
New Brunswick NJ 08901-8557

Dear Mr. Weingart:

During a recent briefing by staff, the EAC discussed and reviewed possible next steps with the provisional voting and voter identification studies as well as the Eagleton contract which is scheduled to conclude on June 30, 2006.

We were in agreement that Eagleton's work on the EAC contract should conclude, as scheduled, by June 30, 2006. In preparation for this conclusion, the EAC requests that the comments and suggestions which were noted during the EAC's recent Board of Advisors and Standards Boards meeting (and were described in Mr. O'Neil's June 8, 2006 letter to Chairman DeGregorio) be included in the final draft report on provisional voting which Eagleton will deliver to the EAC on or about June 30, 2006. The Commissioners have determined that they will take this final draft report and, from it, may develop guidance and best practice recommendations that will be presented to the Board of Advisors and Standards Boards for further review.

The EAC Commissioners have also reviewed and considered next steps with the voter identification draft report which Eagleton has prepared. While the final disposition of the results and findings of this study, on the part of the EAC, are still unclear, the Commissioners have asked that the final draft report of this study also be prepared and submitted to the EAC not later than June 30, 2006.

We look forward to receiving these reports. On behalf of the EAC thank you for the considerable time and energy which the Eagleton/Moritz team has devoted to these critical election issues.

Sincerely,

Thomas R. Wilkey

Washington, DC 20005
Fax: (202) 566-3127

June 8, 2006

Dear Chairman DeGregorio:

Karen Lynn-Dyson relayed the Commission's decision in your meeting of June 1 to take more time to consider how to proceed with the delivery of EAC research reports on provisional voting and voter identification.

The Eagleton-Moritz research team, of course, encourages the Commission's thoughtful consideration of the two reports, but we are mindful of the need to deliver revised documents that respond to the Commission's comments by the close of our contract on June 30th. We believe that if we receive the Commission's final comments on the Provisional Voting report by June 19 we will be able to complete any additional work that the Commission might request and incorporate the results in our final reports before the end of the contract period.

Based on suggestions raised at the meetings, we already plan to supplement the Provisional Voting report with some brief, additional information about the influence of the fail-safe ballot provisions of the National Voting Rights Act on the experience with provisional voting in 2004.

We understand that the Commission must submit the final draft Voter ID report to the same review process by your advisory boards as was followed with the Provisional Voting paper. We understand that step is a prerequisite for wider release. We would appreciate your advice on how to handle this review, given the rapidly approaching end of our contract.

We hope the commission will use both reports, as intended from the outset of this project, as the basis for recommendations for better, if not best, practices to the states. If the Commission cannot decide to issue such recommendations to the states, we hope it will promptly release the reports to provide the states and the broader elections community with this information, analysis and perspective on the issues.

We recognize, based on the reactions at the meetings of the Standards Board and, particularly, the Board of Advisors, that some of the findings, conclusions, and recommendations of the reports will be controversial with some of the Commission's constituencies. But we also believe, based on the comments of the Peer Review Group, the advisors assembled by the Commission, and our response to their critiques, that the reports are grounded on solid research by a well-qualified, nonpartisan team and that the reports will provide new information for the policy process. We believe this information will contribute to achieving the EAC mission of providing helpful information that the states may or may not choose to implement.

191 RYDERS LANE, NEW BRUNSWICK, NJ 08901-8557

Tel: (732) 932-9384
Fax: (732) 932-6778

THE STATE UNIVERSITY OF NEW JERSEY
RUTGERS

E-mail: eagleton@rci.rutgers.edu
Web: www.eagleton.rutgers.edu

The information in the reports can improve the policy process by raising the level of debate over increasingly volatile issues related to election administration. We believe our reports will prove useful to the states as they complete preparations for the 2006 elections. Moreover, the elections community is aware of this work, and awaits the analysis and conclusions.

We look forward to working with you to conclude this research in a way that will serve the public interest.

Very truly yours,

Thomas M. O'Neill
Project Director

Hi Tom-

Just checking to see if your Power Point slides might be ready.

When they are, please send them on to me and hit Reply to All as Julie Hodgkins and Amie Sherrill (the Chairman's Special Assistant) would like copies before the presentation.

Thanks

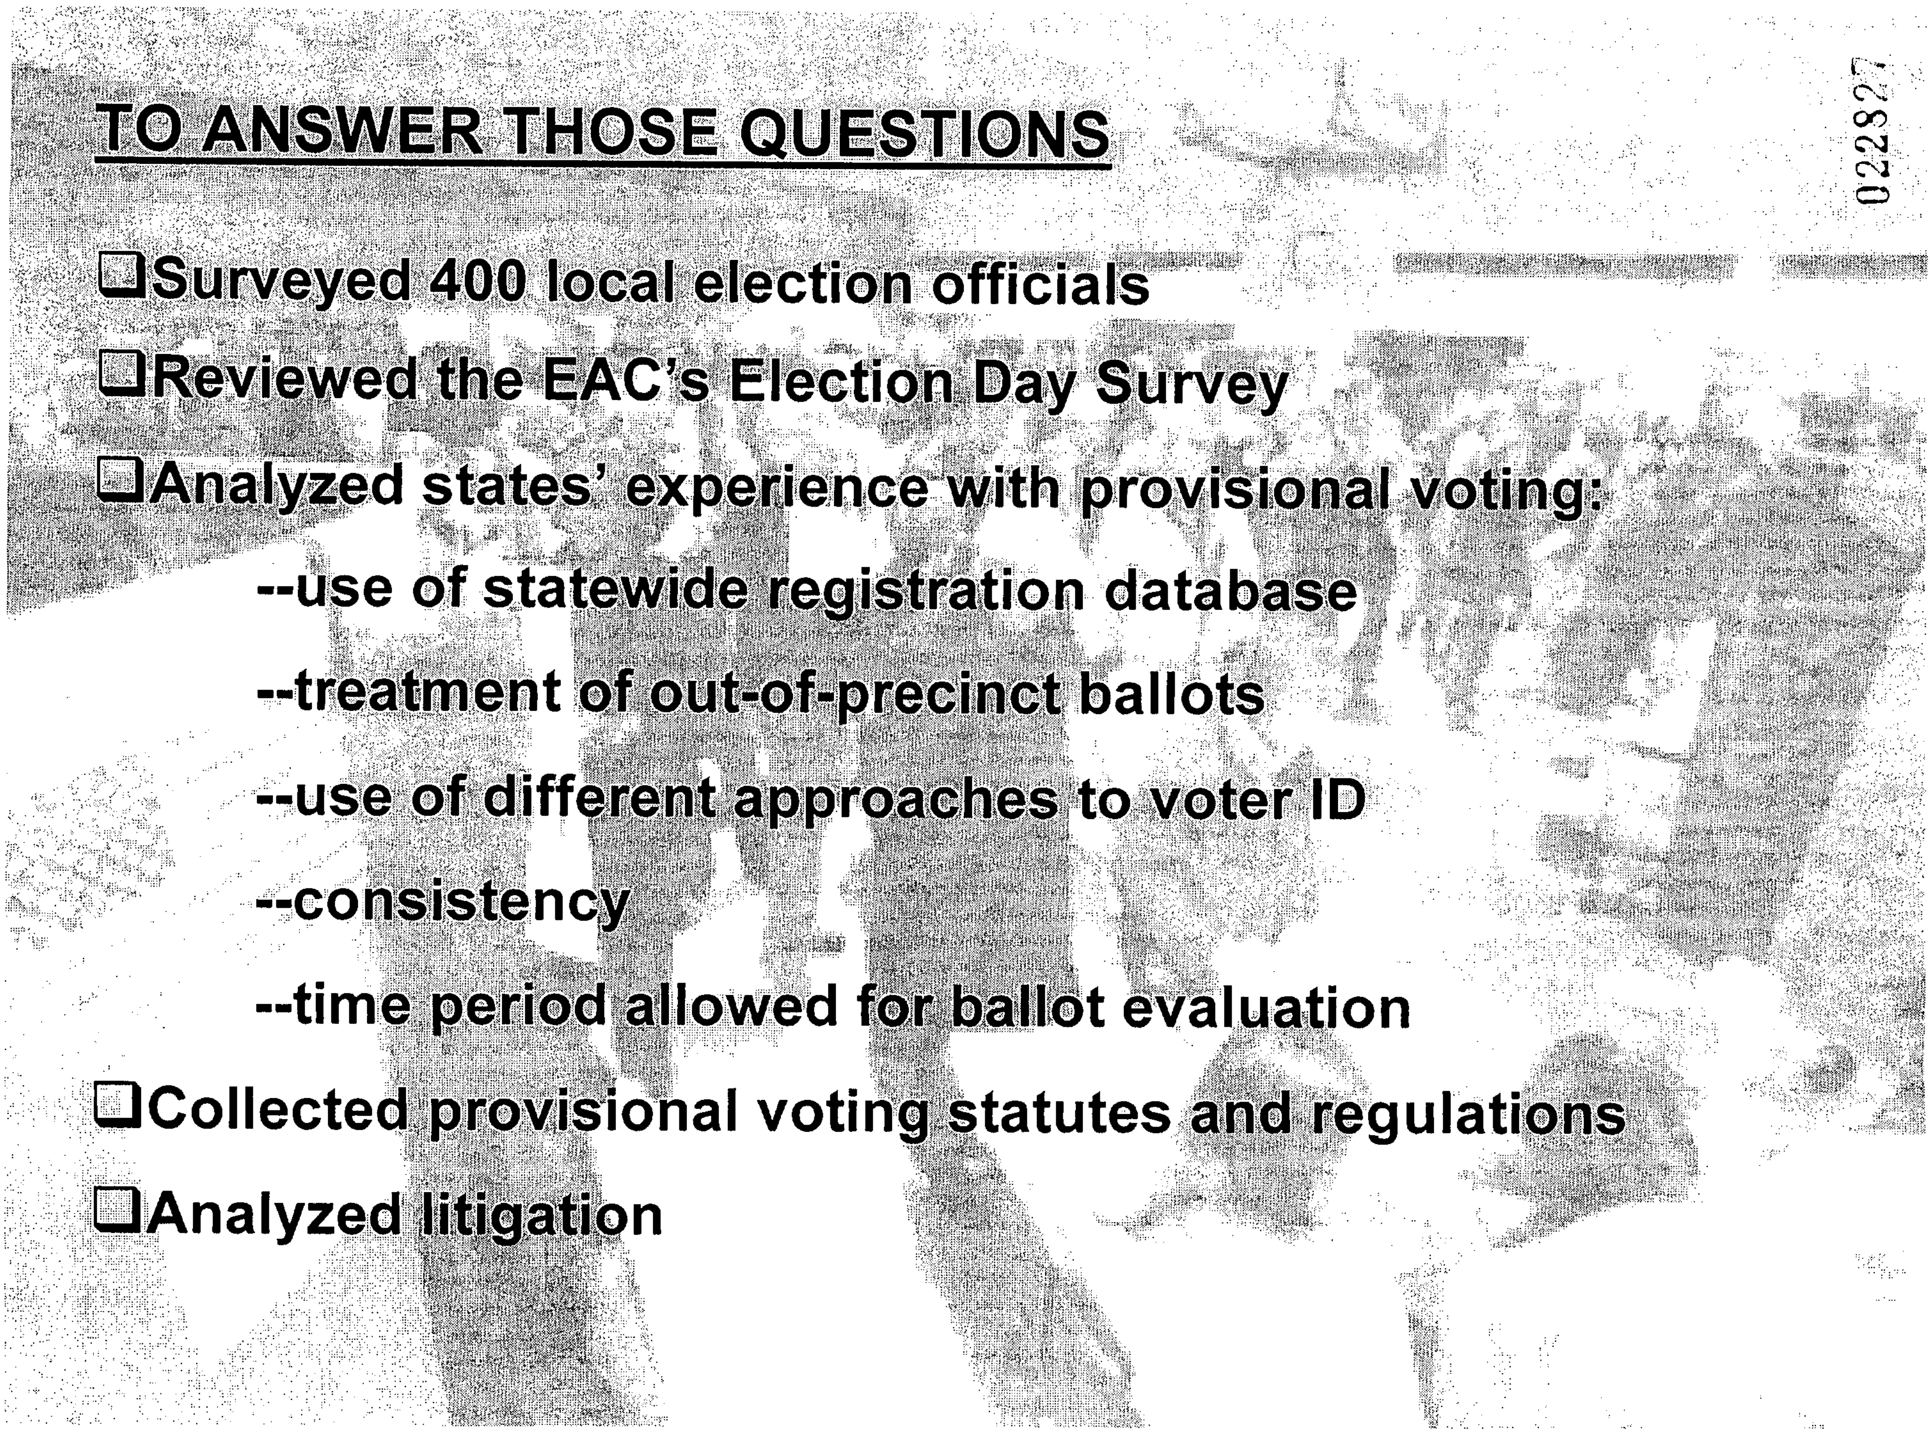
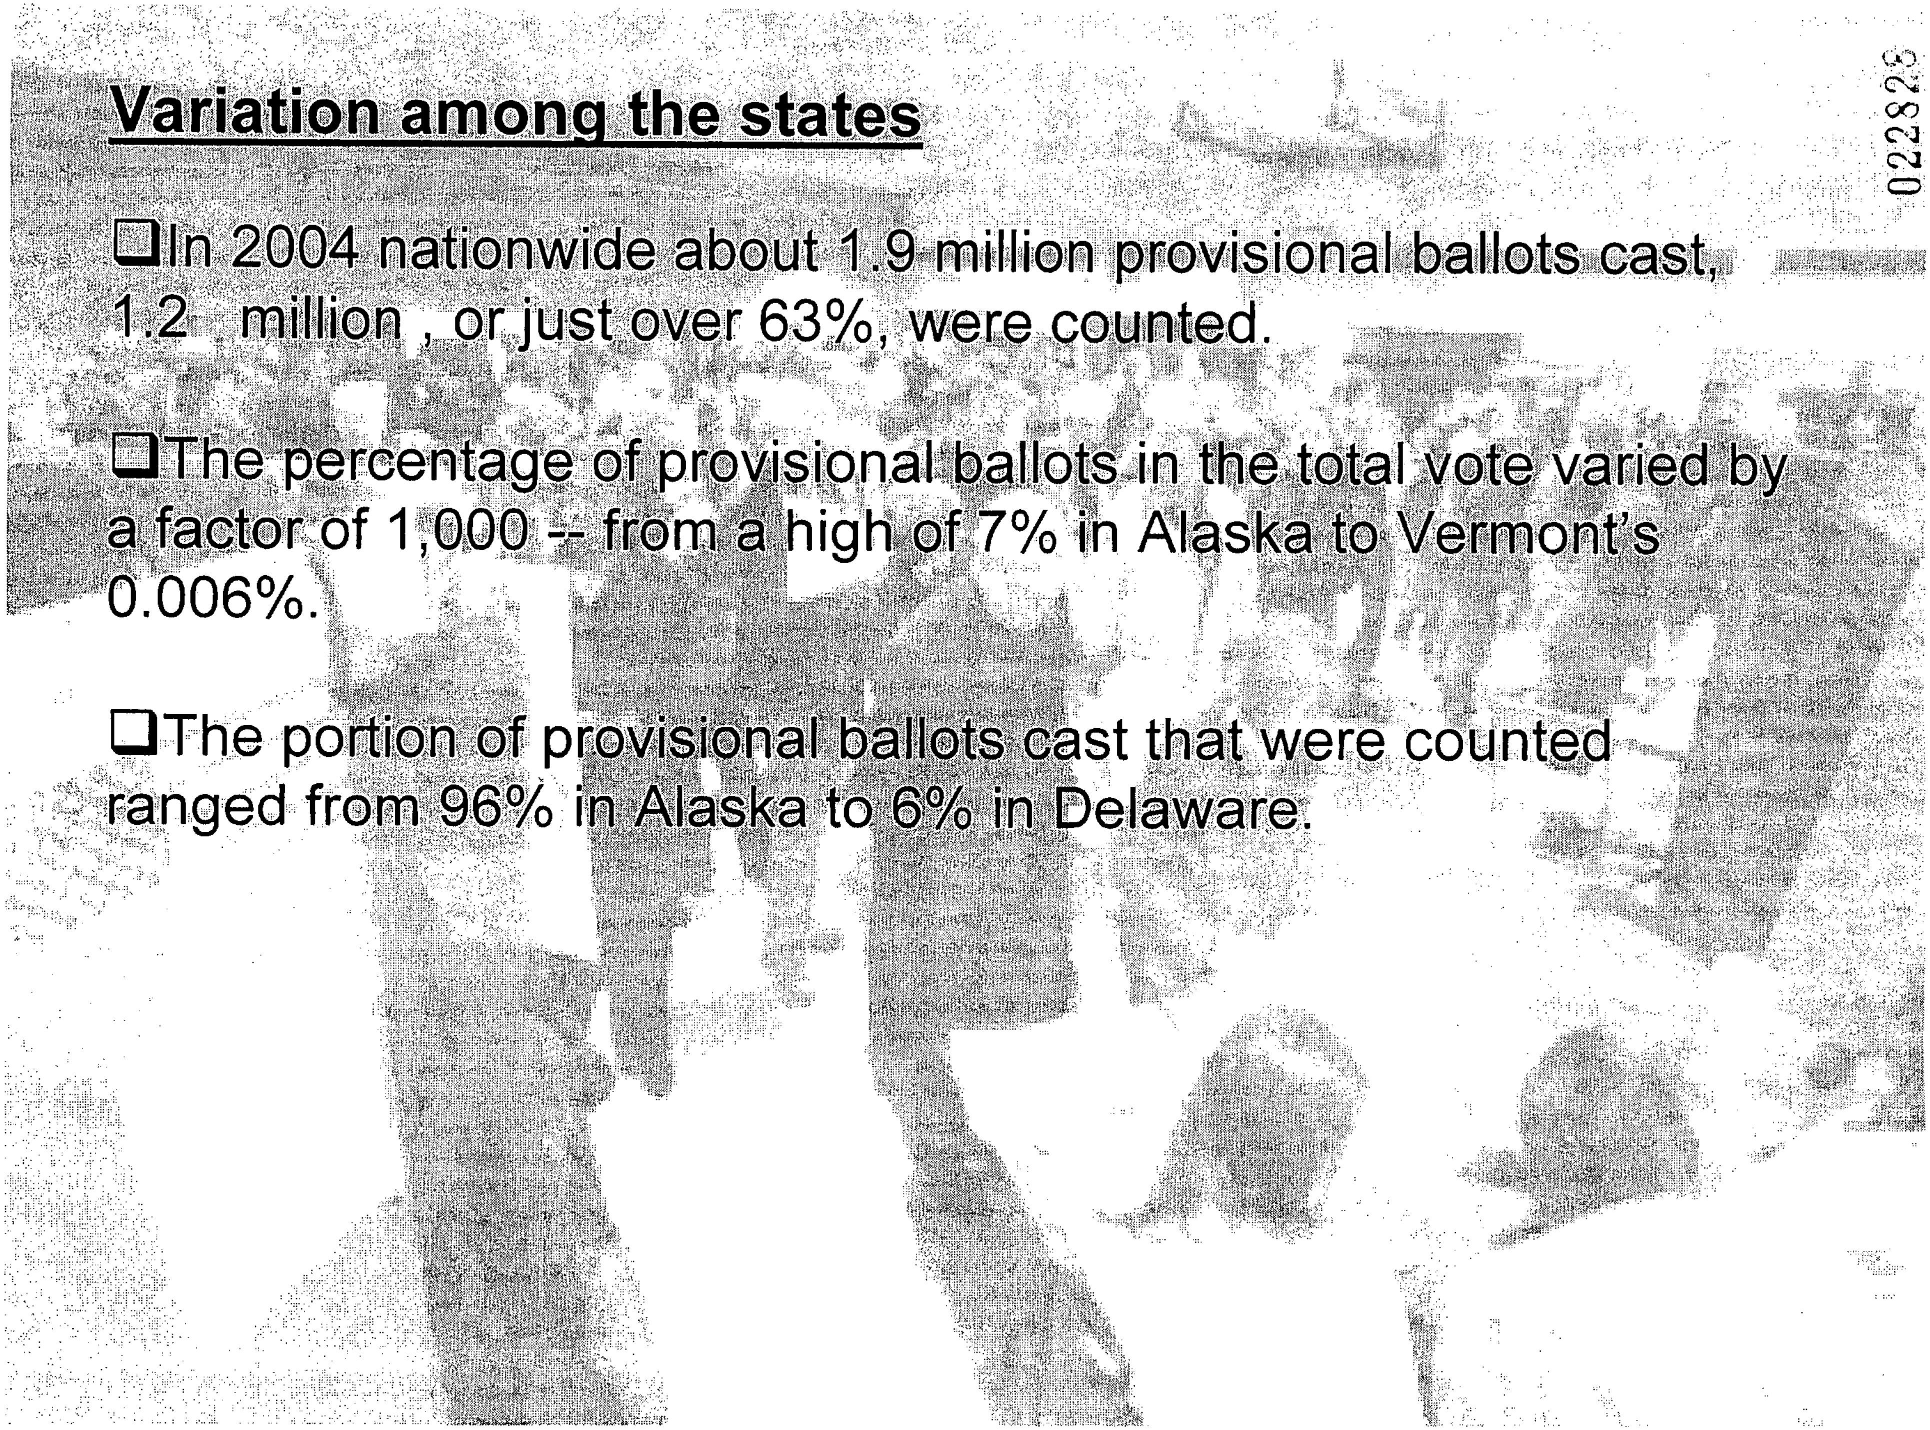
QUESTIONS RAISED BY THE EAC

1. How did states prepare for HAVA's provisional voting requirements?
2. How did preparation and performance vary between states that had previously had some form of Provisional Ballot and those did not?
3. How did litigation affect the implementation of Provisional Voting?
4. How effective was provisional voting in enfranchising qualified voters?
5. Did State and local processes provide for consistent counting of provisional ballots?
6. Did local election officials have a clear understanding of how to implement provisional voting?

TO ANSWER THOSE QUESTIONS

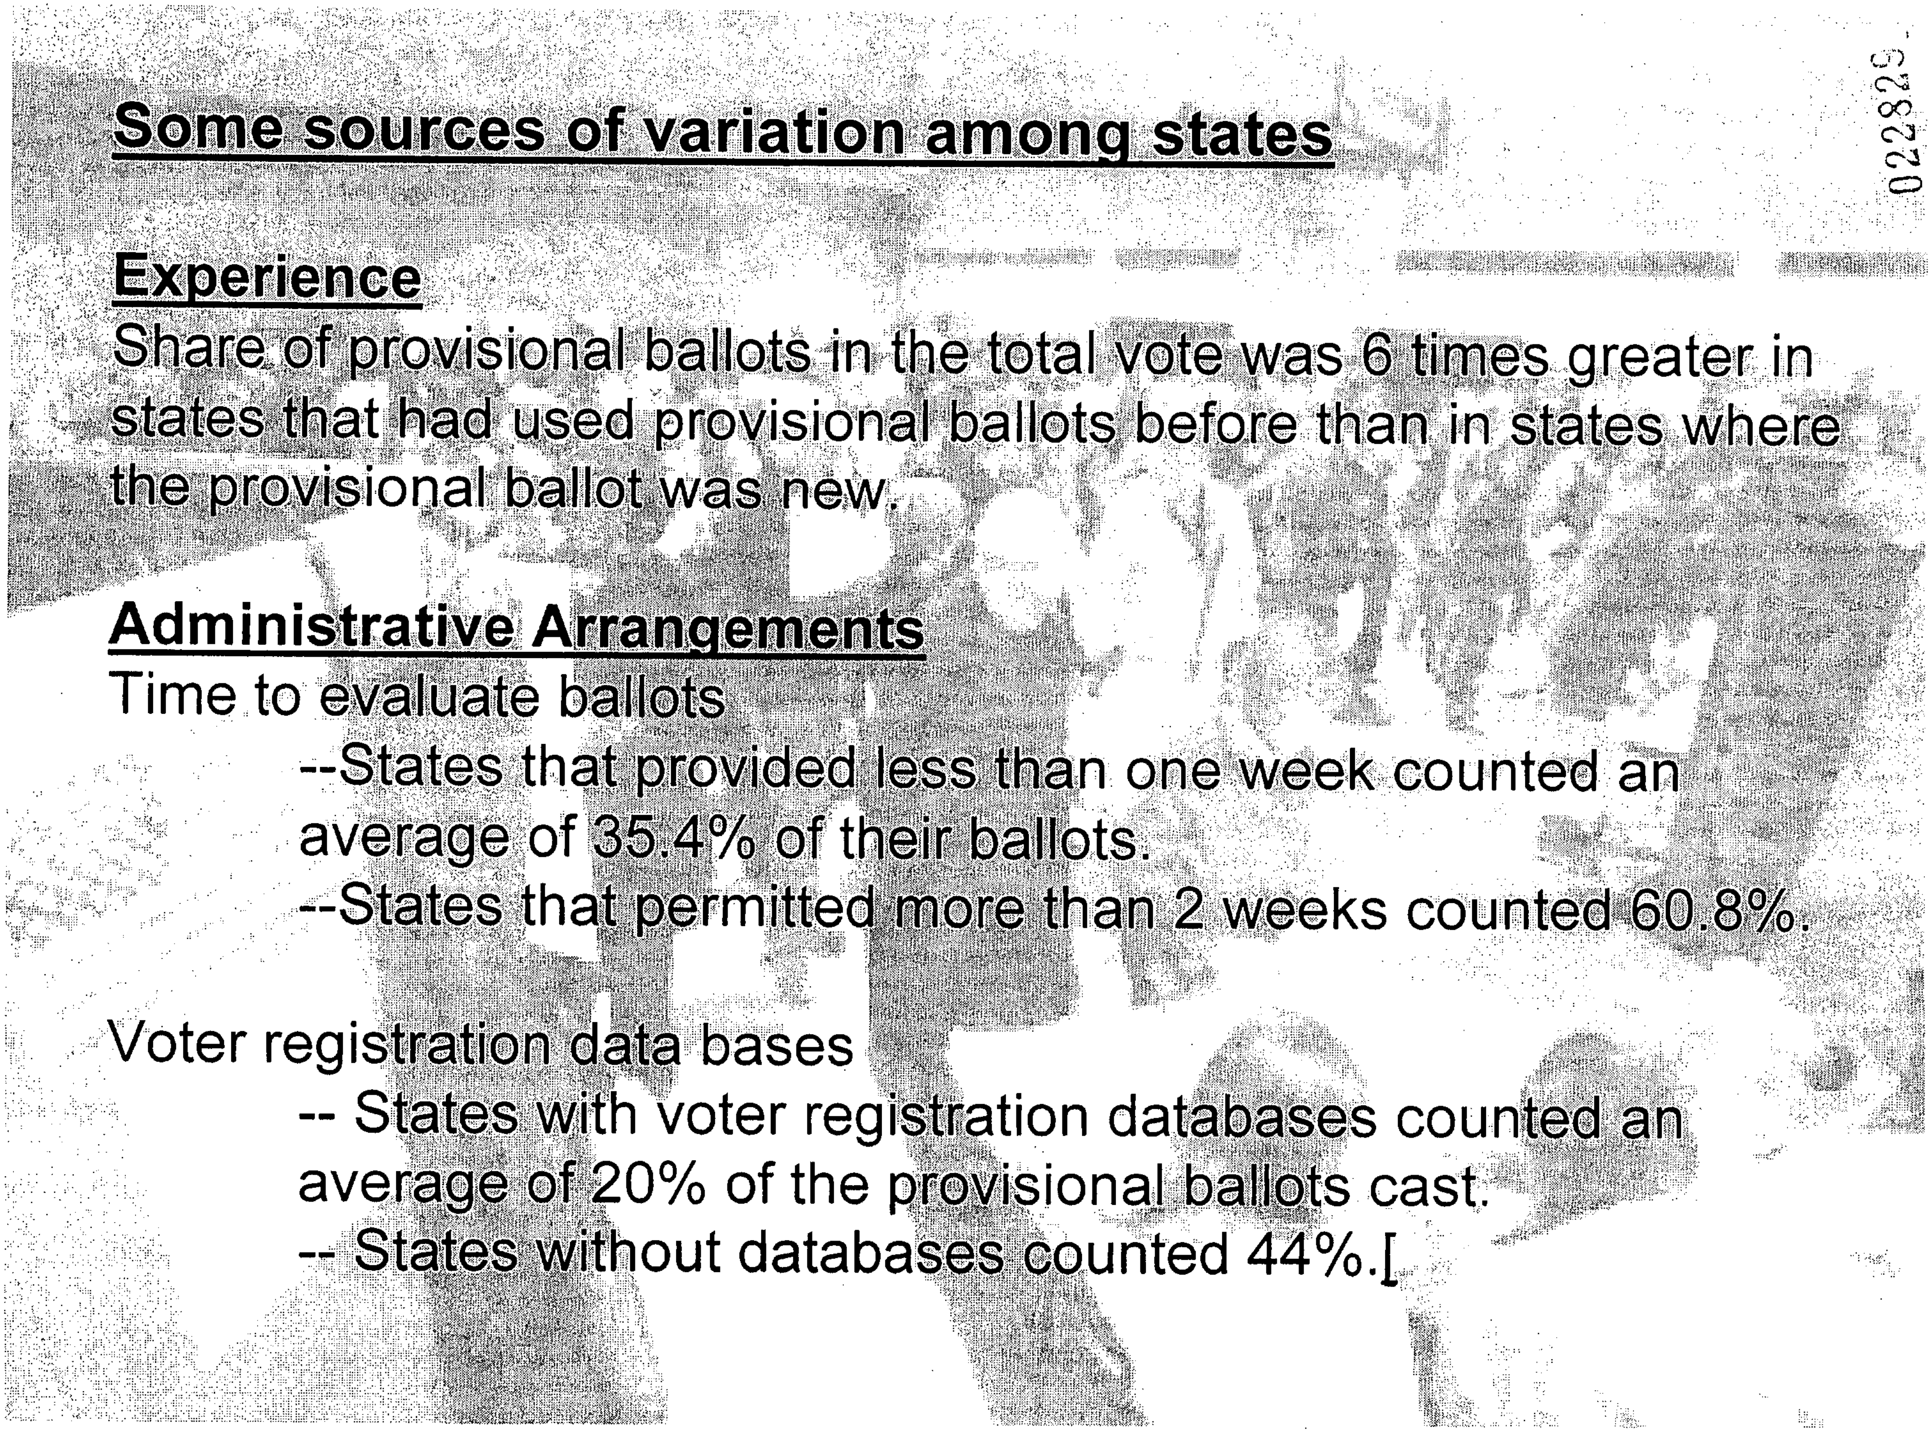


- Surveyed 400 local election officials
- Reviewed the EAC's Election Day Survey
- Analyzed states' experience with provisional voting:
    - --use of statewide registration database
    - --treatment of out-of-precinct ballots
    - --use of different approaches to voter ID
    - --consistency
    - --time period allowed for ballot evaluation
- Collected provisional voting statutes and regulations
- Analyzed litigation



Variation among the states

- In 2004 nationwide about 1.9 million provisional ballots cast, 1.2 million , or just over 63%, were counted.
- The percentage of provisional ballots in the total vote varied by a factor of 1,000 -- from a high of 7% in Alaska to Vermont's 0.006%.
- The portion of provisional ballots cast that were counted ranged from 96% in Alaska to 6% in Delaware.



Some sources of variation among states

Experience

Share of provisional ballots in the total vote was 6 times greater in states that had used provisional ballots before than in states where the provisional ballot was new.

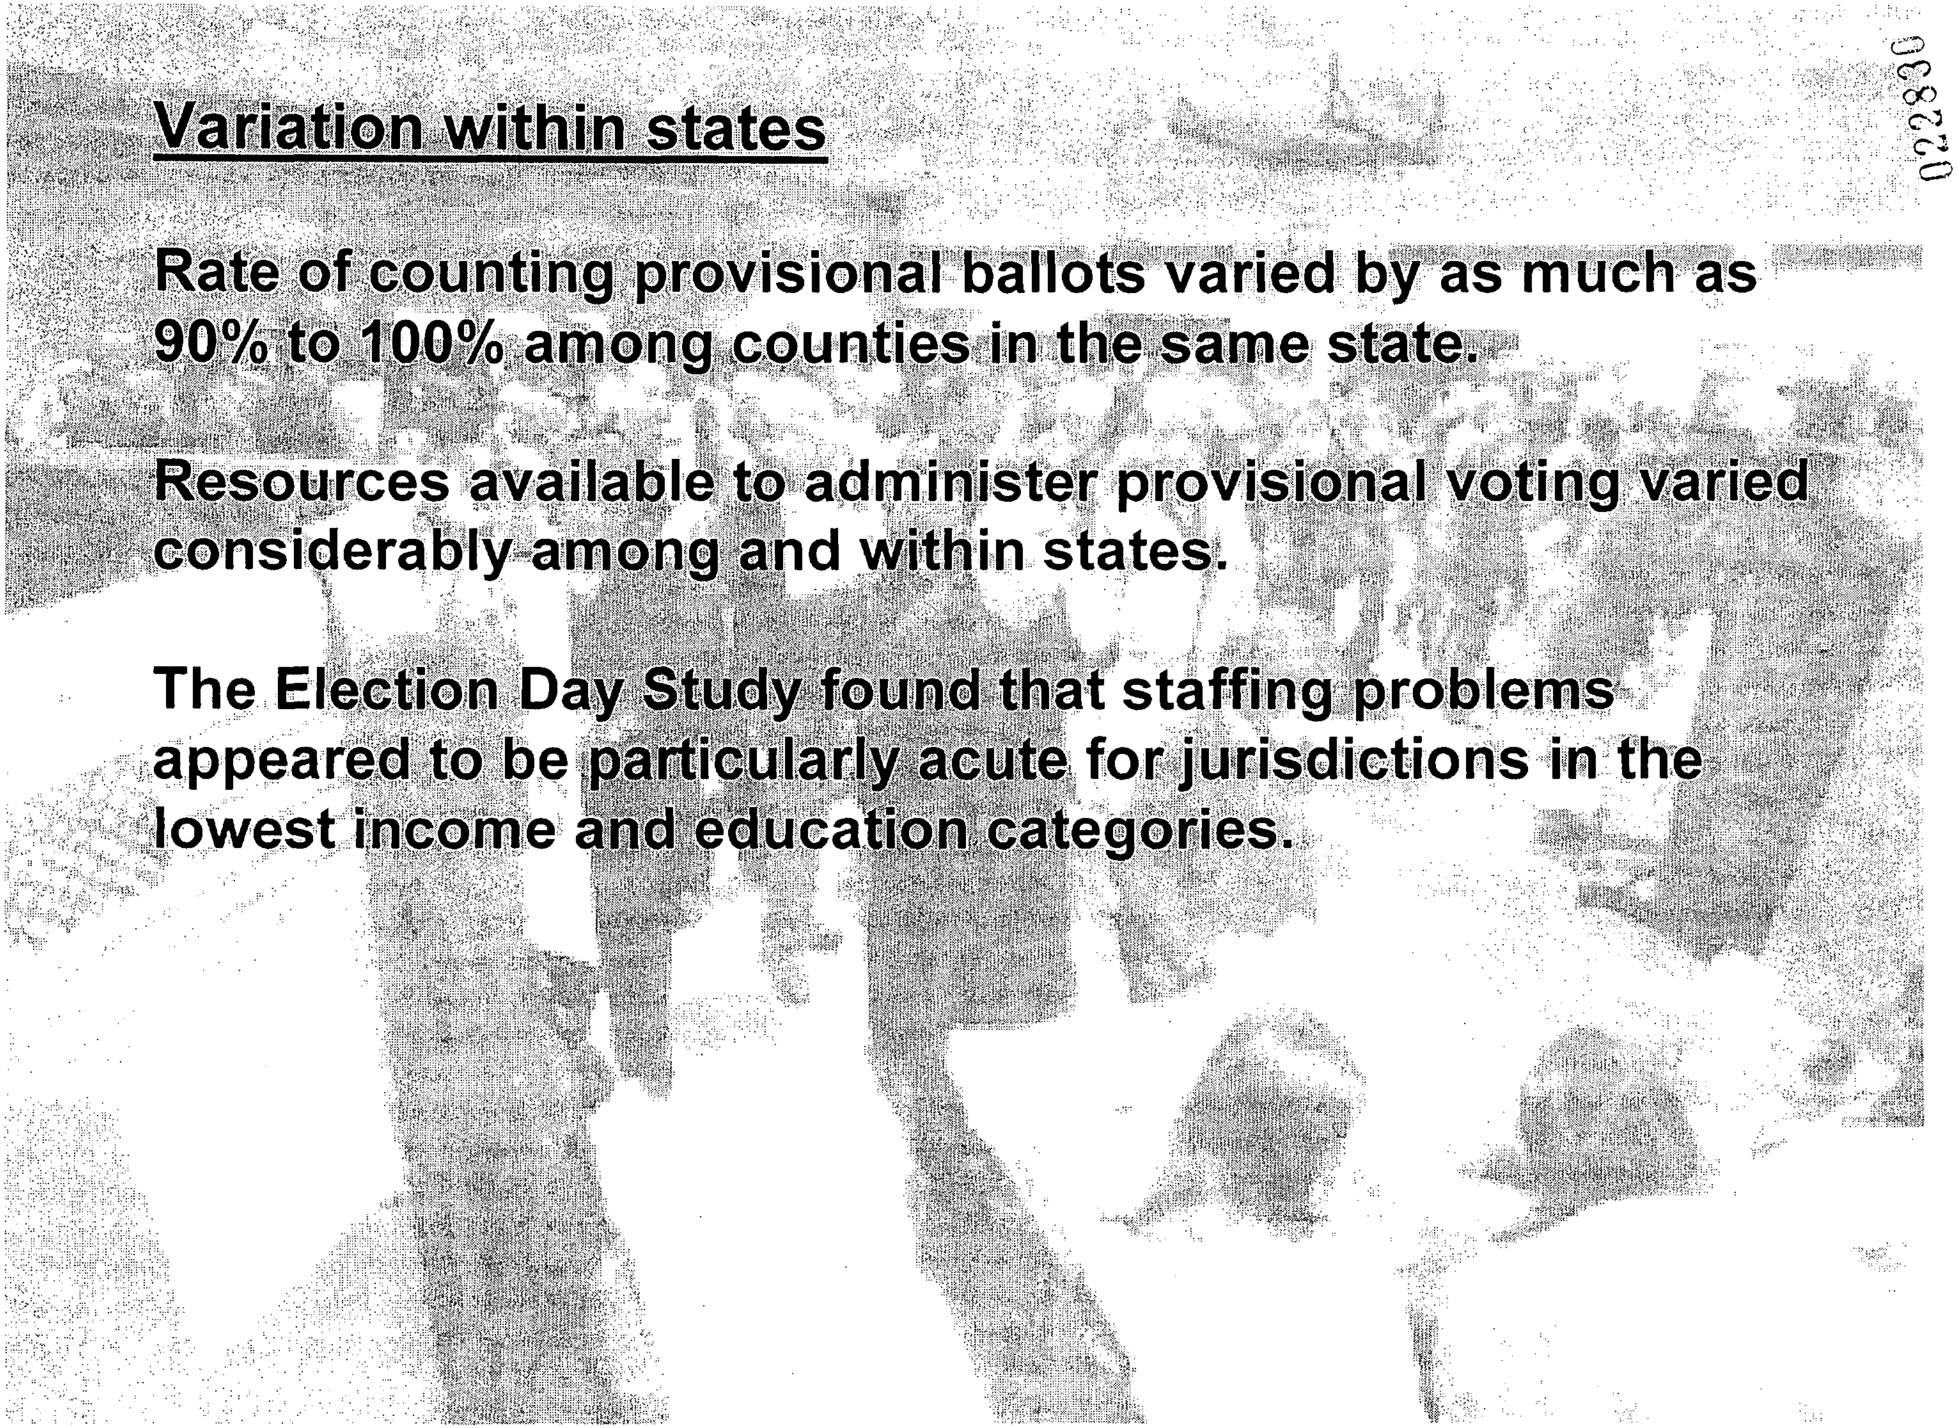
Administrative Arrangements

Time to evaluate ballots

- --States that provided less than one week counted an average of 35.4% of their ballots.
- --States that permitted more than 2 weeks counted 60.8%.

Voter registration data bases

- -- States with voter registration databases counted an average of 20% of the provisional ballots cast.
- -- States without databases counted 44%.[

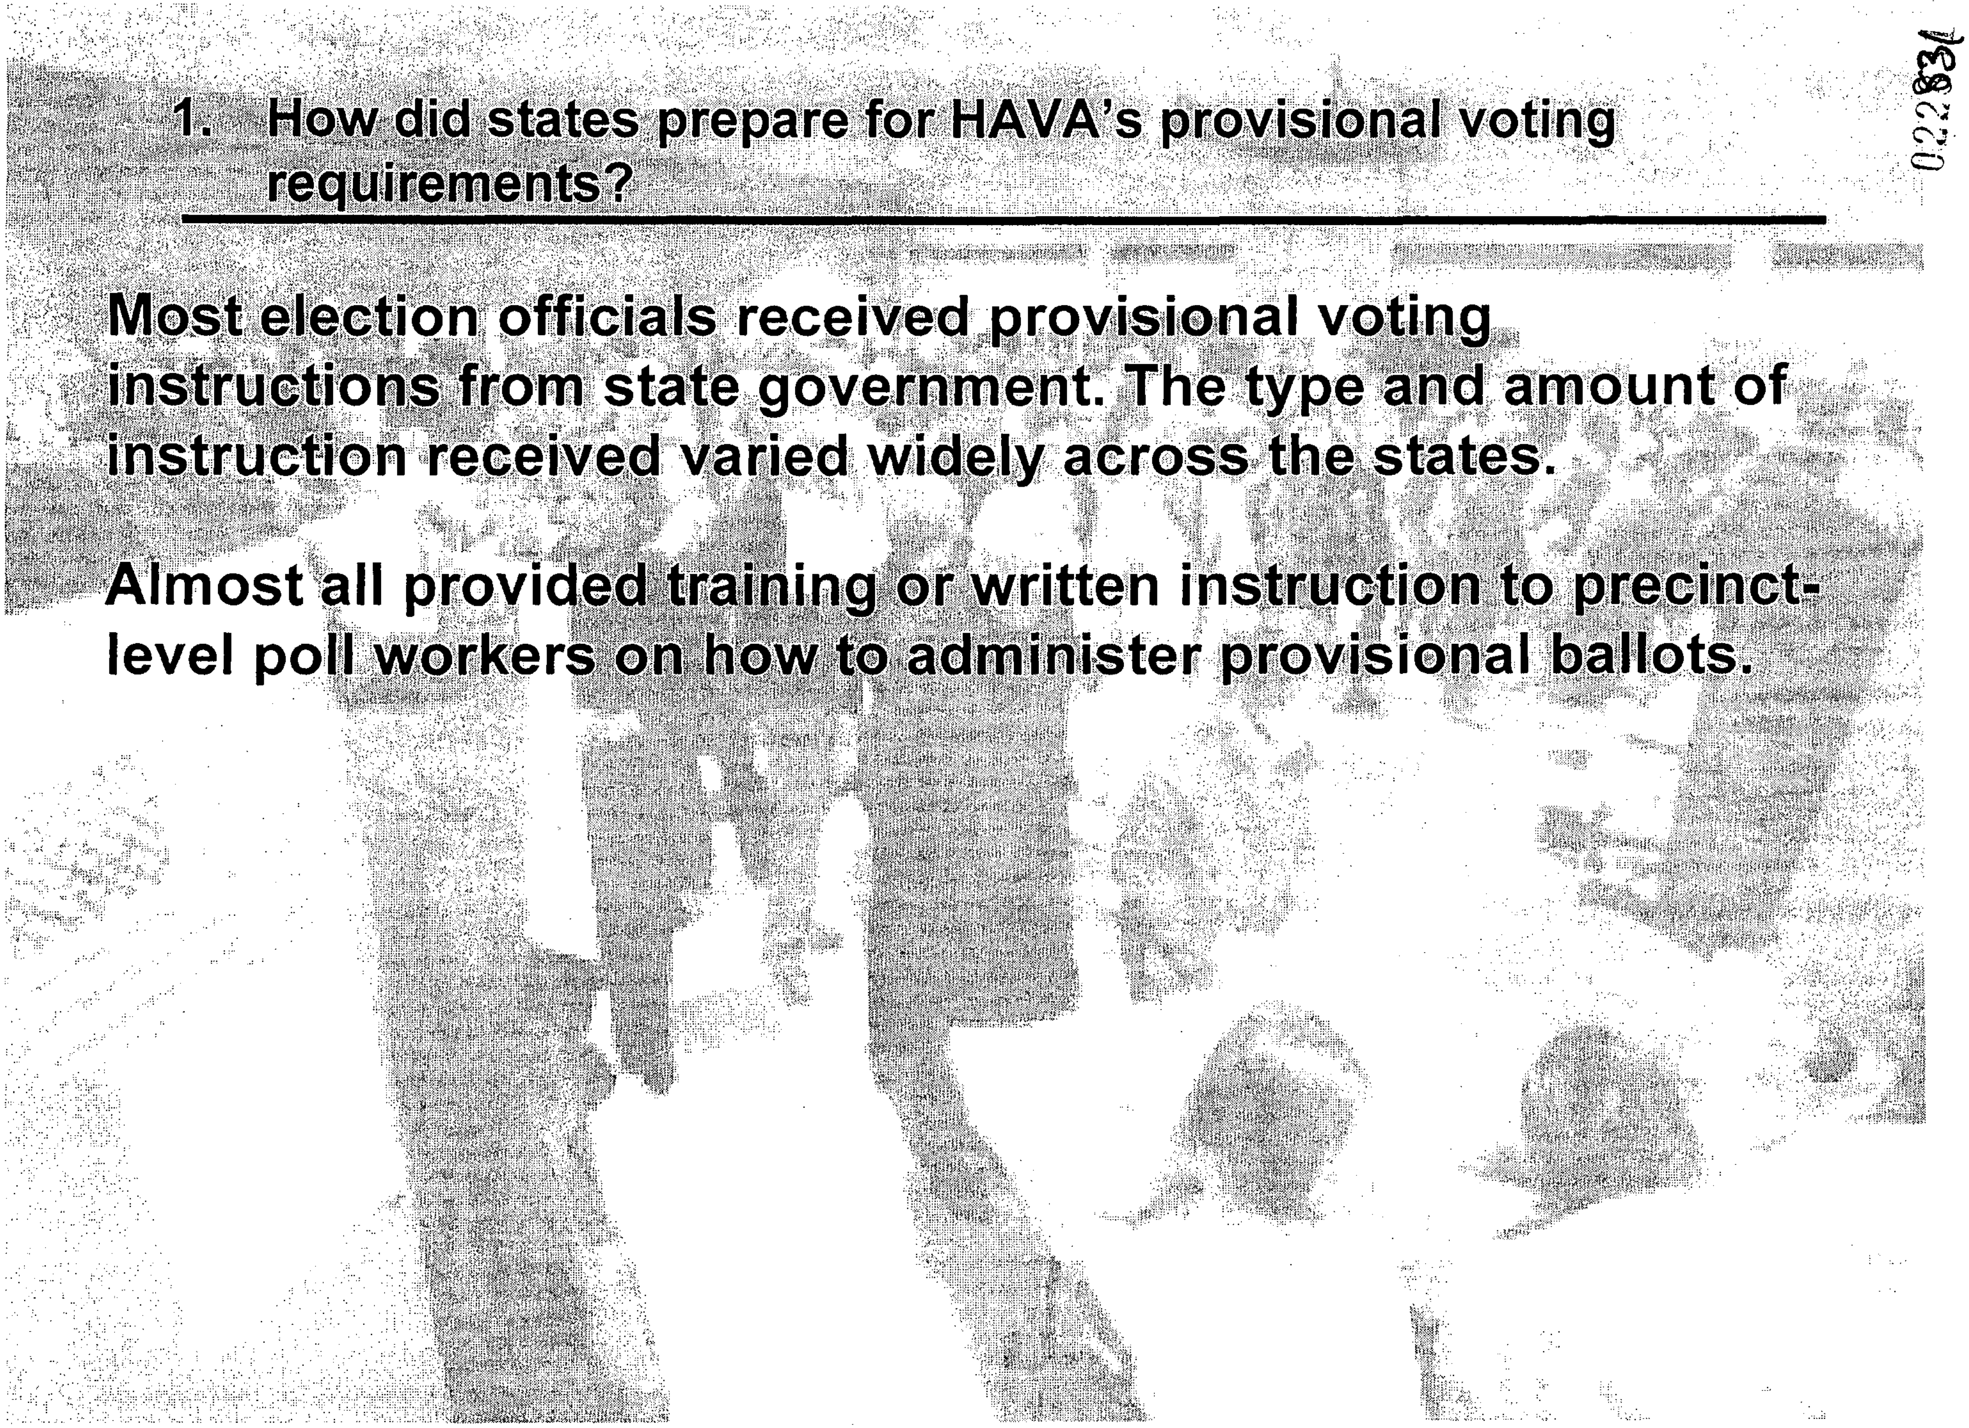


Variation within states

Rate of counting provisional ballots varied by as much as 90% to 100% among counties in the same state.

Resources available to administer provisional voting varied considerably among and within states.

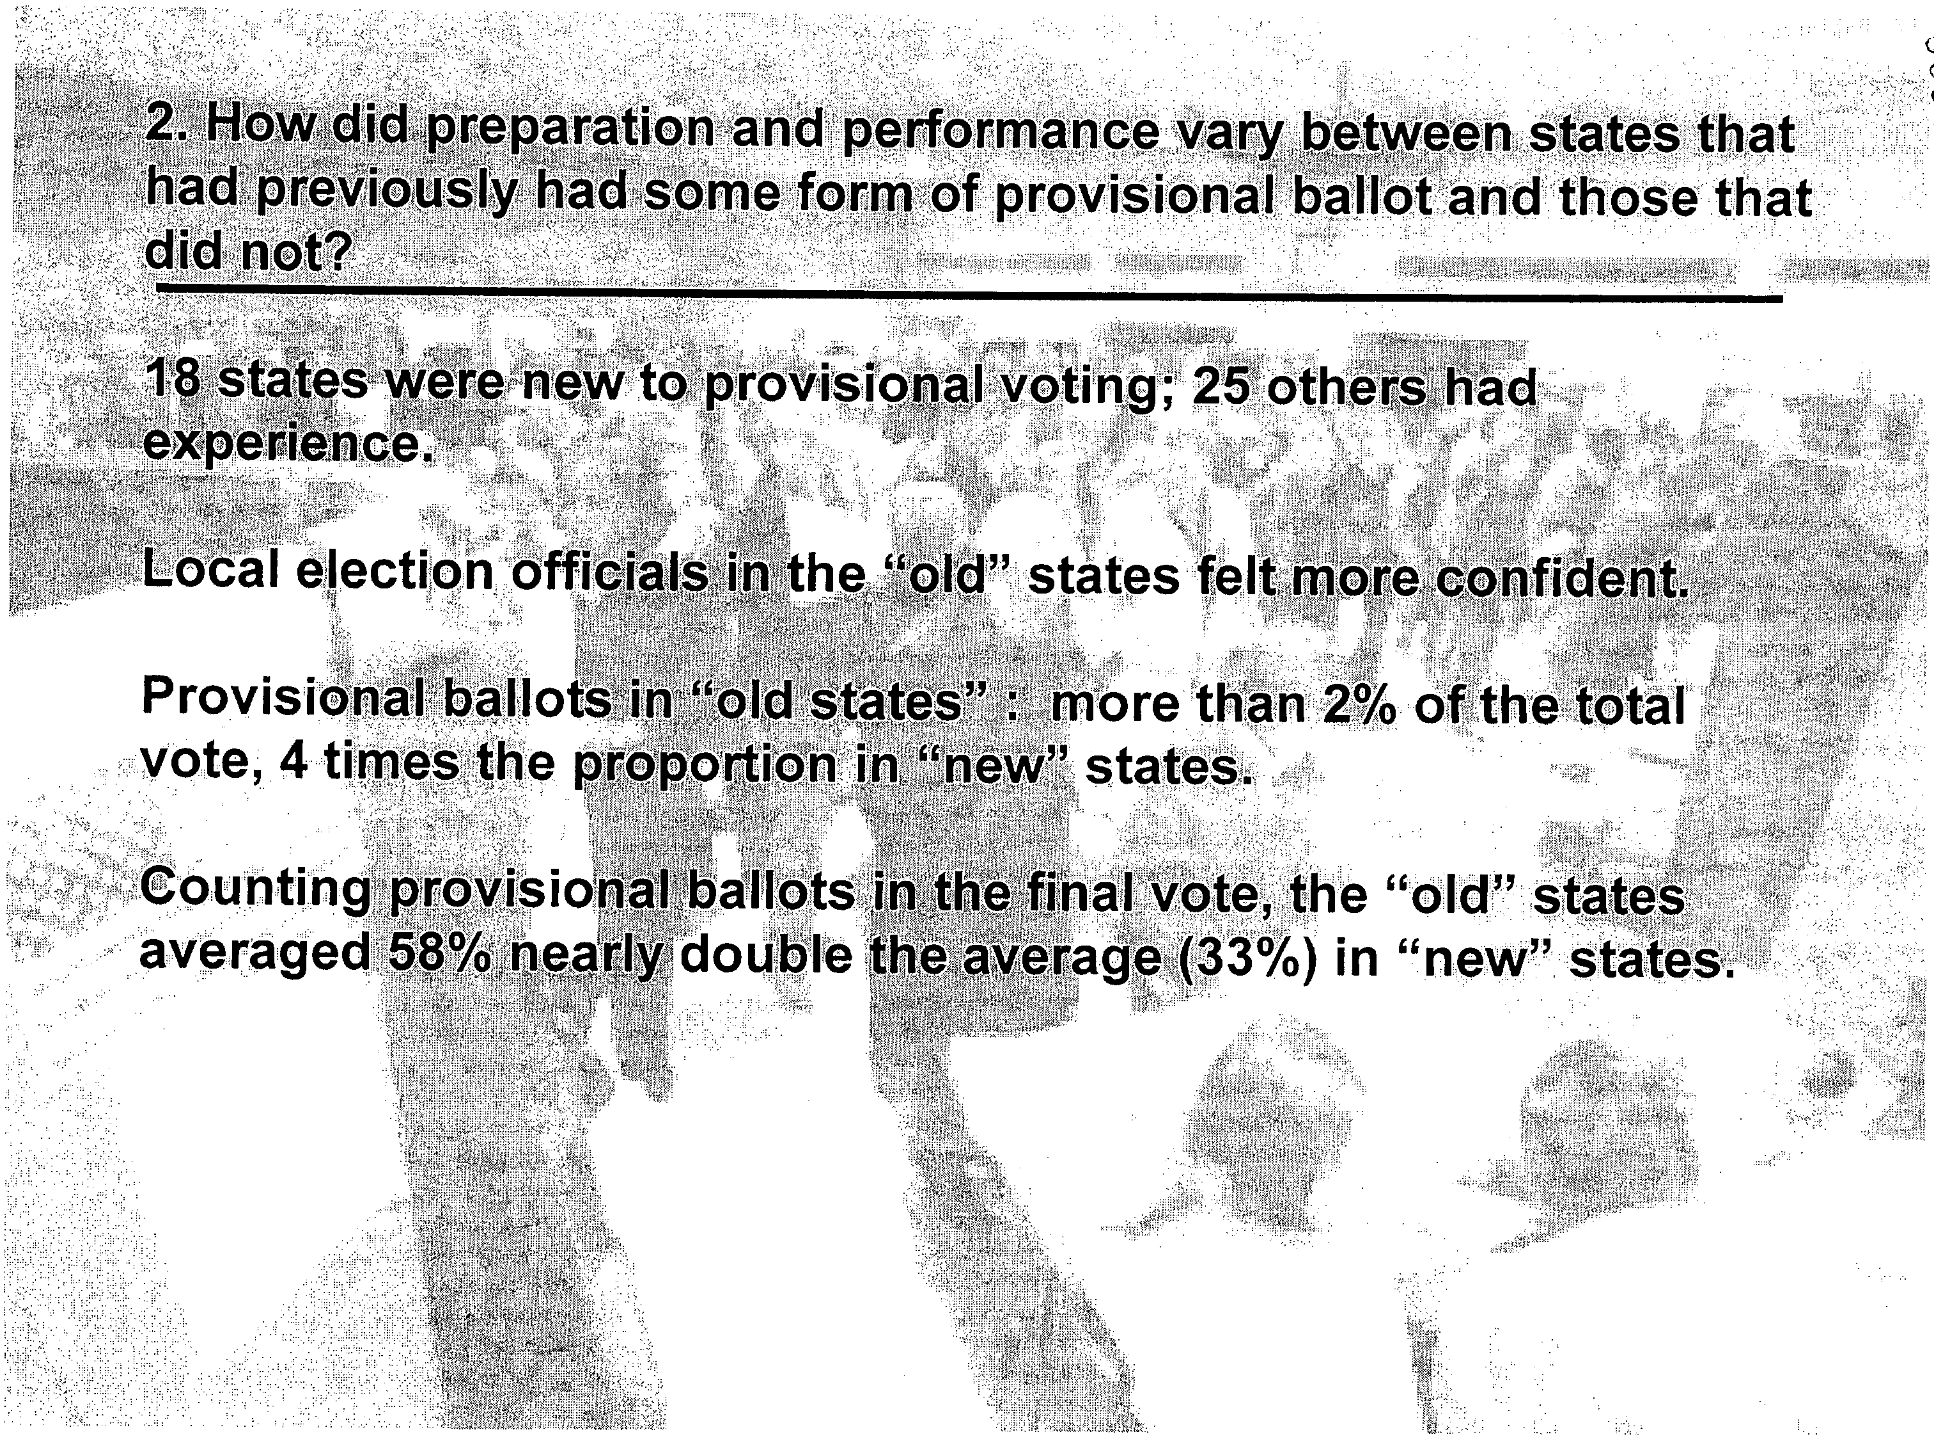
The Election Day Study found that staffing problems appeared to be particularly acute for jurisdictions in the lowest income and education categories.



1. How did states prepare for HAVA's provisional voting requirements?

Most election officials received provisional voting instructions from state government. The type and amount of instruction received varied widely across the states.

Almost all provided training or written instruction to precinct-level poll workers on how to administer provisional ballots.



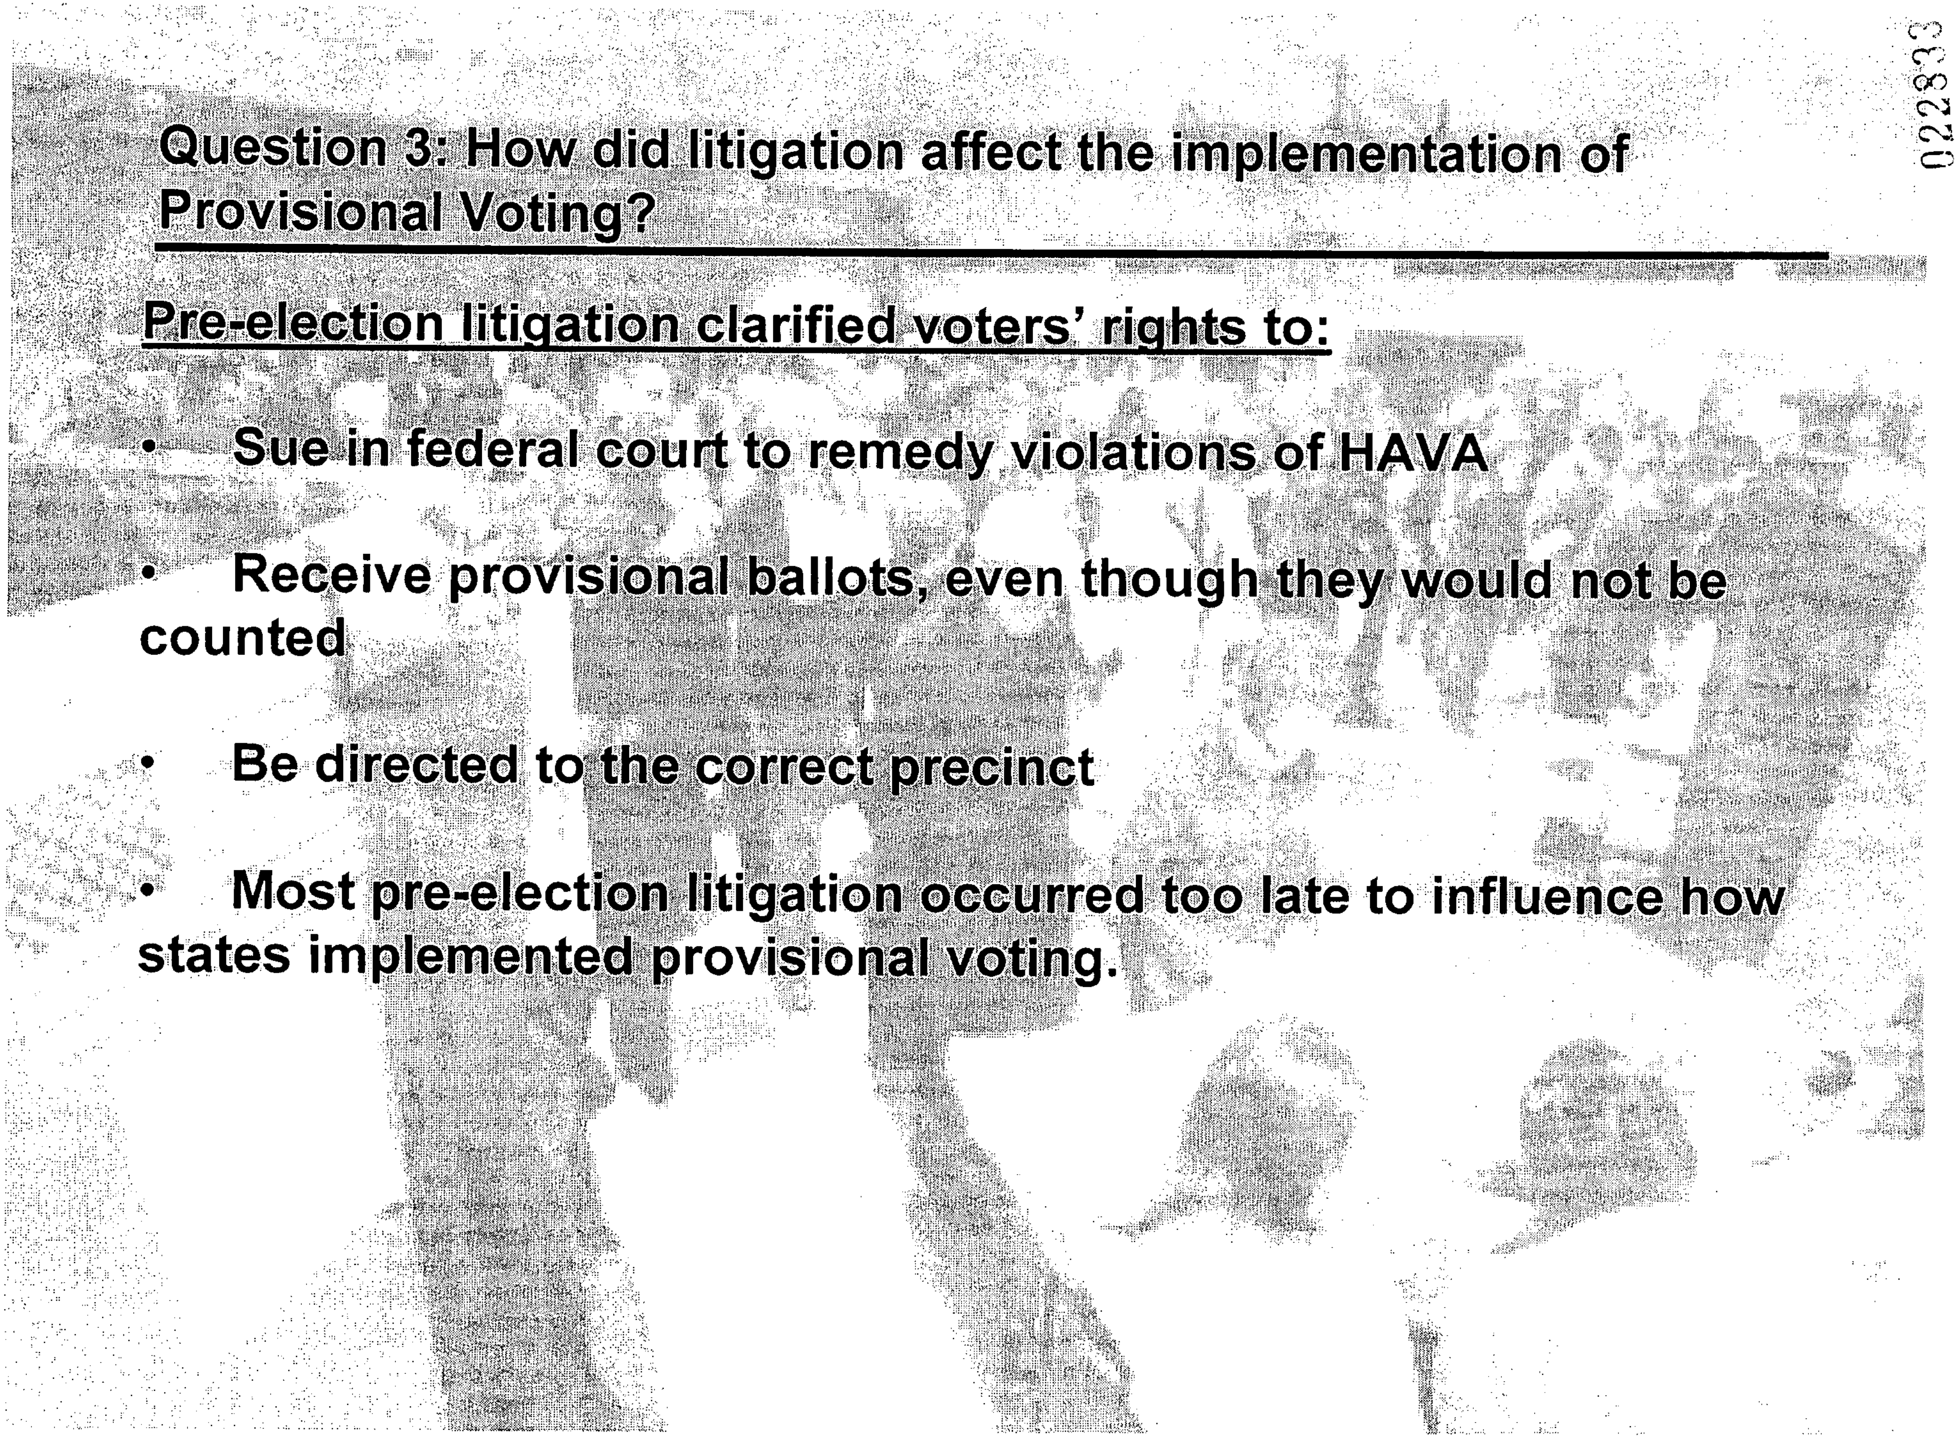
2. How did preparation and performance vary between states that had previously had some form of provisional ballot and those that did not?

18 states were new to provisional voting; 25 others had experience.

Local election officials in the "old" states felt more confident.

Provisional ballots in "old states" : more than 2% of the total vote, 4 times the proportion in "new" states.

Counting provisional ballots in the final vote, the "old" states averaged 58% nearly double the average (33%) in "new" states.

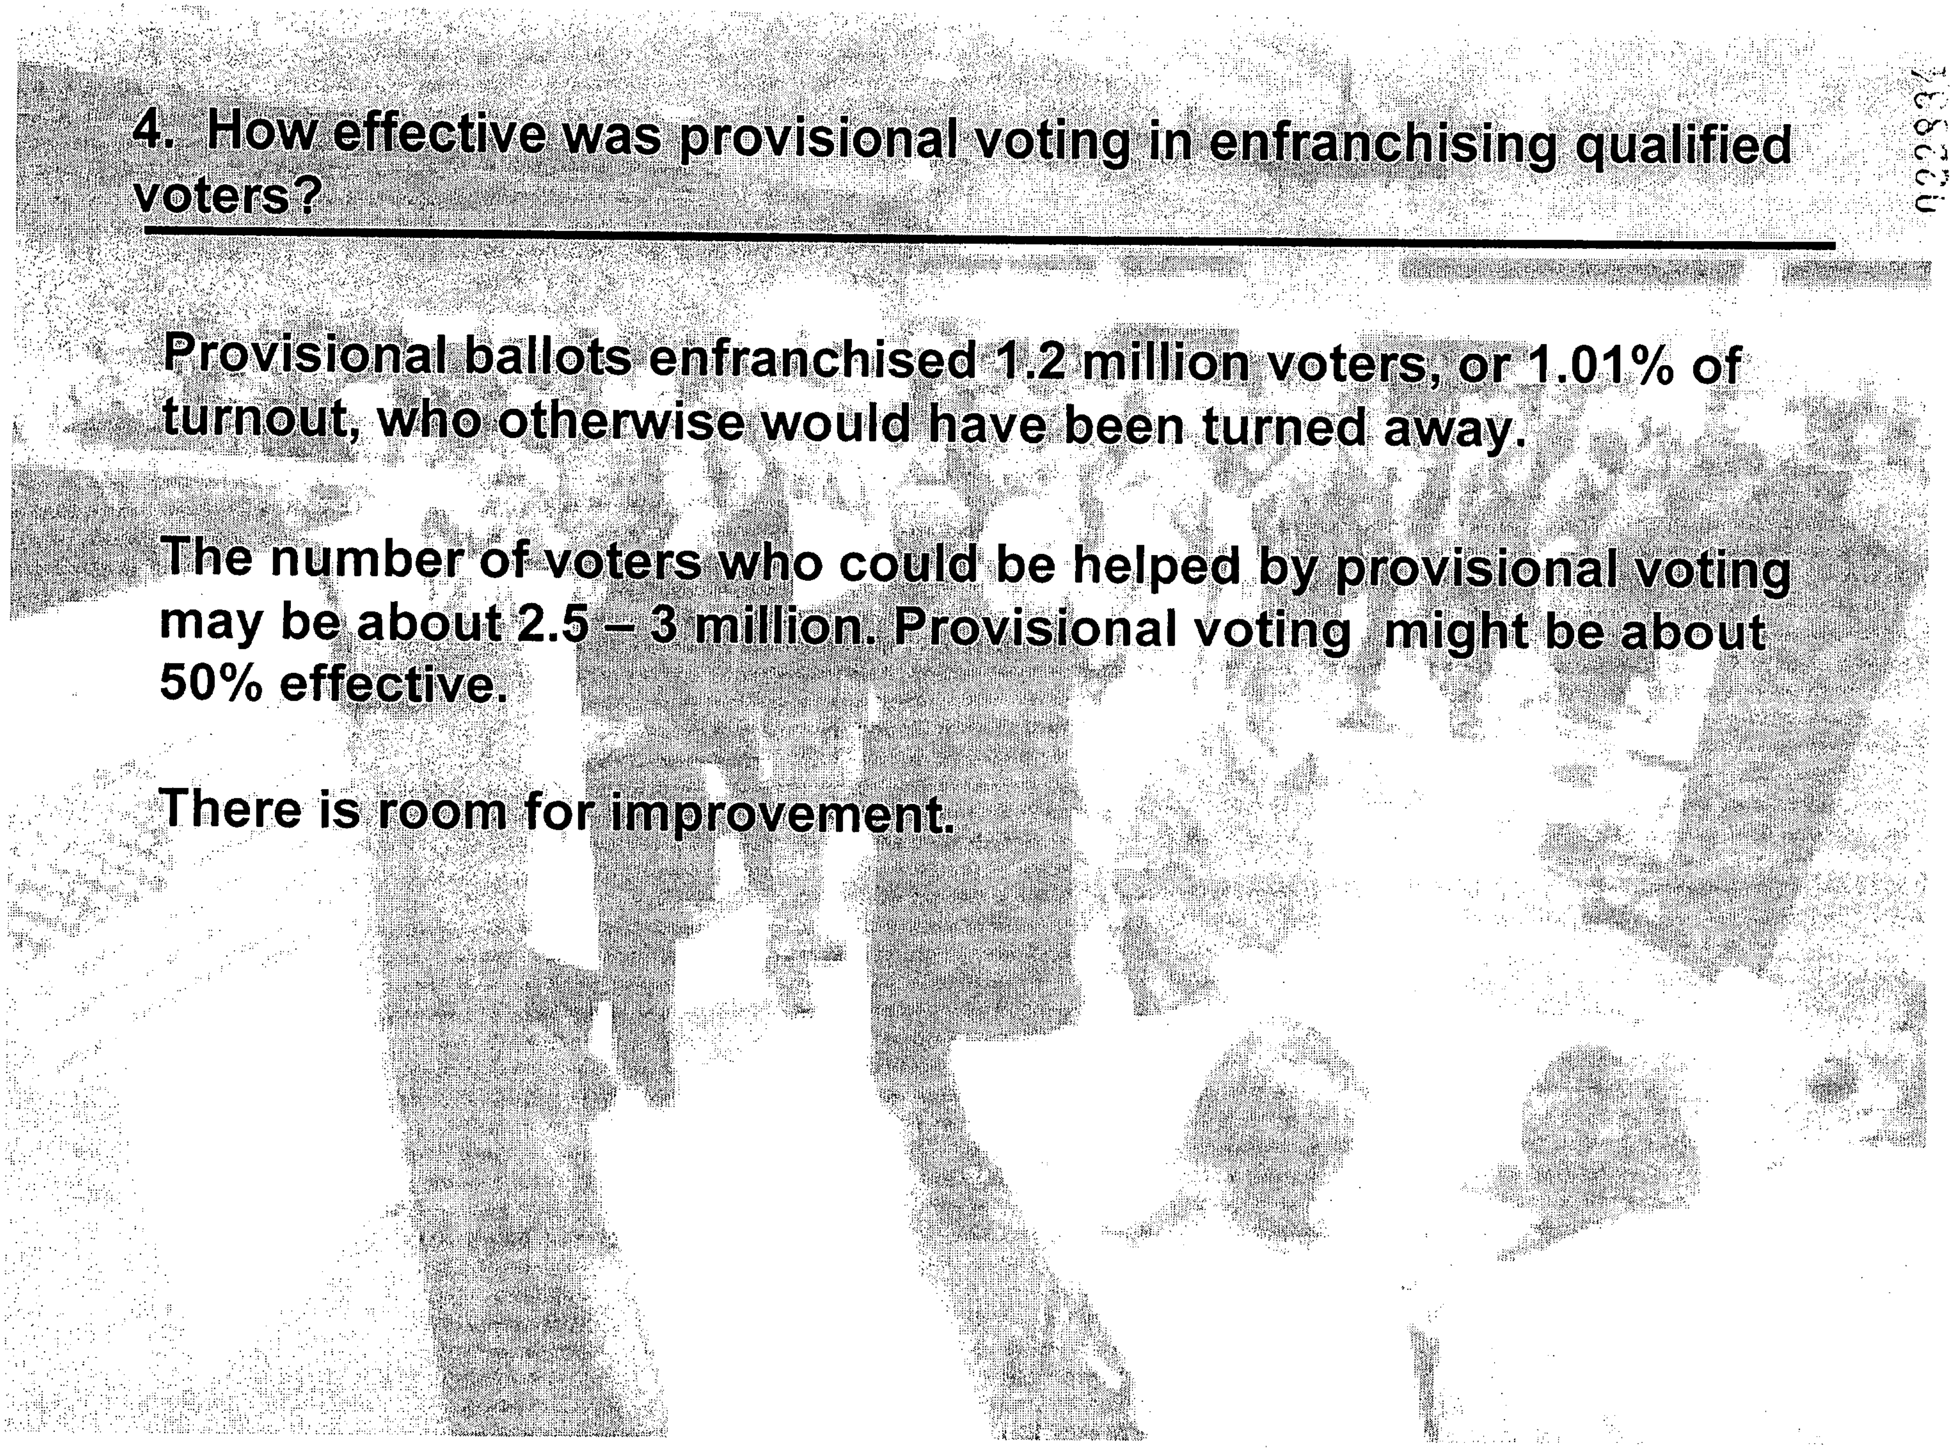


Question 3: How did litigation affect the implementation of Provisional Voting?

Pre-election litigation clarified voters' rights to:

- Sue in federal court to remedy violations of HAVA
- Receive provisional ballots, even though they would not be counted
- Be directed to the correct precinct
- Most pre-election litigation occurred too late to influence how states implemented provisional voting.

4. How effective was provisional voting in enfranchising qualified voters?

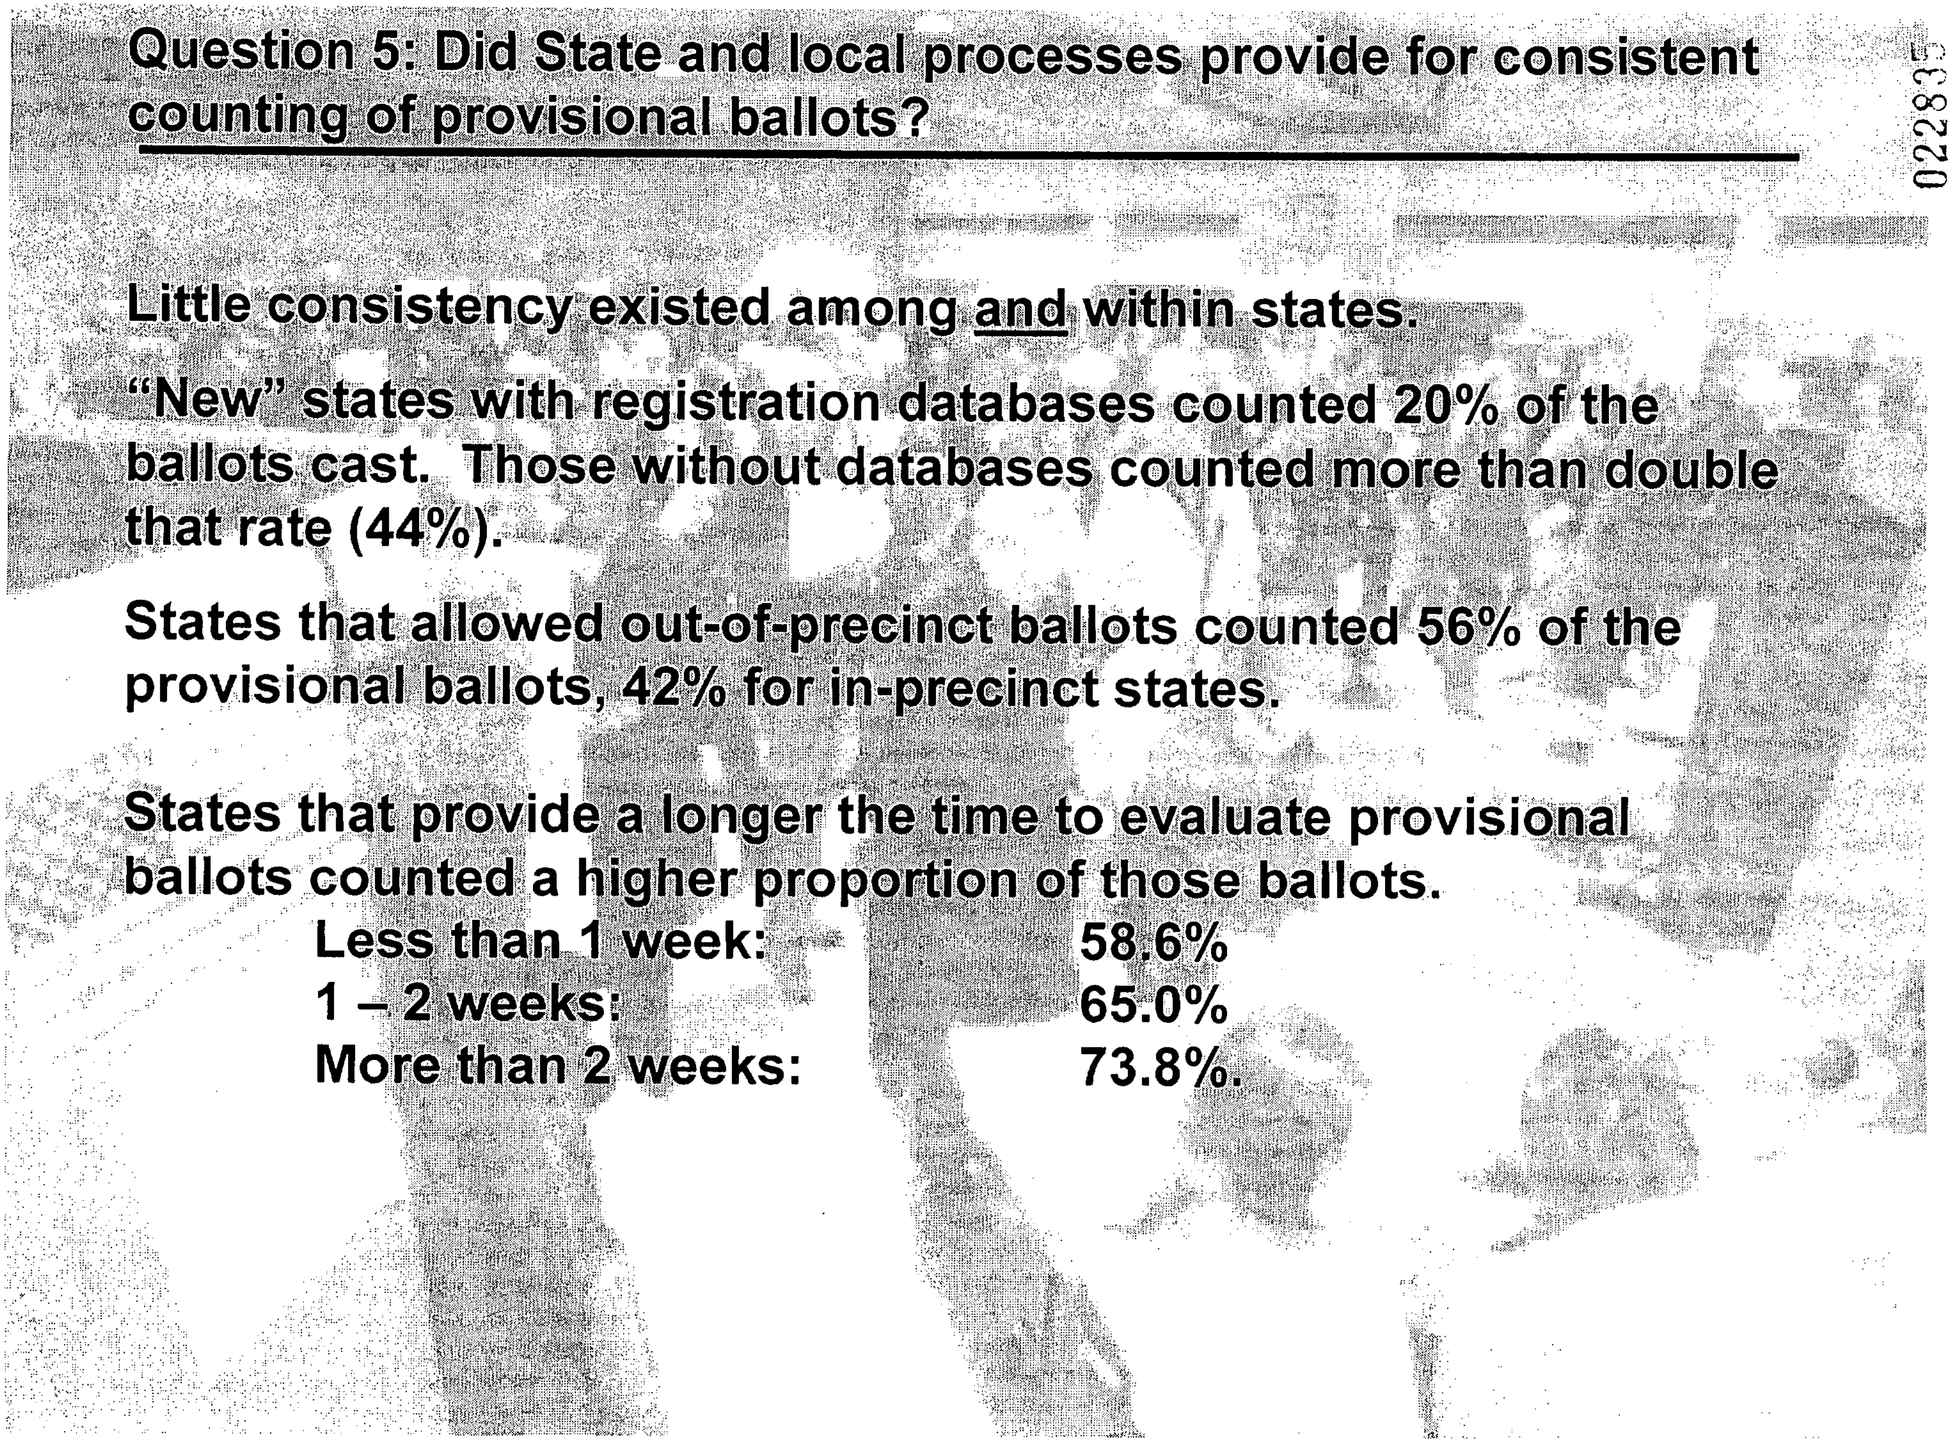


Provisional ballots enfranchised 1.2 million voters, or 1.01% of turnout, who otherwise would have been turned away.

The number of voters who could be helped by provisional voting may be about 2.5 – 3 million. Provisional voting might be about 50% effective.

There is room for improvement.

Question 5: Did State and local processes provide for consistent counting of provisional ballots?



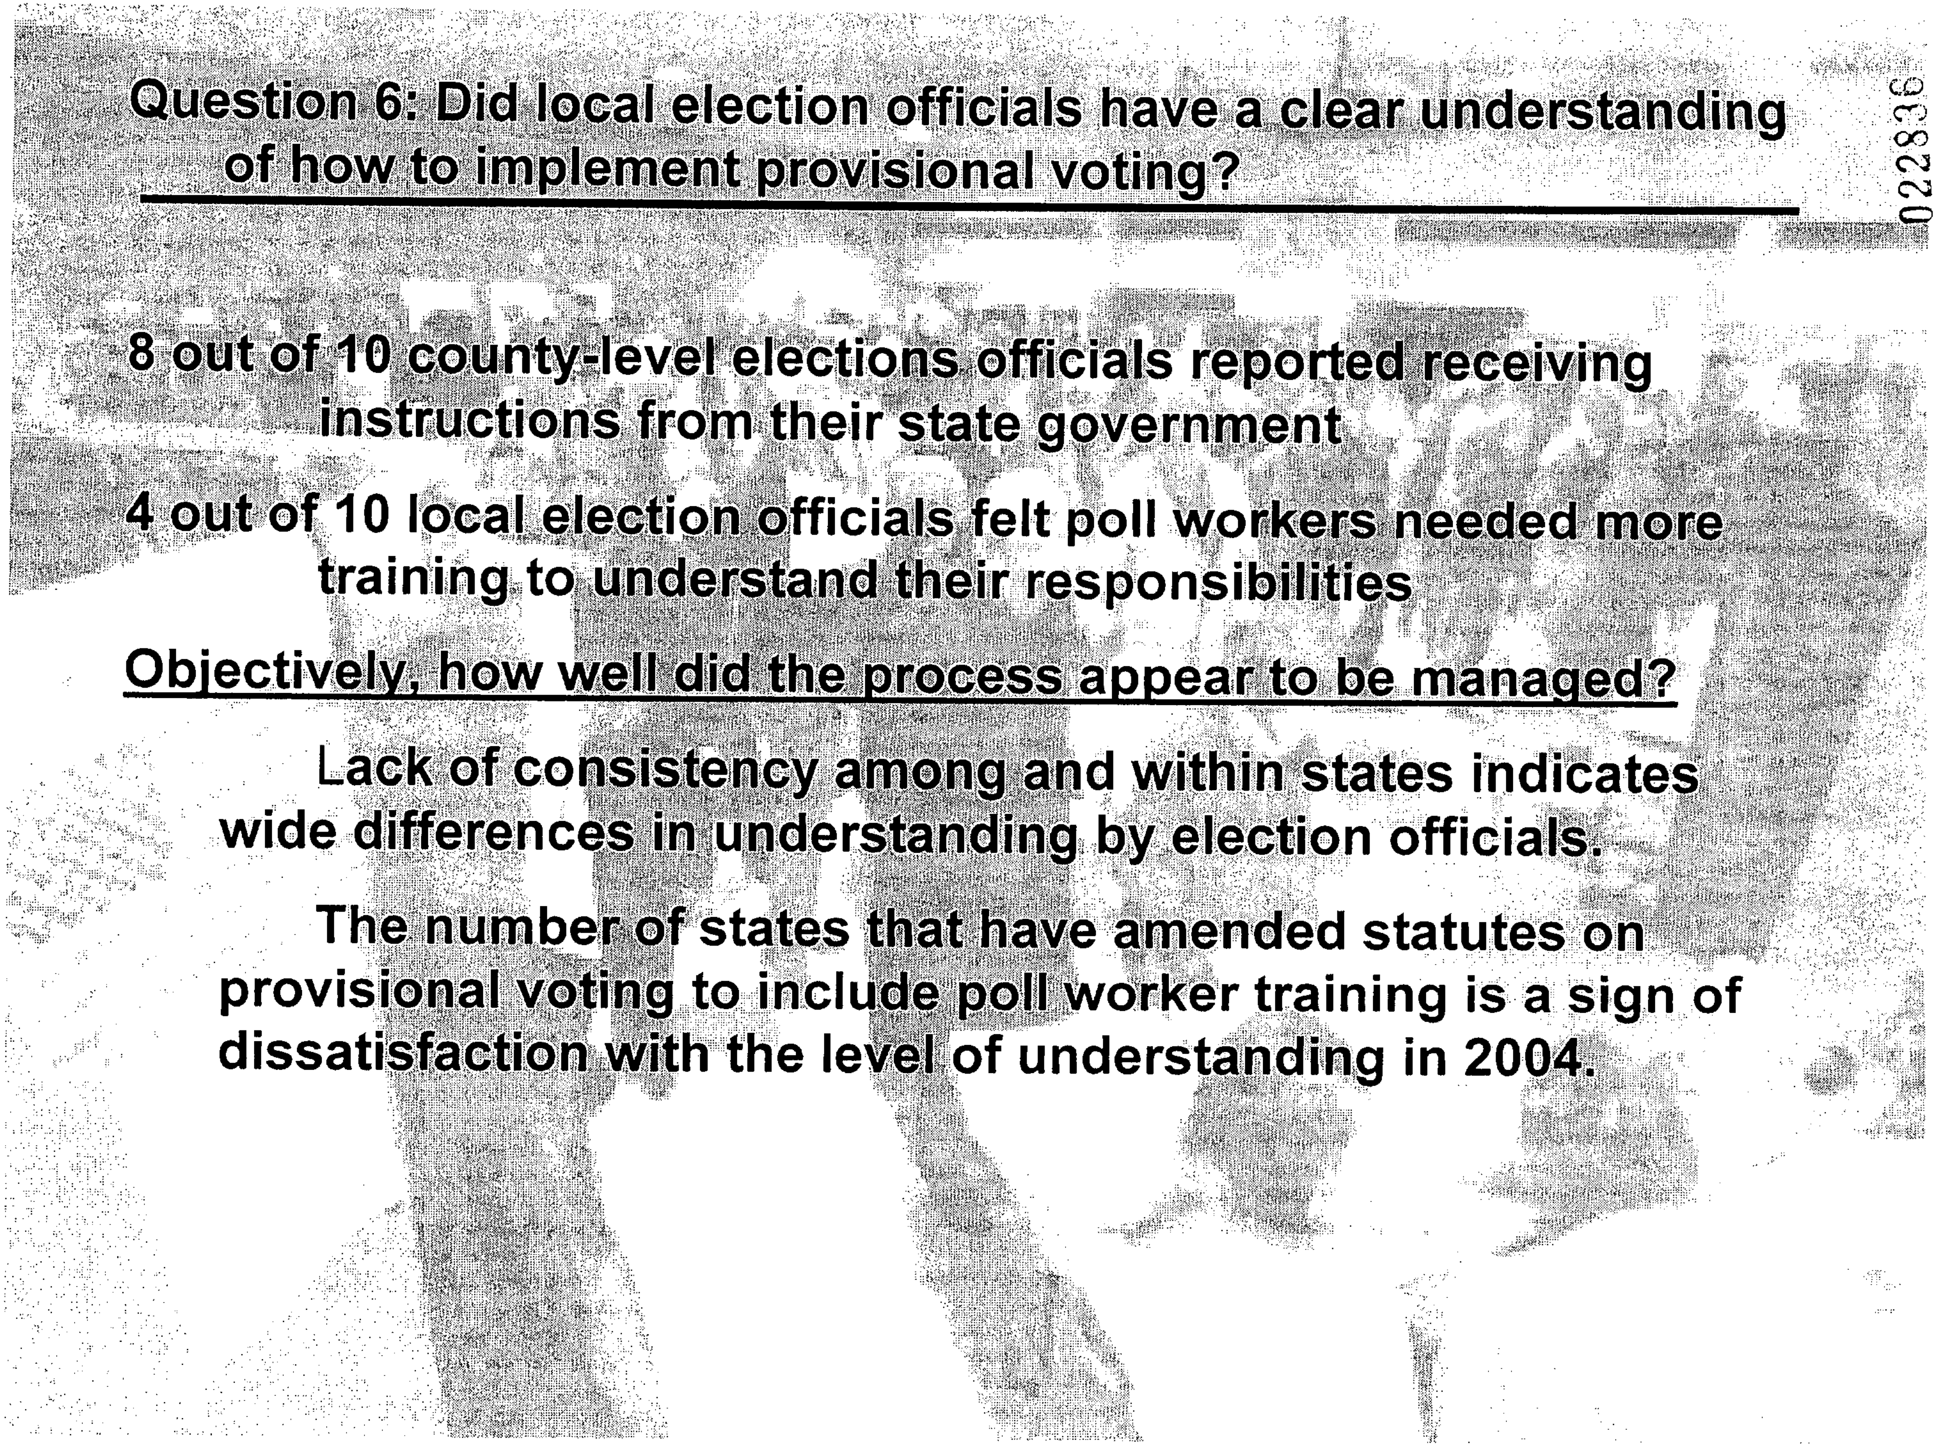
Little consistency existed among and within states.

"New" states with registration databases counted 20% of the ballots cast. Those without databases counted more than double that rate (44%).

States that allowed out-of-precinct ballots counted 56% of the provisional ballots, 42% for in-precinct states.

States that provide a longer the time to evaluate provisional ballots counted a higher proportion of those ballots.

Less than 1 week:	58.6%
1 – 2 weeks:	65.0%
More than 2 weeks:	73.8%.



Question 6: Did local election officials have a clear understanding of how to implement provisional voting?

8 out of 10 county-level elections officials reported receiving instructions from their state government

4 out of 10 local election officials felt poll workers needed more training to understand their responsibilities

Objectively, how well did the process appear to be managed?

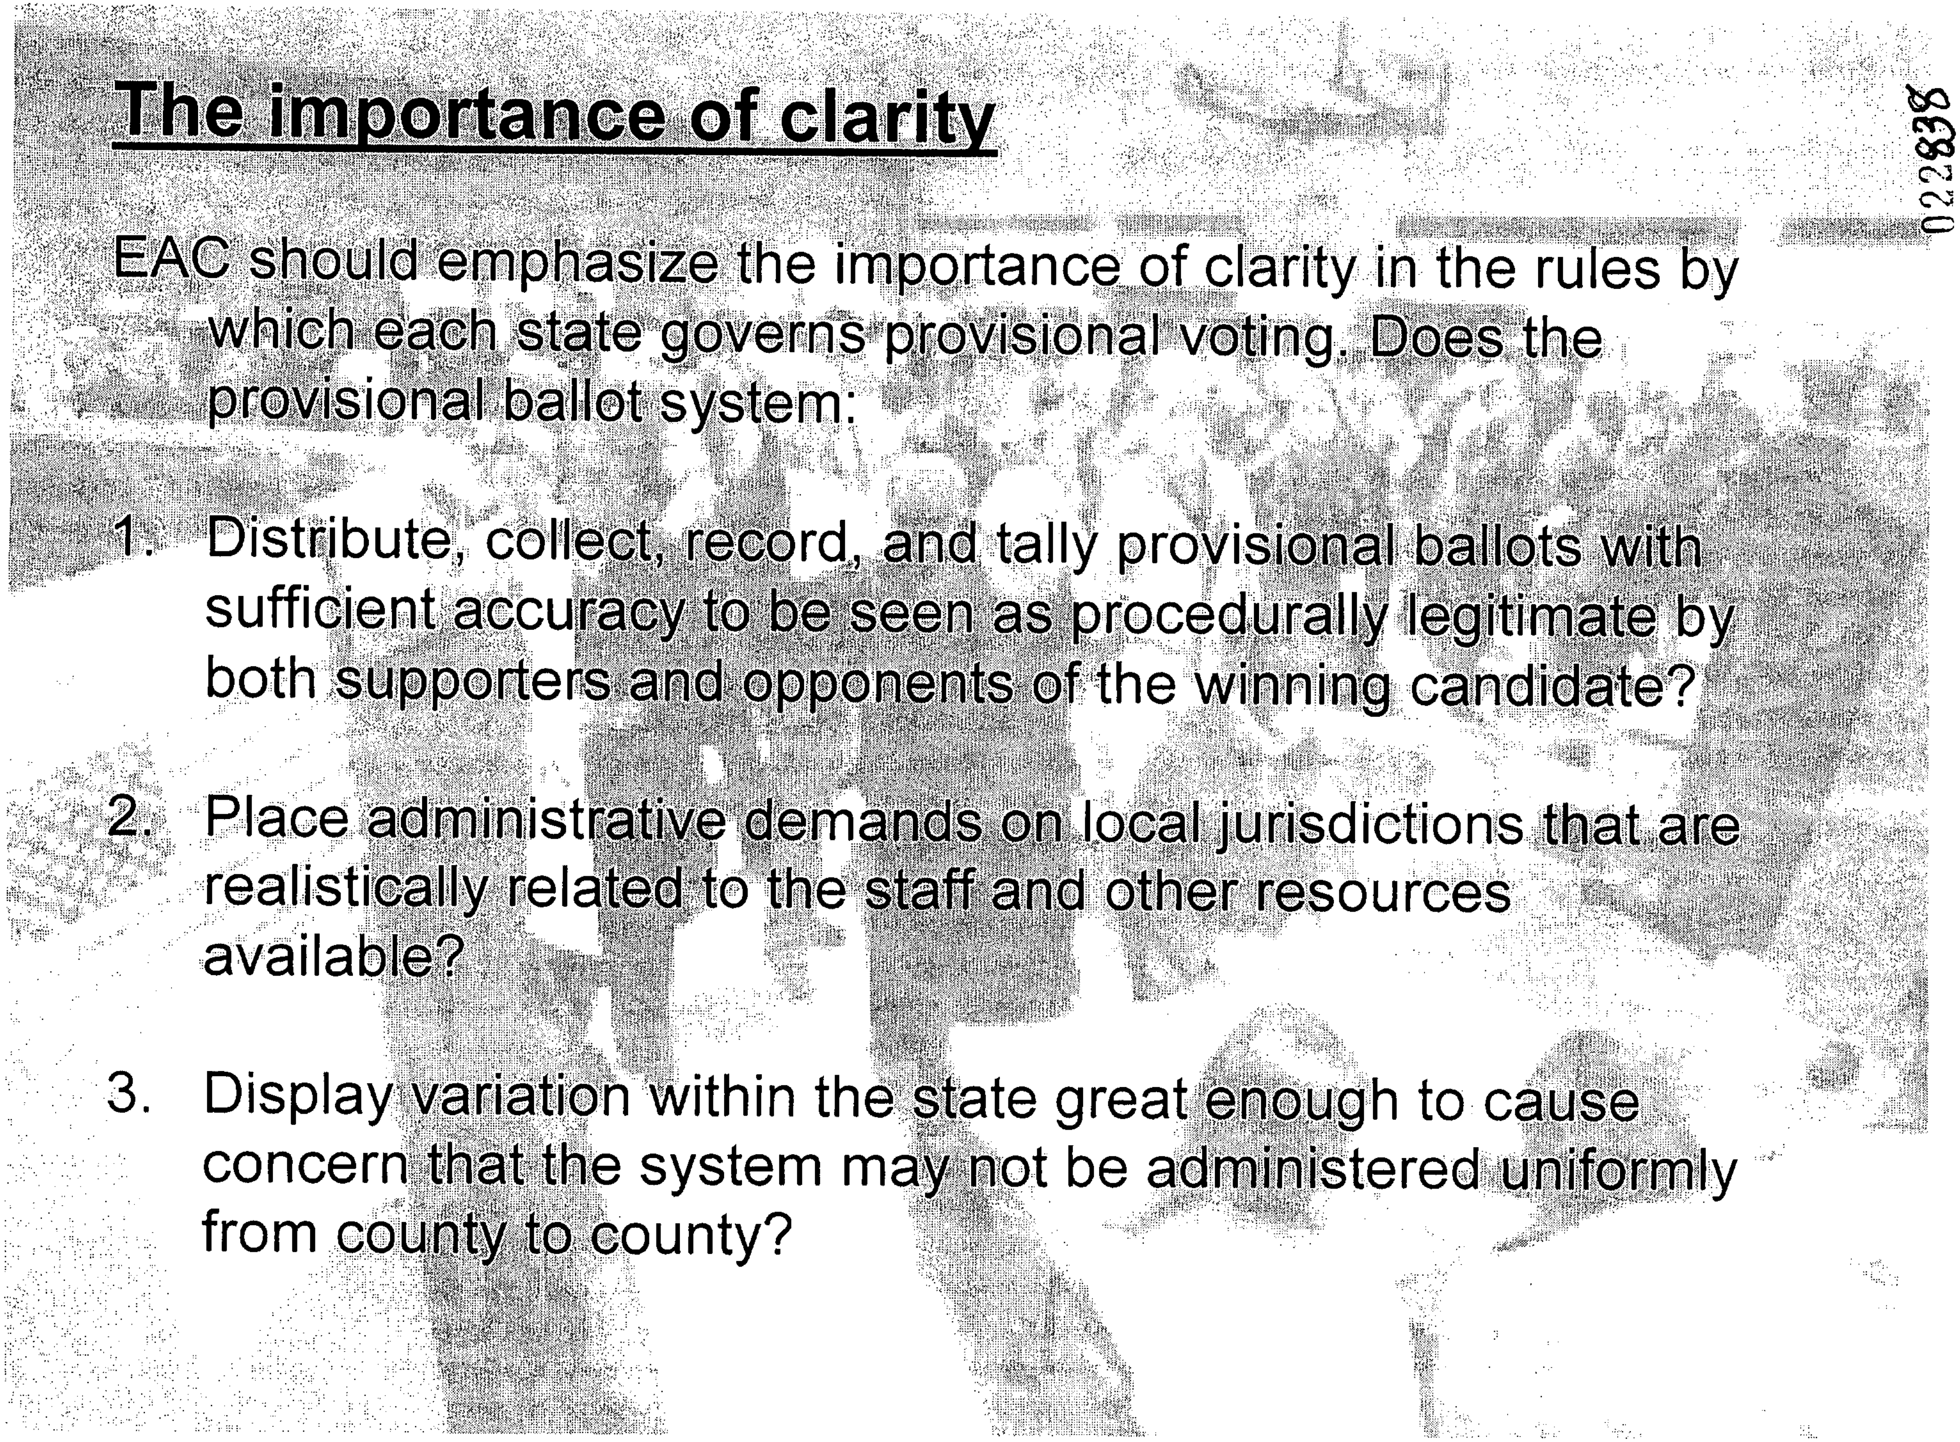
Lack of consistency among and within states indicates wide differences in understanding by election officials.

The number of states that have amended statutes on provisional voting to include poll worker training is a sign of dissatisfaction with the level of understanding in 2004.

RECOMMENDATIONS TO THE EAC

BEST PRACTICES

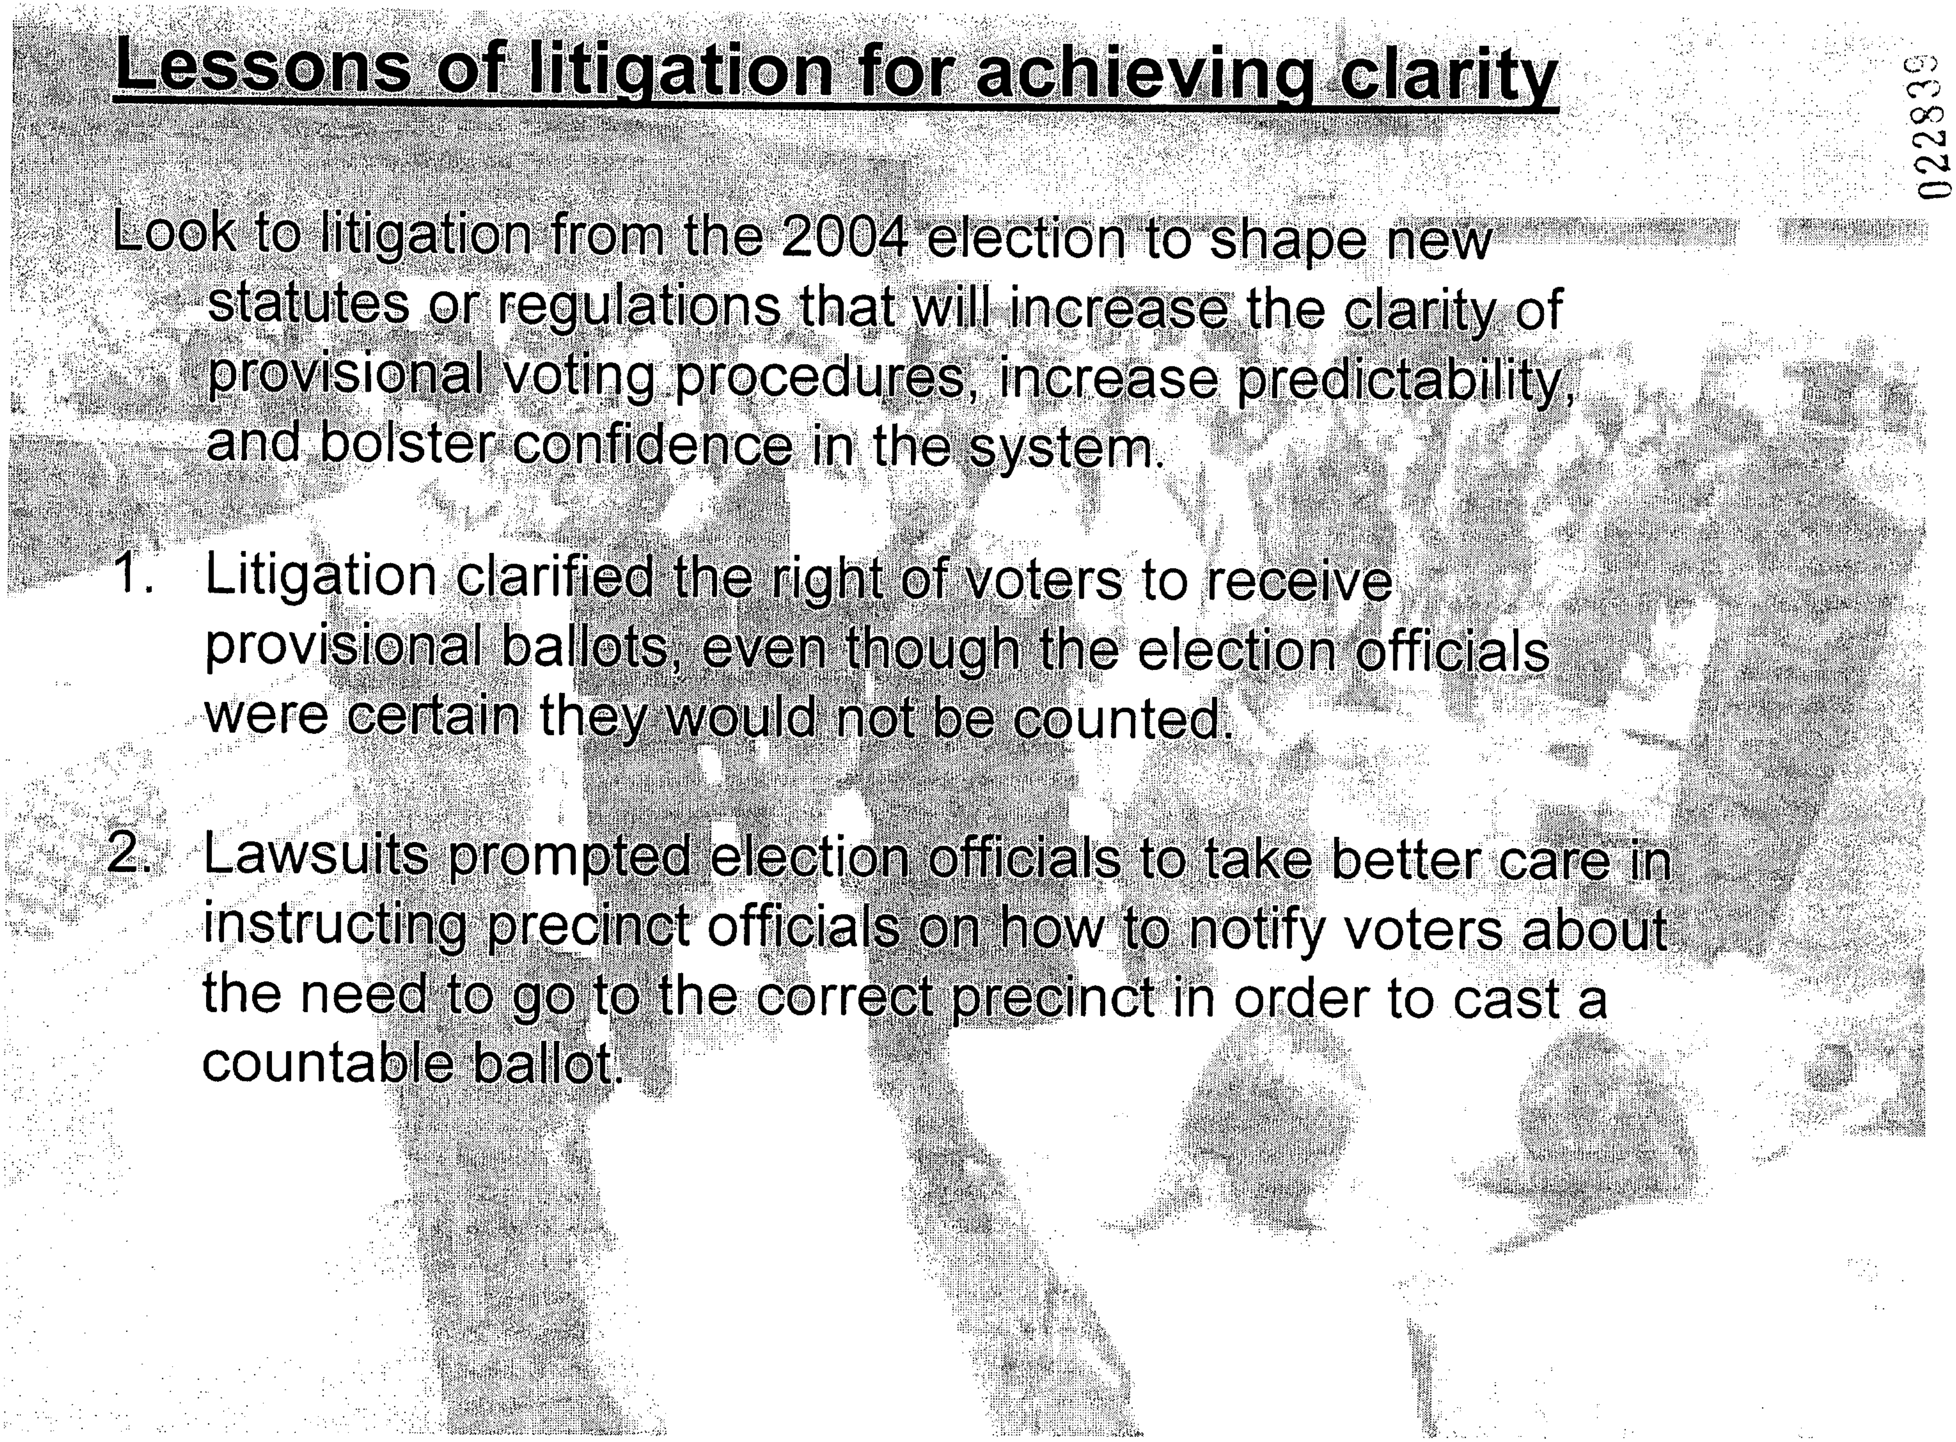
The importance of clarity



EAC should emphasize the importance of clarity in the rules by which each state governs provisional voting. Does the provisional ballot system:

1. Distribute, collect, record, and tally provisional ballots with sufficient accuracy to be seen as procedurally legitimate by both supporters and opponents of the winning candidate?
2. Place administrative demands on local jurisdictions that are realistically related to the staff and other resources available?
3. Display variation within the state great enough to cause concern that the system may not be administered uniformly from county to county?

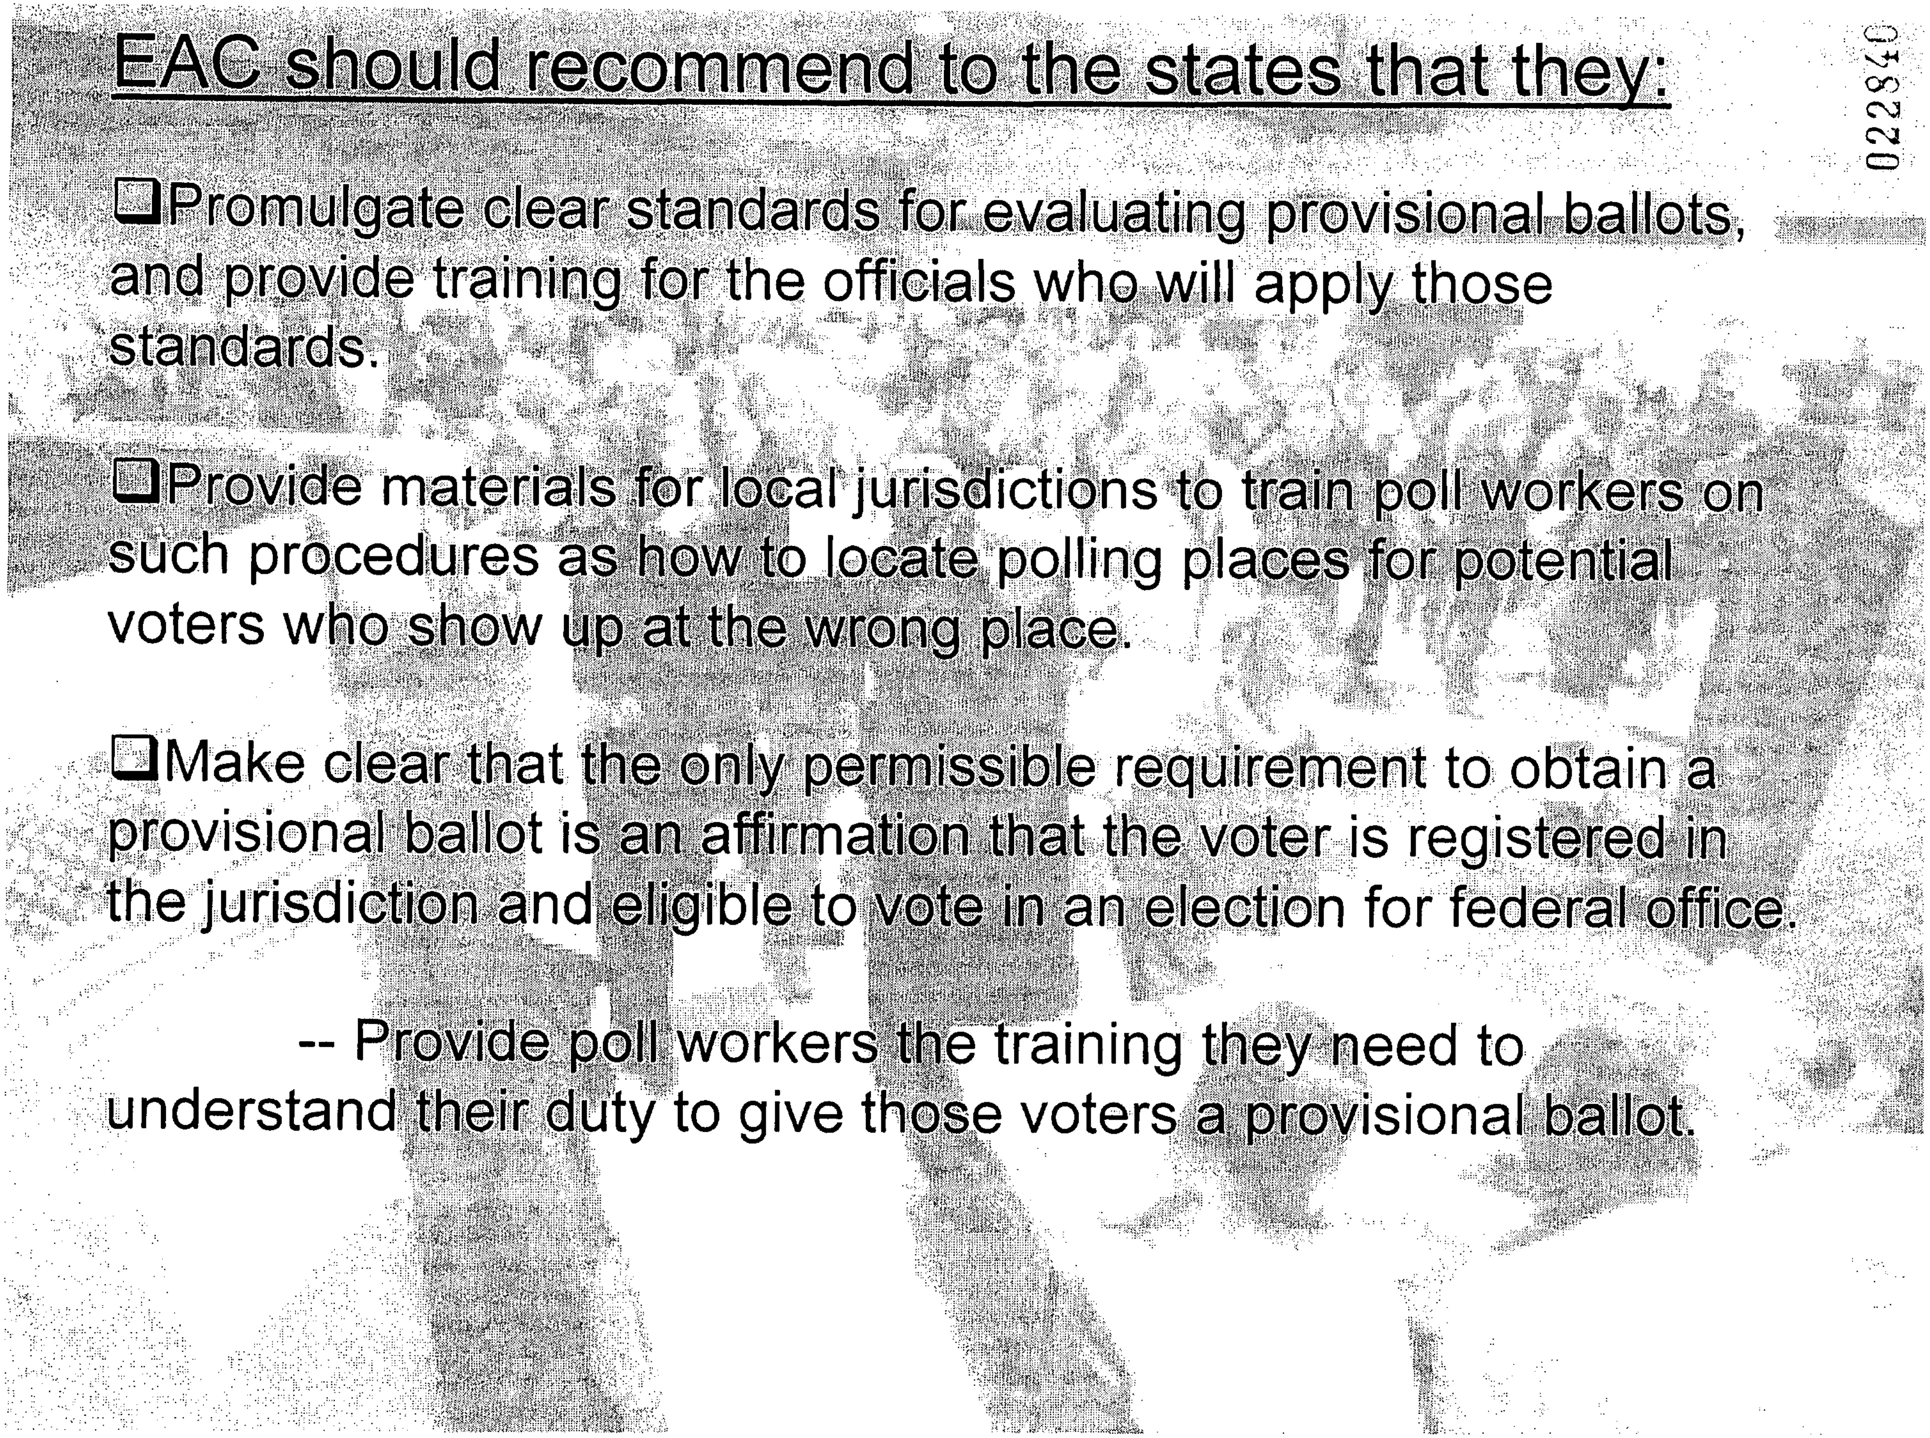
Lessons of litigation for achieving clarity



Look to litigation from the 2004 election to shape new statutes or regulations that will increase the clarity of provisional voting procedures, increase predictability, and bolster confidence in the system.

1. Litigation clarified the right of voters to receive provisional ballots, even though the election officials were certain they would not be counted.

2. Lawsuits prompted election officials to take better care in instructing precinct officials on how to notify voters about the need to go to the correct precinct in order to cast a countable ballot.



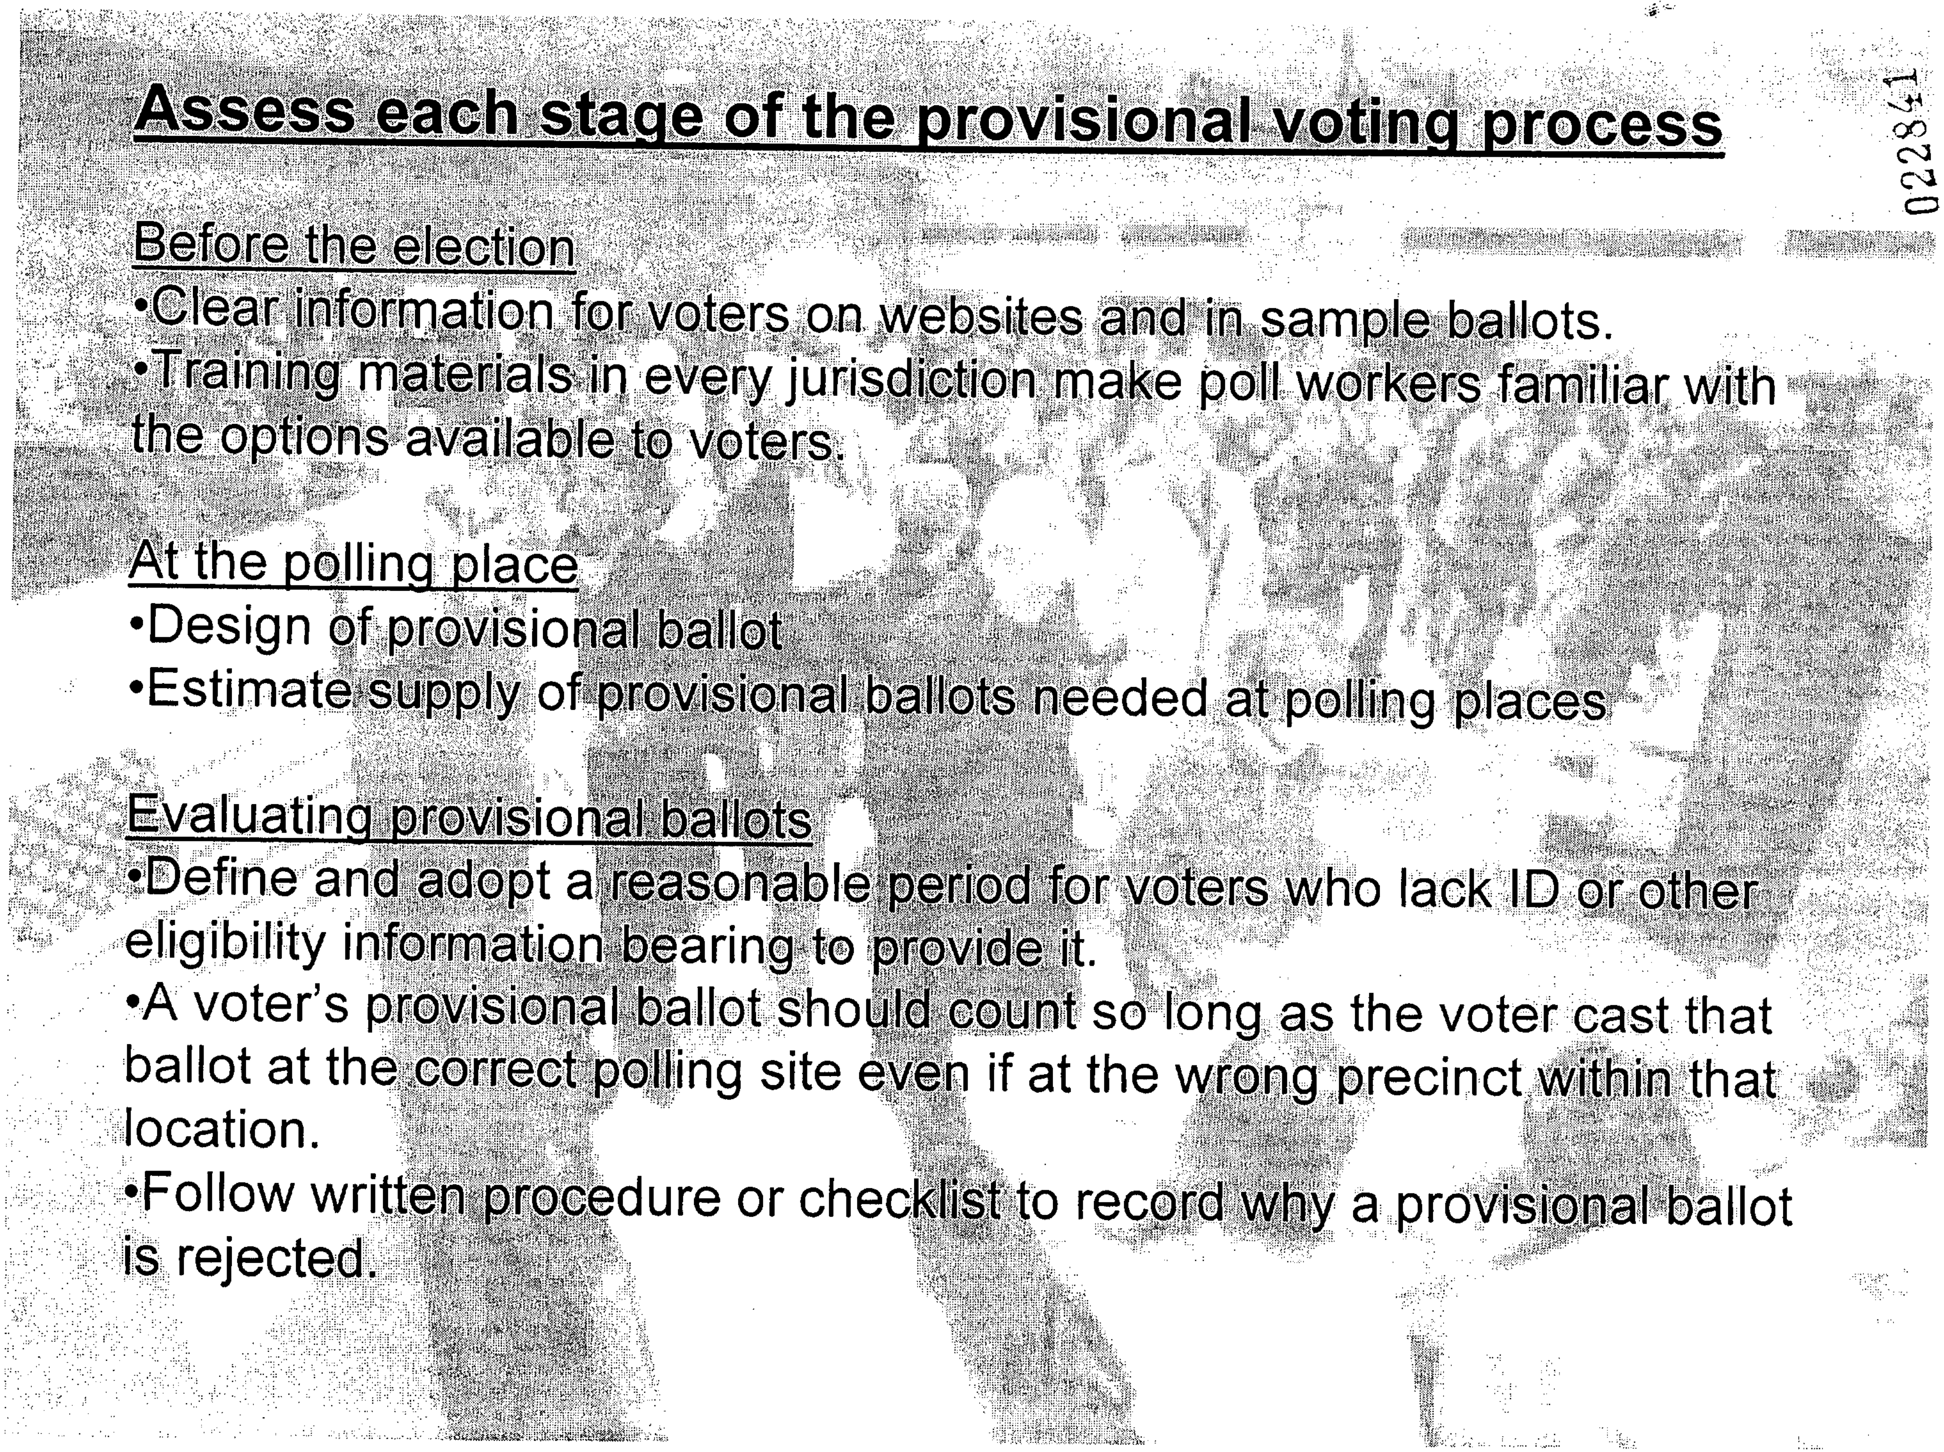
EAC should recommend to the states that they:

☐Promulgate clear standards for evaluating provisional ballots, and provide training for the officials who will apply those standards.

☐Provide materials for local jurisdictions to train poll workers on such procedures as how to locate polling places for potential voters who show up at the wrong place.

☐Make clear that the only permissible requirement to obtain a provisional ballot is an affirmation that the voter is registered in the jurisdiction and eligible to vote in an election for federal office.

-- Provide poll workers the training they need to understand their duty to give those voters a provisional ballot.



Assess each stage of the provisional voting process

Before the election

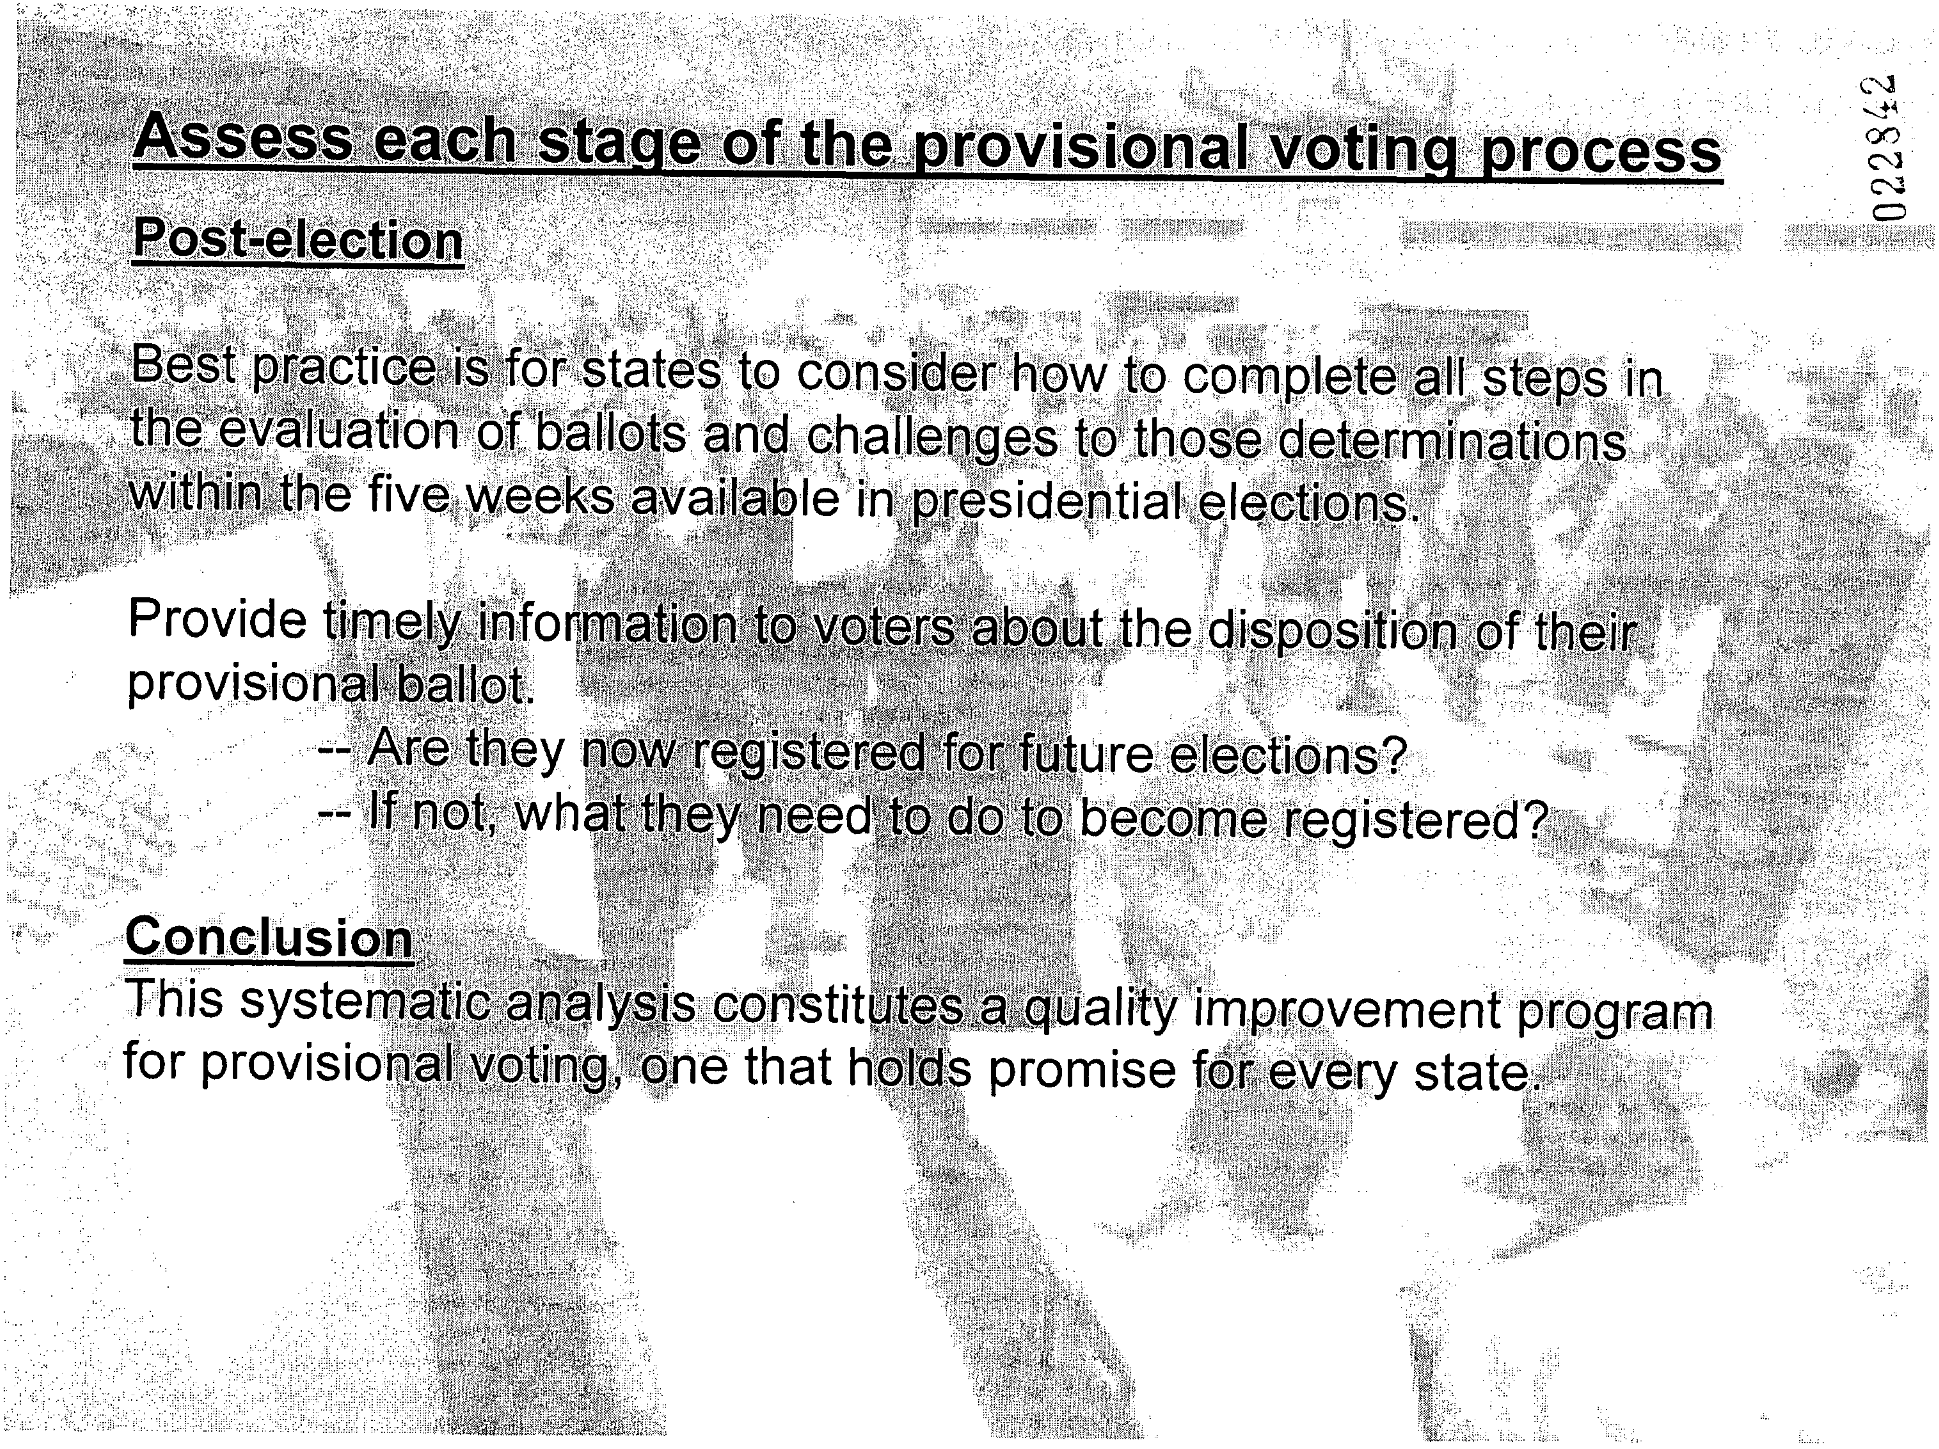
- Clear information for voters on websites and in sample ballots.
- Training materials in every jurisdiction make poll workers familiar with the options available to voters.

At the polling place

- Design of provisional ballot
- Estimate supply of provisional ballots needed at polling places

Evaluating provisional ballots

- Define and adopt a reasonable period for voters who lack ID or other eligibility information bearing to provide it.
- A voter's provisional ballot should count so long as the voter cast that ballot at the correct polling site even if at the wrong precinct within that location.
- Follow written procedure or checklist to record why a provisional ballot is rejected.



Assess each stage of the provisional voting process

Post-election

Best practice is for states to consider how to complete all steps in the evaluation of ballots and challenges to those determinations within the five weeks available in presidential elections.

Provide timely information to voters about the disposition of their provisional ballot.

-- Are they now registered for future elections?
-- If not, what they need to do to become registered?

Conclusion

This systematic analysis constitutes a quality improvement program for provisional voting, one that holds promise for every state.

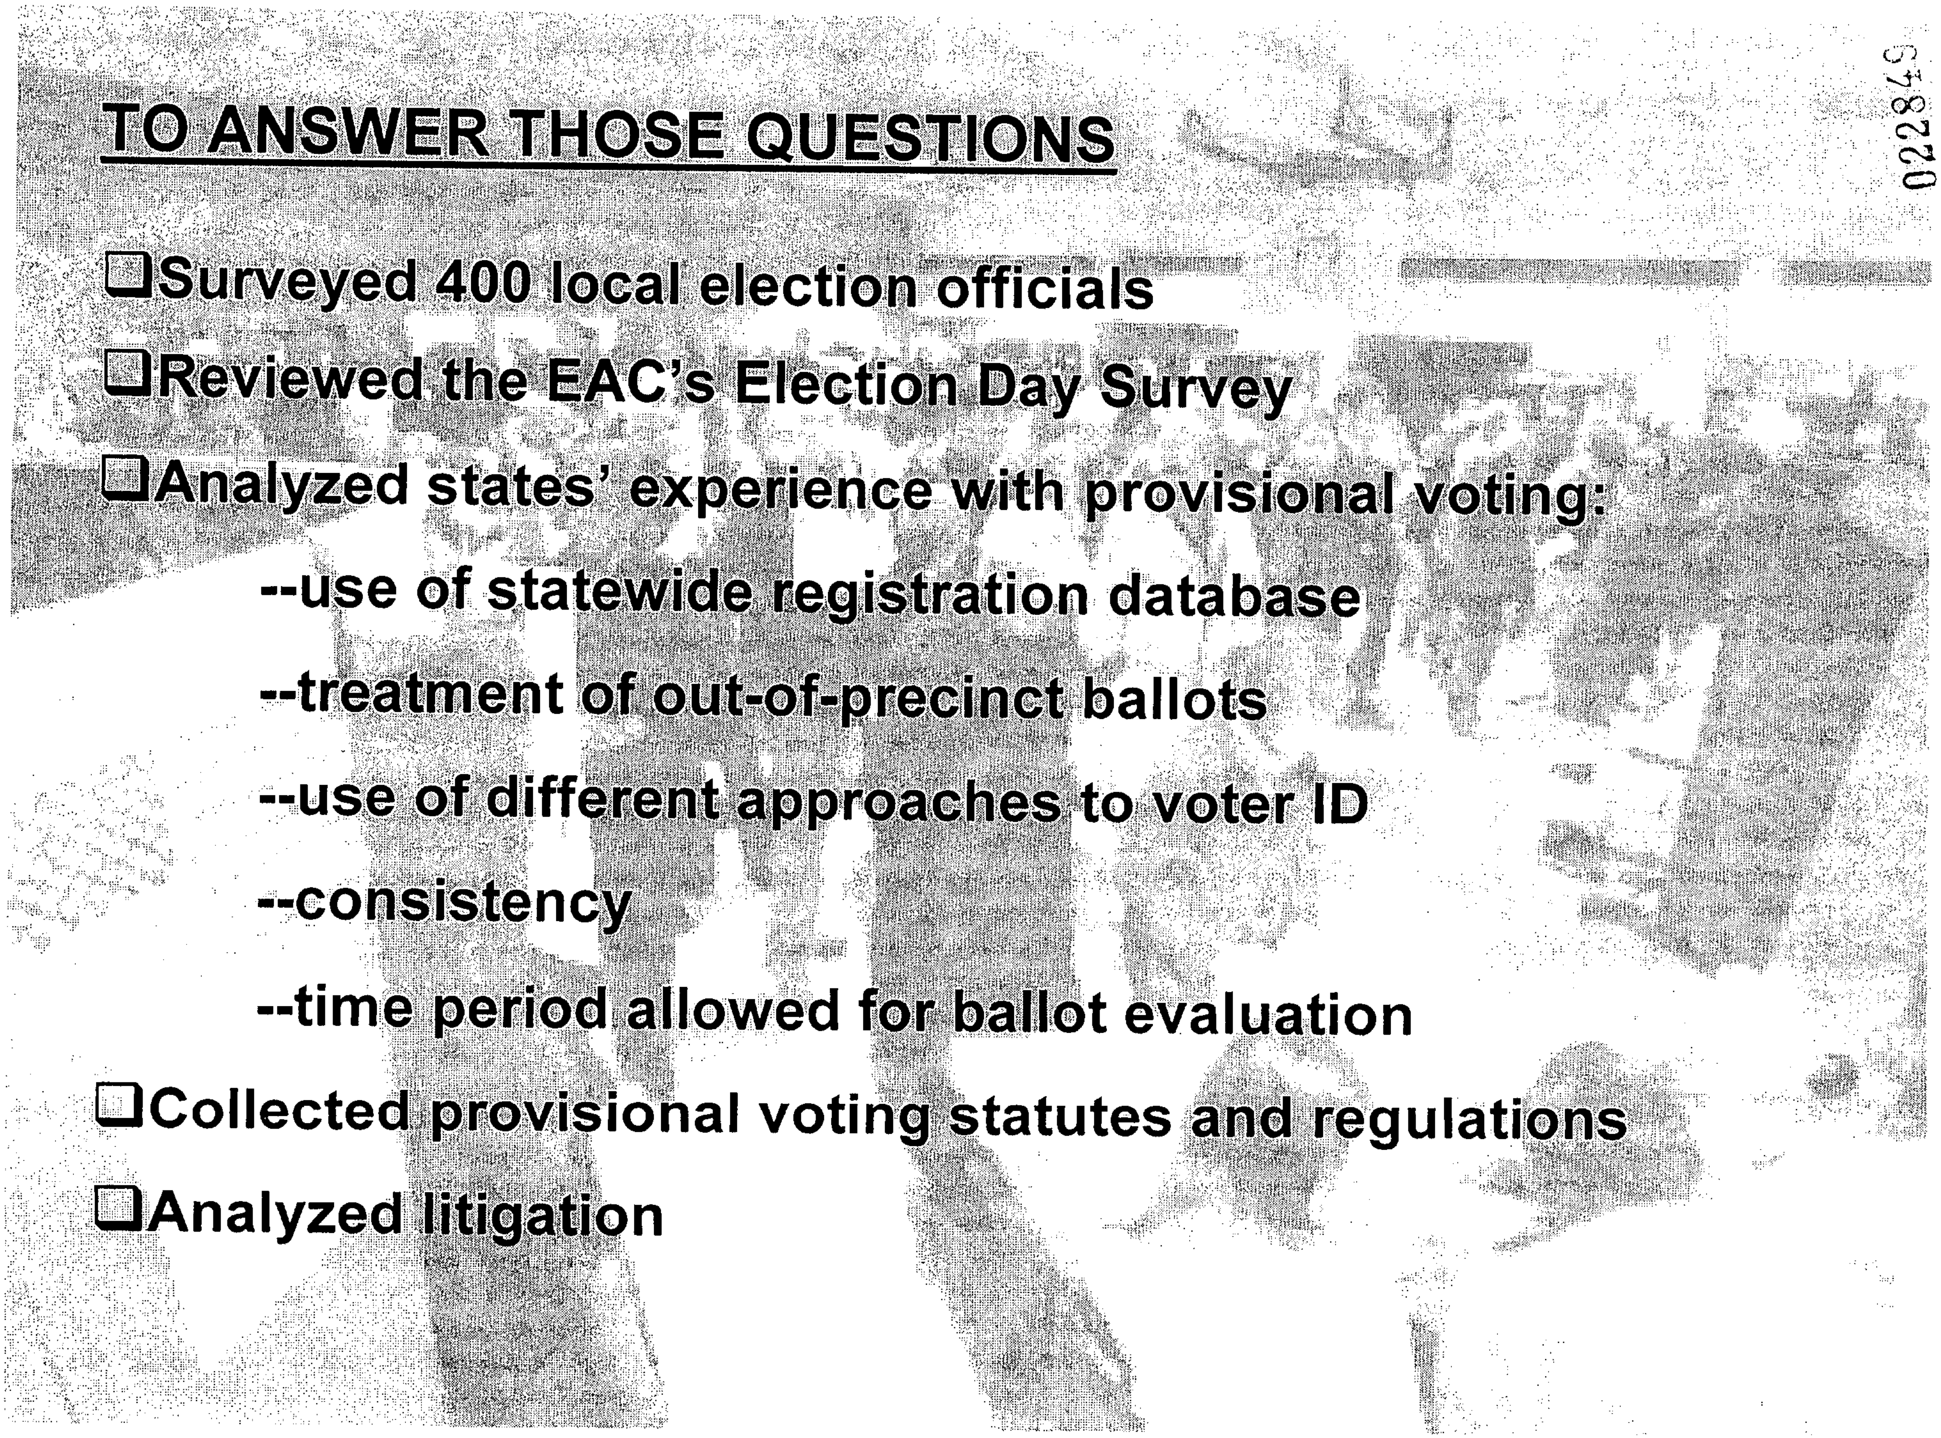
QUESTIONS RAISED BY THE EAC

1. How did states prepare for HAVA's provisional voting requirements?
2. How did preparation and performance vary between states that had previously had some form of Provisional Ballot and those did not?
3. How did litigation affect the implementation of Provisional Voting?
4. How effective was provisional voting in enfranchising qualified voters?
5. Did State and local processes provide for consistent counting of provisional ballots?
6. Did local election officials have a clear understanding of how to implement provisional voting?



TO ANSWER THOSE QUESTIONS

☐Surveyed 400 local election officials

☐Reviewed the EAC's Election Day Survey

☐Analyzed states' experience with provisional voting:

--use of statewide registration database

--treatment of out-of-precinct ballots

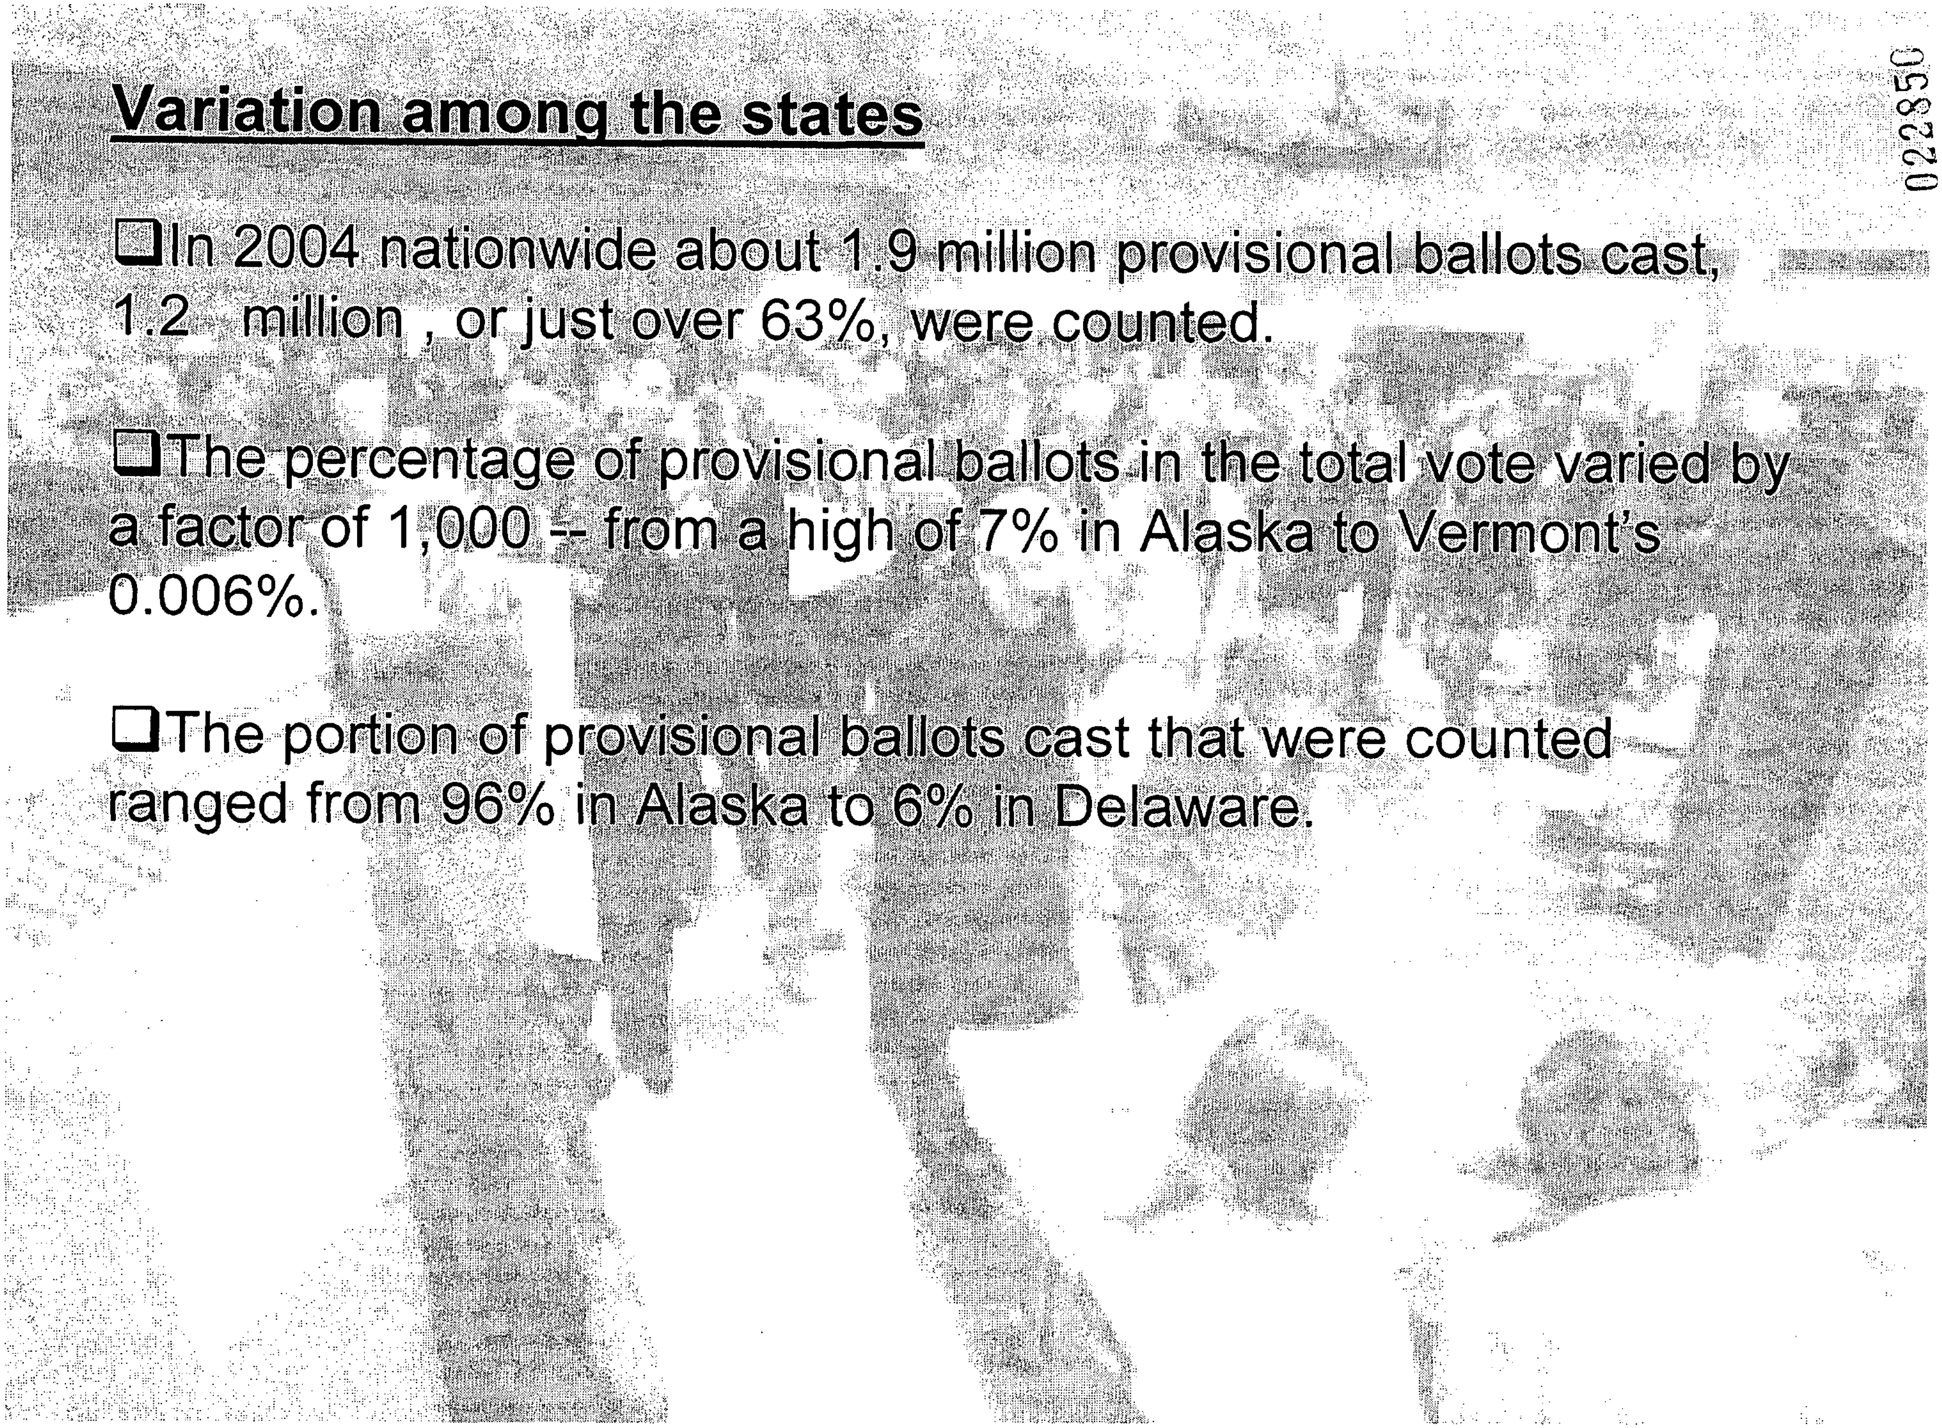
--use of different approaches to voter ID

--consistency

--time period allowed for ballot evaluation

☐Collected provisional voting statutes and regulations

☐Analyzed litigation

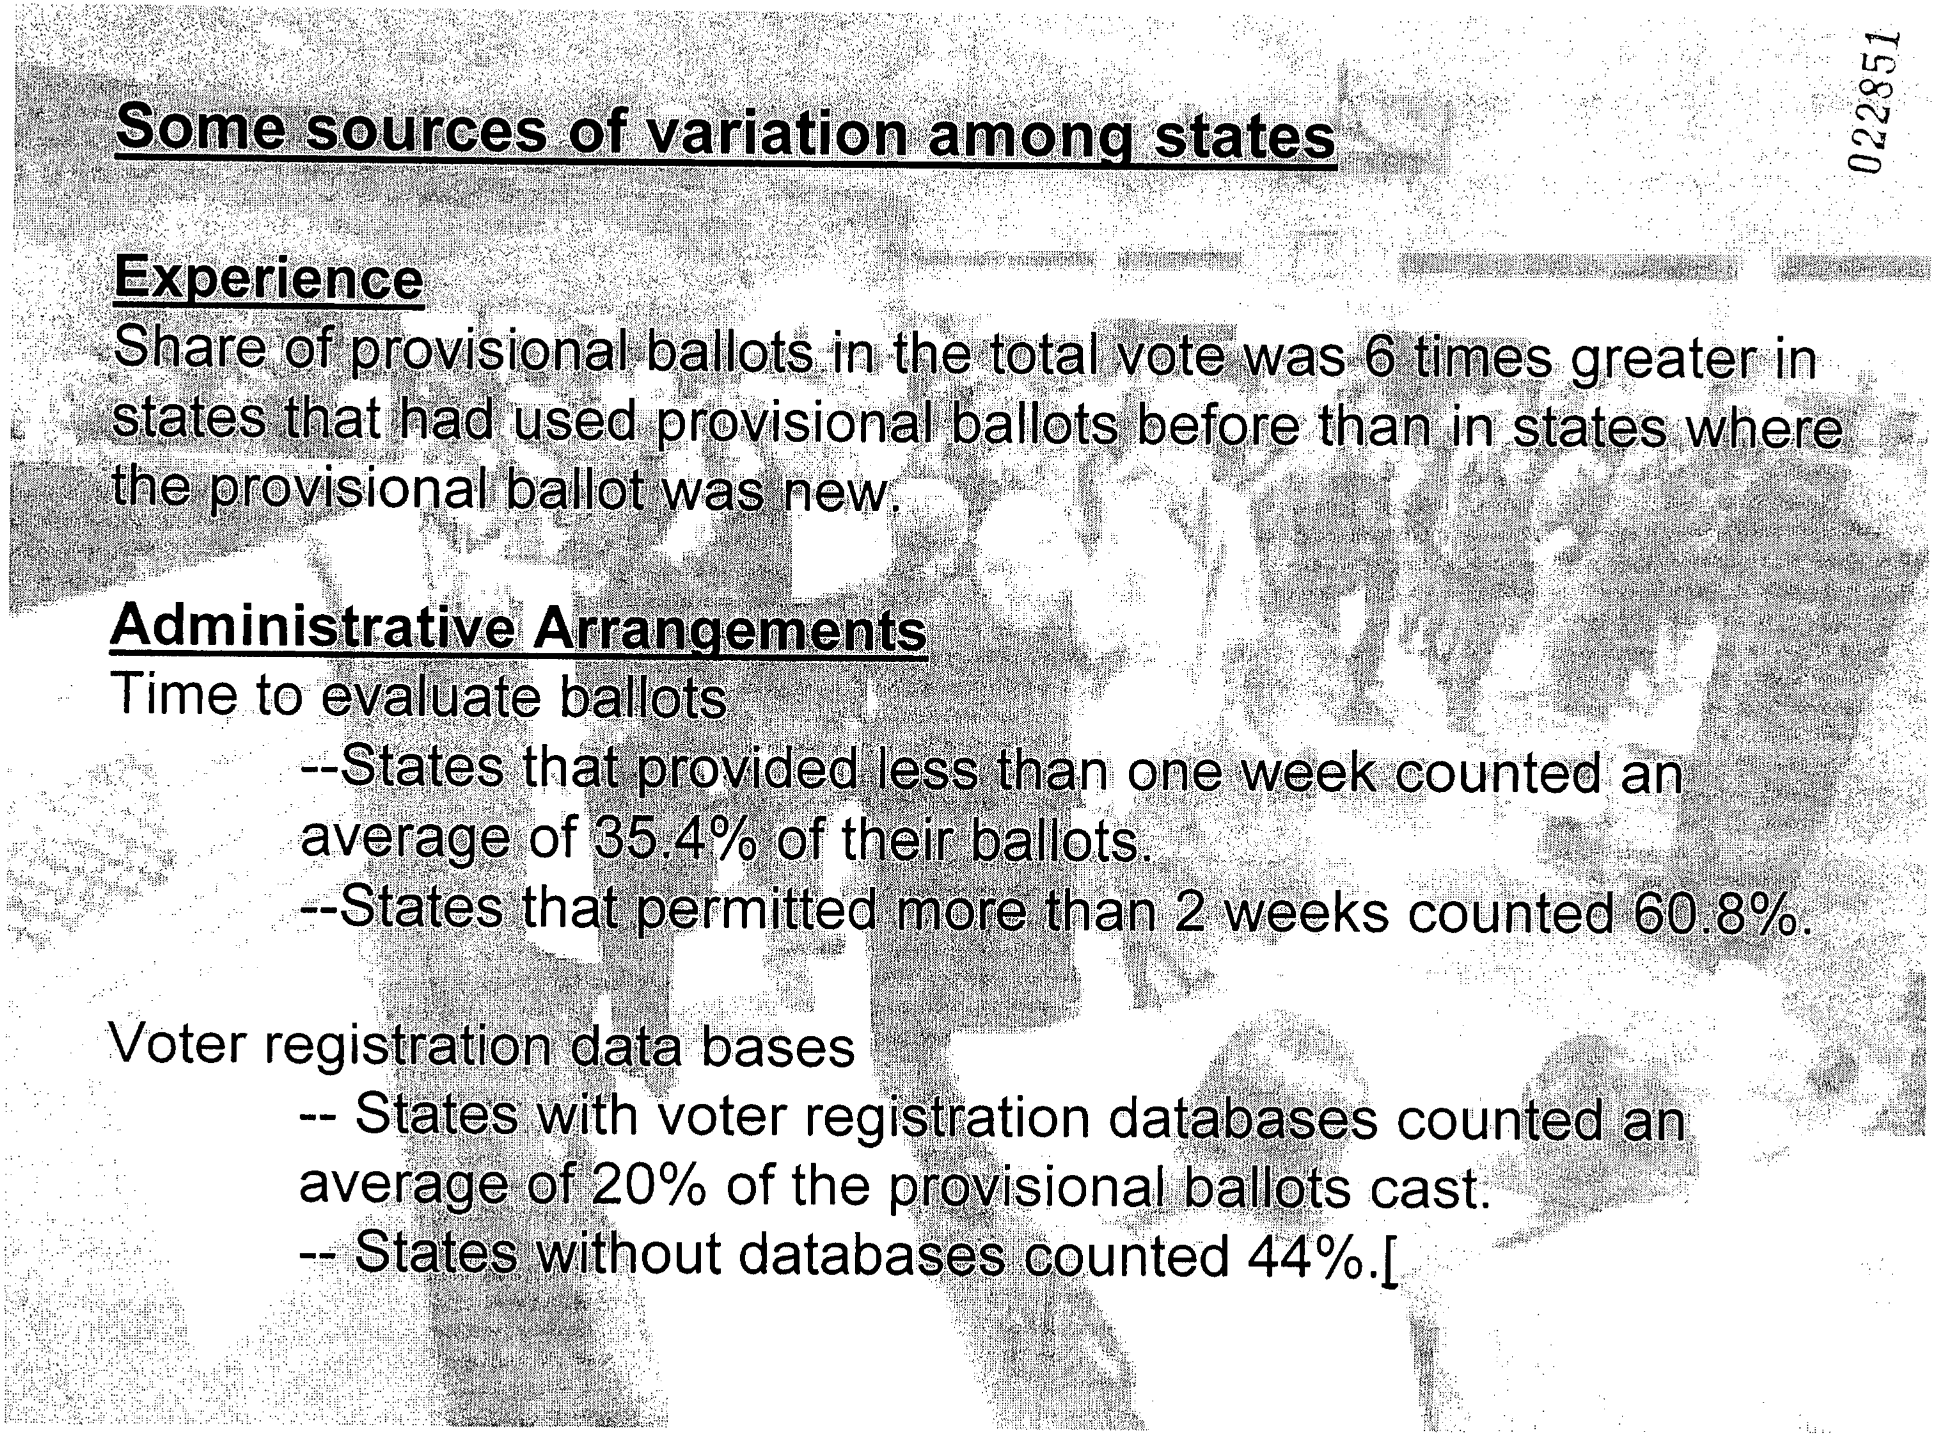


Variation among the states

- In 2004 nationwide about 1.9 million provisional ballots cast, 1.2 million , or just over 63%, were counted.

- The percentage of provisional ballots in the total vote varied by a factor of 1,000 -- from a high of 7% in Alaska to Vermont's 0.006%.

- The portion of provisional ballots cast that were counted ranged from 96% in Alaska to 6% in Delaware.



Some sources of variation among states

Experience

Share of provisional ballots in the total vote was 6 times greater in states that had used provisional ballots before than in states where the provisional ballot was new.

Administrative Arrangements

Time to evaluate ballots

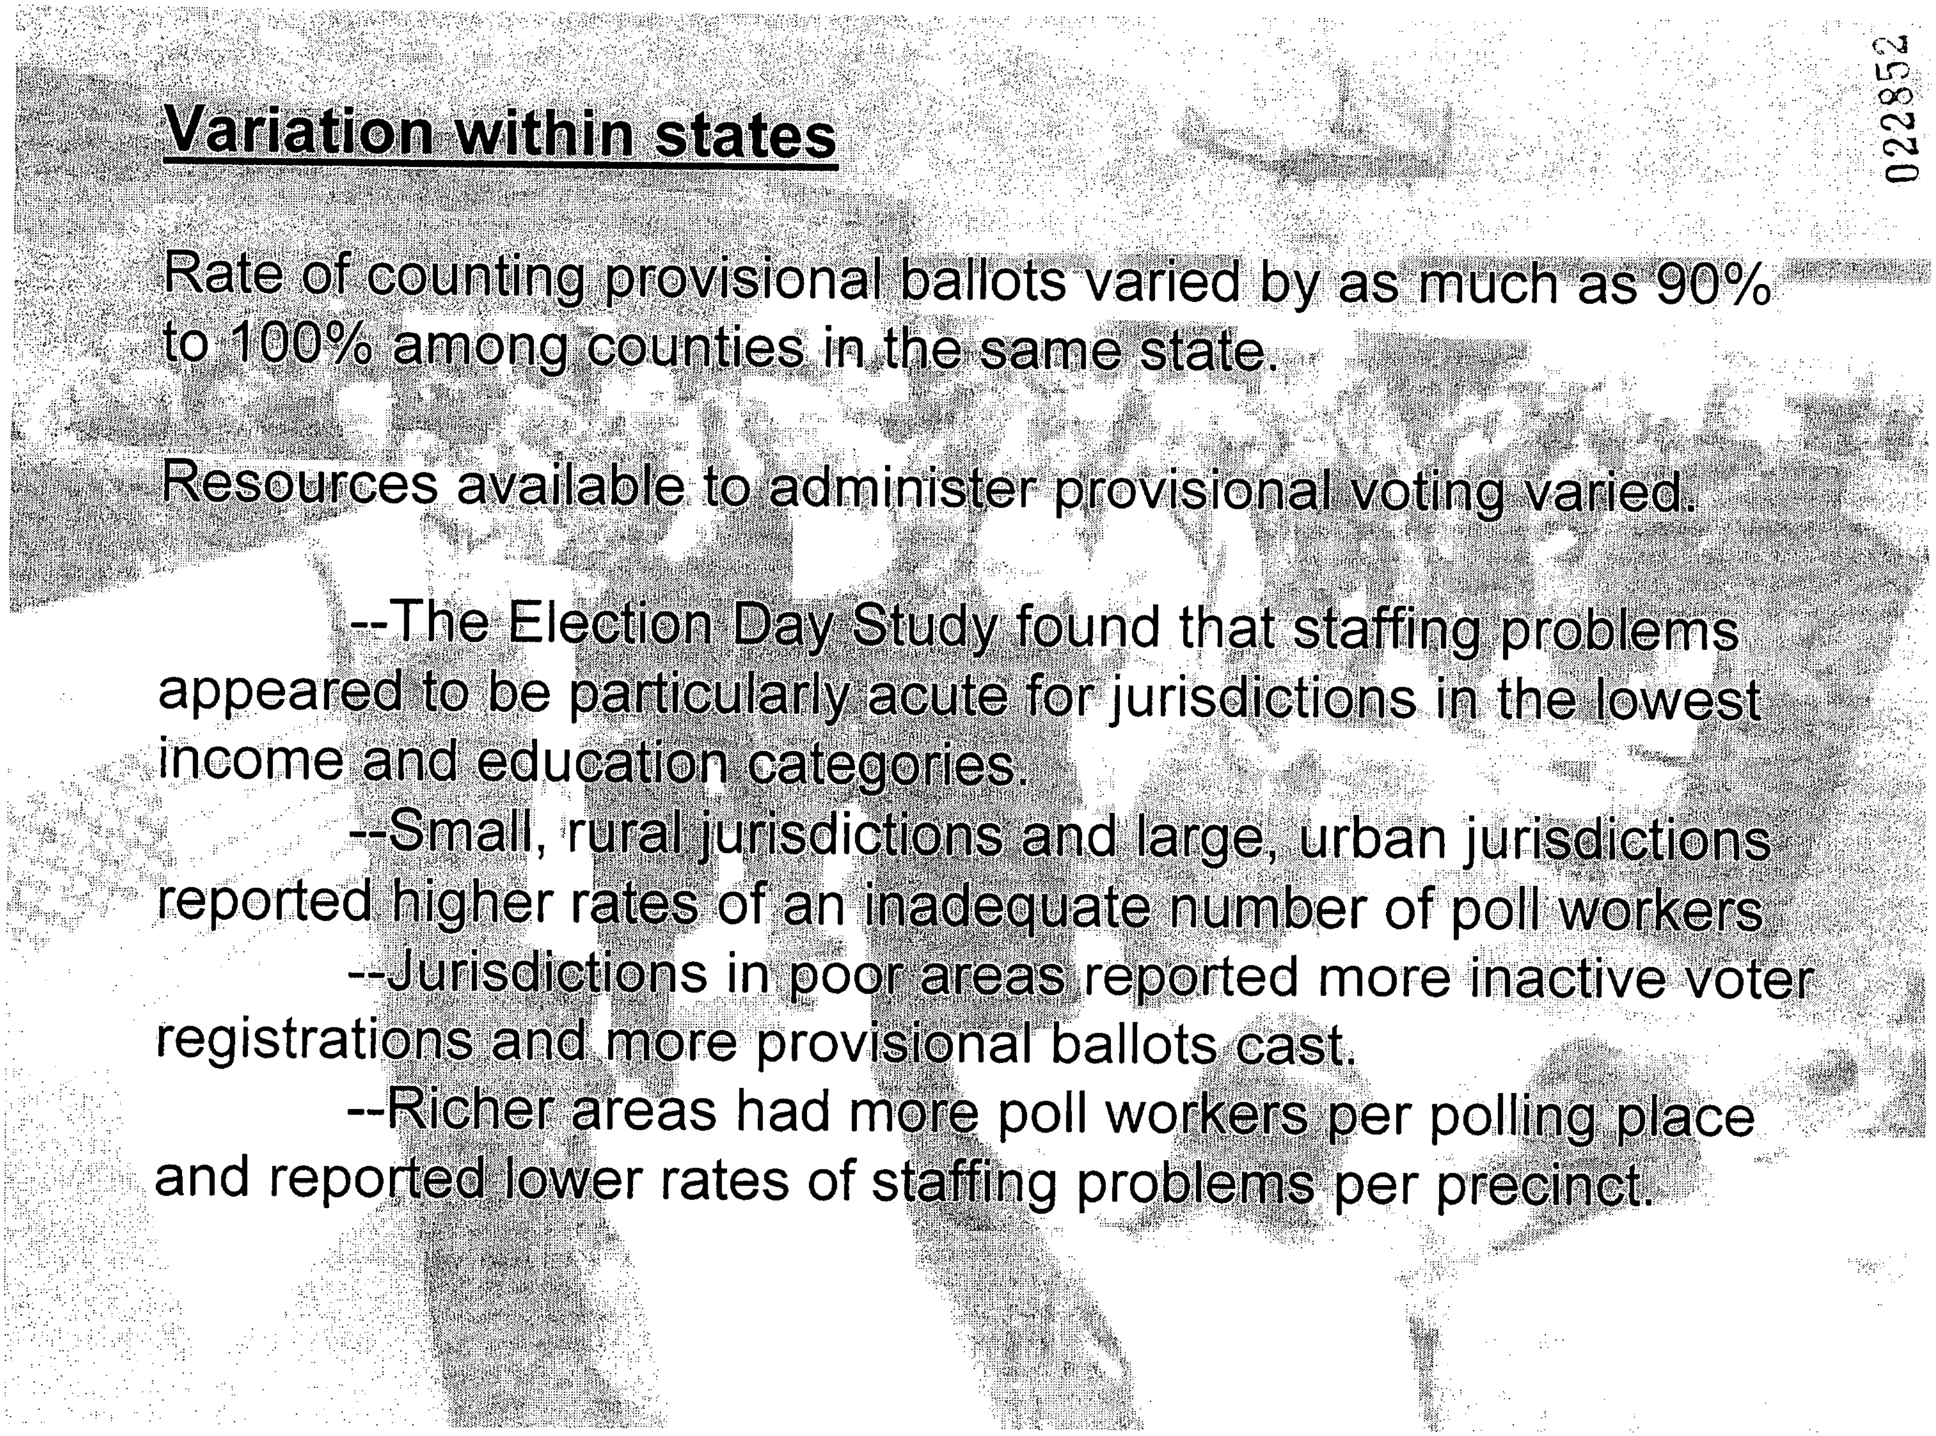
--States that provided less than one week counted an average of 35.4% of their ballots.

--States that permitted more than 2 weeks counted 60.8%.

Voter registration data bases

-- States with voter registration databases counted an average of 20% of the provisional ballots cast.

-- States without databases counted 44%.[



Variation within states

Rate of counting provisional ballots varied by as much as 90% to 100% among counties in the same state.

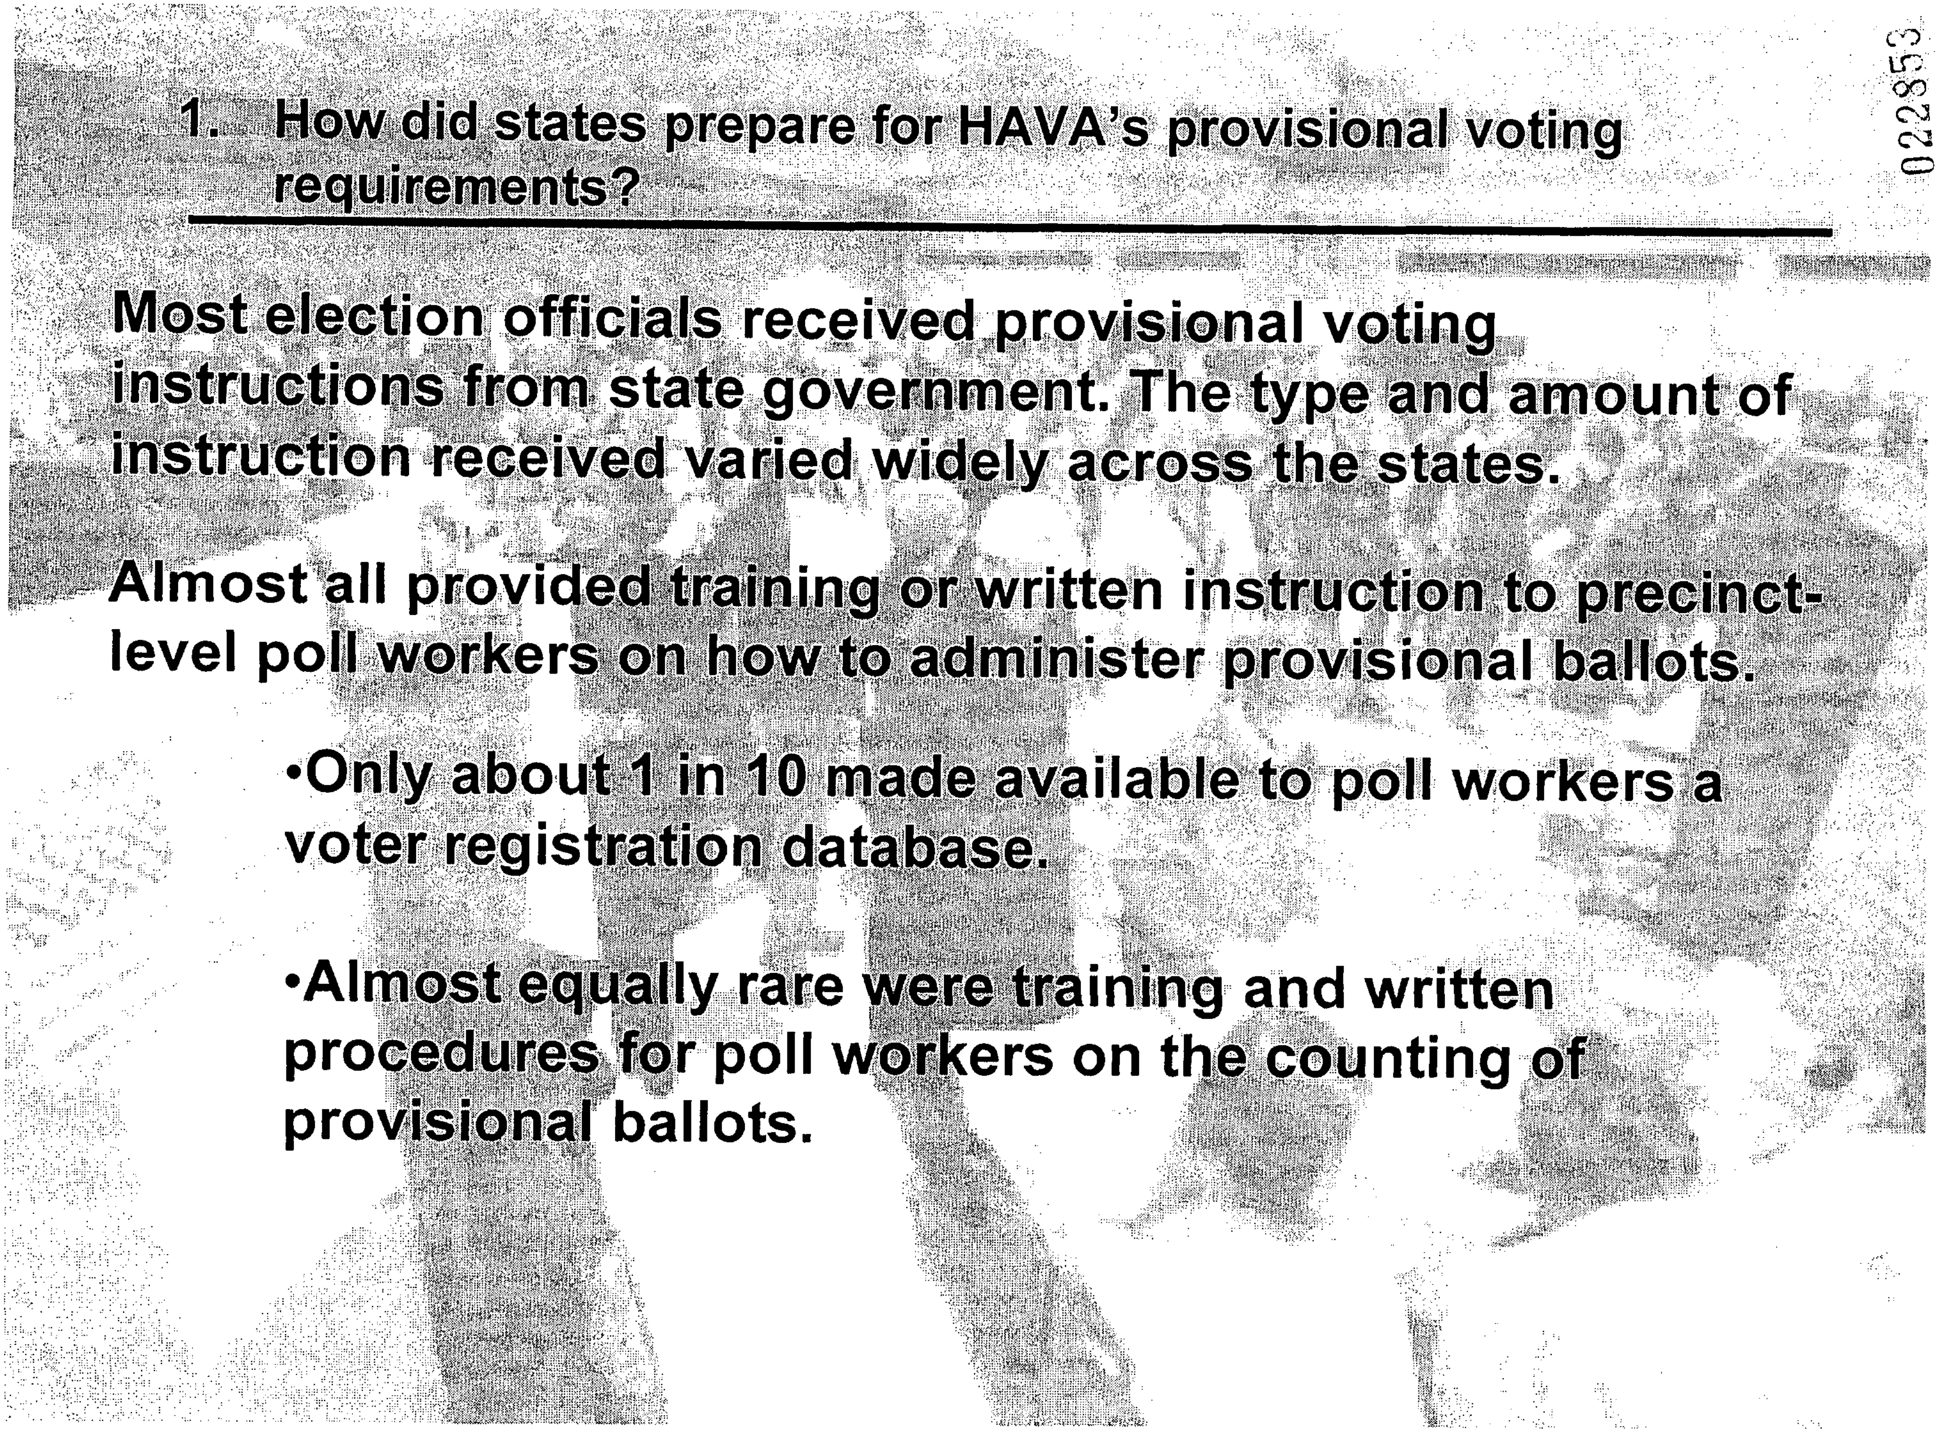
Resources available to administer provisional voting varied.

--The Election Day Study found that staffing problems appeared to be particularly acute for jurisdictions in the lowest income and education categories.

--Small, rural jurisdictions and large, urban jurisdictions reported higher rates of an inadequate number of poll workers

--Jurisdictions in poor areas reported more inactive voter registrations and more provisional ballots cast.

--Richer areas had more poll workers per polling place and reported lower rates of staffing problems per precinct.



1. How did states prepare for HAVA's provisional voting requirements?

Most election officials received provisional voting instructions from state government. The type and amount of instruction received varied widely across the states.

Almost all provided training or written instruction to precinct-level poll workers on how to administer provisional ballots.

- Only about 1 in 10 made available to poll workers a voter registration database.
- Almost equally rare were training and written procedures for poll workers on the counting of provisional ballots.

2. How did preparation and performance vary between states that had previously had some form of provisional ballot and those that did not?

Local election officials in the "old" states felt more confident.

18 states were new to provisional voting; 25 others had experience.

"New" state officials felt:

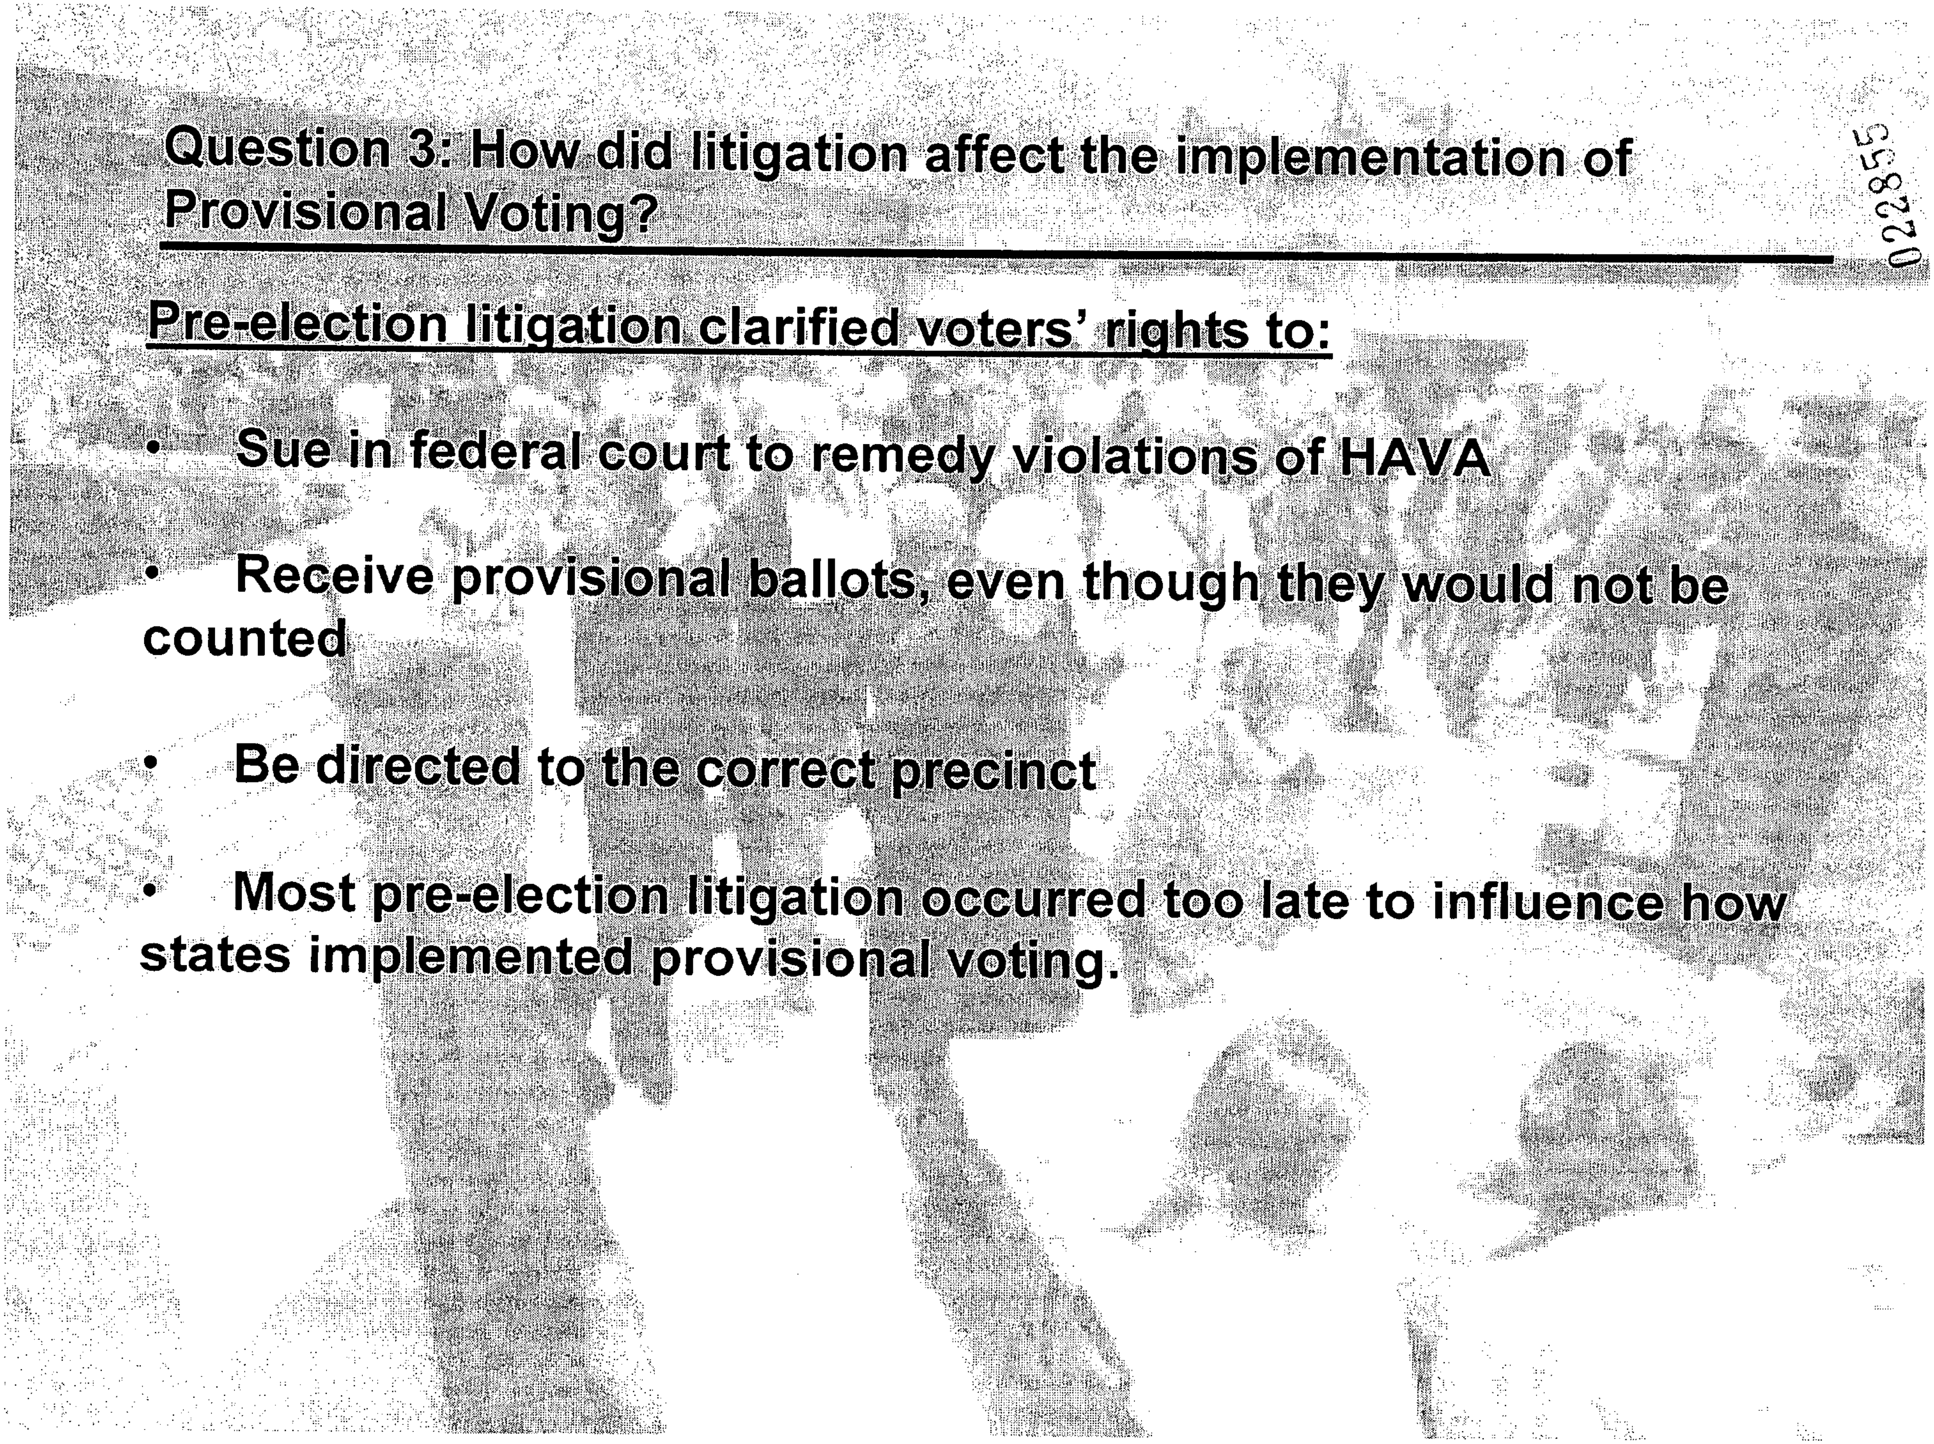
-- Voters did not receive enough information about where to cast a provisional ballot in order to be counted.

-- More funding was needed to educate voters about their rights to cast a provisional ballot.

Provisional ballots in "old states" : more than 2% of the total vote, 4 times the proportion in "new" states.

Counting provisional ballots in the final vote, the "old" states averaged 58% nearly double the average (33%) in "new" states.

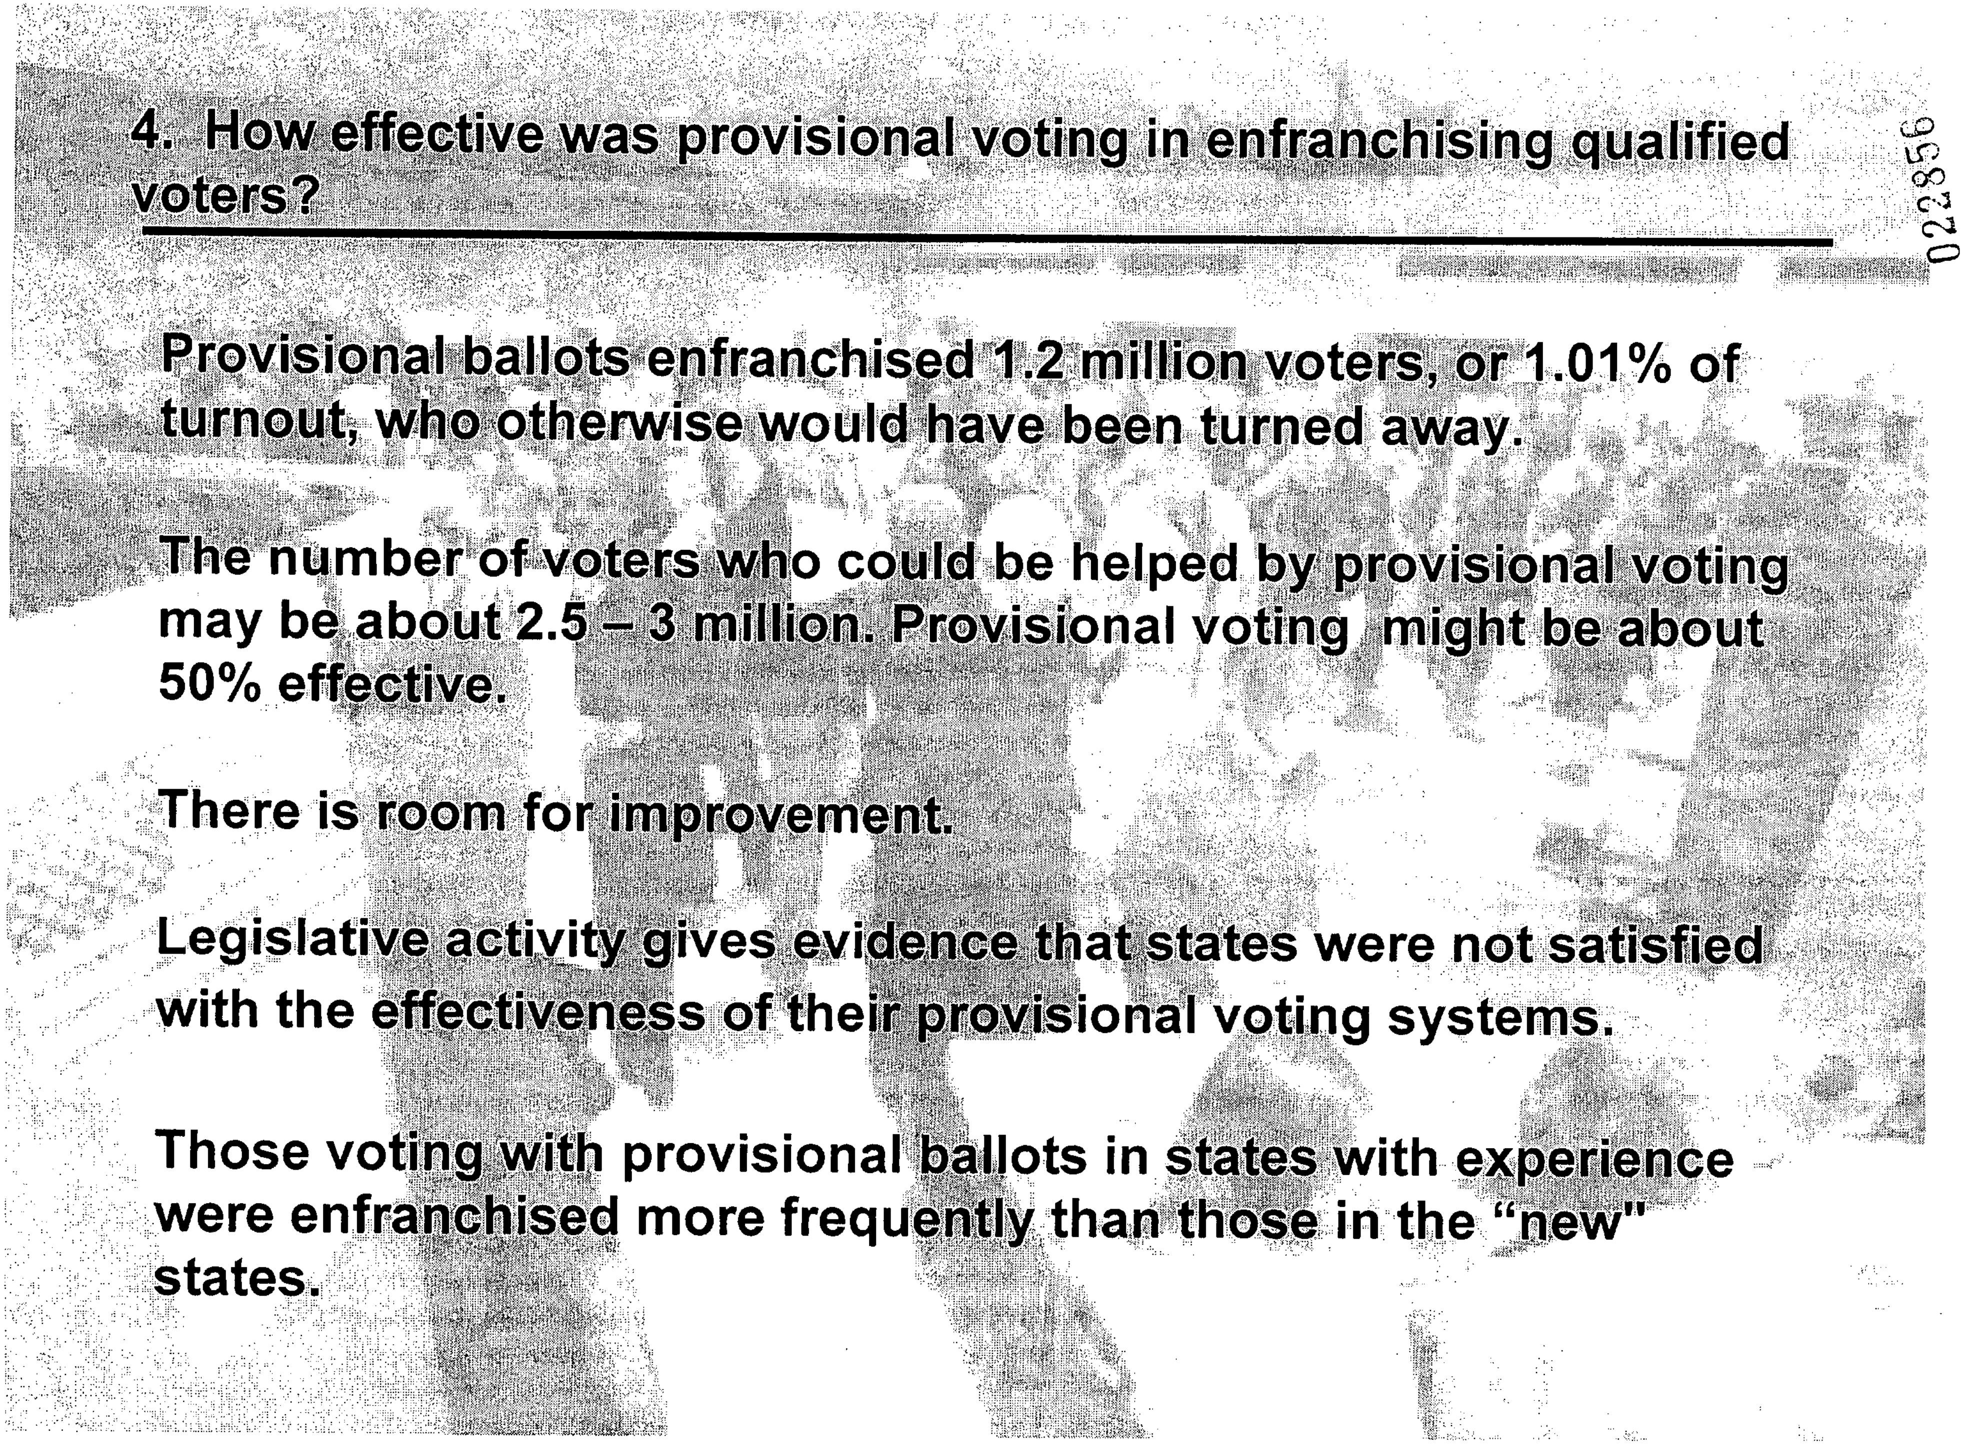
Question 3: How did litigation affect the implementation of Provisional Voting?



Pre-election litigation clarified voters' rights to:

- Sue in federal court to remedy violations of HAVA
- Receive provisional ballots, even though they would not be counted
- Be directed to the correct precinct
- Most pre-election litigation occurred too late to influence how states implemented provisional voting.

4. How effective was provisional voting in enfranchising qualified voters?



Provisional ballots enfranchised 1.2 million voters, or 1.01% of turnout, who otherwise would have been turned away.

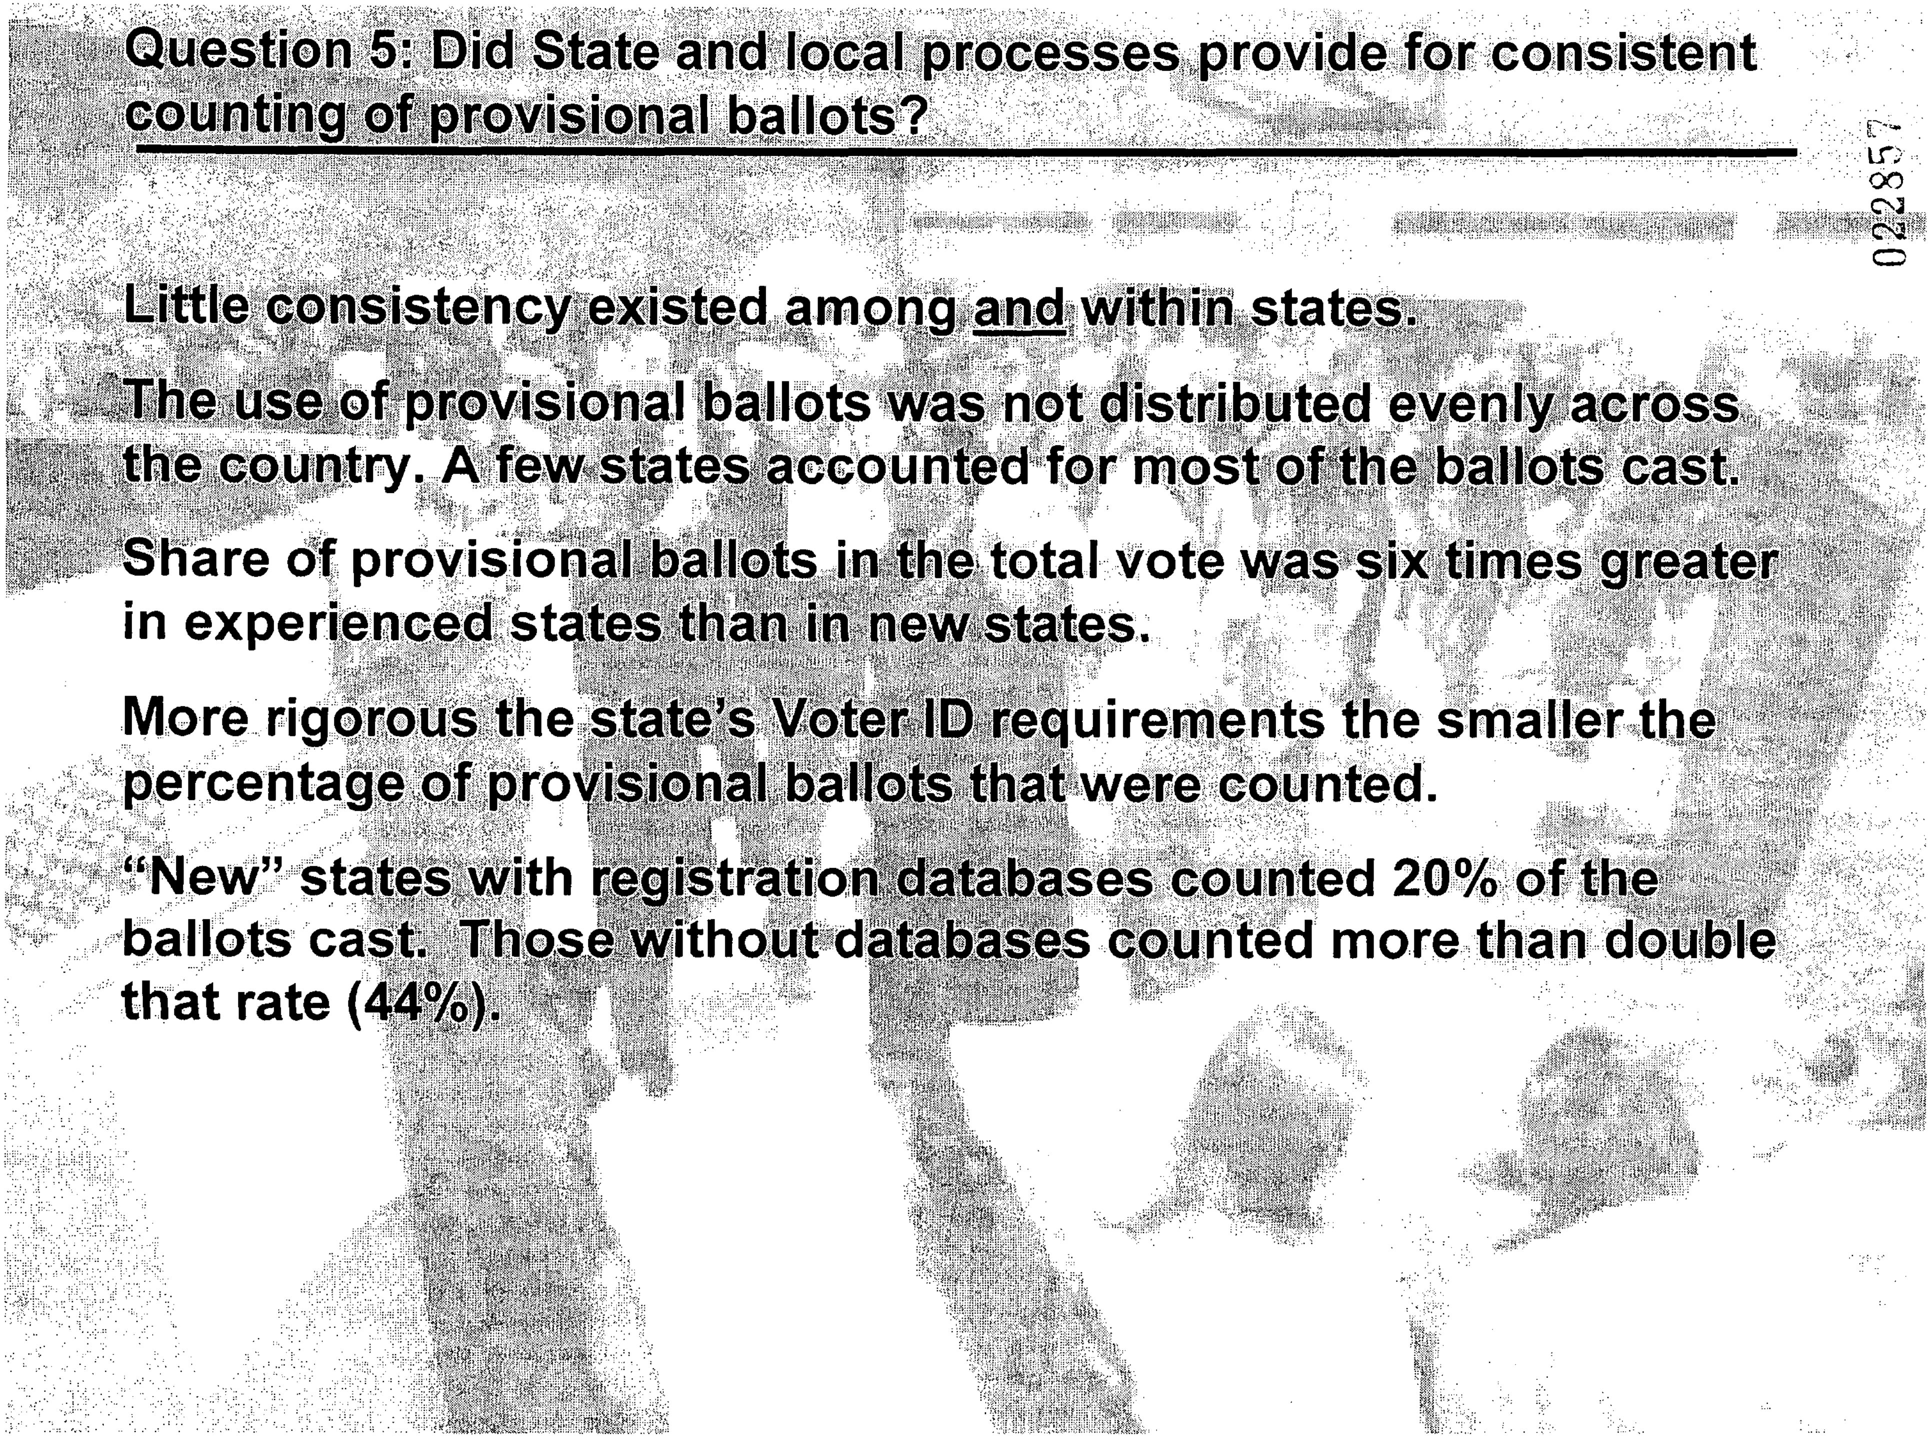
The number of voters who could be helped by provisional voting may be about 2.5 – 3 million. Provisional voting might be about 50% effective.

There is room for improvement.

Legislative activity gives evidence that states were not satisfied with the effectiveness of their provisional voting systems.

Those voting with provisional ballots in states with experience were enfranchised more frequently than those in the “new" states.

Question 5: Did State and local processes provide for consistent counting of provisional ballots?



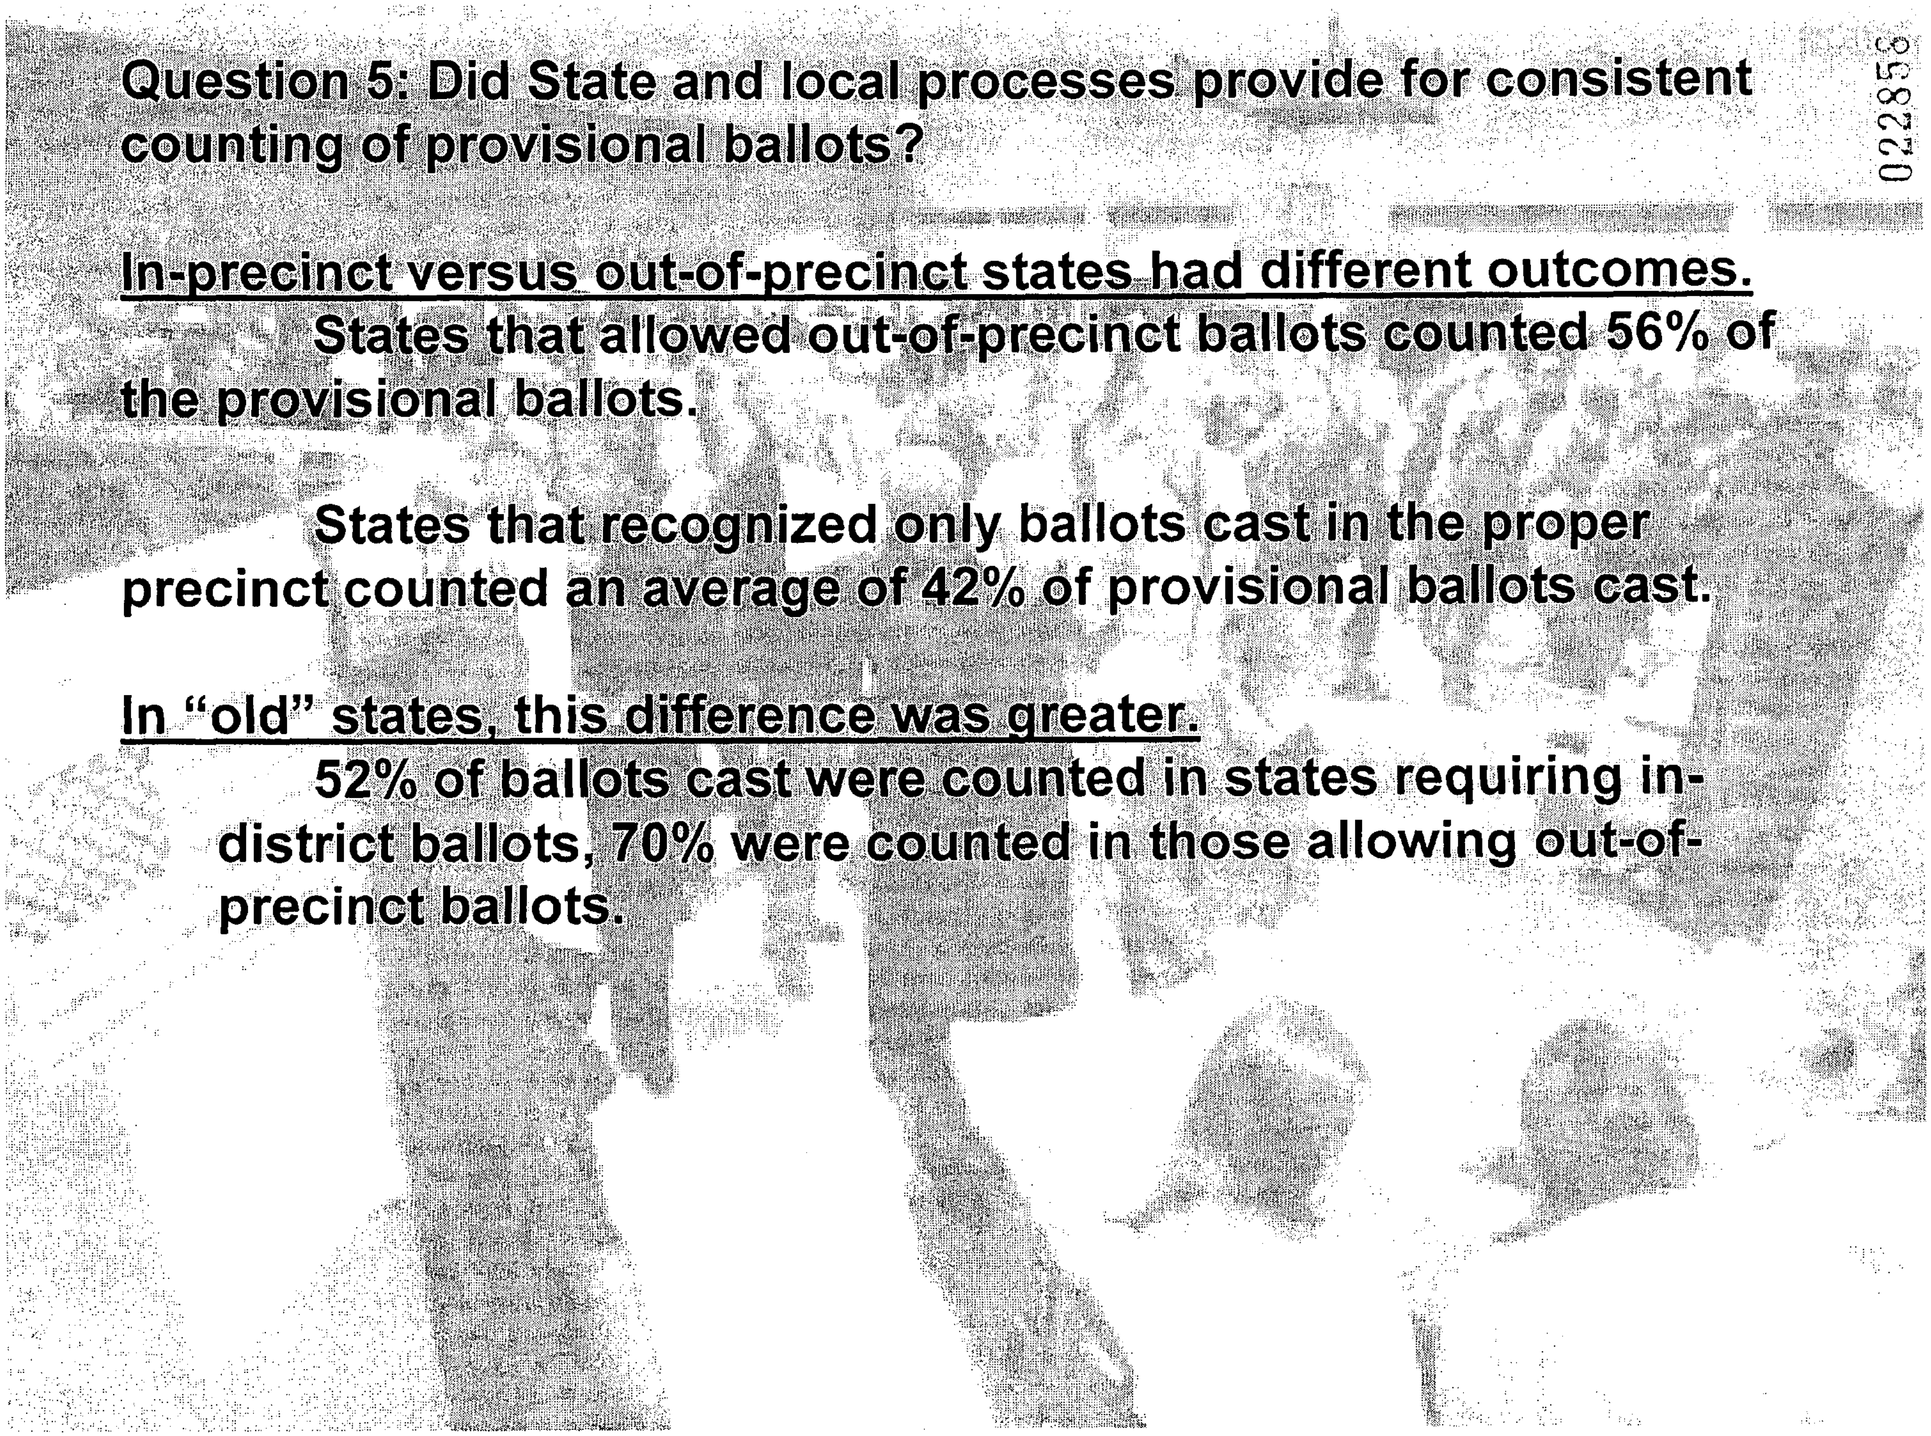
Little consistency existed among and within states.

The use of provisional ballots was not distributed evenly across the country. A few states accounted for most of the ballots cast.

Share of provisional ballots in the total vote was six times greater in experienced states than in new states.

More rigorous the state's Voter ID requirements the smaller the percentage of provisional ballots that were counted.

"New" states with registration databases counted 20% of the ballots cast. Those without databases counted more than double that rate (44%).



Question 5: Did State and local processes provide for consistent counting of provisional ballots?

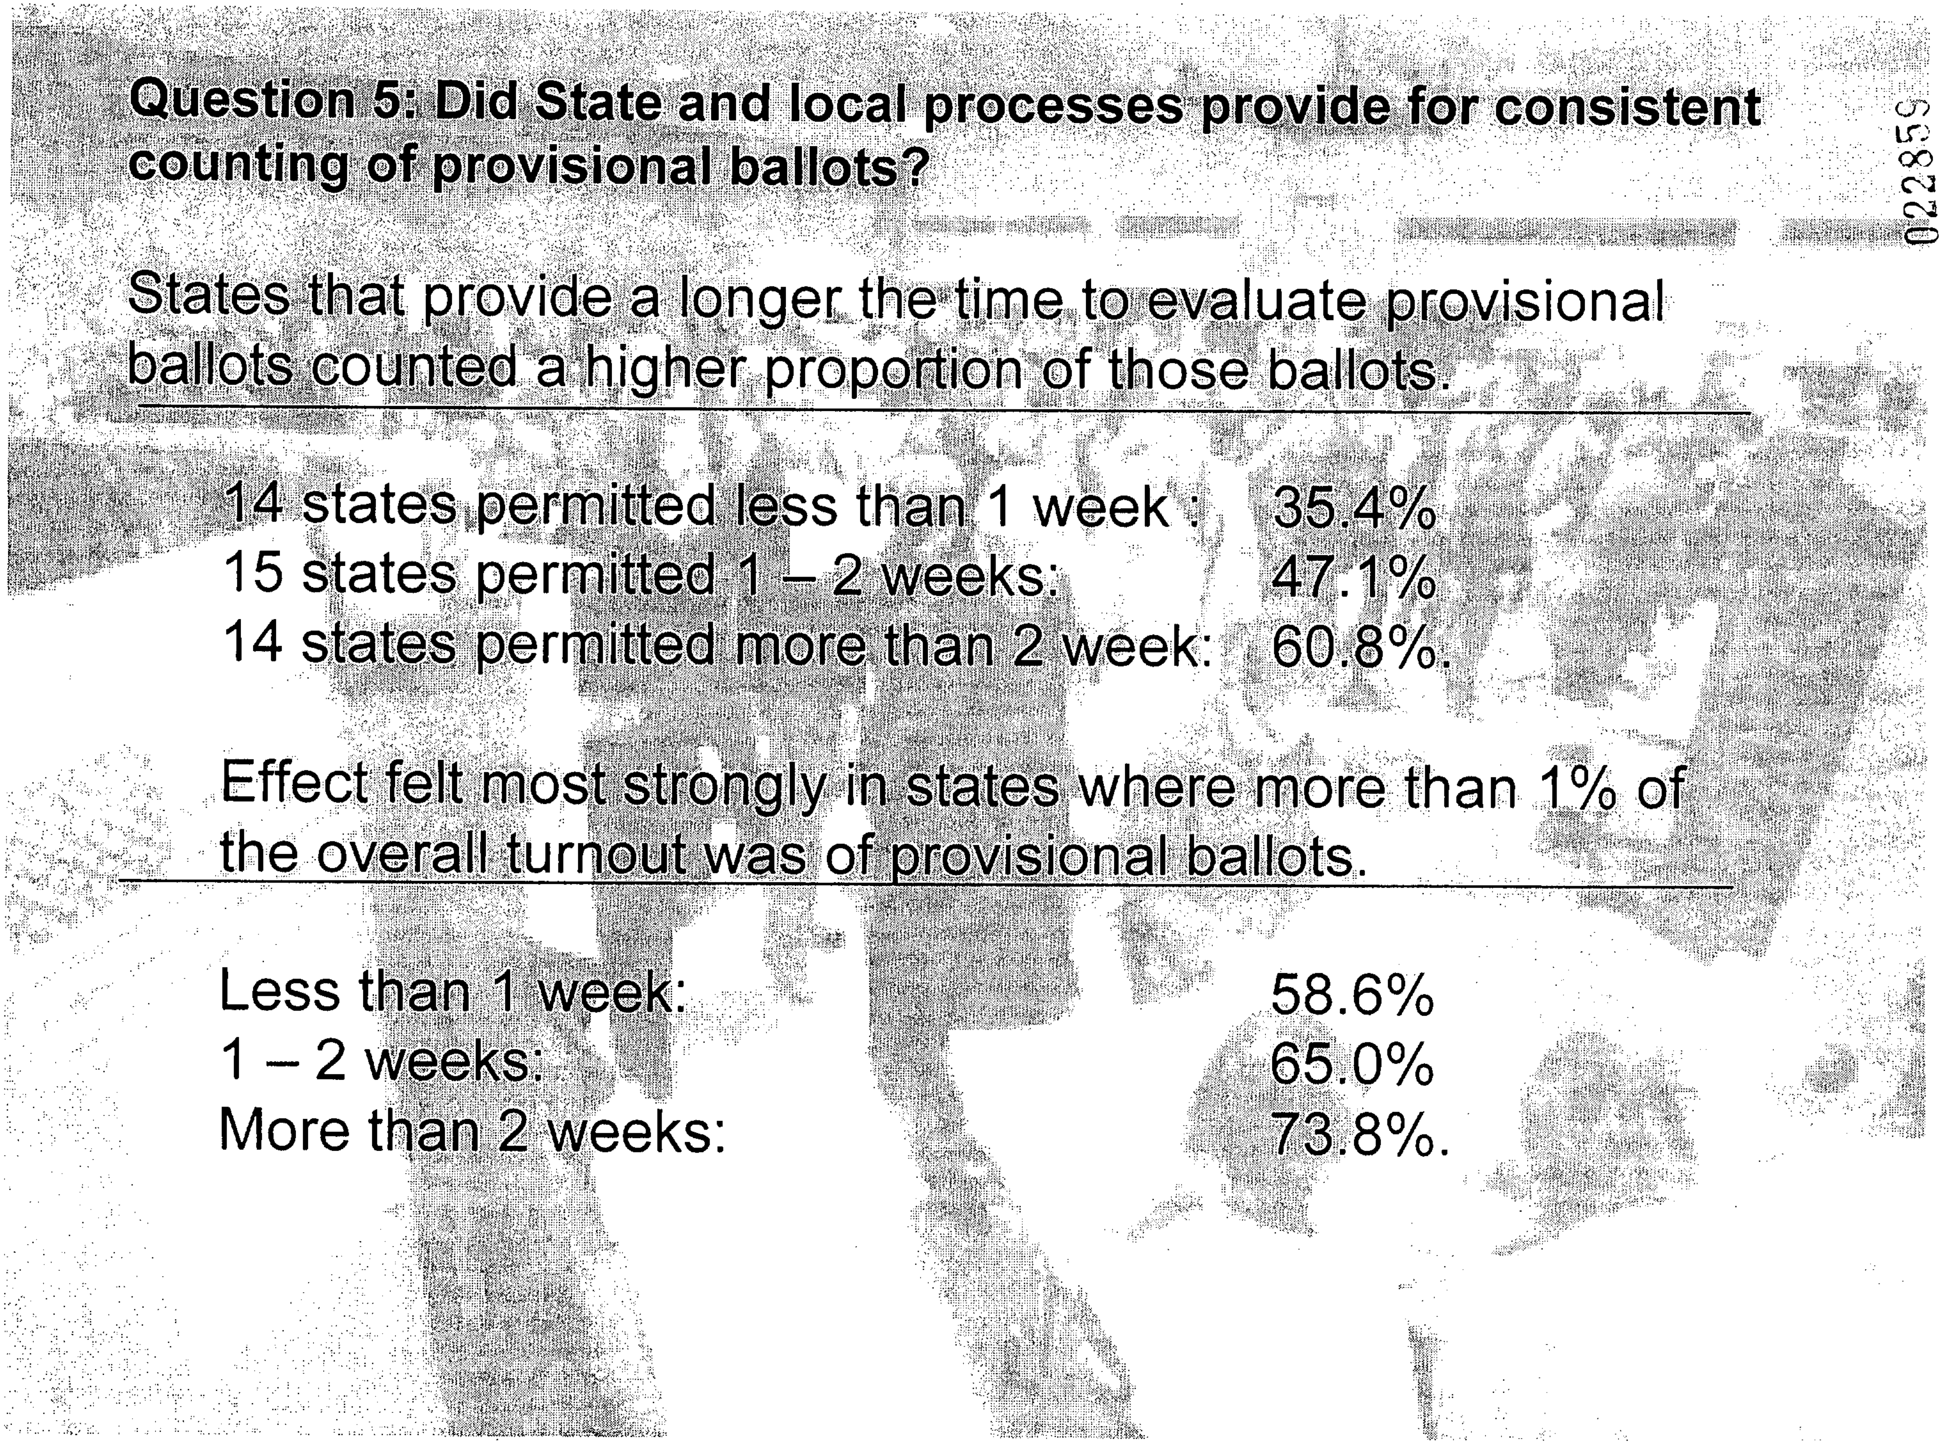
<u>In-precinct versus out-of-precinct states had different outcomes.</u>

States that allowed out-of-precinct ballots counted 56% of the provisional ballots.

States that recognized only ballots cast in the proper precinct counted an average of 42% of provisional ballots cast.

<u>In "old" states, this difference was greater.</u>

52% of ballots cast were counted in states requiring in-district ballots, 70% were counted in those allowing out-of-precinct ballots.



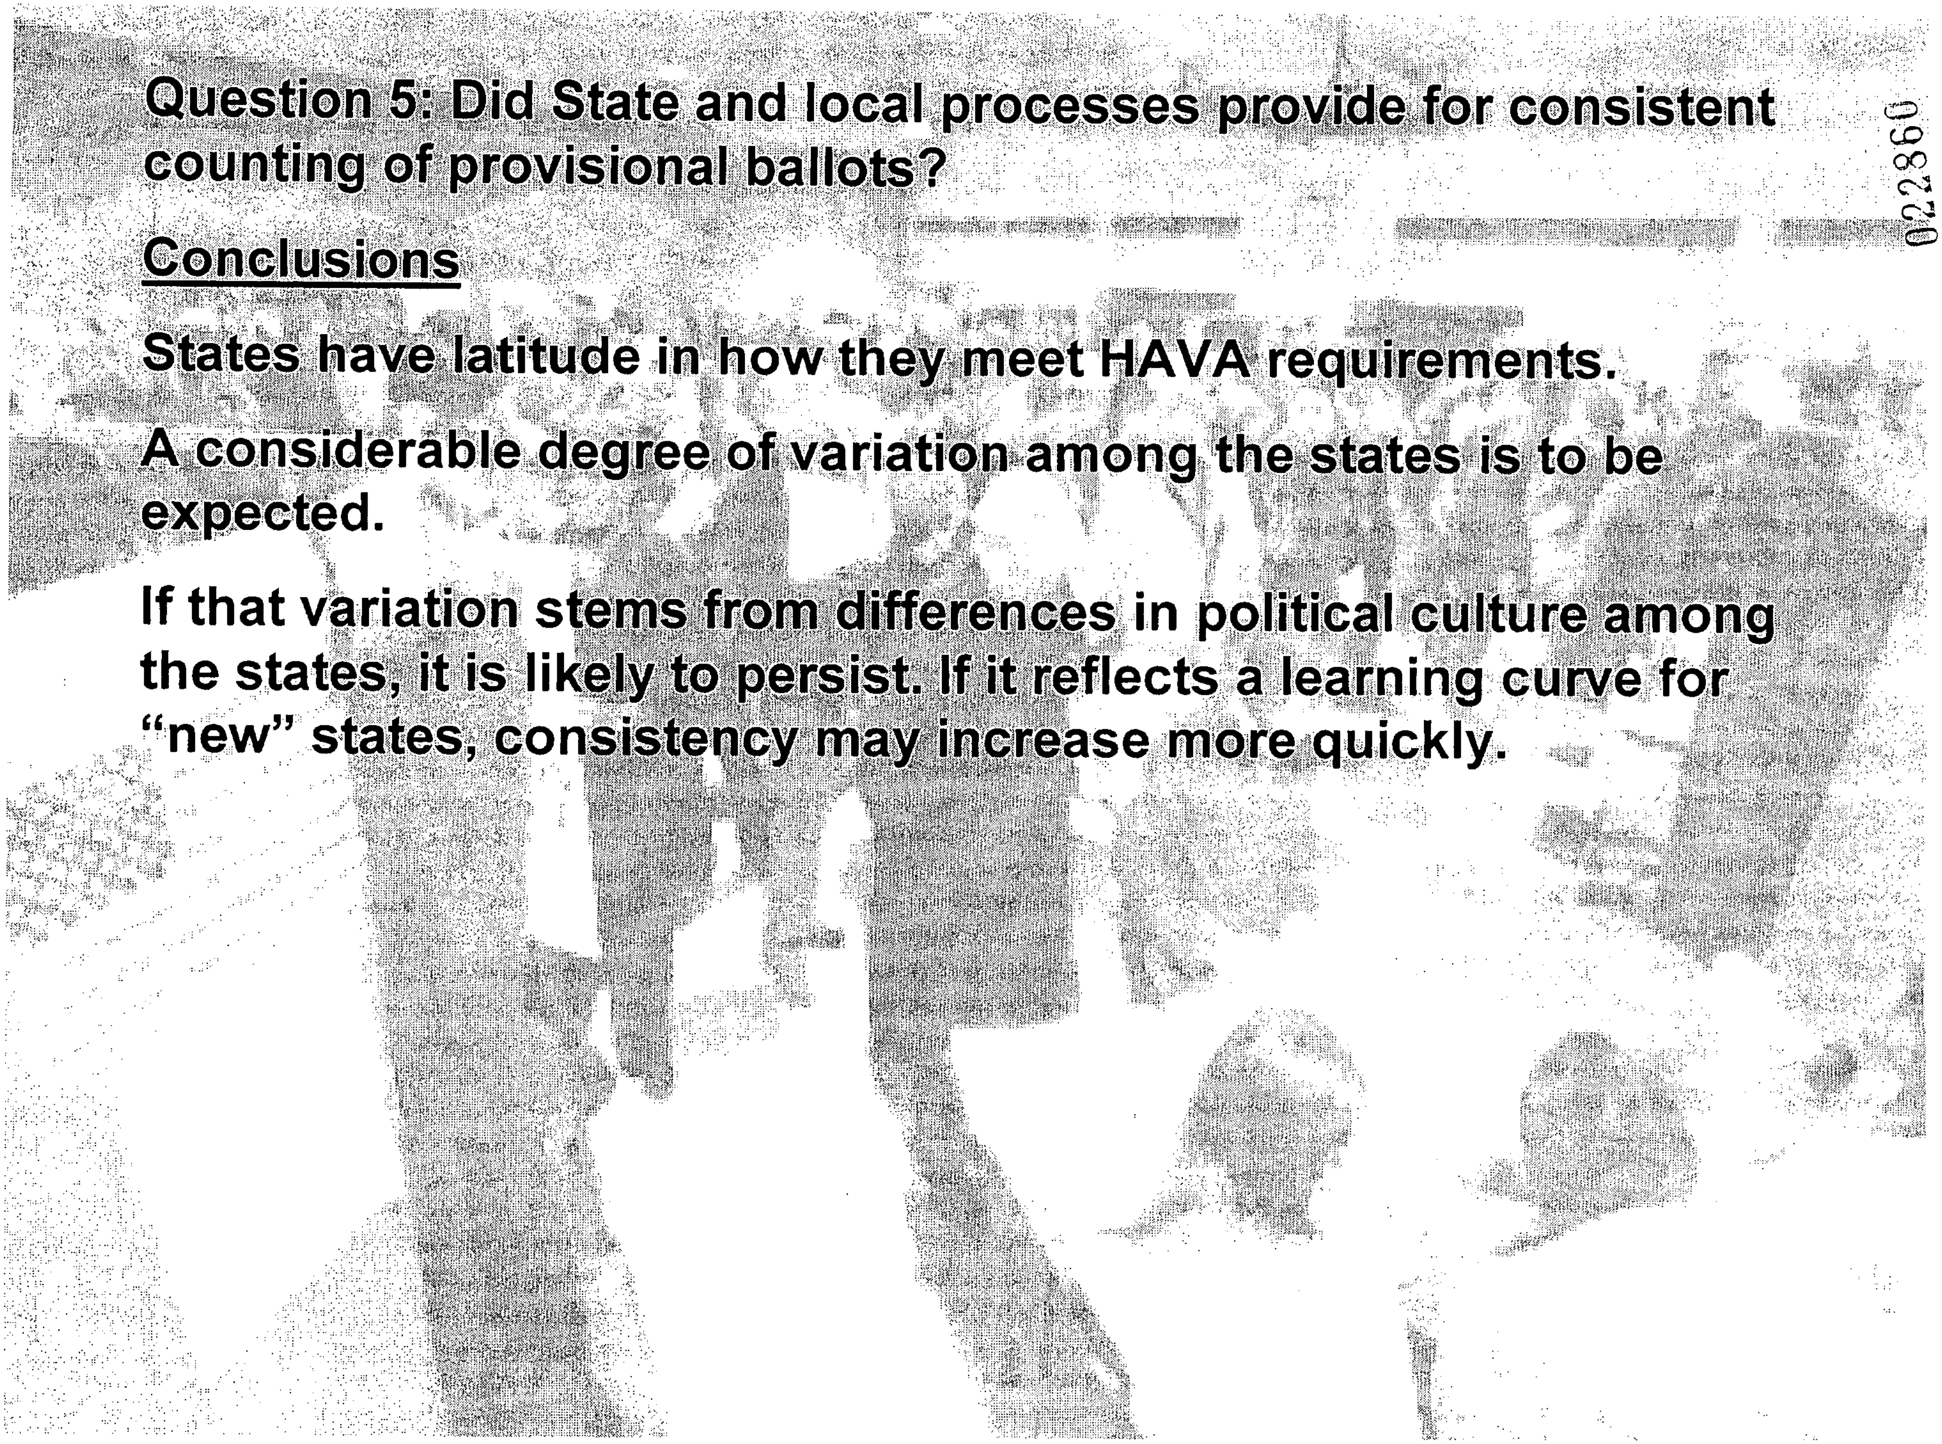
Question 5: Did State and local processes provide for consistent counting of provisional ballots?

States that provide a longer the time to evaluate provisional ballots counted a higher proportion of those ballots.

14 states permitted less than 1 week : 35.4%
15 states permitted 1 – 2 weeks: 47.1%
14 states permitted more than 2 week: 60.8%.

Effect felt most strongly in states where more than 1% of the overall turnout was of provisional ballots.

Less than 1 week: 58.6%
1 – 2 weeks: 65.0%
More than 2 weeks: 73.8%.



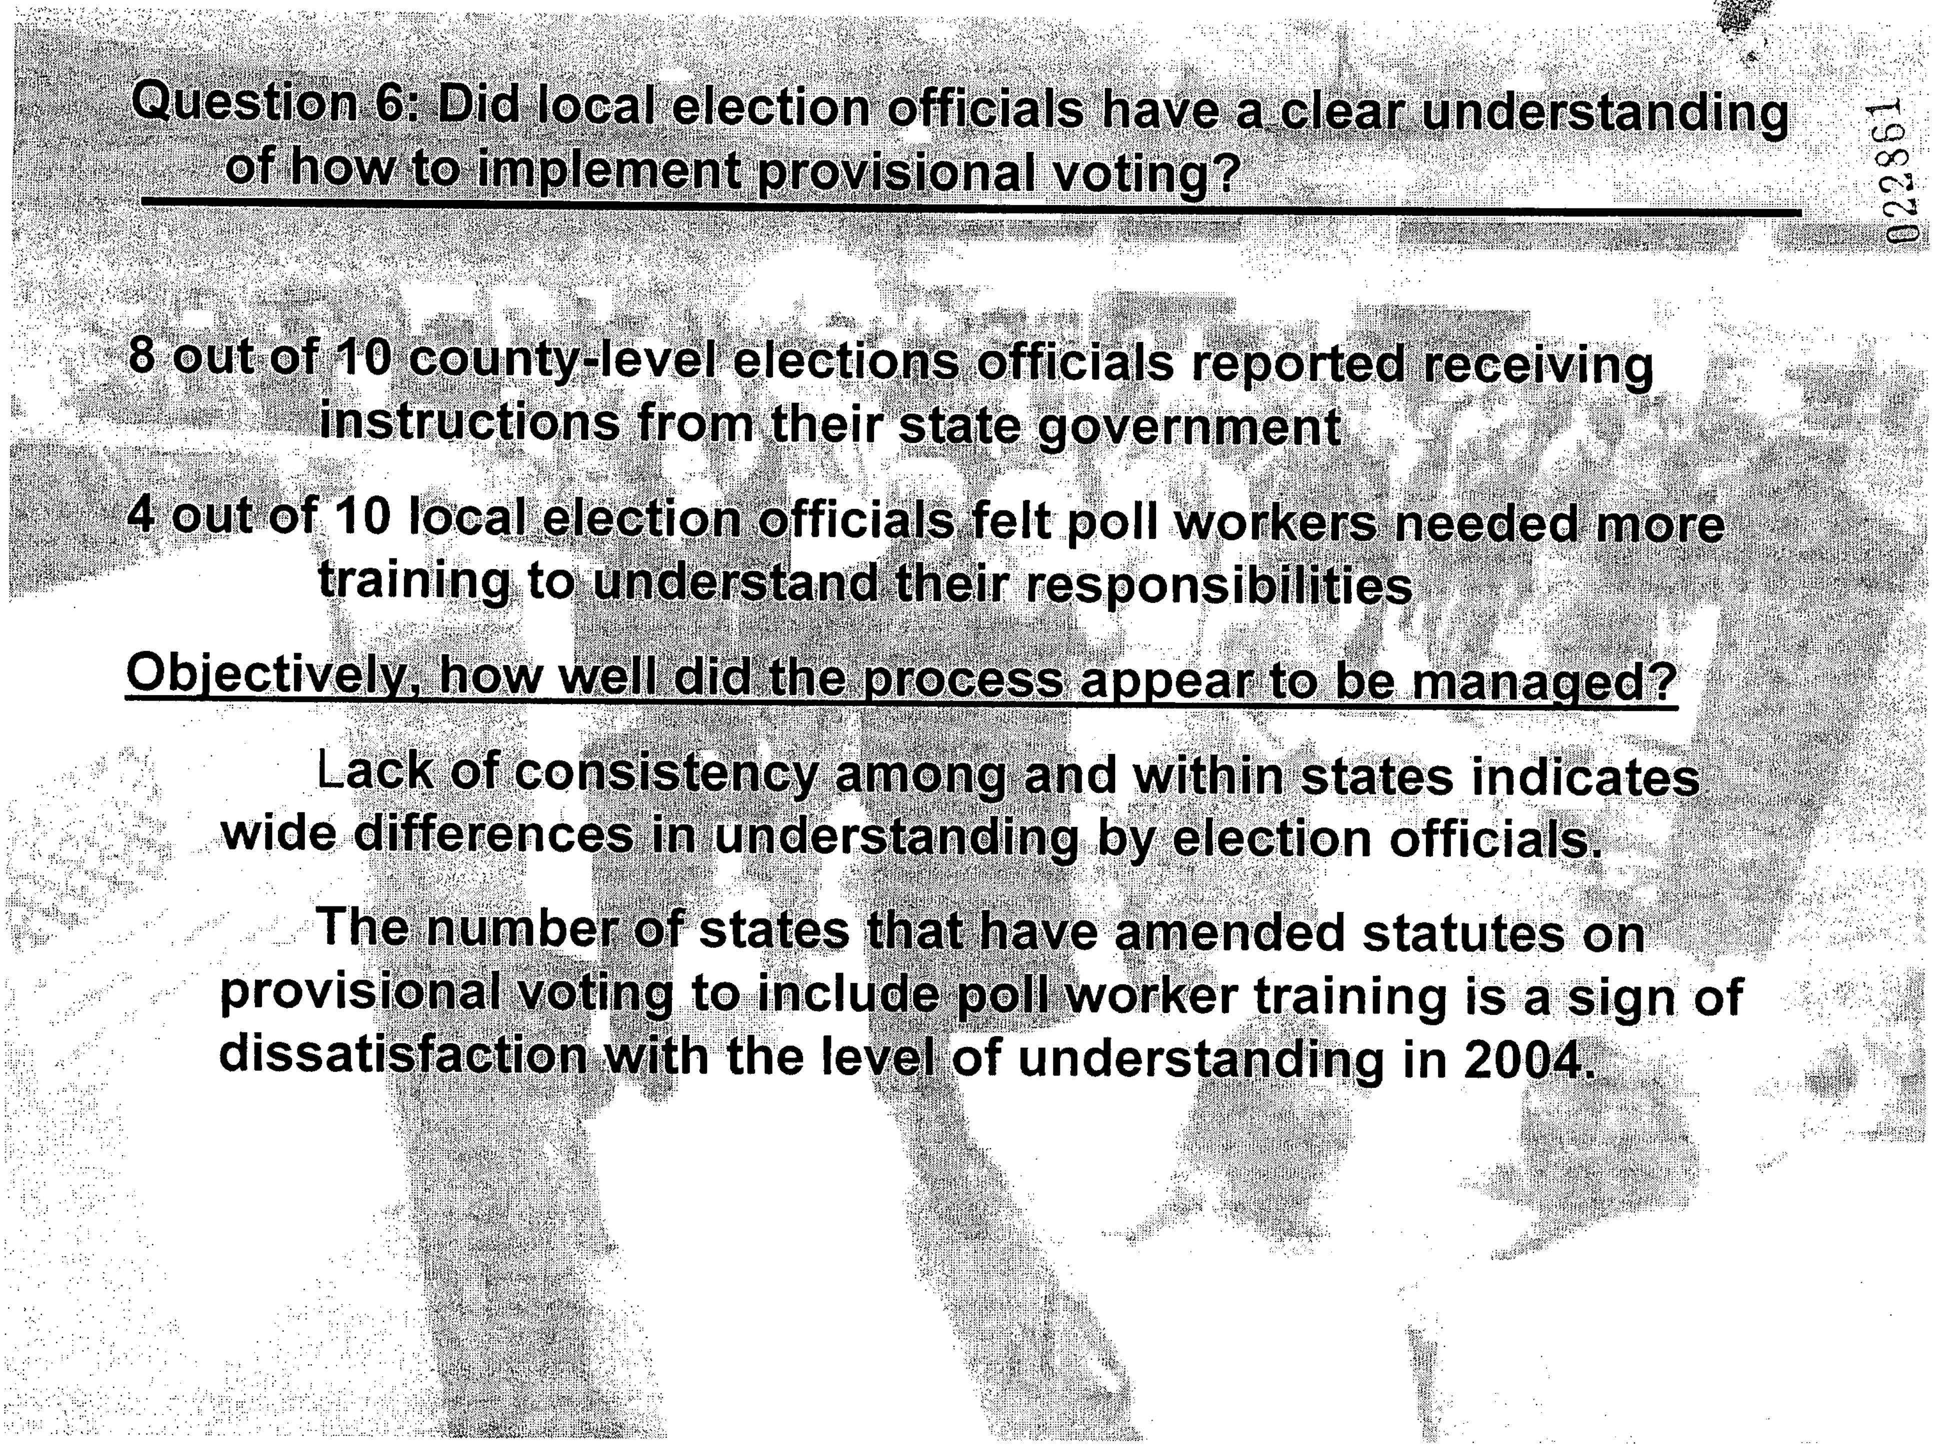
Question 5: Did State and local processes provide for consistent counting of provisional ballots?

Conclusions

States have latitude in how they meet HAVA requirements.

A considerable degree of variation among the states is to be expected.

If that variation stems from differences in political culture among the states, it is likely to persist. If it reflects a learning curve for "new" states, consistency may increase more quickly.



Question 6: Did local election officials have a clear understanding of how to implement provisional voting?

8 out of 10 county-level elections officials reported receiving instructions from their state government

4 out of 10 local election officials felt poll workers needed more training to understand their responsibilities

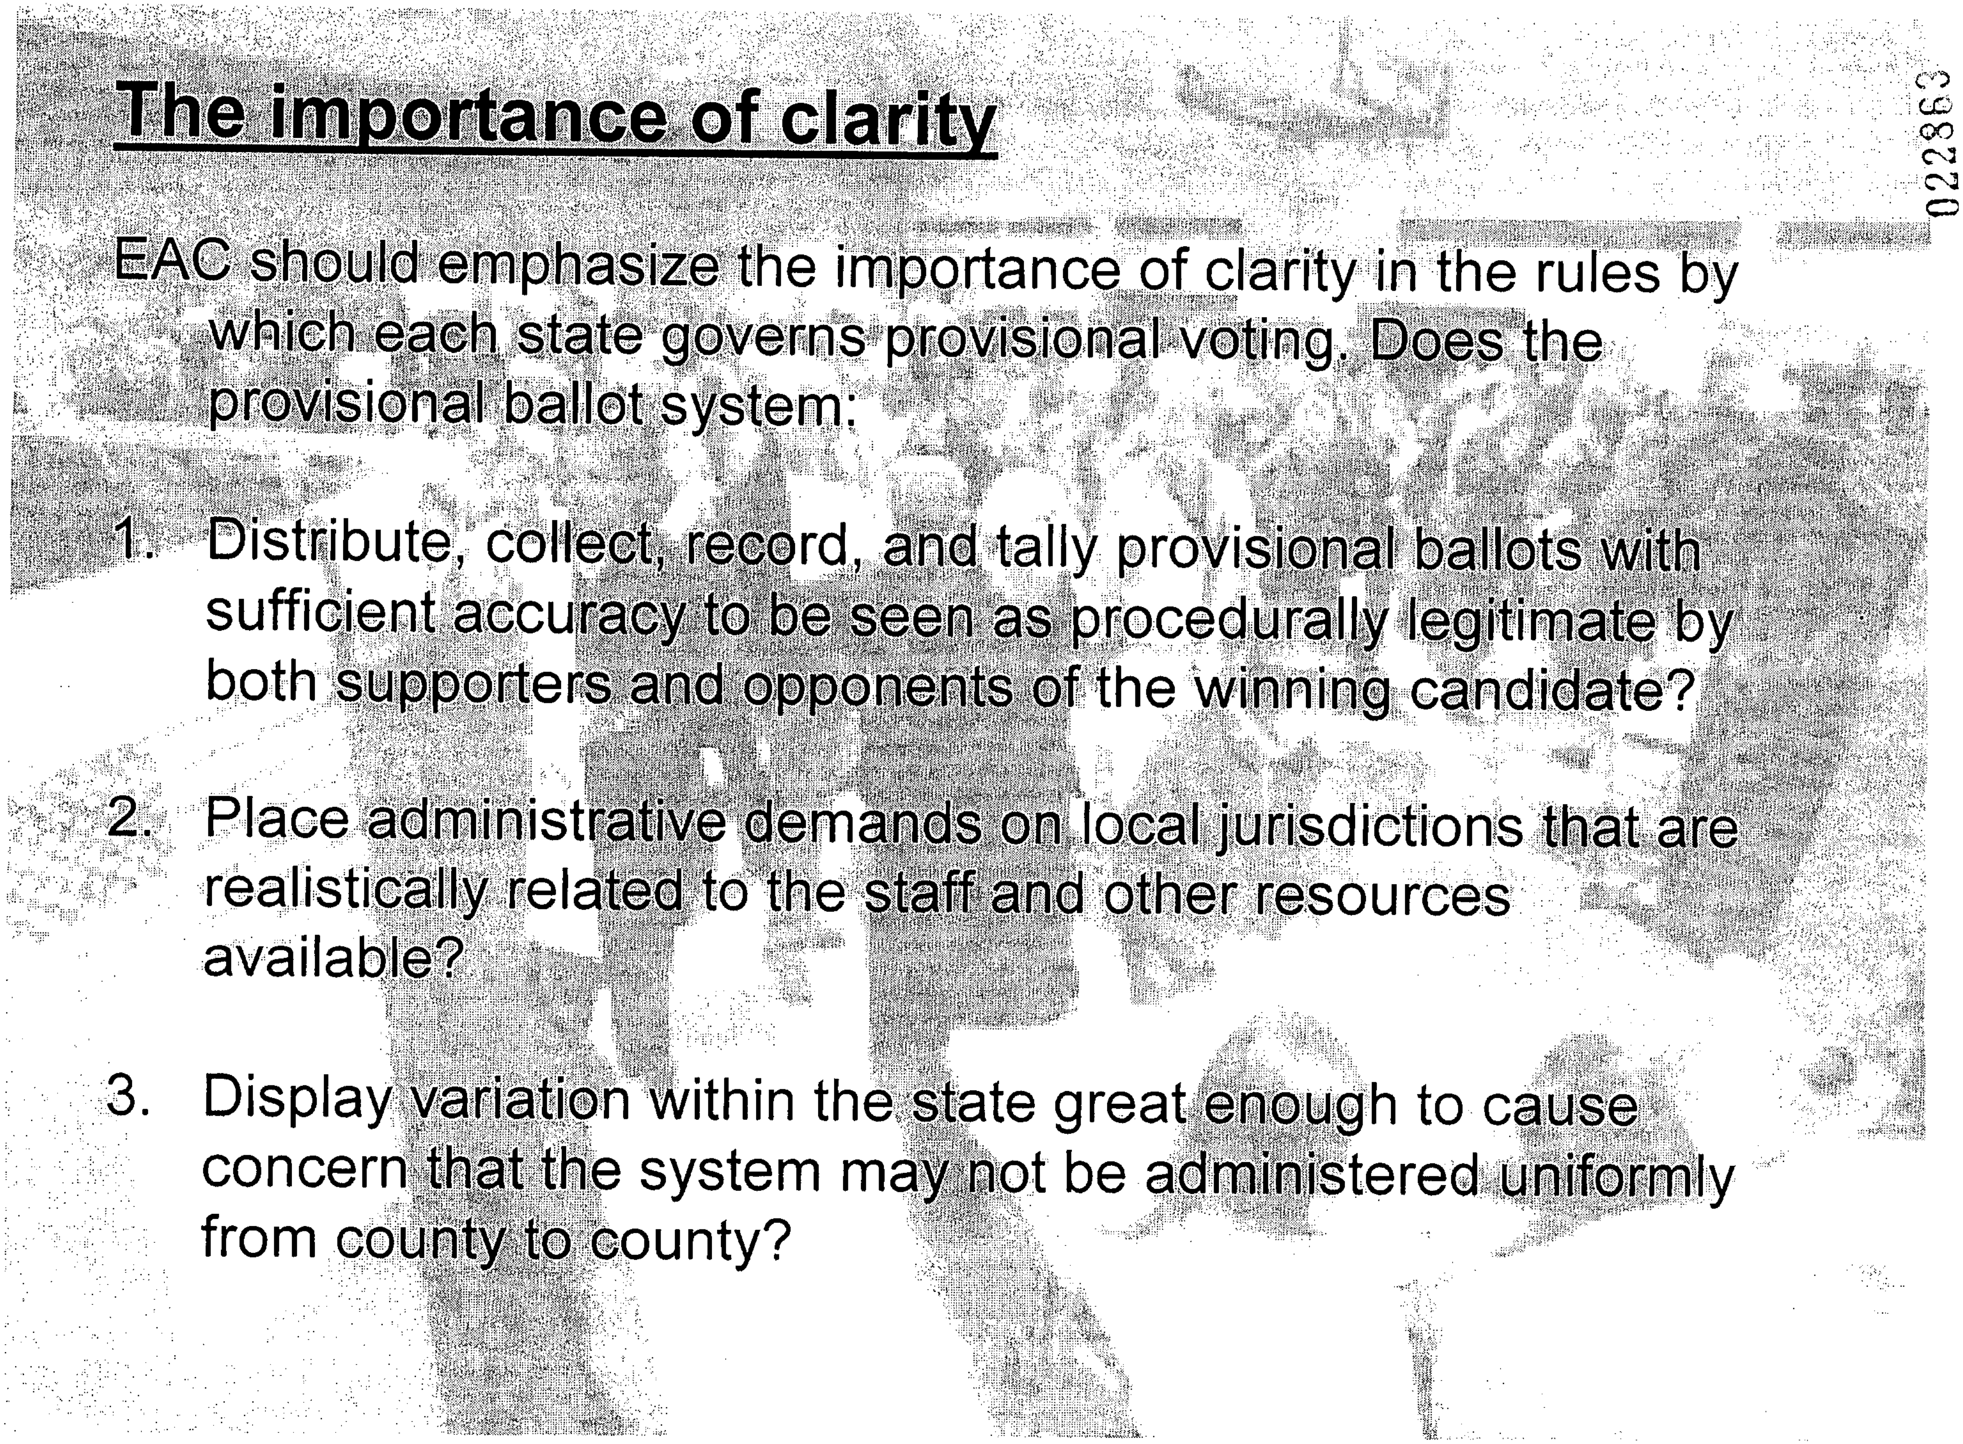
Objectively, how well did the process appear to be managed?

Lack of consistency among and within states indicates wide differences in understanding by election officials.

The number of states that have amended statutes on provisional voting to include poll worker training is a sign of dissatisfaction with the level of understanding in 2004.

RECOMMENDATIONS TO THE EAC

BEST PRACTICES



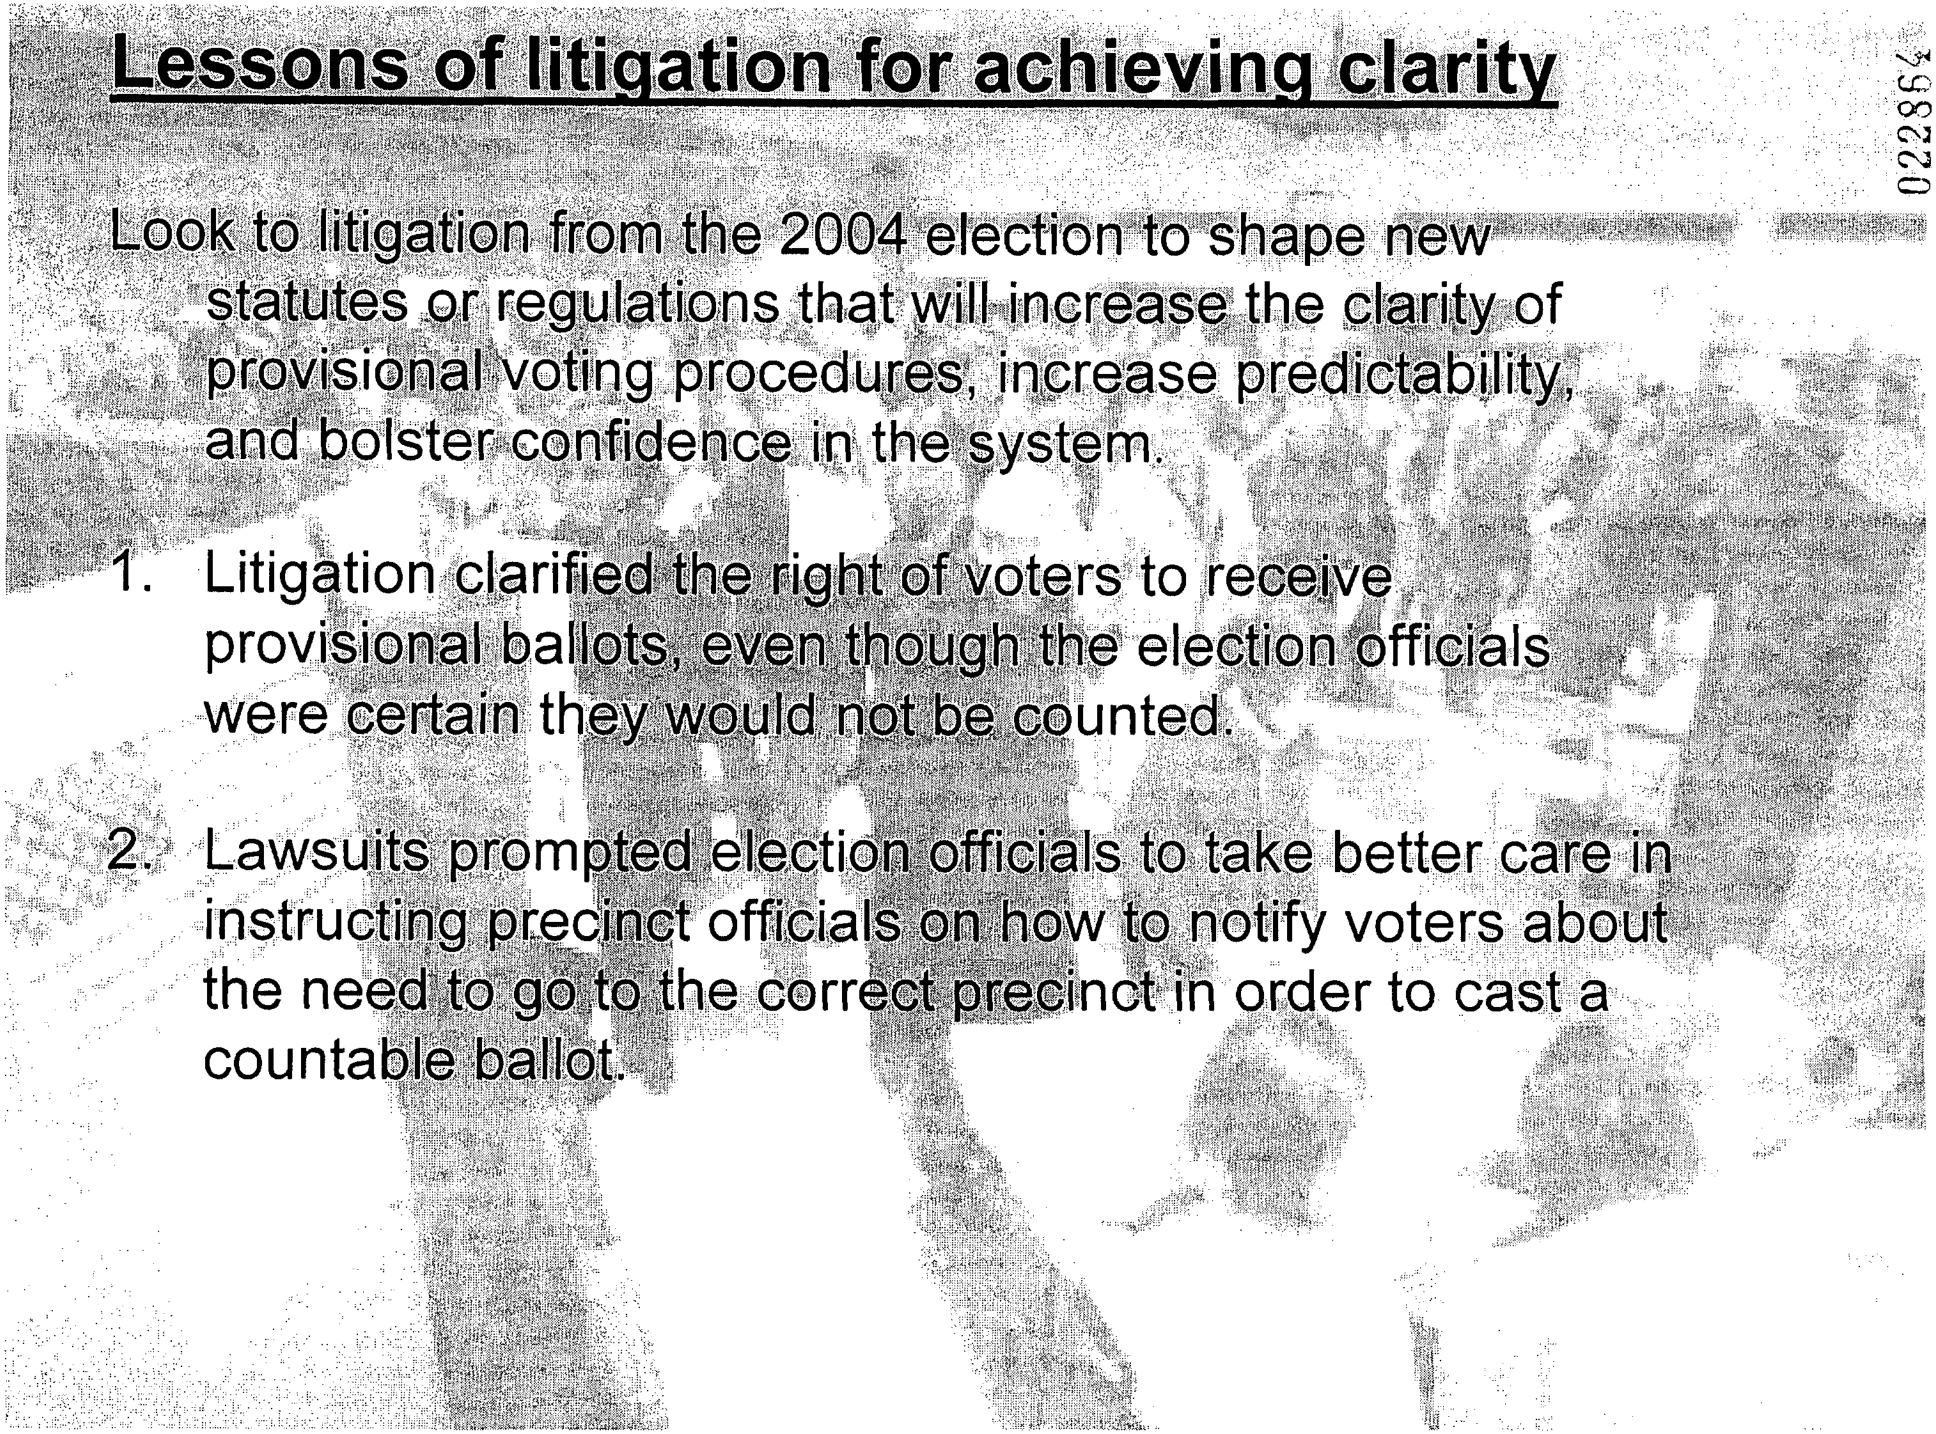
The importance of clarity

EAC should emphasize the importance of clarity in the rules by which each state governs provisional voting. Does the provisional ballot system:

1. Distribute, collect, record, and tally provisional ballots with sufficient accuracy to be seen as procedurally legitimate by both supporters and opponents of the winning candidate?

2. Place administrative demands on local jurisdictions that are realistically related to the staff and other resources available?

3. Display variation within the state great enough to cause concern that the system may not be administered uniformly from county to county?

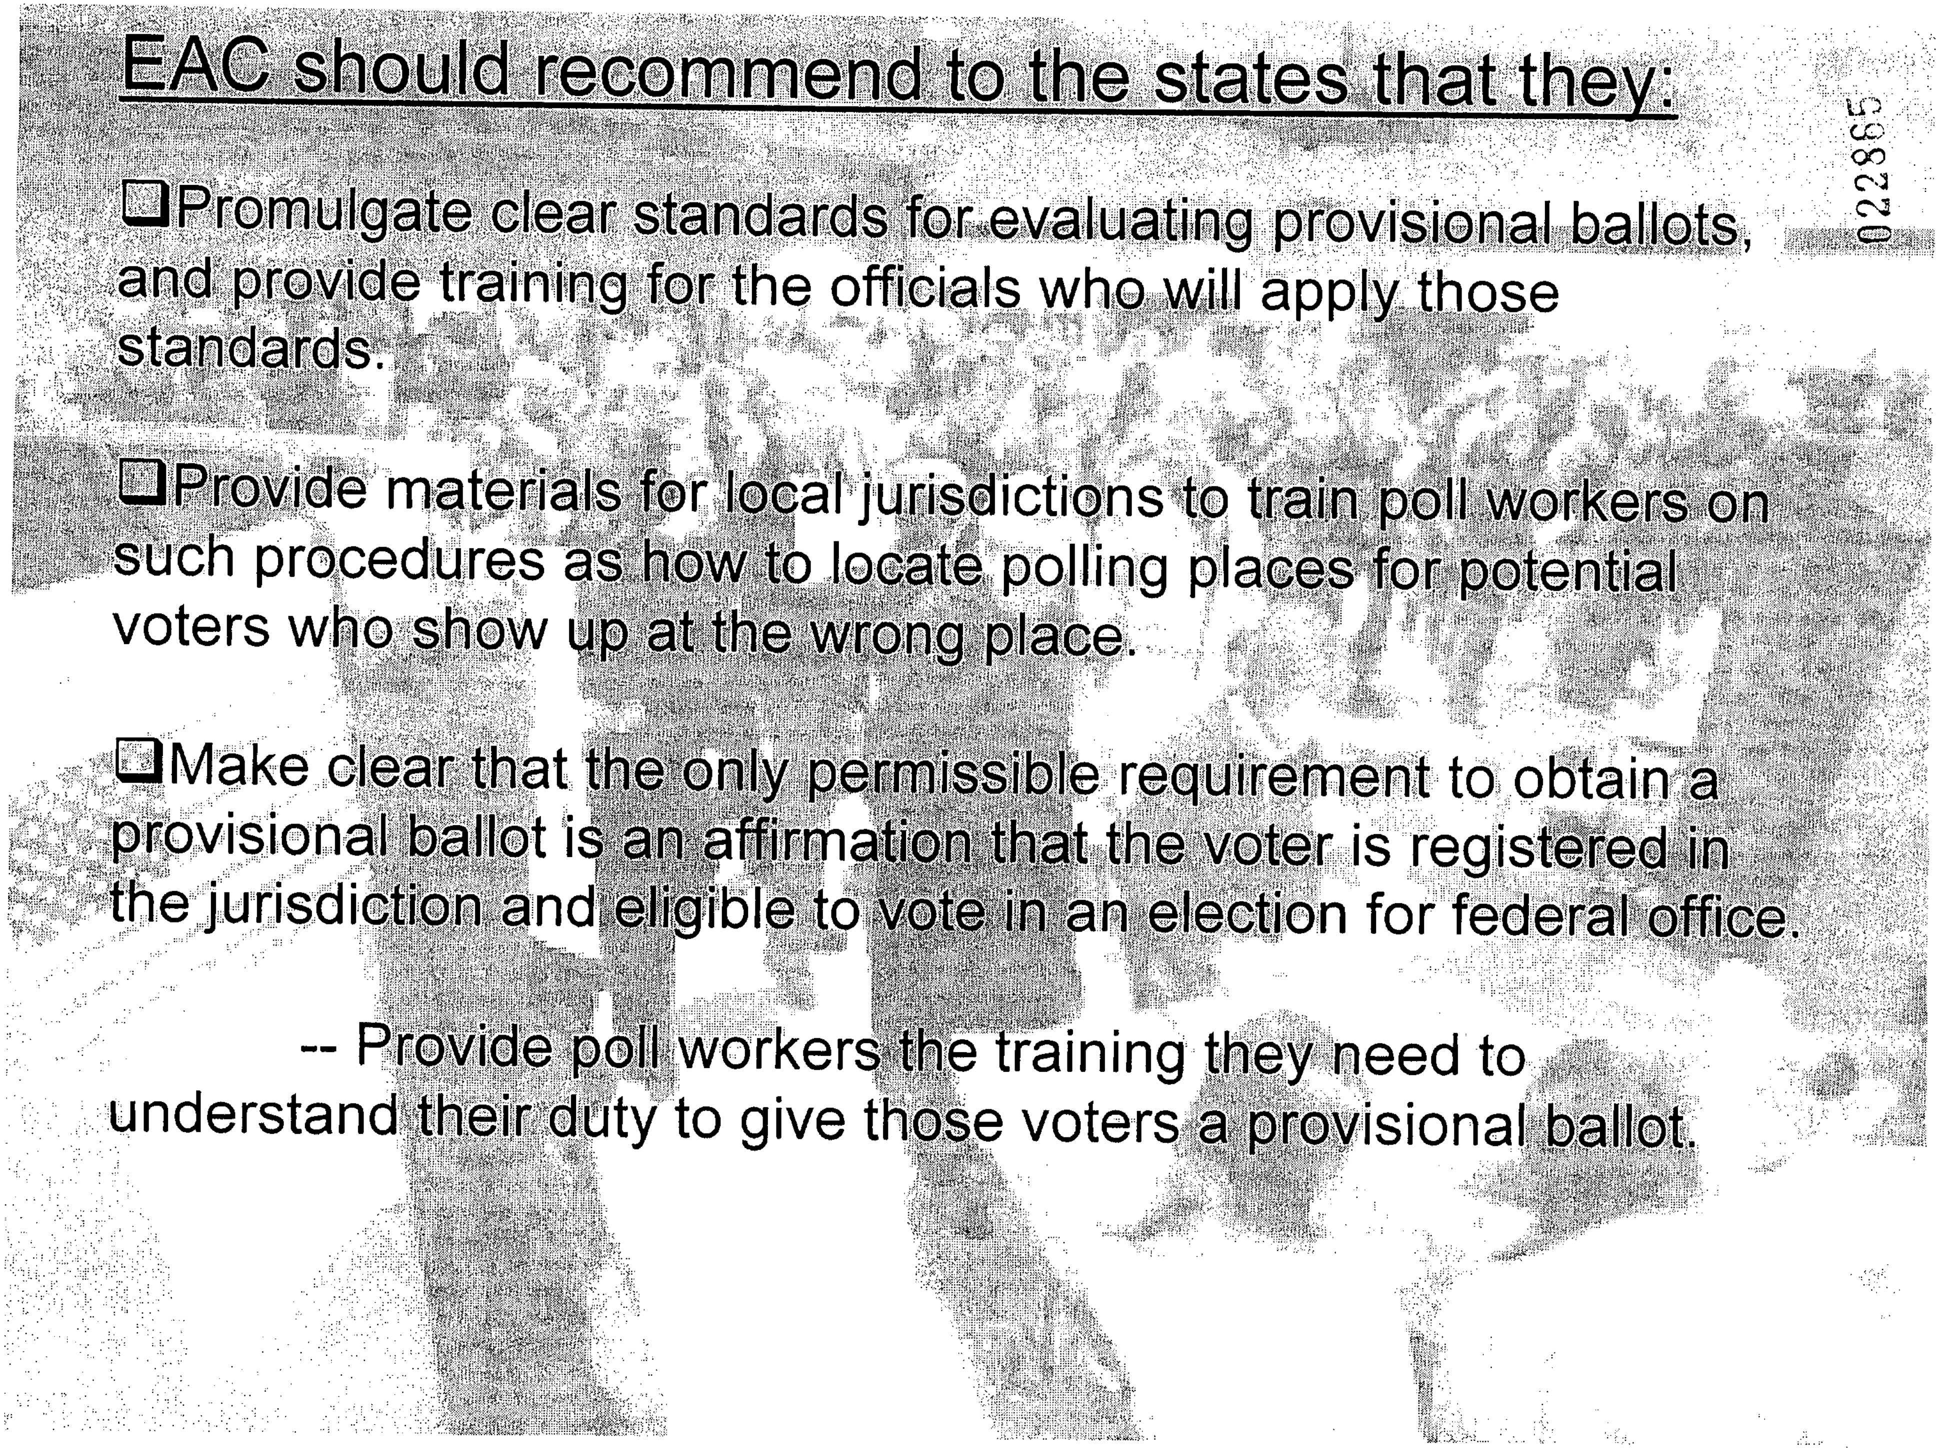


Lessons of litigation for achieving clarity

Look to litigation from the 2004 election to shape new statutes or regulations that will increase the clarity of provisional voting procedures, increase predictability, and bolster confidence in the system.

1. Litigation clarified the right of voters to receive provisional ballots, even though the election officials were certain they would not be counted.

2. Lawsuits prompted election officials to take better care in instructing precinct officials on how to notify voters about the need to go to the correct precinct in order to cast a countable ballot.



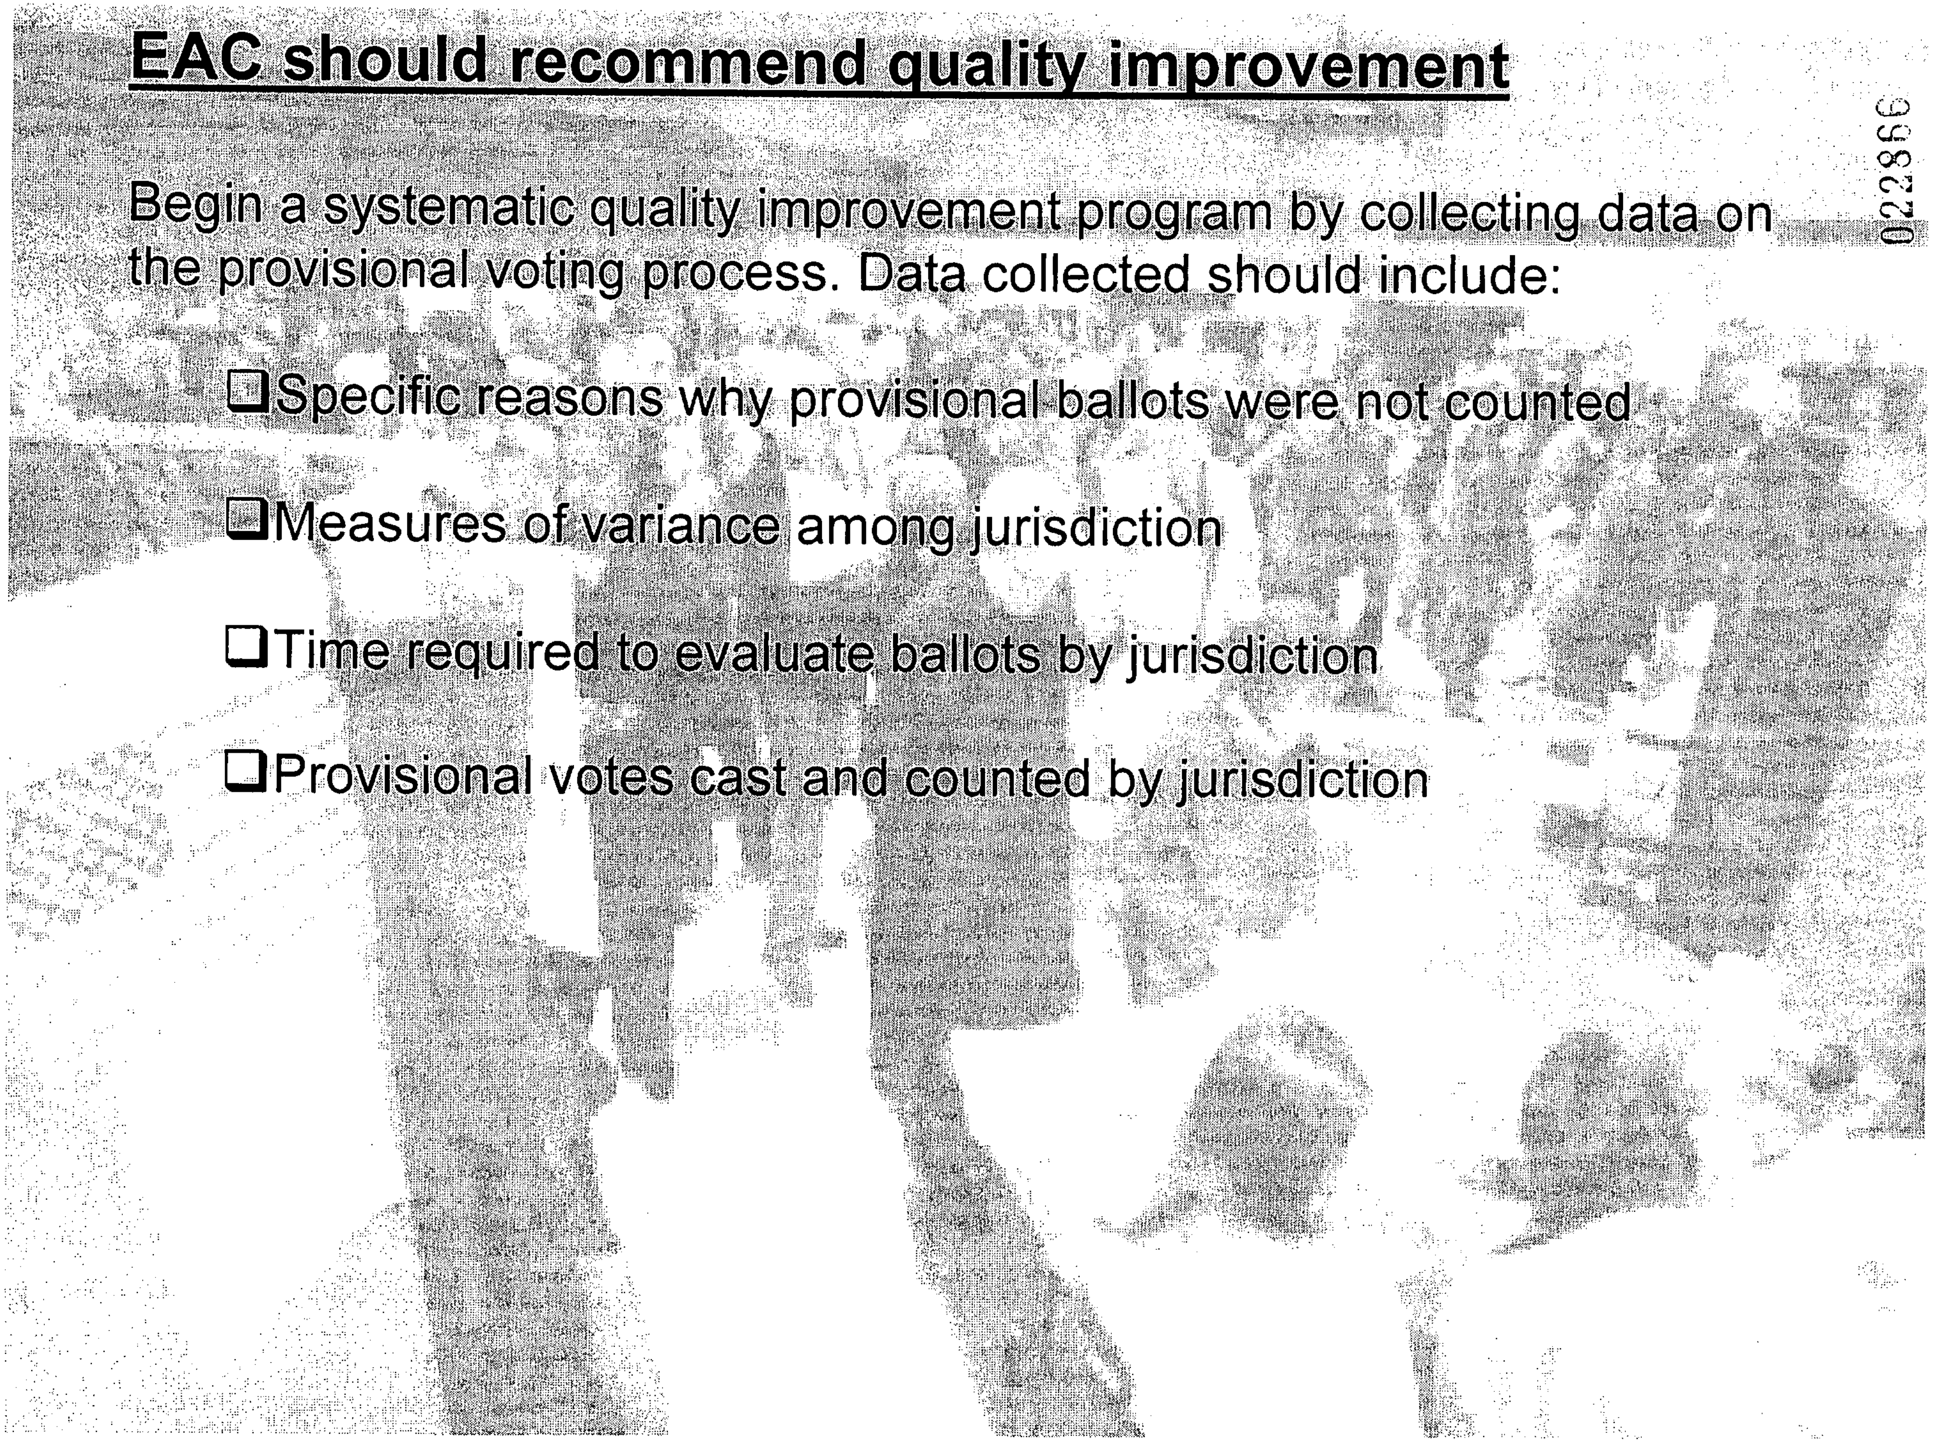
EAC should recommend to the states that they:

❑Promulgate clear standards for evaluating provisional ballots, and provide training for the officials who will apply those standards.

❑Provide materials for local jurisdictions to train poll workers on such procedures as how to locate polling places for potential voters who show up at the wrong place.

❑Make clear that the only permissible requirement to obtain a provisional ballot is an affirmation that the voter is registered in the jurisdiction and eligible to vote in an election for federal office.

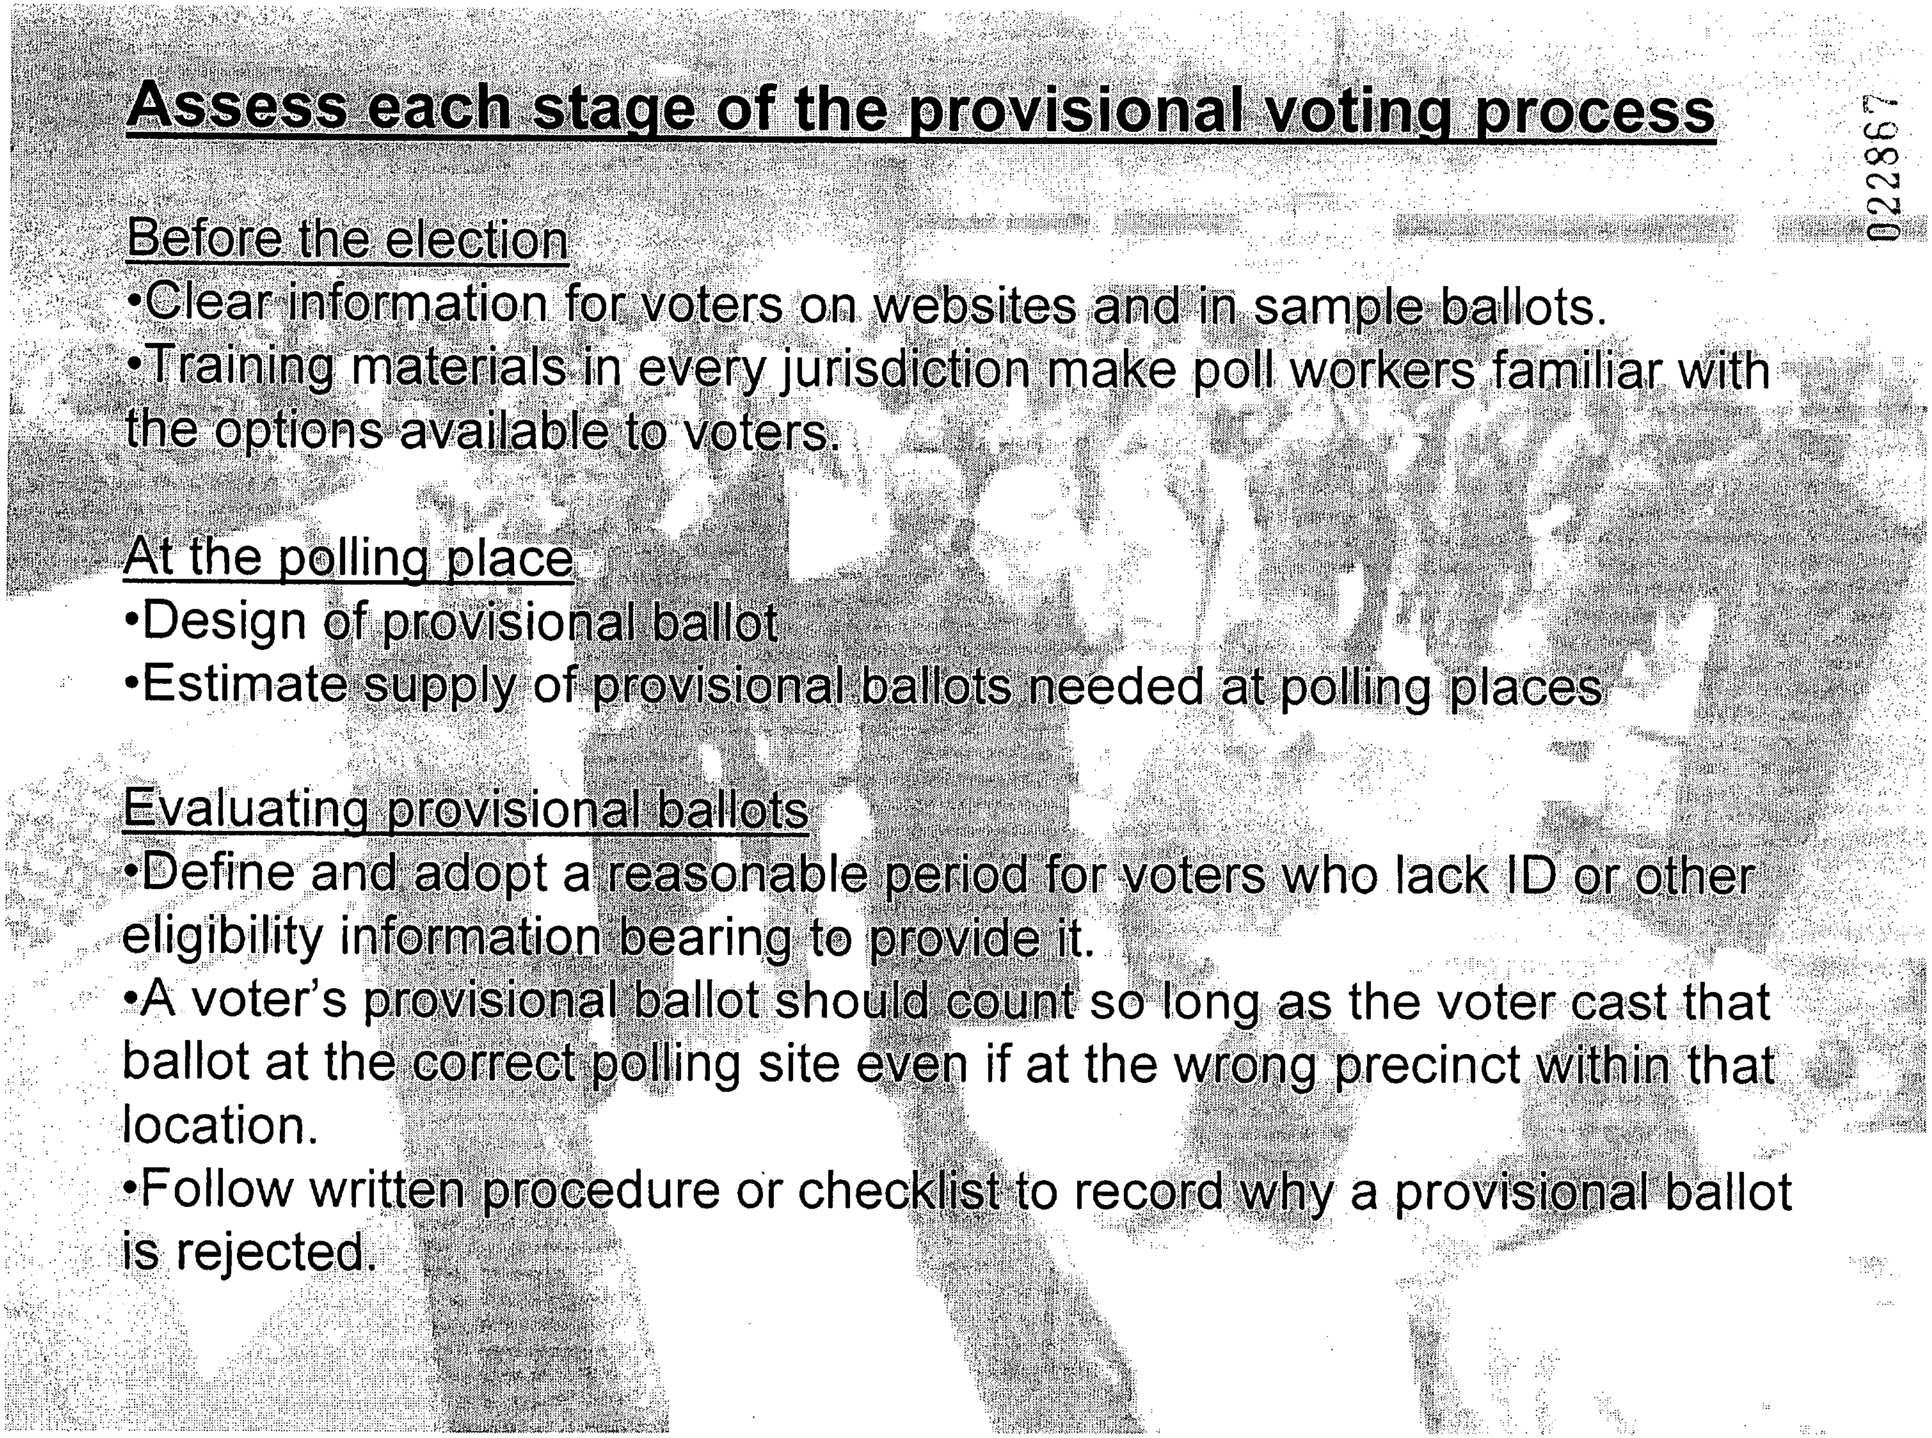
-- Provide poll workers the training they need to understand their duty to give those voters a provisional ballot.



EAC should recommend quality improvement

Begin a systematic quality improvement program by collecting data on the provisional voting process. Data collected should include:

- ☐Specific reasons why provisional ballots were not counted
- ☐Measures of variance among jurisdiction
- ☐Time required to evaluate ballots by jurisdiction
- ☐Provisional votes cast and counted by jurisdiction



Assess each stage of the provisional voting process

Before the election

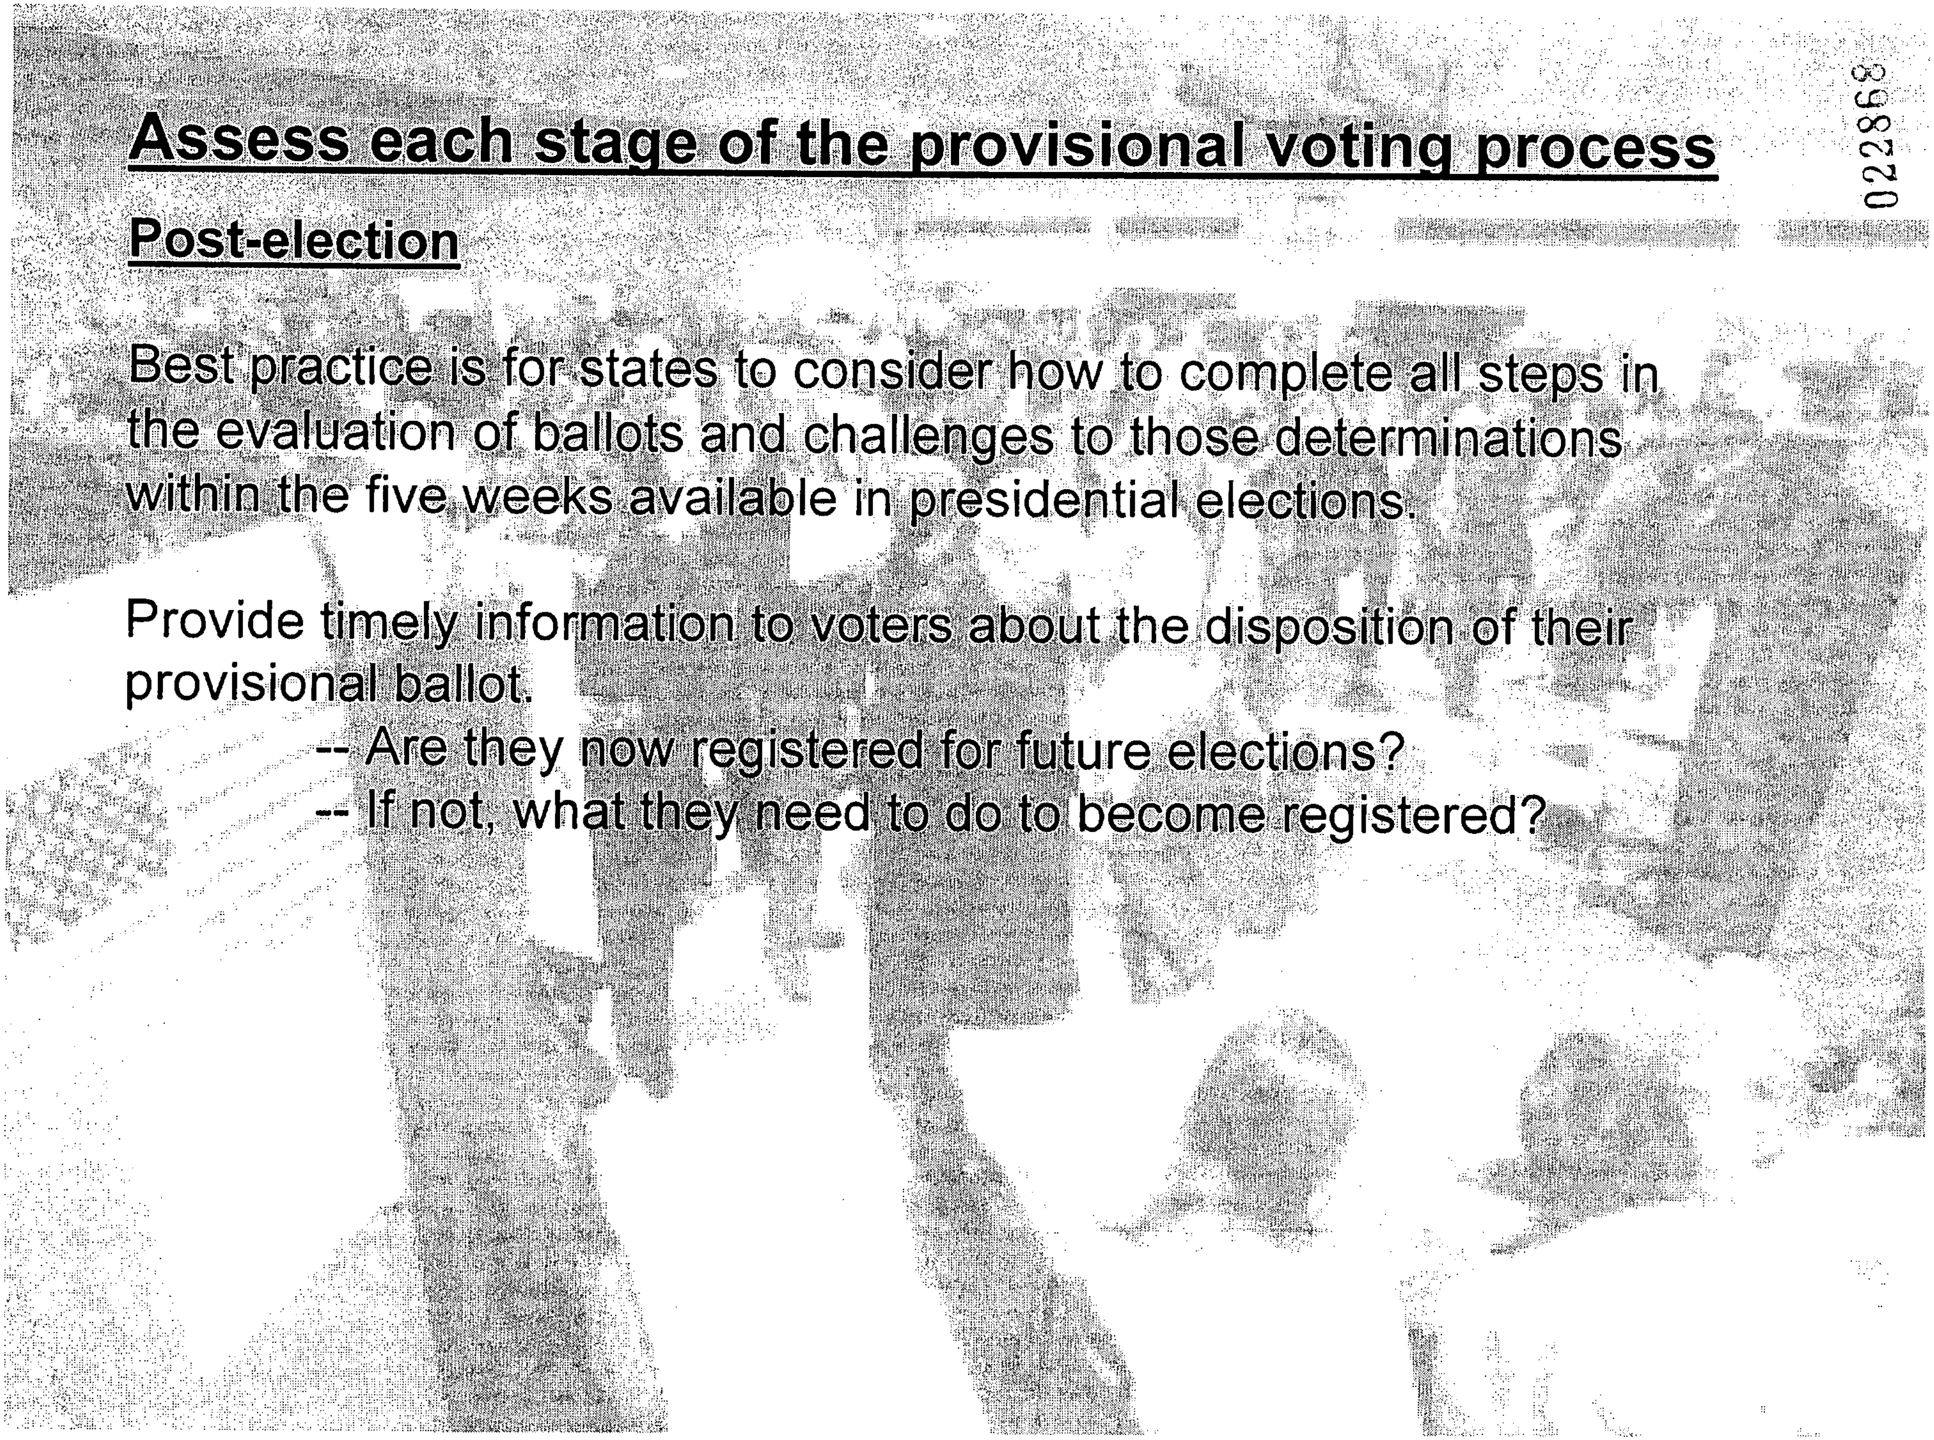
- Clear information for voters on websites and in sample ballots.
- Training materials in every jurisdiction make poll workers familiar with the options available to voters.

At the polling place

- Design of provisional ballot
- Estimate supply of provisional ballots needed at polling places

Evaluating provisional ballots

- Define and adopt a reasonable period for voters who lack ID or other eligibility information bearing to provide it.
- A voter's provisional ballot should count so long as the voter cast that ballot at the correct polling site even if at the wrong precinct within that location.
- Follow written procedure or checklist to record why a provisional ballot is rejected.



Assess each stage of the provisional voting process

Post-election

Best practice is for states to consider how to complete all steps in the evaluation of ballots and challenges to those determinations within the five weeks available in presidential elections.

Provide timely information to voters about the disposition of their provisional ballot.

-- Are they now registered for future elections?
-- If not, what they need to do to become registered?

Background of the Research

This report to the United States Election Assistance Commission (EAC) presents recommendations for best practices to improve the process of provisional voting. It is based on research conducted by the Eagleton Institute of Politics at Rutgers, the State University of New Jersey, and the Moritz College of Law at Ohio State University under contract to the EAC, dated May 24, 2005. The research included a review and legal analysis of state statutes, regulations and litigation concerning provisional voting, a sample survey of local election officials, and a statistical analysis of provisional voting in the 2004 election. Also consulted as a basis for these recommendations were other studies, notably the EAC's Election Day Survey.[1]

The Help America Vote Act of 2002 (HAVA) (Public Law 107-252) authorizes the EAC (SEC. 241, 42 USC 15381) to conduct periodic studies of election administration issues. The purpose of these studies is to promote methods for voting and administering elections, including provisional voting, that are convenient, accessible and easy to use; that yield accurate, secure and expeditious voting systems; that afford each registered and eligible voter an equal opportunity to vote and to have that vote counted; and that are efficient.

Section 302(a) of HAVA requires states to establish the process of provisional balloting by January 2004.[3] The process HAVA outlined leaves considerable room for variation among the states, arguably including such critical questions as who qualifies as a registered voters eligible to cast a provisional ballot that will be counted and, arguably, in what jurisdiction (precinct or larger unit) that the ballot must be cast in order to be counted.[4]

The general requirement is that, if a registered voter appears at a polling place to vote in an election for Federal office, but the potential voter's name does not appear on the official list of eligible voters for the polling place, or if an election official asserts that the individual is not eligible to vote, that potential voter be permitted to cast a provisional ballot. In some states, those who should receive a provisional ballot include, in the words of the Election Day Survey, include first-time voters who cannot provide identification, as required under HAVA, and voters who were

---

[1] Appendix 1 provides detailed information on how this study classifies the states according to the characteristics of their provisional voting procedures and describes how the data used in the statistical analysis may differ from the data in the Election Day Survey, which became available as our research was concluding.

[3] The Election Center's National Task Force Report on Election Reform in July 2001 had described provisional ballots as providing "voters whose registration status cannot be determined at the polls or verified at the election office the opportunity to vote. The validity of these ballots is determined later, thus ensuring that no eligible voter is turned away and those truly ineligible will not have their ballots counted." It recommended "in the absence of election day registration or other solutions to address registration questions, provisional ballots must be adopted by all jurisdictions. " See www.electioncenter.org

[4] The 2004 election saw at least a dozen suits filed on the issue of whether votes cast in the wrong precinct but the correct county should be counted. One federal circuit court decided the issue in *Sandusky County Democratic Party v. Blackwell, 387 F.3d565* (6th Cir. 2004), which held that votes cast outside the correct precinct did not have to be counted. The court relied on the presumption that Congress must be clear in order to alter the state-federal balance; thus Congress, the court concluded, would have been clearer, had it intended to eliminate state control over polling location (387 F.3d at 578). An alternative argument, that HAVA's definition of "jurisdiction" incorporates the broader definition in the National Voting Rights Act, however, has not been settled by a higher court. But for now states do seem to have discretion in how they define "jurisdiction" for the purpose of counting a provisional ballot.

challenged at the poll.[5] HAVA also provides that those who vote pursuant to a court order keeping the polls open after the established closing hour shall vote by provisional ballot. HAVA also requires election administrators to notify individuals of their opportunity to cast a provisional ballot.

Provisional Ballots in the 2004 Election

In the 2004 election, nationwide about 1.9 million votes, or 1.6% of turnout, were cast as provisional ballots. More than 1.2 million, or just over 63% were counted. Provisional ballots accounted for a little more than 1% of the final vote tally.[6]

These totals obscure the tremendous variation in provisional voting among the states. HAVA allows the states considerable latitude in how to implement provisional voting, including deciding who beyond the required categories of voters should receive provisional ballots and how to determine which provisional ballots should be counted. Six states accounted for two-thirds of all the provisional ballots cast.[7] State by state, the percentage of provisional ballots in the total vote varied by a factor of 1,000, from a high of 7% in Alaska's to Vermont's .006%. The portion of provisional ballots cast that were actually counted also displayed wide variation, ranging from 96% in Alaska to 6% in Delaware. States with voter registration databases counted, on average, 20% of the provisional ballots cast. Those without databases counted ballots at more than twice that rate: 44%. (Or, as the Carter-Baker Commission report put it, "provisional ballots were needed half as often in states with unified databases as in states without."[8])

The wide variations in the use of provisional ballots argue for the promulgation of best practices that states can use to determine how to make procedures clearer to both officials and voters could improve the implementation of provisional voting across the country.

One important source of variation among states was a state's previous experience with provisional voting. The share of provisional ballots in the total vote was six times greater in states that had used provisional ballots before than in states where the provisional ballot was new. In the 25 states that had some experience with provisional voting before HAVA, a higher portion of the total vote was cast as provisional ballots and a greater percentage of the provisional ballots cast were counted than in the 18 new to provisional balloting.[9]

---

[5] The definition of who was entitled to a provisional ballot could differ significantly among the states. In California, for example, the Secretary of State directed counties to provide voters with the option of voting on a provisional paper ballot if they felt uncomfortable casting votes on the paperless e-voting machines. "I don't want a voter to not vote on Election Day because the only option before them is a touch-screen voting machine. I want that voter to have the confidence that he or she can vote on paper and have the confidence that their vote was cast as marked," Secretary Shelley said. See http://wired.com/news/evote/0,2645,63298,00.html . (Our analysis revealed no differences in the use of provisional ballots in the counties with these paperless e-voting machines.) In Ohio, long lines at some polling places resulted in legal action directing that voters waiting in line be given provisional ballots to enable them to vote before the polls closed. (Columbus Dispatch, November 3, 2004 .)

[6] These figures differ slightly from those in the Election Day Survey. Data used for this study include complete voting data for New Mexico, for which the Election Day Survey had only partial data, and vote totals for Pennsylvania, which was not included in the provisional voting analysis in the Election Day Survey. See the appendix to this report for a full explanation of the differences in data between this research and the Election Day Survey.

[7] California, New York, Ohio, Arizona, Washington, and North Carolina. The appearance of Arizona, Washington and North Carolina on this list shows that the number of provisional ballots cast depends on factors other than the size of the population.

[8] Report on the Commission on Federal Election Reform, "Building Confidence in U. S. Elections," September 2005, p. 16.

[9] See the appendix for our classification of "old" and "new" states and explanation of why the total is less than 50.

- The percentage of the total vote cast as provisional ballots averaged more than 2% (2.17%) in the 25 experienced states. This was 4 times the rate in states new to provisional voting, which averaged 0.47%.
- The experienced states counted an average of 58% of the provisional ballots cast, nearly double the proportion in the new states, which counted just 33% of cast provisional ballots.
- The combined effect of these two differences was significant. In experienced states 1.53% of the total vote came from counted provisional ballots. In new states, provisional ballots accounted for only 0.23% of the total vote.

Those voting with provisional ballots in experienced states were enfranchised more frequently than those in the new states, another indication that there is room for improvement in provisional balloting procedures.[10] That conclusion gains support from the perspectives of the local election officials revealed in the survey conducted as a part of this research. Local (mostly county level) election officials from "experienced" states were more likely to:

- Be prepared to direct voters to their correct precincts with maps;
- Regard provisional voting as easy to implement;
- Report that provisional voting sped up and improved polling place operations
- Conclude that the provisional voting process helped officials maintain accurate registration databases.

Officials from "new" states, on the other hand, were more likely to agree with the statement that provisional voting created unnecessary problems for election officials and poll workers.

If experience with provisional voting does turn out to be a key variable in performance, that is good news. As states gain experience with provisional ballots their management of the process could become more consistent and more effective over subsequent elections. Further information from the EAC on best practices and the need for more consistent management of the election process could sharpen the lessons learned by experience. The EAC should consider providing the "new" states with information on more effective administration of provisional voting. EAC could also consider convening a national meeting for state and county election officials to share experiences and best practices from their own jurisdictions.

But the optimistic conclusion that experience will make all the difference may be unwarranted. Only if the performance of the "new" states was the result of administrative problems stemming from inexperience will improvement be automatic as election officials move along the learning curve. Two other possibilities exist. Current understanding of the provisional voting processes in use in 2004 is not sufficient to determine unambiguously which view is correct.

1. "New" states may have a political culture different from "old" states. That is, underlying features of the "new" states political system may be the reason they had not adopted some form of provisional voting before HAVA. The "new" states may strike a different balance among the competing objectives of ballot access, ballot security and practical administration. They may ascribe more responsibility to the individual voter to take such

---

[10] Managing the provisional voting process can strain the capacity election administrators. For example, Detroit, counted 123 of the 1,350 provisional ballots cast there in 2004. A recent study concluded that Detroit's 6 day time frame for processing the provisional ballots was very challenging and unrealistic. To overcome this challenge, *the entire department's employees were mobilized to process provisional ballots.*" (emphasis added.) GAO Report-05-997, "Views of Selected Local Officials on Managing Voter Registration and Ensuring Citizens Can Vote," September 2005.

actions as registering early, finding out where the right precinct is, or re-registering after changing address. They may value keeping control at the local level, rather than ceding authority to state or federal directives. If the inconsistent performance in the "new" states arises out of this kind of political culture, improving effectiveness in the use of the provisional ballots -- as measured by intrastate consistency in administration--- will be harder and take longer to achieve.[11]

Formatted: Indent: Left: 0.25"

2. "Old" states may devote fewer resources to updating their registration files or databases because they are comfortable with provisional ballots as a fail safe way for voters with registration problems a way to cast a ballot. The adoption of statewide voter registration databases in compliance with HAVA therefore may reduce the variation in the use of provisional ballots among the states.

Other influences decreasing consistency among the states include:

Deleted: increasing variation

Deleted: d

- The more rigorous the verification requirements of the voter's identity and registration status, the smaller the percentage of provisional ballots that were counted. Some states merely require a voter's signature, some match signatures, some require identity documents, others require an affidavit, and a few require photo identification. [12]
  - In the 4 states that simply matched signatures, nearly 3.5% of the total turnout consisted of provisional ballots, and just under three-fourths of those ballots (73%) were counted.
  - In the 14 states that required voters to provide such additional information as address or date of birth just over 1.5% of the total turnout consisted of provisional ballots, and 55% of those ballots were counted.
  - In the 14 states that required an affidavit (attesting, for example, that the voter was legally registered and eligible to vote in the jurisdiction) just over one-half of a percent (0.6%) of turnout came from provisional ballots, and less than one-third of those (30%) were counted. (But note that HAVA requires all voters to certify that they are eligible and registered in order to cast a provisional ballot, which is functionally an affidavit. The 14 states described here used an explicit affidavit form.)
  - In the 10 states that required voters to return later with identifying documents just under 1.5% of the total turnout came from provisional ballots, and more than half (52%) of these were counted. Voters apparently found this requirement less onerous than the affidavit, even though it required a separate trip to a government office.

Deleted: ertified

Deleted: ertified

- Voter registration databases provided information that reduced the number of provisional ballots counted.[13] In states using provisional voting for the first time, states with

---

[11] Despite differing political cultures among states and the latitude HAVA provides states, the statute does, indeed impose some degree of uniformity on issues that Congress thought essential. For example, before HAVA, took effect, "no state gave the voter the right to find out the status of their ballot after the election. " Now all offer that opportunity. See Bali and Silver, "The Impact of Politics, Race and Fiscal Strains on State Electoral Reforms after Election 2000," manuscript, Department of Political Science, Michigan State University. Resisting HAVA's mandates through foot-dragging lacks any legitimate foundation in law or policy.

[12] See Table 2 in Appendix 2 for information on the verification method used in each state.

[13] The Election Day Survey found that states using statewide voter registration databases reported a lower incidence of casting provisional ballots than states without voter registration databases, suggesting that better administration of voter registration rolls might be associated with fewer instances where voters would be required to cast a provisional ballot due to a problem with their voter registration.

registered-voter databases counted only 20% of the ballots that were cast. States without such databases counted more than double that rate (44%). As HAVA's requirement for adoption of statewide databases spreads across the country, this variation among states is likely to narrow. Real-time access to a continually updated, statewide list of registered voters should reduce the number of provisional ballots used and reduce the percentage counted since most of those who receive them will be less likely to be actually registered in the state.

- States that counted out-of-precinct ballots counted 56% of the provisional ballots cast. States that counted ballots cast only in the proper precinct counted an average of 42% of provisional ballots.[14]
  - In experienced states, the disparity was even more pronounced: 52% of provisional ballots cast were counted in states requiring in-district ballots, while 70% were counted in those allowing out-of-precinct ballots.
  - If all states had counted out-of-precinct ballots, perhaps 290,000 more voters would have been enfranchised across the country.[15]

Variation With-in States

Not only was there little consistency among states in the use of provisional ballots, there was also little consistency within states. This was true in both new and old states. Of the 20 states for which we have county-level provisional ballot data, the rate of counting provisional ballots varied by as much as 90% to 100% among counties in the same state. This suggests that additional factors outside of the statewide factors analyzed here also influence the use of provisional ballots.[16] Reacting to the lack of consistency within states, the Carter-Baker Commission recommended that "states, not counties or municipalities, should establish uniform procedures for the verification and counting of provisional ballots, and that procedure should be applied uniformly throughout the state."[17]

[14] The Election Day Survey concluded that : "Jurisdictions with jurisdiction-wide provisional ballot acceptance reported higher rates of provisional ballots cast, 2.09 percent of registration or 4.67 percent of ballots cast in polling places, than those with in-precinct-only acceptance, 0.72 and 1.18 percent, respectively. Predictably, those jurisdictions with more permissive jurisdiction-wide acceptance reported higher rates of counting provisional ballots, 71.50 percent, than other jurisdictions, 52.50 percent."

Deleted: Election Day Study

[15] This estimate is a rough approximation. States that recognize out-of-precinct ballots counted, on average, 56% of the provisional votes cast. Applying that ratio to the 1.9 million provisional ballots cast nationwide would result in 1.1 million provisional ballots that would have been counted if all states accepted out-of-precinct votes. States that did not recognize out-of-precinct ballots counted 42% of the provisional ballots cast, or about 813,000 ballots, for a difference of about 290,000 votes.

Formatted: Normal, Don't adjust space between Latin and Asian text, Don't adjust space between Asian text and numbers, Tabs: 5.5", Left

[16] For example, The Election Day Survey also found that "the reported rate of provisional ballots cast increases with population size, from 0.10 percent for voter registration in jurisdictions under 1,000 voting age population (VAP), to 2.51 percent in jurisdictions over one million VAP. It also calculated that, "The highest reported rate of counting provisional ballots was also among predominantly Hispanic jurisdictions, 79.30 percent, followed by predominantly non-Hispanic White areas, 62.60 percent; predominantly non-Hispanic Black communities, 58.60 percent; and predominantly non-Hispanic Native American jurisdictions, 48.70 percent.

[17] Report of the Commission on Federal Election Reform, "Building Confidence in U.S. Elections," September 2005, p.16. The report observed that, ". . .different procedures for counting provisional ballots within and between states led to legal challenges and political protests. Had the margin of victory for the presidential contest been narrower, the lengthy dispute that followed the 2000 election could have been repeated."

- Some counties in Washington tracked down voters who would otherwise have had their provisional ballots rejected because they had failed to complete part of their registration form, gave them the chance to correct those omissions, and then counted the provisional ballot. This would probably not have come to light except for the sharp examination caused by the very close election for governor.

Resources available to administer provisional voting varied considerably among and within states. The result is that differences in demographics and resources result in different experiences with provisional voting. For example, the Election Day Survey found that:

- Jurisdictions with lower education and income tend to report more inactive voter registrations, lower turnout, and more provisional ballots cast.

- Jurisdictions with higher levels of income and education reported higher average numbers of poll workers per polling place or precinct and reported lower rates of staffing problems per precinct.

- Staffing problems appeared to be particularly acute for jurisdictions in the lowest income and education categories. Small, rural jurisdictions and large, urban jurisdictions tended to report higher rates of an inadequate number of poll workers within polling places or precincts.

- Predominantly non-Hispanic, Black jurisdictions reported a greater percentage of polling places or precincts with an inadequate number of poll workers. Predominantly non-Hispanic, Native American jurisdictions reported the second highest percentage of staffing problems.

The conclusions to be drawn from these findings are clear. In voting districts with lower education levels, poverty, high mobility, and inadequately staffed polling places, the voting process is unlikely to function well. More people will end up casting provisional ballots. That makes the provisional voting process especially important. But if jurisdictions struggle with regular voting, how well are they likely to do with the more complicated provisional balloting process? In precincts were the voting process, in general, is managed poorly, provisional ballots cannot be expected to work much better. In these areas, the focus should be on broader measures to improve the overall functionality of struggling voting districts, although improving the management of provisional balloting may help at the margin.

Effectiveness of Provisional Voting

The certainty of our conclusions about the effectiveness of provisional voting is limited because of a fundamental challenge of methodology and the lack of important information. An ideal assessment of how well provisional ballots served the needs of voters and the public interest requires knowing the decisions of local officials in 200,000 precincts on how to inform voters about provisional voting; their performance in providing a provisional ballot to those qualified to receive one, and their decisions whether to count a provisional ballot. And information needed about the eligibility or registration status of provisional voters is also not available.

We see no automatic correlation between the quality of a state's voting system and either the number of provisional ballots cast or counted. Low numbers could reflect an accurate statewide voting data and good voter education. Or they could suggest that provisional ballots were not made easily available. High numbers could be seen as signifying an effective provisional voting system or a weak registration process. But we do know, that in 2004 provisional ballots enfranchised 1.2 million citizens, who would otherwise have been turned away from the polls.

Not knowing the total number of registered voters who might have voted but could not makes a precise, quantitative estimate of the effectiveness of provisional voting impossible. The Cal Tech – MIT Voting Technology Project, however, estimated that 4 – 6 million votes were lost in the 2000 presidential election for the reasons shown in Table 1 below. The estimate is an approximation, but it may provide data good enough for a general assessment of the size of the pool of potential voters who might have been helped by the provisional ballot process.

Estimates of Votes Lost In 2000 Presidential Election

Votes Lost (Millions)	*Cause*
1.5 – 2	Faulty equipment and confusing ballots
1.5 – 3	Registration mix-ups
<1	Polling place operations
?	Absentee ballot administration

Table 1 Cal Tech – MIT Voting Technology Project Estimates
4 – 6 million votes are lost in presidential elections due to the causes shown in the table. Registration mix-ups (e.g., name not on list) and polling place operations (e.g., directed to wrong precinct) are the causes most likely to be remedied by provisional voting.

The table shows that the universe of voters who could be helped by provisional voting might be 2.5 – 3 million voters. A rough estimate of the effectiveness of provisional voting in 2004, then, might be 40% to 50% (ballots counted/votes lost)*. Whatever the precise figure, it seems reasonable to conclude that there is considerable room for improvement in the administration of provisional voting.

Legislative Response

Indeed, several states[20] came to the conclusion that the administration of their provisional voting procedures needed to be improved and amended their statutes after the 2004 election. State legislation adopted since the election points to particular areas of concern.

Not enough time to examine and count the provisional ballots. Florida, Indiana, Virginia, and Washington all have clarified or extended the timeline to evaluate the ballots. But taking more time can prove a problem, particularly in presidential elections with the looming deadline to certify the vote for the Electoral College.[21]

Lack of uniform rules for counting ballots and effective training of the election officials in interpreting and applying those rules to determine the validity of ballots. Colorado, New Mexico, North Carolina, and Washington have all passed legislation focused on improving the efficacy and consistency of the voting and counting process.

The issue of counting provisional ballots cast in the wrong precinct was addressed by Colorado, Arkansas, and North Dakota.

Litigation

Successful legal challenges to the process highlight areas where provisional voting procedures were wanting. A flurry of litigation occurred around the country in October 2004 concerning the so-called "wrong precinct issue" – whether provisional ballots cast by voters in a precinct other than their designated one would be counted for statewide races. These lawsuits were largely unsuccessful in their stated goal: most courts, including the U.S. Court of Appeals for the Sixth Circuit (the only federal appeals court to rule on the issue), rejected the contention that HAVA requires the counting of these wrong-precinct provisional ballots.

This litigation was significant nonetheless.

---

[*] Another interpretation of the data should be considered. The Census Bureau's Current Population Survey (CPS) developed the category of "registration mix-ups" to assess the states' registration systems after each election when it asks people if they were registered and if they voted. The CPS gives breakdowns of reasons why people did not vote. Survey responders tend to deflect blame when answering questions about voting. In the narrow context of provisional ballots, 'registration problems' would cover only voters who went to the polls where the determination that they were not registered was wrong or were registered, but in the wrong precinct. If they were in the wrong precinct, provisional voting can help them in only 17 states. In 2004, only 6.8% of those not voting and registered blamed registration problems, while 6.9% reported so in 2000.

[20] Twelve states made statutory or regulatory changes: Arizona, Arkansas, Colorado, Florida, Georgia, Indiana, Louisiana, Montana, New Mexico, North Carolina, Virginia and Wyoming. See Table 4 in Appendix 2.

[21] The resources available to evaluate and count provisional ballots within a tight schedule may not be easily available. The General Accounting Office reports that Detroit, where 1,350 provisional ballots were cast and 123 counted, found the 6-day time frame for processing provisional ballots "very challenging and unrealistic. To overcome this challenge, the *entire department's employees were mobilized to process provisional ballots*." The report also found that in Los Angeles County, "staff had to prepare duplicate ballots to remove ineligible or invalid contests when voters cast their ballots at the wrong precinct. To overcome this challenge, staffing was increased to prepare the duplicate ballots." In a close, contested election, "duplicate" ballots would doubtless receive long and careful scrutiny." See Appendix 7, GAO, "Views of Selected Local Election Officials on Managing Voter Registration and Ensuring Eligible Citizens Can Vote," September 2005. (GAO Report-05-997)

- First, the Sixth Circuit decision established the precedent that voters have the right to sue in federal court to remedy violations of HAVA.
- Second –and significantly-- the litigation clarified the right of voters to receive provisional ballots, even though the election officials were certain they would not be counted. The decision also defined an ancillary right –the right to be directed to the correct precinct. There voters could cast a regular ballot that would be counted. If they insisted on casting a provisional ballot in the wrong precinct, they would be on notice that it would be a symbolic gesture only.

Deleted: First, the Sixth Circuit decision established the precedent that voters have the right to sue in federal court to remedy violations of HAVA. (A state's decision not to count wrong-precinct provisional ballots, however, was found by the court not to violate HAVA. ¶

Formatted: Bullets and Numbering

- Third, these lawsuits prompted election officials to take better care in instructing precinct officials on how to notify voters about the need to go to the correct precinct in order to cast a countable ballot – although the litigation regrettably came too late to be truly effective in this regard. In many states, on Election Day 2004, the procedures in place for notifying voters about where to go were less than ideal, reflecting less-than-ideal procedures for training poll workers on this point.

There was also pre-election litigation over the question whether voters who had requested an absentee ballot were entitled to cast a provisional ballot. In both cases (one in Colorado and one, decided on Election Day, in Ohio), the federal courts ruled that HAVA requires that these voters receive a provisional ballot. Afterwards, it is for state officials under state law to determine whether these provisional ballots will be counted, in part by determining if these provisional voters already had voted an absentee ballot (in which case one ballot should be ruled ineligible, in order to avoid double voting). These decisions confirm the basic premise that provisional ballots should be available whenever voters believe they are entitled to them, so that their preferences can be recorded, with a subsequent determination whether these preferences count as valid votes.

Need for Promulgation of Best Practices

Because every provisional ballot counted represents a voter who, if the system had worked really well, should have voted by regular ballot, the advent of statewide registration databases is likely to reduce the use provisional ballots. The one area in which such databases may not make a difference is for those who voted by provisional ballot because they did not bring required identification documents to the polling place. Beyond that exception, even with statewide registries in every state, provisional voting will remain an important failsafe, and voters should have confidence that the failsafe will operate correctly.

The wide variation in the implementation of provisional voting among and within states suggests that EAC can help states strengthen their processes. Research-based recommendations for best, or at least better, practices based on the experience gained in the 2004 election can be useful in states' efforts to achieve greater consistency in the administration of provisional voting.

Deleted: Because every provisional ballot counted represents a voter who, if the system had worked really well, should have voted by regular ballot, the advent of statewide registration databases is likely to reduce the use provisional ballots. Beyond that exception, even with statewide registries in every state, provisional voting will remain an important failsafe, and voters should have confidence that the failsafe will operate correctly. EAC's guidance and recommendations for best practices will provide information to allow states to adopt procedures likely to strengthen their systems.

Recommendations for Best Practices

Recent legislative activity shows that state efforts to improve the provisional voting process are underway. Those states, as well as others that have not yet begun to correct shortcomings that became apparent in 2004, can benefit from considering the best practices described here. By recommending best practices, the EAC will offer informed advice while respecting diversity among the states. One way to strengthen the recommendations and build a constituency for them would be for EAC to ask its advisory committee members to recommend as best practices procedures that have worked in their states.

Deleted: They offer

Self-evaluation of Provisional Voting –4 Key Questions

The first recommendation is not for a specific procedure, but rather for a way of thinking about provisional voting. As legislators and election officials in the states prepare for the 2006 election, they should ask themselves these questions about their provisional voting systems.

1. Does the provisional voting system distribute, collect, record, and tally provisional ballots with sufficient accuracy to be seen as procedurally legitimate by both supporters and opponents of the winning candidate? Does the tally include all votes cast by properly registered voters who correctly completed the steps required?

2. Is the system sufficiently robust to perform well under the pressure of a close election when ballot evaluation will be under scrutiny and with litigation looming?

Deleted: with the

Deleted: process

Deleted: by and

Deleted: the possibility of

3. Do the procedural requirements of the system permit cost-efficient operation? Are the administrative demands of the system reasonably related to the staff and other resource requirements available?

Deleted:

4. How great is the variation in the use of provisional voting in counties or equivalent levels of voting jurisdiction within the state? Is the variation great enough to cause concern that the system may not be administered uniformly across the state?

Deleted: is

If the answers to these questions leave room for doubt about the effectiveness of the system or some of its parts, the EAC's recommendation of best practices should provide the starting point for a state's effort to improve its provisional voting system.

Deleted: for

Best Practices For Each Step In The Process

We examined each step of the provisional voting process to identify specific areas where the states should focus their attention, and we offer recommendations in each area appropriate to the responsibilities that HAVA assigns the EAC for the proper functioning of the provisional voting process.

Deleted: We examined each step of the provisional voting process to identify specific areas where the states should focus their attention, and we offer recommendations in each area appropriate to the responsibilities that HAVA assigns the EAC for the proper functioning of the provisional voting process.¶

The Importance of Clarity

The EAC should emphasize above all else the importance of clarity in the rules governing every stage of provisional voting. As the Century Foundation's recent report observed, "Close elections increasingly may be settled in part by the evaluating and counting of provisional ballots. . . To avoid post election disputes over provisional ballots—disputes that will diminish public confidence in the accuracy and legitimacy of the result-- well in advance of the election, states should establish, announce, and publicize clear statewide standards for every aspect of the provisional ballot process, from who is entitled to receive a provisional ballot to which ones are counted."[22]

Litigation surrounding the 2004 election resulted in decisions that, if reflected in state statutes or regulations and disseminated in effective training for poll workers, can increase the clarity of provisional ballot procedures, increase predictability, and bolster confidence in the system. By taking the following steps, states can incorporate those court rulings into their procedures.

Deleted: own

---

[22] The Century Foundation, Balancing Access and Integrity, Report of the Working Group on State Implementation of Election Reforms, July 2005.

- Promulgate, ideally by legislation, clear standards for evaluating provisional ballots, and provide training for the officials who will apply those standards. For example, in Washington State, the court determined that an election official's failure in evaluating ballots to do a complete check against all signature records is an error serious enough to warrant recanvassing.[23] Clear direction by regulation or statute on what records to use in evaluating ballots could have saved precious time and effort and increased the reliability of the provisional voting system.

- States should provide poll workers the training and information resources they need, as for example, how to locate polling places for potential voters who show up at the wrong place. Usable and useful information in the hands of poll workers can protect voters from be penalized by ministerial errors at the polling place.[24]

- States should make clear that the only permissible requirement to obtain a provisional ballot is an affirmation that the voter is registered in the jurisdiction and eligible to vote in an election for federal office. [25] Recent legislation in Arizona indicates that the EAC's recommendations should emphasize HAVA's requirement that persons appearing at the polling place claiming to be registered voters cannot be denied a ballot because they do not have identification with them. Poll workers need appropriate training to understand their duty to give such voters a provisional ballot. [26]

A. Registration and Pre-Election Information for Voters

Providing crisp, clear information to voters before the election is important to the success of the provisional voting process. The better voters understand their rights and obligations, the easier the system will be to manage, and the more legitimate the appearance of the process. States can begin by assessing the utility and clarity of the information for voters on their websites and by considering what information might be added to sample ballots mailed to voters before elections. Best practices in this area would include:

1. If states require identification at the time of registration, the kind of IDs required should be stated precisely and clearly and be publicly and widely available in a form that all voters can understand. For example, "You must bring your driver's license. If you don't have a driver's license, then you must bring an ID card with your photograph on it and this ID card must be issued by a government agency." [27]

---

[23] See *Washington State Republican Party v. King County Division of Records*, 103 P3d 725, 727-728 (Wash. 2004)

[24] See *Panio v. Sunderland* 824 N.E.2d 488, 490 (NY, 2005) See also Order, *Hawkins v. Blunt*, No.04-4177-CV-C-RED (W.D. Mo. October 12, 2004). While rejecting the notion that all ballots cast in the wrong precinct should be counted, the court ruled that provisional votes cast in the wrong precinct should be thrown out provided that the voter had been directed to the correct precinct. This meant that provisional votes cast in the wrong precinct (and even the wrong polling place) would count if there were no evidence that the voter had been directed to a different polling place. The court placed a duty upon election officials to make sure the voters were in the correct locations. Note that this question would not arise in a state that counted ballots cast in the wrong polling place but within the correct county.

[25] *Sandusky County Democratic Party v. Blackwell,* 387 F.3d 565, 774 (6th Cir. 2004)

[26] *The Florida Democratic Party v. Hood*, 342 F. Supp. 2d 1073, 1075-76 (N.D. Fla. 2004). The court explained that provisional voting is designed to correct the situation that occurs when election officials do not have perfect knowledge and when they make incorrect determinations about eligibility (the "fail-safe" notion). Denying voters provisional ballots because of on-the-spot determinations directly contradicts this idea. Even before the cited decision, the Florida Secretary of State's office had determined that any voter who makes the declaration required by federal law is entitled to vote a provisional ballot, even if the voter is in the wrong precinct.

[27] Websites in 29 states describe, with varying degrees of specificity, the identification voters may need. In 18 states voters can learn something about the precinct in which they should vote. And in 6 states (California, District of Columbia, Kentucky, Michigan, North Carolina, and South Carolina) they can verify their registration on the website.

2. The process to re-enfranchise felons should be clear and straightforward. To avoid litigation over the registration status of felons, best practice should be defined as making re-enfranchisement automatic, or no more burdensome than the process required for any new registrant.[28]

Deleted:

Deleted: ment for

Deleted: process

3. A state website for voters should offer full, clear information on boundaries of precincts, location of polling places, requirements for identification, and other necessary guidance that will facilitate registration and the casting of a regular ballot. An 800 number should also be provided. Models are available: the statewide databases in Florida and Michigan provide voters with provisional voting information, registration verification and precinct location information.

Deleted: For example,

B. At the Polling Place

Avoiding error at the polling place will allow more voters to cast a regular ballot and all others who request it to cast a provisional ballot.

1. The layout and staffing of the polling place, particularly the multi-precinct polling place is important. Greeters, maps, and prominently posted voter information about provisional ballots, ID requirements, and related topics can help the potential voters cast their ballot in the right place. States should require poll workers to be familiar with the options and provide the resources needed for them to achieve the knowledge needed to be helpful and effective. Colorado has clear regulations on polling place requirements, including HAVA information and voting demonstration display.[29] After the 2004 election, New Mexico adopted a requirement for poll workers to attend an "election school." [30] Such statutory direction could help other states ensure uniform instruction of poll workers.

Deleted: This

Deleted: prove

Deleted: ful for

Deleted: , and other states can benefit from this example.

2. The provisional ballot should be of a design or color sufficiently different from a regular ballot to avoid confusion over counting, as occurred in Washington State. The ballot might include a tear-off leaflet with information for voters such as: "Reasons Why Your Provisional Ballot Might Not Be Counted" on one side and "What to Do if My Provisional Ballot Is Not Counted" on the other.

3. Because provisional ballots offer a fail-safe, supplies of the ballots at each polling place should be sufficient for all the potential voters likely to need them. In 2004, some polling places ran out of ballots, with unknown effects on the opportunity to vote. In Middlesex County, New Jersey, for example, on Election Day the Superior Court ordered the county clerk to assure that sufficient provisional ballots were available at several heavily used polling places, and it authorized the clerk "in the event additional provisional ballots are required . . .to photocopy official provisional ballots." [31] At least two states, Connecticut and Delaware, provide guidelines to local election officials on how to estimate the demand for provisional ballots. States that do not offer a practical method to guide the supply of provisional ballots at polling places should consider doing so. The guideline should take into account both the number of voters in the district and the

number of provisional ballots actually cast in recent elections. Connecticut sets the number at 1% of the voters in the district, Delaware at 6%.[32]

4. To achieve the procedural clarity needed to forestall disputes, states should establish a clear chain of custody for the handling of provisional ballots from production through distribution, collection and, finally, evaluation. A number of states have clear procedures for at least parts of this chain of custody. Illinois includes the potentially beneficial requirement that ballots be transported by bi-partisan teams, which offers the potential to avoid some charges of election fraud.[33]

C. Evaluating Voter Eligibility and Counting Provisional Ballots

The clarity of criteria for evaluating voter eligibility is critical to a sound process for deciding which of the cast provisional ballots should be counted. The recognition of the validity of those criteria is important to establishing the legitimacy of the system as a whole. The experience in 2004 in North Carolina, Washington, and Ohio underline the importance of clear criteria. As the Century Foundation report put it, "Whatever procedures the states choose [to determine if a provisional ballot should be counted], the paramount consideration—as with all others concerning provisional voting—is that they be clear and thus not susceptible to post-election manipulation and litigation."[34] Nonetheless, the *Panio v. Sutherland*[35] decision in New York shows the difficulty of defining the range of administrative errors from which the provisional voters should be held harmless. Even when the standard is "clerical error" judges can differ over what that means exactly. Possibly a state law might be able to clarify a definition by giving examples of clerical errors, but even then the definition is unlikely to be perfect.

1. State statutes or regulations should define a reasonable period for voters who lack the HAVA-specified ID or other information bearing on their eligibility to provide it in order to facilitate the state's ability to verify that the person casting the provisional ballot is the same one who registered. While there may be a concern to ensure that the individual who returns with the ID may not be the same individual who cast the provisional ballot, the spirit of HAVA demands that the opportunity to prove identity be provided after Election Day. A signature match can go far in establishing that the individual who voted

and the individual returning later with identification is, in fact, the same person. Encouraging a voter who lacks ID on Election Day to return later to help the verification process by providing proper identification will strengthen the system and increase public confidence in the electoral process. Our data indicate that some voters would prefer to return with ID rather than to sign an affidavit, perhaps because of uncertainty about the legal process involved in the affidavit. At least 11 states allow voters to provide ID or other information one to 13 days after voting. Of particular interest is Kansas, which allows voters to proffer their ID by electronic means or by mail, as well as in person.[37]

2. More provisional voters are enfranchised in those states that count ballots cast outside the correct precinct. [38] The best practice may be to count provisional ballots even if they are cast in the wrong precinct. While HAVA arguably leaves this decision up to the states, pointing out the effect of the narrower definition on the portion of ballots counted could be useful to the states in deciding this question. States should be aware, however, of the additional burden placed on the ballot-evaluation process when out-of-precinct ballots are considered. See the experience in Los Angeles County with the difficulties in evaluating out-of-precinct ballots described earlier in this report.

Deleted: define "jurisdiction" more broadly than the precinct.

Deleted: but

Deleted: in footnote 14 above.

3. Alternatively, if a state chooses to require voters to appear at their assigned precinct, where the same polling site serves more than one precinct, a voter's provisional ballot should count so long as the voter cast that ballot correct polling site even if at the wrong precinct within that location. [39]
4. Officials should follow a written procedure, and perhaps a checklist, to identify the reason why a provisional ballot is rejected (e.g., check the applicable box "unregistered voter"; "lack of signature match" "wrong precinct," etc.) Those forms should be disclosed publicly when completed. Colorado's election rules offer particularly clear guidance to the official evaluating a provisional ballot.[40]

Colorado Rejection Codes (Any ballot given a rejection code shall not be counted):

RFS	(Rejection federal or state) No federal or state candidates or issues to duplicate.
RNS	(Rejection not signed) Provisional Ballot Affidavit not signed.
RIN	(Rejection incomplete information provided) Required information is incomplete and the designated election official is unable to confirm voter's eligibility.
RNR	(Rejection not registered) Voter did not register by the voter registration deadline or by emergency registration, Colorado voter registration record was not found, or voter was previously cancelled and has not been reinstated pursuant to 1-2-605(10). C.R.S.
REE	(Rejection envelope empty) Provisional ballot envelope is empty.
RAB	(Rejection voter voted absentee) Designated election official has confirmed that voter voted an absentee ballot.
REV	(Rejection based on ballot cast in early voting) Voter voted early.

---

[38] See Andersen, op. cit, pgs. 23 – 24 for an analysis of the significant effect of counting out-of-precinct ballots. The Election Day Survey found that, "Most notably, jurisdictions that permitted jurisdiction-wide acceptance of provisional ballots reported higher rates of provisional ballots being cast, but also reported a much higher incidence of provisional ballots being counted, than other jurisdictions."

[39] Chances are administrative error accounts for the voter being directed to the wrong precinct under these circumstances.

RIP	(Rejection based on incorrect party) Incorrect Party in Primary Election.
RFE	(Rejection felon not eligible to vote) Individual was convicted of a felony and is either serving a sentence of confinement or detention or is on parole.
RWC	(Rejection elector not registered in county or State of Colorado) Non-county or non-state resident; therefore voter not eligible to vote in the county where the provisional ballot was voted.
RID	(Rejection first time voter has not supplied identification upon registration or thereafter prior to and during time voter voted) First Time Voter who registered by mail or through a voter registration drive, is tagged as id deficient, and did not provide id at the time of voting.
RRD	(Rejection registration deficient) Voter had deficient or incomplete registration and required information was not provided prior to or at the time of filling in the provisional ballot envelope. Voter's eligibility cannot be established.

D. Verification of Provisional Ballots

1. States that use the information on the provisional ballot to permit voters who have changed their addresses to update their registrations should adopt clear procedures on that process and specify how the new information will be communicated between different Boards of Elections

Formatted: Bullets and Numbering

2. The time by which election officials must complete their eligibility evaluations is critical, particularly in presidential elections. States should consider in particular how to divide the time allowed them by the safe-harbor provisions that apply in presidential elections to the certification to the Electoral College. Some part of this five-week period will be consumed by the eligibility evaluation, but states should take care to provide a sufficient period of time as well for challenges. If a state consumes 21 days following the election in the eligibility evaluations, only two weeks will remain for legal challenges to be concluded. Is that sufficient? Or should the state provide the resources needed to complete the eligibility determinations in 10 days or two weeks, leaving three weeks or more for legal challenges in a close election? Our research did not identify an optimum division of the five weeks available. The best practice here is for states to consider the issue and make a careful decision about how to complete all steps in the evaluation of ballots and challenges to those determinations within the five weeks available.

Formatted: Bullets and Numbering

E. Post-election Information for Voters

Timely information to voters about the disposition of their provisional ballot will provide helpful feedback and more important enable voters to determine if they are registered for future elections and, if not, what they need to do to become registered.

1. Establish mechanisms to ensure that voters casting provisional ballots are informed whether they are now registered for future elections and, if not, what they need to do to become registered.

F. State Laws Governing Litigation over Provisional Voting

1. Establish special, streamlined litigation procedures for Election Day complaints that individuals are being denied the right to cast a provisional ballot

Deleted: 15

Broader Considerations

G. Integrity and the Appearance of Integrity

1. State laws or regulations providing for non or bi-partisan bodies to make a public determination of the validity of provisional ballots would increase confidence in the system.

2. To improve transparency, state laws or regulations should require the purging process for registration to be public and with an opportunity for voters to correct an erroneous determination that they should be purged.

3. State laws or regulation should require the evaluation process for provisional ballots to be public.

H. Continuous Assessment of the Provisional Ballot -- Process and Performance

Defining what constitutes a successful provisional voting system is difficult. As noted earlier, the most successful system is probably not the one with the most provisional votes cast (that could indicate problems with the registration system). Nor is the system with the greatest number counted or with the fewest counted necessarily superior because the evaluation process could be flawed.

Deleted: (

Deleted:)

Defining quality requires a broad perspective about how well the system works, how open it is to error recognition and correction, and how well provisional voting processes are connected to the registration and voter identification regimes. The EAC should consider engaging one of the national quality organizations to evaluate the provisional ballot process within the broader context of the electoral system. Pending such a review, the EAC can recommend that states take the following actions.

Deleted: it can

Deleted: the

1. Recognize that the first step to improving quality is to see the provisional voting process as a system and take a systems approach to regular evaluation through standardized metrics with explicit goals for performance.

2. States should begin by collecting data systematically on the provisional voting process so that they can evaluate their voting system and assess changes from one election to the next. The effort should start in the 2006 election, and the data collected should include:
    -- Provisional votes cast and counted by jurisdiction, say counties, with details on why the voter had to vote provisionally (lack of ID, not on list, challenged at polling place, issued absentee ballot, etc) and number of ballots actually counted in each category.
    -- Reasons why provisional ballots were not counted, using categories such as those that have been adopted by Colorado, described earlier in this report.
    -- Measures of variance among jurisdictions.
    -- Number of poll workers trained in administration of provisional voting by polling place
    -- Number of jurisdictions posting information on provisional voting in the polling place
    -- Time required to evaluate ballots by jurisdiction

Improving understanding of the provisional voting process through analysis of detailed information will enable state and local election officials to strengthen their systems. By collecting and analyzing this data states can identify which aspects of the registration and electoral system are most important in shunting voters into the provisional ballot process. Responsible officials can then look to their registration system, identification requirements or poll worker training as a way to reduce the need for voters to cast their ballots provisionally.

Conclusion -- Research-based, continuing improvements for provisional voting are needed

Formatted: Font color: Red

The recommendations above are based on research that began in late May 2005. Our research focused on six key questions raised by the EAC. The answers to those questions provided the foundation for our policy recommendation. Those questions are:

1. How did the states prepare for the onset of the HAVA provisional ballot requirement?
2. How did this vary between states that had previously had some form of provisional ballot and those that did not?
3. How did litigation affect implementation?
4. How effective was provisional voting in enfranchising qualified voters?
5. Did state and local processes provide for consistent counting of provisional ballots?
6. Did local election officials have a clear understanding of how to implement provisional voting?

Formatted: Bullets and Numbering

To answer those questions, the Eagleton-Moritz team undertook the following research efforts:

1. Survey of 400 local (mostly county) election officials to learn their views about the administration of provisional voting and to gain insights into their experience in the 2004 election.
2. Review of news and other published reports in all 50 states to understand the local background of provisional voting and develop leads for detailed analysis.
3. Statistical analysis of provisional voting to determine associations between the use of provisional voting and such variables as states' experience with provisional voting, use of statewide registration databases, counting out-of-precinct ballots, and use of different approached to voter identification
4. Collection and review of the provisional voting statutes and regulations in all 50 states.
5. Analysis of litigation affecting provisional voting or growing out of disputes over provisional voting in all states.

Formatted: Bullets and Numbering

Deleted: ¶

Our research-based recommendations provide EAC with a strategy to engage the states in a continuing effort to strengthen the provisional voting process and increase the consistency with which provisional voting is administered, particularly within a state. As EAC and the states moved forward to assess and adopt the recommendations made here, provisional voting merits continuing observation and research. The situation is fluid. As states, particularly states that did not offer a provisional ballot before 2004, gain greater experience with the process and as statewide voter databases are adopted, the provisional voting process will demand further, research-based refinement.

Deleted: 15

ATTACHMENT 1 – Characteristics of the Provisional Voting Process

Classification of the States

Our research on provisional voting divided the various states into several categories to allow an assessment of how different factors may have influenced the process of casting and counting provisional ballots. This analysis was conducted before the release of the Election Day Study, and the categories we used may differ in some respects from its work. The categories analyzed here are:

Formatted: Bullets and Numbering

1. New vs. Old (states that used a provisional ballot before the 2004 election)
2. Use of a statewide database of registered voters vs. no use of a statewide database
3. Counting out-of-precinct ballots vs. not counting out-of-precinct ballots
4. Voter identification requirements
5. Method used to verify provisional ballots
6. Levels of provisional ballots cast and counted

Comment [o1]:

We first assigned states within these categories based on classifications done by Electionline.org in its studies. The Electionline data was the only published information available at the time of our research. We reviewed the Electionline data carefully, and, in select cases, updated it with new, detailed information that had become available after its publication. The changes we made are explained below.

Please note that:

--Idaho, Maine, Minnesota, New Hampshire, Wisconsin and Wyoming were excluded from our analysis. They have election-day registration systems, and did not need to use HAVA-compliant provisional ballots.

--North Dakota does not register voters, so it also was excluded from HAVA requirements and did not use provisional voting.

--Mississippi has not reported its provisional voting results and could not be included in our analysis, though it was compliant in 2004.

--Pennsylvania did not report its totals for the Election Day Study, but we obtained information on Pennsylvania and did include it in our analysis.

Deleted: 15

New vs. Old States

We classified states as "new" or "old" based on the 2001 Electionline study of provisional voting[41] and condensing its classifications into a single dichotomous variable, new/old with all other cases excluded. The Electionline study divided states into five categories of their use of provisional ballots in the 2000 election:

1. Use of provisional ballots (P)
2. Limited use of provisional ballots (LP)
3. Affidavit ballots (A)
4. No system in place (N)
5. Unnecessary/Not Applicable (U/NA)

Comment [o2]: It would be useful here to insert a table showing our classification as old or new.

Formatted: Bullets and Numbering

We collapsed all of the states listed as using provisional ballots, limited use of provisional ballots or affidavit ballots as "old" states, because the states in all three categories would have been familiar with key aspects of provisional voting.. States that had no provisional voting system in place for the 2002 election, and were HAVA compliant in 2004, were listed as "new" states, as 2004 would have been the first year in which they would be offering the option of provisional voting. States that were listed as unnecessary or not applicable were excluded from this study, as they were exempt from the HAVA regulations in 2004 because they either allowed same-day registration or did not register voters.

Comment [o3]: Under this criterion, how did Florida become an "old" state?

Rhode Island is the only state categorized as an old state by Electionline that we moved into the list of new states. Electionline's map shows Rhode Island as a state that used provisional voting in 2000, but in the state description, it is listed as having no system in place. We learned from the Rhode Island Board of Elections that the state had previously permitted potential voters to sign an affidavit if they did not appear on a precinct's list of registered voters, but felt they were registered to vote. Based on the signed affidavit, the election official would then contact a county official to see if the voter was on a more complete registration list. If the voter's name was on the complete list, that voter was permitted to cast a regular ballot. As this process did not grant the voter a provisional ballot, but served as a different type of administrative failsafe, we concluded that Rhode Island's first use of provisional voting was in 2004 and, therefore, classified the state as "new" to the system of provisional balloting.

Statewide List of Registered Voters

The Electionline preview of the 2004 Election[42] was the starting point for compiling a list of states that had a statewide database of registered voters. That study listed 34 States that did not have their statewide database systems complete, and 16 that did, including the District of Columbia. North Dakota does not register voters, so does not need to compile such a database. Electionline's criterion for concluding that a state had a statewide list was that the state have participation from all jurisdictions in a statewide system. We added Oklahoma to the list of states with statewide databases because we found they had met the Electionline criteria by the 2004 election, albeit too late for inclusion in the Electionline survey.

Minnesota has a statewide database but was excluded from the analysis because it did not offer provisional ballots and was exempt from the HAVA requirements.

Comment [o4]:

Out-of-Precinct Ballots

We based our classification of states that allow the counting of ballots cast outside the correct precinct on the data in the 2004 Electionline preview of the 2004 election[2]. States that evaluated ballots cast in a precinct where the voter was not registered were categorized as "out-of-precinct." States that invalidated such ballots were categorized as "In-precinct only."

Deleted: 15

Table 3
CATEGORIZATION OF STATES -- Counting Out-Of-Precinct Ballots

Out-of-Precinct	In-Precinct Only	HAVA EXEMPT OR NA
Alaska	Alabama	Idaho
Arkansas	Arizona	Maine
California	Colorado	Mississippi
Delaware	Connecticut	New Hampshire
Georgia	District of Columbia	North Dakota
Illinois	Florida	Wisconsin
Kansas	Hawaii	Wyoming
Louisiana	Indiana	
Maryland	Iowa	
New Mexico	Kentucky	
North Carolina	Massachusetts	
Oregon	Michigan	
Pennsylvania	Missouri	
Rhode Island	Montana	
Utah	Nebraska	
Vermont	Nevada	
Washington	New Jersey	
	New York

Voter Identification

We relied on Electionline studies, including the Voter Identification study[43] and the 2004 Election Preview, to classify the states on their requirements for voter identification. Each state's categorization is taken directly from the Electionline studies except Hawaii.[44] The five different, and increasingly rigorous, categories are: Give Name (8 states), Sign Name (14 states), Match Signature (8 states), Provide ID (15 states), and Photo ID (5 states).

Table 4
CATEGORIZATION OF STATES -- Forms of Identification Required

---

[43] This study can be found at: http://electionline.org/Portals/1/Publications/Voter%20Identification.pdf

[44] In 2004, ElelctionLine listed Hawaii as requiring identification. Our review of statutes revealed that Hawaii could require photo ID. Since that is the most rigorous form of identification that may be required of voters, we classified Hawaii under this category.

Deleted: 15

States in italics are exempt from HAVA or did not report Provisional Ballot data and are not included in the analysis.

Give Name	Sign Name	Match Signature	Provide ID	Photo ID
Maine	California	Illinois	Alabama	Florida
Massachusetts	DC	Nevada	Alaska	Hawaii
New Hampshire	*Idaho*	New Jersey	Arizona	Louisiana
North Carolina	Indiana	New York	Arkansas	South Carolina
Rhode Island	Iowa	Ohio	Colorado	South Dakota
Utah	Kansas	Oregon	Connecticut	
Vermont	Maryland	Pennsylvania	Delaware	
Wisconsin	Michigan	West Virginia	Georgia	
Wyoming	Minnesota		Kentucky	
	Mississippi		Missouri	
	Nebraska		Montana	
	New Mexico		*North Dakota*	
	Oklahoma		Tennessee	
	Washington		Texas	
			Virginia	
9	14	8	15	5

South Dakota complicates the effort to assign each state to a category. It permits voters to sign an affidavit that would allow them to vote without presenting photo ID. While Hawaii did not normally require photo ID, its statutes gave challenged voters the opportunity to respond by producing a photo ID.

Comment [o5]: Again, this would work better as a table.

Verification Method

We identified four different ways states assessed provisional ballots to determine if they should be counted: signature match, match voter data, signed affidavits, and bringing back identification later. We gathered information about these verification techniques by checking state websites and consulting journalistic accounts. We consulted state legislation to provide further information where needed.

Table 5
CATEGORIZATION OF STATES -- Ballot Evaluation Methods
States in italics are exempt from HAVA or did not report Provisional Ballot data and are not included in the analysis.

Signature Match	Data Match	Affidavit	Return with ID	NA
Alaska	Alabama	Connecticut	Indiana	Idaho

Data Collection

To assemble our data for analysis, we began by using the data on provisional votes cast and counted reported by Electionline. To increase the accuracy of this data, we surveyed each state's election websites for updated data, and for reported numbers on the county level. We then sent emails to 49 (we excluded Alaska, see below) states and the District of Columbia, requesting updated data on the number of provisional votes cast and counted by county. We received information from 25 states by our cut-off date of August 25, 2005.

---

[*] North Carolina lacked clear standards to evaluate provisional ballots and is excluded from this analysis.

Deleted: 15

Table 6
Updated information by State

Received Updated Data	**Did Not Receive Updated Data**
California	Alabama
District of Columbia	Alaska[45]
Florida	Arizona
Hawaii	Arkansas
Indiana	Colorado
Iowa	Connecticut
Kansas	Delaware
Louisiana	Georgia
Maryland[46]	Idaho
Missouri	Illinois
Montana	Kentucky
Nebraska[47]	Maine
Nevada	Massachusetts
New Jersey	Michigan
New Mexico	Minnesota
Ohio	Mississippi
Oklahoma	New Hampshire
Oregon	New York
Pennsylvania	North Carolina
Rhode Island	North Dakota
South Dakota	South Carolina
Tennessee	Utah
Texas	Vermont
Virginia	Wisconsin
Washington	Wyoming
West Virginia	
26 States	**25 States**

---

[45] Alaska was not contacted via email, as the state does not have voting districts comparable to counties in other states and could not be matched with comparable census data.

[46] Maryland reported provisional ballots that were counted per county, but not number cast.

[47] Nebraska reported an incomplete list of provisional ballots cast and counted by county, but designated counties by number, rather than by name.

Deleted: 15

Data Differences

The data used in this study differs from the data reported in the Election Day Study for 19 states. The Election Day Study was not completed until well after our statistical analysis of provisional voting was finished, on the schedule laid out in our work plan. Where there are differences, they are typically very small, usually fewer than 100 votes either cast or counted. Of the 9 states that have differences of more than 100 votes cast or counted, 7 have reported their numbers directly to us and can be considered updated data that EDS had not obtained. For one of those states, New Mexico, EDS had incomplete data, and for another, Pennsylvania, EDS had no data at all. The data that we have collected reflects updated numbers from the states that have changed following recounts and litigation that altered how ballots were evaluated.

State	EDS Numbers Cast/Counted	Our Numbers Cast/Counted	Differences	Updated Info from State?
Alabama	6,478/1,865	6560/1836	82/29	No
Alaska	23,285/22,498	23,275/22,498	10/0	No
Colorado	51,529/39,086	51,477/39,163	52/77	No
Georgia	12,893/4,489	12,893/3,839	0/650	No
Hawaii	346/25	348/25	2/0	Yes
Iowa	15,406/8,038	15,454/8,048	48/10	Yes
Kansas	45,535/32,079	45,563/31,805	28/274	Yes
Montana	688/378	653/357	35/21	Yes
Nebraska	17,421/13,788	17,003/13,298	418/490	Yes

The table shows that the universe of voters who could be helped by provisional voting might be 2.5 – 3 million voters. A rough estimate of the effectiveness of provisional voting in 2004, then, might be 40% to 50% (ballots counted/votes lost)*. Whatever the precise figure, it seems reasonable to conclude that there is considerable room for improvement in the administration of provisional voting.

---

* Another interpretation of the data should be considered. The Census Bureau's Current Population Survey (CPS) developed the category of "registration mix-ups" to assess the states' registration systems after each election when it asks people if they were registered and if they voted. The CPS gives breakdowns of reasons why people did not vote. Survey responders tend to deflect blame when answering questions about voting. In the narrow context of provisional ballots, 'registration problems' would cover only voters who went to the polls where the determination that they were not registered was wrong or were registered, but in the wrong precinct. If they were in the wrong precinct, provisional voting can help them in only 17 states. In 2004, only 6.8% of those not voting and registered blamed registration problems, while 6.9% reported so in 2000.

Subject Provisional Voting Report Status and Request for Advice

KeyDatesRev1110.doc Karen - We would like to talk with you about the process and schedule for completing our work in a way that is most useful to the EAC. I am attaching a draft timeline for the completion of this work and listing below five specific questions we need to resolve as quickly as possible. I would appreciate it if you would call me to discuss how best to address these matters - whether by telephone or by coming to meet in Washington.

We are planning to submit our report on Provisional Voting to the EAC by November 18^th . Although it is not required in our contract, we will at the same time give copies to the members of the Peer Review Group offering them the opportunity to send us any additional corrections or other comments.

We are considering making all our recommendations for both Provisional Voting and Voter ID in the form of Best Practices. Some of them might well lend themselves to Guidance, but our discussion of the earlier draft with the EAC left us with the clear impression that on this topic the preference was for recommendations for Best Practices rather than a Guidance document. The calendar also argues for the Best Practices route to enable the EAC to give states advice they can use in 2006. (The attached draft timeline would need to be revised if the EAC prefers to propose some of the recommendations as Guidance.)

QUESTIONS:

1. Does the EAC agree with the approach described above to make all recommendations in the form of Best Practices rather than Guidance?

2. How long will it take the EAC to review and return comments on our draft Provisional Voting document? Is our attached revised schedule

realistic in anticipating EAC comments no later than the week of December 12^th on the report we send you at the end of this week?

3. After we revise our report on Provisional Voting to reflect any comments we receive from the EAC, and follow a similar process for our report on Voter Identification, what further steps would the Commission like us to take? Would you want us to conduct a review with your Board of Advisors and/or hold public hearings even though these steps are, we understand, required only for a Guidance Document? A review by the Board of Advisors would offer the opportunity to solicit suggestions for Best Practices from its members, thus strengthening the document and building a constituency for their adoption. (The attached draft timeline does not include such additional reviews.)

4. In any case, we will need a no-cost extension to the contract to carry us past December 31^st . How do we make that request?

5. Assuming that we conduct fewer public hearings than we had anticipated, can we reallocate funds we had budgeted for that purpose to cover the higher than anticipated personnel and consultant costs we will be incurring after the first of the year?

We look forward to discussing these matters with you.

Thanks, John

DRAFT FOR DISCUSSION

REVISED SCHEDULE FOR EAC PROJECT

November 2005 – February 2006

November 10, 2005

Assumes no guidance document, only analysis and recommended best practices

DATE	Project Management	Provisional Voting	Voter ID
Week of 10/31		Review draft report to EAC (Team) Submit comments on report (Team)	Voter ID Research to TV
Week of 11/7	Status reports to JD for October tasks (all)	Redraft report (TON) Review and approve report (Team) Final draft report (TON)	Research continues (TV)
Week of 11/14	Submit monthly progress report (JD)	**Submit report to EAC for review** and to PRG for information Discuss with EAC use of Board of Advisors to expand "best practices." (TON, JW) EAC reviews report	Research continues (TV)
Week of 11/21		EAC review continues	Complete data collection for Voter ID analysis. (TV)
Week of 11/28		EAC review continues	Draft report on Voter ID analysis (TV)

Week of 12/5	Status reports to JD for November tasks (all)	EAC review continues	Internal review (PT)
Week of 12/12	Submit monthly progress report (JD)	Receive EAC comments on report Revise and PT review	Revise draft (TV) Draft alternatives (TON) Review and comment on alternatives (PT)
Week of 12/19		**Finalize analysis and best practices to EAC for publication**[1]	Complete draft report and alternatives (TV, TON)
Week of 12/26			Review draft report and alternatives (PT)
Week of 1/2/06	Status reports to JD for December tasks (all)		**Report and alternatives to PRG**
Week of 1/9/06			PRG meets and comments Revise (TV & TON)

---

[1] If the EAC chooses not to issue a Guidance Document on provisional voting but only to recommend "best practices," the register publication, hearing and comment period may not be required, which would shorten the process by at least 30 days.

DRAFT FOR DISCUSSION

Week of 1/16/06	Submit monthly progress report (JD)		**Submit draft report, alternatives and compendium to EAC** EAC reviews
Week of 1/23/06			EAC review continues
Week of 1/30/06			Comments from EAC Revise (TV & TON)
Week of 2/6/06	Status reports to JD for January tasks (all)		Review and approve revised report and recommendations for best practices (PT)
Week of 2/13/06	Submit monthly progress report (JD)		**Submit report and best practices to EAC**
Week of 2/20/06	FINAL status reports to JD for all tasks (all) Final project and fiscal report to EAC **PROJECT ENDS**

Subject Final Provisional Voting and Voter ID reports

Karen,

Attached are our final reports on Provisional Voting and Voter Identification in PDF format. The hard copies with all attachments are on their way to you via Fed Ex.

I understand from your email today that we will be receiving a letter from Tom Wilkey on the final steps to wrap up the contract. All of us are eager to see the Commission move forward with recommendations to the states for best practices on provisional voting and to take the next step on voter id issues by submitting our report to the advisory boards.

Thanks for your long effort to help us see this research through to submission. I hope we'll have a further chance to work together as our recommendations approach implementation.

Hope you enjoy some time off during the coming long weekend and July 4 celebration.

Best Practices to Improve Voter Identification Requirements

CONTENTS

The Research Team

This research report on Voter Identification Requirements in the 2004 election is part of a broader analysis that also includes a study of Provisional Voting, which has already been submitted to the EAC. Conducting the work was a consortium of The Eagleton Institute of Politics of Rutgers, The State University of New Jersey, and The Moritz College of Law of The Ohio State University.

The Eagleton Institute explores state and national politics through research, education, and public service, linking the study of politics with its day-to-day practice. It focuses attention on how contemporary political systems work, how they change, and how they might work better. Eagleton regularly undertakes projects to enhance political understanding and involvement, often in collaboration with government agencies, the media, non-profit groups, and other academic institutions.

The Moritz College of Law has served the citizens of Ohio and the nation since its establishment in 1891.It has played a leading role in the legal profession through countless contributions made by graduates and faculty. Its contributions to election law have become well known through its Election Law @ Moritz website. *Election Law @ Moritz* illuminates public understanding of election law and its role in our nation's democracy.

Peer Review Group

A draft of this report and the statistical analysis in its appendix were critiqued by a Peer Review Group. The comments of its members improved the quality of our work. While the Group as a whole and the comments of its members individually contributed generously to the research effort, any errors of fact or weaknesses in inference are the responsibility of the Eagleton-Moritz research team. The members of the Peer Review Group do not necessarily share the views reflected in our recommendations.

REPORT AND RECOMMENDATIONS TO THE EAC
VOTER IDENTIFICATION ISSUES

Report Background

The Help America Vote Act of 2002 (HAVA) (Public Law 107-252) authorizes the United States Election Assistance Commission (EAC) (Sec. 241, 42 USC 15381) to conduct periodic studies of election administration issues. The purpose of these studies is to promote methods for voting and administering elections, including provisional voting, that are convenient, accessible and easy to use; that yield accurate, secure and expeditious voting systems; that afford each registered and eligible voter an equal opportunity to vote and to have that vote counted; and that are efficient.

This study provides information on voter identification practices in the 2004 election. It makes recommendations for best practices to evaluate future proposals for voter ID requirements, including the systematic collection and evaluation of information from the states. The research was conducted by the Eagleton Institute of Politics at Rutgers, the State University of New Jersey, and the Moritz College of Law at the Ohio State University under a contract with the EAC, dated May 24, 2005. The work included a review and legal analysis of state statutes, regulations and litigation concerning voter identification and provisional voting as well as a statistical analysis of the relationship of various requirements for voter identification to turnout in the 2004 election. This report is a companion to a report on Provisional Voting submitted to the EAC on November 28, 2005 under the same contract.

EXECUTIVE SUMMARY AND RECOMMENDATIONS

Background and Methods

This report arrives at a time of considerable ferment over the issue of voter identification. The debate across the nation over requiring voters to produce a specific identification document before being permitted to cast a regular (as opposed to a provisional) ballot, has revealed supporters and opponents in polarized camps.

- Proponents of stricter identification requirements base their case on improving the security of the ballot by reducing opportunities for one kind of vote fraud –multiple voting or voting by those who are not eligible. The proponents argue that their goal is to ensure that only those legally entitled to vote do so, and do so only once at each election.

- Opponents seek to forestall more stringent identification requirements, such as government-issued photo ID, in order to ensure broad access to a regular ballot. They fear that some voters --such as, they argue, racial and ethnic minorities, the young, and elderly voters-- may lack convenient access to the required ID documents, or that such voters may be fearful of submitting their ID documents to official scrutiny and thus stay away from the polls.
- Both sides argue that their preferred policy will engender faith in the electoral process among citizens.

This report considers policy issues associated with the voter ID debate. It inquires whether empirical study can suggest a way to estimate the effects of different voter ID requirements on turnout. That analysis would constitute an important first step in assessing tradeoffs between ballot security and ballot access. The aim of this research is to contribute to the effort to raise the quality of the debate over this contentious topic. The tradeoffs between ballot security and ballot access are crucial. A voting system that requires voters to produce an identity document or documents may prevent the ineligible from voting. It may also prevent eligible voters from casting a ballot. If the ID requirement of a ballot protection system blocks ineligible voters from the polls at the cost of preventing eligible voters who lack the required forms of identification, the integrity of the ballot may not have been improved; the harm may be as great as the benefit.

As part of the project's effort to analyze the relationship between Voter ID requirements, turnout, and their policy implications, a statistical analysis examined the potential variation in turnout. This statistical study developed a model to illuminate the relationships between voter ID requirements and turnout. This model's findings and limitations suggest avenues for further research and analysis that may assist the EAC and the states as they explore policies to balance the goals of ballot integrity and ballot access.

The statistical analysis describes one possible way to estimate what might be the incremental effect on voters' access to the ballot of an increase in the rigor of voter identification requirements. We do not offer this statistical analysis as the last word, but rather as a preliminary word on the subject. Its findings must be regarded as tentative; the information (such as the specific reasons some potential voters are not allowed to cast a regular ballot) that that might permit greater certainty is simply not available. Indeed, as our recommendations indicate, the next step to improve understanding of the effects of stricter voter identification on

turnout and on vote fraud is to collect more information on both topics systematically and regularly.

Making a statistical estimate of the effect of voting regulations on turnout is difficult. The dynamics of turnout are complex, much studied, and only partially understood. Some agreement exists, however, that three factors that exert substantial influence on voter turnout are:[1] the socioeconomic status of the potential voter; legal requirements to vote; and the political context of the election. By focusing on how voters identify themselves at the polls, this report emphasizes legal requirements. The statistical analysis also considers some of the socioeconomic, racial, and age characteristics of the electorate, as well as the political context in 2004 (such as whether a state was a battleground in the presidential race).

Examining tradeoffs between ballot security and ballot access requires some measure of the effectiveness of voter ID requirements in reducing multiple voting or voting by ineligible voters. The existing evidence on the incidence of vote fraud, especially on the kind of vote fraud that could be reduced by requiring more rigorous voter identification, is not sufficient to evaluate those tradeoffs.[2] Assessing the effectiveness of voter ID as a way to protect the integrity of the ballot should logically include an estimate of the nature and frequency of vote fraud. This research does not include consideration of vote fraud, nor does it estimate the possible effectiveness of various voter ID regimes to counter attempts at vote fraud. Our analysis also cannot take into account how many potential voters who did not turn out under comparatively stricter voter ID requirements might have been ineligible or eligible to vote.

Despite these qualifications regarding the quality of the available data and the limitations of statistical analysis, however, the different statistical methods and two different sets of data on turnout in 2004 election used in the study point to the same general finding. Stricter voter identification requirements (for example, requiring voters to present non-photo ID compared to simply stating their names) were correlated with reduced turnout in the models employed, as described in detail in Appendix C. [3] As explained below, these models find that a statistically

---

[1] See, for example, Tom William Rice and Patrick J. Kenney, "Voter Turnout in Presidential Primaries." 1985. Political Behavior, 7: 101-112. Identification requirements are not the only legal restrictions on voting. States also differ, for example, in their registration requirements (including how long before the election registration must take place and the identity documents required register).

[2] The EAC has contracted with other researchers to study vote fraud issues.

[3] Appendix C: Tim Vercellotti, Eagleton Institute of Politics, *Analysis of Effects of Voter Identification Requirements on Turnout.* Using the aggregate data, photo ID did not have a significant effect on turnout, possibly because in the

significant relationship exists, even when controlling for other factors (such as whether the election was in a battleground state) that might affect turnout. (But note that in the model using the aggregate data, photo ID did not have a significant effect on turnout. The reason may have been that in this election, each state with a photo ID requirement provided an alternate way for those without a photo ID to cast a regular ballot.) Without knowing more about the effects of stricter voter ID on reducing multiple voting or voting by ineligible voters, however, the tradeoffs between ballot security and ballot access cannot be assessed.

Methodology

The report includes detailed information on the nature of the statutory requirements across the country in 2004 and on the statutes and court decisions that provide the legal context for the voter ID debate. We gathered information on the requirements in effect in the 50 states and the District of Columbia in that year. Based on our interpretation of state statutes, supplemented in some cases by conversations with state election officials, we divided the states' ID requirements into five categories. We believe each category is more rigorous than the one preceding, based on the demands they make on voters.[4] The categories range from "Stating Name" which we judge to be somewhat less demanding than "Signing Name." "Signature Match" requires poll workers to examine the signature and compare it to a sample, which is slightly more demanding than the voter simply signing. "Present ID" requires voters to offer some documentary evidence of their identity, ranging from a utility bill to a passport. It is more demanding than the previous three categories because it requires that the voter remember to bring this documentation to the polls. (Even a simple ID, such as a utility bill, may not be available to some renters or, say, those in group housing.) We regard a government "Photo ID" as the most rigorous requirement. Such identity documents may not be uniformly and conveniently available to all voters.

For each state, we identified both the "maximum" and "minimum" identification requirements. The term "maximum" refers to the most that voters may be *asked* to do or show at the polling place (putting aside cases in which particular voter's eligibility may be questioned pursuant to a state challenge process). The term "minimum," on the other hand, refers to the most that voters can be *required* to do or show, in order to cast regular ballot (again leaving aside a state

---

2004 election every state requiring photo ID provided an alternative way to cast a regular ballot for those voters who lacked photo identification. The individual data from the Current Population Survey did show a significant effect, but only for the overall sample and for white voters, which may be an artifact of the large sample size.

[4] Even the most relaxed provisions for identification at the polls –anything stricter than the honor system used in North Dakota—will impose some burden on particular voters. Harvard Law Review 119:1146

challenge process). We have included "maximum" requirements in our analysis, and not simply "minimum" requirements, because simply asking voters to produce particular identifying information may have a deterrent effect, even if voters are ultimately allowed to cast a regular ballot without that identification. For example, in a state where voters are asked to show photo ID at the polling place, but still allowed to vote by completing an affidavit confirming their eligibility, the "maximum" of being asked to show photo ID may deter some voters even though the "minimum" would allow them to vote without photo ID.

It is worth emphasizing that, at the time of the 2004 election, there was *no* state that had a "minimum" requirement of showing photo ID – in other words, there was no state that required voters to show photo ID in order to cast a regular ballot. For this reason, our report does not measure the impact of laws, like those recently enacted in Indiana and Georgia, which require voters to show photo ID in order to cast a regular ballot without an affidavit exception.

To examine the potential variation on turnout rates associated with each type of voter ID requirements in effect on Election Day 2004, the statistical analysis drew on two sets of data. These were, first, aggregate turnout data at the county level for each state and, second, the reports of individual voters collected in the November 2004 Current Population Survey by the U. S. Census Bureau. Using two different data sets makes it possible to check the validity of one analysis against the other. It also provides insights not possible using only one of the data sets. The aggregate analysis cannot provide valid estimates on the effects of different ID requirements on particular demographic groups (e.g., the old, the young, African-Americans, the poor, or high school graduates). The Current Population Survey data does permit that kind of analysis, although it has the disadvantage of relying on self-reports by respondents about their registration status and experience in the polling place.

To understand legal issues that have been raised in recent litigation over voter ID requirements, we collected and analyzed the few major cases that have been decided so far on this issue. The decisions so far provide some guidance on the constitutional and other constraints as to voter ID requirements.

Summary of Findings

As voter identification requirements vary, voter turnout varies as well. This finding emerged from both the statistical analysis's aggregate data and the individual-level data, although not always

for both the maximum and minimum sets of requirements. The overall relationship between the stringency of ID requirements and turnout was fairly small, but still statistically significant.

In the model used with the aggregate data in the statistical analysis, for the maximum ID requirements, the match-signature requirement and the provide-a- non-photo-ID requirement, but not the photo ID requirement, were all correlated with lower turnout compared to requiring that voters state their names. When the registration closing deadline was added as an independent variable in the aggregate analysis, signature match and non-photo id remained significant and negative predictors in the model.

The reduction in turnout was not the same for all demographic groups in the citizen voting age population.

The non-photo identification requirement showed the most significant and consistent correlation with reduced turnout. This result may be surprising given the intense debates surrounding photo identification requirements. The effect of photo ID requirements cannot, however, be assessed from the data the statistical analysis examined, since none of the states had laws in 2004 that conditioned voting on presentation of photo ID. Each of the five states that had photo ID as a "maximum" requirement (i.e., the most that voters could be asked to show at the polls) accepted another type of identification or an affidavit as a "minimum" requirement in the 2004 election (i.e., they were allowed to cast a regular ballot with something less than photo ID).

Significant questions about the relationship of voter identification requirements to turnout remain unanswered. The data examined in this project could not capture the dynamics of how identification requirements might lower turnout. If ID requirements dampen turnout, is it because individuals are aware of the requirements and stay away from the polls because they cannot or do not want to meet the requirements? Or, do the requirements result in some voters being turned away when they cannot meet the requirements on Election Day? Other factors that may also be correlated with stricter ID laws – such as less user-friendly voter registration systems – may actually be causing lower turnout. The CPS data do not include the information needed to answer this question. Knowing more about the "on the ground" experiences of voters concerning identification requirements could guide policy-makers at the state and local level in determining whether and at what point in the electoral cycle a concerted public information campaign might be most effective in helping voters to meet identification requirements. Such

knowledge also could help in designing training for election judges to handle questions about, and potential disputes over, voter identification requirements.

Our analysis of litigation suggests that the courts will look more strictly at requirements that voters produce a photo ID in order to cast a regular ballot, than at non-photo ID laws. The courts have used a balancing test to weigh the legitimate interest in preventing election fraud against the citizen's right to privacy (protecting social security numbers from public disclosure, for example) and the reasonableness of requirements for identity documents. To provide both the clarity and certainty in administration of elections needed to forestall destabilizing challenges to outcomes, a best practice for the states may be to limit requirements for voter identification to the minimum needed to prevent duplicate registration and ensure eligibility.

The current lack of understanding of precisely how voter ID requirements affect turnout could be ameliorated by requiring the collection and reporting of additional data, including the reasons potential voters are required to cast a provisional ballot and the reasons for rejecting provisional ballots during the 2006 and subsequent elections. Also useful would be the results of surveys of voters on their experiences in meeting voter ID requirements and on what type of ballot they cast.[5] And, of course, more information is needed on the incidence and varieties of vote fraud, but that inquiry is outside the scope of this report.

Recommendations for consideration and action by the EAC

The dynamics of Voter ID requirements –how more rigorous voter ID requirements may affect the decision by potential voters to go or stay away from the polls– are not perfectly understood. This lack of understanding should be recognized in the policy process in the states. The debate over voter ID in the states would be improved by additional research sponsored by the EAC.

The EAC should consider the following actions to improve understanding of the relationship between voter ID requirements and the two important goals of ensuring ballot access and ensuring ballot integrity.

---

[5] Arizona held its first election with its new, stricter ID requirements on March 14, 2006. In at least one county (Maricopa) election officials handed a survey to voters that asked if they knew about the voter identification law and if they did, how they found out about it. Edythe Jensen, "New Voter ID Law Goes Smoothly in Chandler," *Arizona Republic*, March 15, 2006. More surveys of this kind can illuminate the dynamics of voter ID and voting in ways that are not possible now because of insufficient data.

1. Encourage or sponsor further research to clarify the connection between Voter ID requirements and the number of potential voters actually able to cast a ballot that is actually counted.
2. Recommend as a best practice the publication of a "Voting Impact Statement" by states as they assess their voter ID requirements to protect the integrity of the ballot. The analysis will help ensure that efforts to increase ballot security have a neutral effect on electoral participation by eligible voters. A "Voter Impact Statement" would estimate the number and demographics of 1) eligible, potential voters that may be kept from the polls or permitted to cast a provisional ballot by a stricter ID requirement; and 2) and assess the number of ineligible voters who will be prevented from voting by the stricter ID requirements.
3. Encourage or require the states in the 2006 election and beyond, to collect and report reliable, credible information on the relationship between ballot access and ballot security. EAC should publish an analysis of this information to provide a sound factual basis for the states to consider as they estimate the incidence of the kinds of vote fraud that more stringent ID requirements may prevent. The analysis should describe the dynamics of the voter ID process in preserving the security of the ballot. EAC might also use the information reported by the states to encourage further assessment by the states of the effectiveness of programs to ensure that all eligible voters have required ID and are permitted to vote in future elections. Well-designed longitudinal studies in the states can show the results of changing voter ID requirements on electoral participation over time. The studies should include precinct-level data to provide the fine-grained analysis that can provide a solid foundation for policy.
    I. Useful information could be supplied by state-sponsored surveys of voters conducted by local election officials. Such surveys would make clear why those who cast a provisional ballot were found ineligible to cast a regular ballot. The answers would illuminate the frequency with which ID issues divert voters into the provisional ballot line.
    II. Surveys to ask voters what they know about the voter id requirements would also provide useful context for evaluating the effect of various voter ID requirements on electoral participation.
    III. Spot checks by state election officials on how the identification process works at polling places could provide information on how closely actual practice tracks

statutory or regulatory requirements. Such reports should be available to the public.

4. Encourage states to examine the time period allowed for voters who cast a provisional ballot because they lacked required ID to return with their identification. In eleven states, voters who had to cast a provisional ballot because they lacked the ID required for a regular ballot were permitted to return later with their ID. Their provision of this ID is the critical step in evaluating the ballots. The length of the period in which the voter may return with ID is important. In setting the time period for return, which now varies among the states from the same day to about two weeks, states should consider three factors: the convenience of the voter, the total time allowed to evaluate ballots[6], and the safe harbor provision in presidential elections.
5. Recommendations to the states from EAC should reflect current judicial trends. Requirements that voters provide some identifying documentation have been upheld where photo ID is *not* the only acceptable form. Whether laws requiring photo ID will be upheld is less certain.

SUMMARY OF RESEARCH

Background and Approach of the Study

Voter ID requirements are just one set of rules governing voting that may affect turnout. Social scientists have long studied how election rules affect participation in elections. The general view today is that the individual citizen makes the choice of whether to vote in a way similar to other decisions that a rational citizen makes, by comparing costs and benefits. The benefits of voting are fairly stable and hard to specify given the remote probability that any one vote will make a difference in an election. But whatever the benefit as perceived by an individual voter, as the costs of voting (for example, time, hassle, acquisition of information) increase, the likelihood that a citizen will vote decrease. Not all groups in the population calculate the cost of participation in the same way, so that election laws (such as registration or identification requirements) may affect different groups differently.

A short summary of some of the social science literature illustrates what may be a broad consensus that the rules of elections affect turnout, but note the important differences in the details of what groups may be most affected.

---

[6] Our research on provisional voting reveals that states that provide more than a week to evaluate provisional ballots end up counting substantially more of those ballots than states that provide less than a week.

- Bowler, Brockington and Donovan in "Election Systems and Voter Turnout: Experiments in the United States". *The Journal of Politics*, 63:3 (August 2001) concluded that electoral systems help shape turnout by altering the benefits perceived by voters. For example, cumulative voting systems have 5% greater turnout than plurality systems
- The effect of registration systems has been the subject of many studies over the last 40 years. Kelley, Ayres, and Bowen in "Registration and Voting: Putting First Things First." *American Political Science Review.* 61:2 (June 1967) found that local variations in the rate of voting are most directly tied to variations in the rate of registering to vote, and that the rate of registering to vote in localities is most directly related to the laws and administration of the registration process. They concluded that the decline in voting over the past 80 years was due, in part, to the rise of registration laws.
- Brians and Grofman in "Election Day Registration's Effect on U.S. Voter Turnout." *Social Science Quarterly.* 82:1 (March 2001), found that relaxing registration laws produces higher turnout. In particular, they observed that relaxing registration laws is more likely to promote voter turnout among those with medium levels of income and education, rather than those at the lowest levels. Highton in "Easy Registration and Voter Turnout," *Journal of Politics.* 59:2 (May 1997), concluded similarly that registration laws affect voter turnout, but also observed that easier registration promotes turnout among those in lower socio-economic status.

- Mitchell and Wlezien. "The Impact of Legal Constraints on Voter Registration, Turnout, and the Composition of the American Electorate," *Political Behavior.* 17:2 (June 1995) agreed that easier registration promotes higher turnout, but also concluded that higher turnout from easier registration would be unlikely to change the composition of the electorate. Nagler in "The Effect of Registration Laws and Education on U.S. Voter Turnout." *American Political Science Review.* 85:4 (December 1991) found that registration laws decrease voter turnout by depressing the eligible electorate, but that lower educated people are not disproportionately impacted by these laws. But Rosenstone and Raymond E. Wolfinger in "The Effect of Registration Laws on Voter Turnout." *American Political Science Review.* 72:1 (March 1978) found that while registration laws did affect both voter turnout and the composition of the electorate, the sharpest effect of these restrictions was felt in the South and among the least educated.

- Squire, Wolfinger, and Glass in "Residential Mobility and Voter Turnout." *American Political Science Review.* 81:1 (March 1987) found that people who move constitute a major demographic group affected by registration laws. They estimated that altering laws to facilitate voting by recently moved people could increase turnout by 9%. Highton in "Residential Mobility, Community Mobility, and Voter Turnout." *Political Behavior.* 22:2 (June 2000) also found that people who move have lower turnout than stable residents, and estimated that the decline was more a result of registration laws than a loss of social connections.
- Highton and Wolfinger in "Estimating the Effects of the National Voter Registration Act of 1993." *Political Behavior.* 20:2 (June 1998) concluded that the Motor Voter laws led to a significant increase in voting; that eliminating voter purges for not voting also increases voting; and that these effects are felt most heavily by the young (under 30) and the mobile (moved within past 2 years). Knack, in "Does 'Motor Voter' Work? Evidence from State-Level Data." *Journal of Politics.*, 57:3 (August 1995), also found that motor voter does lead to increased registration and voting, but that other parts of NVRA of 1993, like mail-in registrations, agency-based registrations, and limitations on voter purges had not been as influential two years after the passage of the act.

While voter ID may not have been the subject of as much research as the registration process, establishing the eligibility of a person to vote has long been part of the electoral process. Voters may have to identify themselves twice in the electoral process: when registering to vote and then when casting a ballot. The pressures felt by the voter arising from the need to check ID, even so simple a check as a signature match, can be greater at the polls on Election Day than at the time of registration. Poll workers may feel under pressure when faced with long lines and limited time.

Voter ID requirements on Election Day

This analysis focuses on ID requirements on Election Day, but with an appreciation that the ID requirements at time of registration and on Election Day are inter-related. [7] The emphasis in this report is on Voter ID requirements on Election Day and afterwards as election judges evaluate provisional ballots. This is the critical period for the electoral system, the time when ballot access and ballot security are in the most sensitive balance.

---

[7] As the Carter-Baker Commission noted, photo ID requirements for in-person voting do little to address the problem of fraudulent registration by mail, especially in states that do not require third-party organizations that register voters to verify ID. Commission on Federal Election Reform, pp 46-47.

The report looks at voter ID issues that go beyond the rather narrow identification requirements in HAVA. Much of the current debate in state legislatures over voter ID ranges beyond HAVA to require more rigorous documentation of identity for all would-be voters, not just those who had not registered in person and are casting a ballot for the first time. Current controversies in the states over voter ID seems to have been sparked in part by the HAVA requirements, but goes beyond those requirements, and sets the context for the analysis here.[8]

We recognize that the previously technical, rather dull subject of voter ID requirements has become fiercely partisan and divisive in many states. The polarization of the debate has raised the stakes over this issue, making dispassionate analysis both more valuable and more rare.[9] Voter ID is often described as the critical step in protecting the integrity of the ballot, the process to ensure that the potential voter is eligible and, if eligible, is permitted to cast one ballot and one ballot only. Truly protecting the integrity of the ballot, however, requires a perspective that takes in the entire voting process. It demands more than preventing the ineligible from voting, and should also ensure that all those who are eligible and want to vote can cast a ballot that counts. The protection effort must embrace all forms of voting, including absentee ballots, and consider each step in the process from registration through vote counting.

A voting system that requires voters to produce an identity document or documents may prevent the ineligible from voting. It may also prevent the eligible from casting a ballot. If the ID requirements block ineligible voters from the polls at the cost of preventing eligible voters who cannot obtain or have left at home the required forms of identification, the integrity of the ballot may not have been improved; the harm may be as great as the benefit. Ultimately, a normative evaluation of whether a state should adopt a stricter voter ID requirement (and, if so, what particular form that new requirement should take) will weigh value judgments as well as available factual evidence. Nonetheless, this report has proceeded on the premise that

---

[8] Harvard Law Review 119:1127: "Legislators hoping to stiffen their state antifraud laws have taken their cue from identification provisions buried in HAVA."

[9] "Of the various electoral procedure laws passed in the fifty states since the 2000 and 2004 presidential elections and those still being debated in state legislatures and local media, few arouse more potent partisan feelings than voter identification laws." *Harvard Law Review* 119:1144. John Fund's 2004 book, *Stealing Elections: How Voter Fraud Threaten Our Democracy*, cites (pages 16 – 17) a Rasmussen Research poll that asked respondents if they were more concerned with voting by ineligible participants or with disenfranchisement of eligible voters. Sixty-two percent of Kerry supporters, but only 18 percent of Bush supporters, worried more about *disenfranchisement*; 58 percent of Bush supporters, but only 19 percent of Kerry supporters were more concerned with *voter fraud*.

increased understanding of the factual evidence relating to the imposition of voter ID requirements, based on available data and statistical analysis of that data, can help inform the policy process.

Assessing the effectiveness of voter ID as a way to protect the integrity of the ballot should logically include an estimate of the nature and frequency of vote fraud. The EAC has commissioned a separate analysis of the incidence of vote fraud. Consequently, this research does not include consideration of vote fraud nor the possible effectiveness of various voter ID regimes to counter attempts at vote fraud. As a result, our study of the possible effects of voter ID requirements on turnout cannot take into account how many potential voters who did not turn out under comparatively stricter voter ID requirements might have been ineligible or eligible to vote.

In some states, voters lacking required ID, or who have ID that does not reflect their current address, are able to vote only by casting a provisional ballot.[10] Voter ID requirements that require voters to bring a document to the polls --rather than simply sign their names-- may divert more voters to the provisional ballot. Requiring poll workers to request and check ID, can put stress on the already demanding environment of the polling place. Scrutiny of ID can create lines at the polling places. Further delays can result when voters cast a provisional ballot and fill out the ballot envelope. Voters who cast a provisional ballot because they lack their ID on Election Day, and who then fail to return with the needed document or documents, will have their ballot rejected.[11] And, of course, the cost of processing provisional ballots is greater than the cost of regular ballots.

Each of these potential consequences of more elaborate voter identification processes can increase the chance of litigation. Long lines will, at best, discourage voters and at worst make voting seem a hassle, an impression that could keep more citizens (even those with ID) from the polls.

---

[10] For example, the Florida voter ID law adopted after the 2004 election and pre-cleared by the Department of Justice, permits voters who cannot meet the ID requirements to sign an affidavit on the envelope of a provisional ballot, which will be counted if the signature matches that on the voter's registration form.

[11] The EAC's Election Day Study found "improper ID," to be the third most common reason for a provisional ballot to be rejected. "Improper ID" was cited by 7 states responding to the survey, compared to 14 mentions for voting in the wrong precinct. *Election Day Study*, Chapter 6, p. 5.

Evaluating the effect of different Voter ID regimes can be most effective when based on clear standards –legal, equitable, practical. The standards outlined here might be described as questions policy-makers should ask about Voter ID requirements. We suggest seven questions that address important dimensions of the problem.

1. Is the Voter ID system designed on the basis of valid and reliable empirical studies of the incidence of the sorts of vote fraud it is designed to prevent?[12]
2. How effective is the ID requirement in increasing the security of the ballot? How well can it be coordinated with a statewide voter database?[13]
3. How practical is the requirement? (Can it be administered smoothly by the staff and budget likely to be made available? How much additional training of polling place workers might be required?) Is it simple enough or can it be defined with sufficient clarity that poll workers throughout the state can administer it uniformly and with a minimum of local interpretation made on the fly under the pressure of Election Day?[14]
4. How cost-effective is the system? Does it demonstrably increase the security of the ballot affordably, measured in both monetary and other costs? To improve understanding of the non-monetary component of the costs, conducting a voter impact study might be appropriate. The voter impact study would examine, before the adoption of the regulation, the cost of compliance by the voter (such as the cost in time and money of acquiring a photo ID card), any offsetting benefits to voters, and the possible disparate effects of the regulation on various groups of voters.[15] A thorough, objective impact statement that demonstrated the nexus between the identification regime and the integrity of the ballot could provide protection against inevitable legal challenges.

---

[12] "Often where the battle over voter identification is most heated, real evidence of voter fraud proves scarce: in Georgia, for example, the Secretary of State averred that she had never encountered a single instance of voter impersonation at the polls. State laws might sometimes impose tighter restrictions on in-person voting than on absentee ballots, which yield the greatest incidence of, and provide the easiest avenue for, voter fraud. . ." Harvard Law Review 127:1144 (2006)

[13] See the final section of this report for a brief overview of possible effects of a statewide voter database on voter identification issues.

[14] In New York, in 2004, disparities in training and voting information were made apparent in a study finding elections officials had wildly varying interpretations of what the state's voter identification requirement actually was. Tova Wang, "Warning Bell in Ohio," December 5, 2005. Website, the Foundation for National Progress.

[15] "Absent clear empirical evidence demonstrating widespread individual voter fraud, legislatures need to fashion narrowly tailored voter identification provisions with an eye toward the inevitable and well-grounded constitutional challenges that will arise in the courts. Only as states grow more adept at administering elections will courts likely demonstrate greater willingness to uphold strict identification requirements." Harvard Law Review 127:1144 (2006)

5. If a side effect of the Voter ID regulation is likely to reduce turnout, generally or among particular groups, is it possible to take other steps to ameliorate the adverse consequences?[16]
6. Does it comply with the letter and spirit of Voting Rights Act?
7. The seventh question is the most difficult to answer. How neutral is the effect of the Voter ID requirement on the composition of the qualified and eligible electorate? Might it, intentionally or unintentionally, reduce the turnout of particular groups of voters or supporters of one party or another without an offsetting decrease in vote fraud?

Voter ID and Turnout

Based on research for this study by the Moritz College of Law, states had one of five types of maximum requirements in place on Election Day 2004.These are shown in Table 1, *Voter ID Requirements*. The five categories: at the polling place, voters were asked to either: state their names (10 states); sign their names (13 states and the District of Columbia); sign their names, to be matched to a signature on file (seven states); provide a form of identification that did not necessarily include a photo (15 states); or provide a photo identification (five states).[17] Using this information made it possible to code the states according to these requirements, and examine the assumption that voter identification requirements would pose an increasingly demanding requirement in this order: stating one's name, signing one's name, matching one's signature to a signature on file, providing a form of identification, and providing a form of photo identification, however, in all "photo ID" states in 2004, voters without photo ID could cast a regular ballot after signing an affidavit concerning their identity and eligibility or provide other forms of ID). The report refers to this set of ID requirements as "maximum," the most rigorous ID the voter can be asked to present at the polling place in order to cast a regular ballot.[18]

Election laws in several states offer exceptions to these requirements if potential voters lack the necessary form of identification. Laws in those states set a minimum standard – that is the

---

[16] For example, the Carter-Baker Commission coupled its recommendation for a national voter ID card to a call for an affirmative effort by the states to reach out and register the unregistered, that is, to use the new Voter ID regime as a means to enroll more voters. Similarly, Richard Hasen has suggested combining a national voter ID with universal registration. See his "Beyond the Margin of Litigation: Reforming U.S. Election Administration to Avoid Electoral Meltdown," 62 Washington and Lee Law Review 937 (2005).

[17] Oregon conducts elections entirely by mail. Voters sign their mail-in ballots, and election officials match the signatures to signatures on file. For the purposes of this analysis, Oregon is classified as a state that requires a signature match.

[18] As noted above, our analysis does not consider additional requirements that particular voters may be subjected to as part of an official challenge process, in the event that their eligibility is called into question.

minimum requirement that a voter may be required to satisfy in order to vote using a regular ballot. States can be categorized based on the minimum requirement for voting with a regular ballot. In 2004 the categories were somewhat different compared to the maximum requirement, in that none of the states required photo identification as a minimum standard for voting with a regular ballot. That is, voters who lacked photo ID would still be allowed to vote in all states, if able to meet another requirement. Four states required voters to swear an affidavit as to their identity (Florida, Indiana, Louisiana, and North Dakota). The five categories for minimum requirements were: state name (12 states), sign name (14 states and the District of Columbia), match one's signature to a signature on file (six states), provide a non-photo identification (14 states), or swear an affidavit (four states). The analysis also examined this array of minimum identification requirements to assess how they correlated with turnout: state name, sign name, match signature, provide non-photo identification, and, given the potential legal consequences for providing false information, swearing an affidavit. As noted above, *no* state had a "minimum" requirement of showing photo ID. This analysis therefore cannot estimate the effect of laws, such as those recently enacted in Indiana and Georgia that require voters to show photo ID in order to cast a regular ballot without an affidavit or other exception.

We recognize the difficulties in summarizing each state's voter ID requirements. The problem is illustrated by the number of footnotes to Table 1 below. The variety of statutory and regulatory details among the states is complex.

Moving beyond the statutes and regulations, we also recognize that the assignment of each state to one category may fail to reflect actual practice at many polling places. As in any system run by fallible humans, the voter ID process is subject to variation in practice.[19] Voters may have been confronted with demands for identification different from the directives in state statutes or regulation. It seems reasonable to conclude, however, that while actual practices may vary, the variance is around each state's legal requirement for ID. The analysis of the effect of state requirements on turnout must be viewed with some caution. We believe that the categories used in this report provide an acceptable level of discrimination among voter identification regimes.

---

[19] One state election official told us that, "We have 110 election jurisdictions in Illinois, and I have reason to believe [the voter ID requirements] are administered little bit differently in each one. We wish it weren't that way, but it probably is."

* States applies only HAVA's ID requirement, applicable to first-time voters who registered by mail and did not provide applicable ID at the time of registration.

[1] Arizona voters who lack a photo ID may present 2 forms of ID with no photograph.

[2] Florida required a photo ID in 2004, but voters without that credential could sign an affidavit concerning their identity and eligibility and cast a regular ballot. Florida subsequently changed its law to require that voters present photo ID to cast a regular ballot, though voters without photo ID may still cast a provisional ballot by signing an affidavit, which ballot should ordinarily be counted.

[3] Louisiana required a photo ID in 2004. Voters without that credential could sign an affidavit concerning their identity and eligibility and cast a regular ballot.

[4] Pennsylvania requires ID of all first-time voters, whether they registered by mail or in-person.

[5] Voters lacking a photo ID could vote by providing another form of ID in 2004.

[6] Voters lacking a photo ID could vote by providing another form of ID in 2004.

[7] Tennessee voters must provide signature and address. In counties without computerized lists, the signature is compared to the registration card. In counties with computerized lists, the signature is compared to a signature on ID presented with the registration.

[8] Texas voters must present a current registration certificate. Those without a certificate can vote provisionally after completing an affidavit.

Relationship of Voter ID requirements to Turnout

The statistical analysis examined the potential variation in turnout rates based on the type of voter identification required in each state on Election Day 2004 using two sets of data: aggregate turnout data at the county level for each state, as compiled by the Eagleton Institute of Politics, and individual-level survey data included in the November 2004 Current Population Survey conducted by the U.S. Census Bureau.

The statistical analysis examined turnout among U.S. citizens of voting age in both the aggregate and the individual-level data. Determining citizenship status in the individual-level data simply involved restricting the analyses to individuals who identified themselves as citizens in the November 2004 Current Population Survey. (Those who said they were not citizens did not have the opportunity to answer the supplemental voting questions contained in the Current Population Survey.)

Findings of the statistical analysis

The analysis looked at the voter identification requirements in two ways, as a continuous variable and as a series of discrete variables. As a continuous variable the maximum voter identification requirements are ranked according to how demanding they were judged to be, with photo ID as the most demanding requirement. As discrete variables, the statistical analysis assume that stating name is the least demanding ID requirement and compare each other requirement to it.

The analysis treating the requirements as a continuous variable offers some statistical support for the premise that as the level of required proof increases, turnout declines. Averaging across counties in each state, statewide turnout is negatively correlated with maximum voter identification requirements ($r = -.30$, $p < .05$). In considering the array of minimum requirements, with affidavit as the most demanding requirement, however, the correlation between voter identification and turnout is negative, but it is not statistically significant ($r= -.20$, $p = .16$). This suggests that the relationship between turnout rates and minimum requirements may not be linear. Breaking down the turnout rates by type of requirement reveals in greater detail the relationship between voter identification requirements and voter turnout.

Table 2 – Variation in 2004 State Turnout Based on Voter Identification Requirements

Maximum Requirement		Minimum Requirement	
Voter Identification Required in the States	Mean Voter Turnout for States in that Category	Voter Identification Required in the States	Mean Voter Turnout for States in that Category
State Name	**64.2 %**	State Name	**63.0 %**
Sign Name	**61.1 %**	Sign Name	**60.4 %**
Match Signature	**60.9 %**	Match Signature	**61.7 %**
Provide Non-Photo ID	**59.3 %**	Provide Non-Photo ID	**59.0 %**
Provide Photo ID	**58.1 %**	Swear Affidavit	**60.1 %**
Average Turnout (All States)	***60.9 %***		

This table displays the mean turnout using the aggregate county level data for each state in 2004.

The aggregate data show that 60.9 percent of the estimated citizen voting age population voted in 2004. Differences in voter turnout at the state level in 2004 varied based on voter identification requirements. Taking into account the maximum requirements, an average of 64.6 percent of the voting age population turned out in states that required voters to state their names, compared to 58.1 percent in states that required photo identification. A similar trend

emerged when considering minimum requirements. Sixty-three percent of the voting age population turned out in states requiring voters to state their names, compared to 60.1 percent in states that required an affidavit from voters. Given the lack of a clear, consistent linear relationship between turnout and minimum identification requirements, however, we opted to treat the voter identification requirements as a series of dichotomous variables.[21](Dichotomous variables reflect either the presence or absence of a characteristic. In the dummy variable for non-photo ID, a state would be coded as 1 if it required non-photo ID, and 0 otherwise.)

Voter identification requirements are just one factor that might affect voter turnout. Multivariate models that take into account other predictors of turnout can paint a more complete picture of the relationship between voter identification requirements and turnout. This analysis estimated the effects of voter identification requirements in multivariate models that also took into account the electoral context in 2004 and demographic characteristics of the population in each county. While the model takes account of several important variables, statistical models do not capture all the messiness of the real world. It is a simplification of a complex reality, and its results should be treated with appropriate caution.

The model also took into account such variables as:

- Was the county in a presidential battleground state?
- Was the county was in a state with a competitive race for governor and/or the U.S. Senate?
- Percentage of the voting-age population in each county that was Hispanic or African-American [22]
- Percentage of county residents age 65 and older
- Percentage of county residents below the poverty line

Another contextual factor to consider is voter registration requirements, such as the deadline for registration. As states set the deadline farther away from Election Day, the task of remembering

---

[21] The voter identification requirements are coded as a series of dummy variables, coding each variable as one if the requirement existed in a given state, and zero otherwise. This yielded five dichotomous variables for maximum requirements (state name, sign name, match signature, non-photo identification, or photo identification), and five dichotomous variables for minimum requirements (state name, sign name, match signature, non-photo identification, or providing an affidavit). Omitted is the variable for stating one's name so that it could serve as the reference category in comparison with the other four identification requirements in each of the statistical analyses.

[22] The U.S. Census projections for 2003 provided the data for the percentage of the voting-age population in each county that was Hispanic or African-American and for the percentage of county residents age 65 and older.

to register to vote becomes more challenging. Thus our model takes into account the number of days between each state's registration deadline and the election.

The dependent variable in each model using the aggregate data was voter turnout at the county level, with turnout calculated as the percentage of the citizen voting-age population that voted in the 2004 election.

The results of this modeling suggest that the stricter voter identification requirements of matching one's signature to a signature on file with election authorities or presenting a non-photo ID are associated with lower turnout compared to turnout in states that required voters to simply state their name, holding constant the electoral context and demographic variables.

Contextual factors, such as whether the county was in a battleground state or whether that state had a competitive race for governor and/or U.S. Senate, were associated with increased voter turnout. The time between the closing date for registration and the election was correlated with a slight negative effect on turnout. As the percentage of Hispanics in the county's population increased, turnout declined. The percentage of senior citizens in the county and household median income were associated with higher turnout. The percentage of African-Americans in the county did not have a significant effect in the model. The percentage of senior citizens in the county and household median income showed a positive correlation with turnout. In this aggregate model, the percentage of African-Americans in the county was not associated with a significant difference in turnout.

The relationship of the minimum voter identification requirements to turnout was not demonstrated. None of the dummy variables for voter identification requirements were statistically significant. (A "dummy variable" represents a particular attribute and has the value zero or one for each observation, e.g. 1 for male and 0 for female.) Being a battleground state and having a competitive statewide race were significant and positive, as was the percentage of senior citizens in the county and household median income. The percentage of Hispanics in the county's population continued to be associated with reduced turnout, as was the number of days between the closing date for registration and the election. [23]

---

[23] This test incorporated a series of interactions between the maximum and minimum voter identification requirements and the percentage of African-Americans and Hispanics living in the counties. In each case the interactions did not improve the fit of the models to the data. See tables A-1 and A-2 in the appendix of Vercellotti's paper in the appendices.

Analysis of the aggregate data at the county level generates some support for the hypothesis that stricter identification requirements are correlated with lower turnout. For the maximum requirements, a signature match and non-photo identification –but not photo identification– were correlated at a significant level with lower turnout in 2004, compared to requiring that voters simply state their names.

Aggregate data, however, cannot fully capture the individual demographic factors that may figure into the decision to turn out to vote.[24] Voter identification requirements could have a relationship to the turnout of particular groups of voters, in ways that county-level aggregate data on turnout would not capture. To explore the effects of voter identification requirements on turnout more completely, it is important to examine individual-level data as well.

Individual-level Analysis

Individual-level turnout data exists in the November 2004 Current Population Survey conducted by the U.S. Census Bureau. The Census Bureau conducts the CPS monthly to measure unemployment and other workforce data, but the bureau adds a battery of voter participation questions to the November survey in even-numbered years to coincide with either a presidential or midterm Congressional election.

One of the of the CPS is the sheer size of the sample. The survey's Voting and Registration Supplement consisted of interviews, either by telephone or in person, with 96,452 respondents.[25] The large sample size permits analyses of smaller groups, such as Black or Hispanic voters or voters with less than a high school education. The statistical analysis in relying on the CPS is based on reports from *self-described* registered voters. Omitted are those who said they were not registered to vote, as are those who said they cast absentee ballots because the identification requirements for absentee ballots may differ from those required when one votes in person. Eliminated from the sample are respondents who said they were not U.S. citizens, who in this survey were not asked the voter registration and turnout questions. In

---

[24] For example, previous research has found that education is a powerful determinant of turnout (Wolfinger and Rosenstone 1980, but see also Nagler 1991).[24] Married people also are more likely to vote than those who are not married (Alvarez and Ansolabehere 2002; Alvarez, Nagler and Wilson 2004; Fisher, Kenny, and Morton 1993).

[25] It is important to note that the Census Bureau allows respondents to answer on behalf of themselves and others in the household during the interview. While proxy reporting of voter turnout raises the possibility of inaccurate reports concerning whether another member of the household voted, follow-up interviews with those for whom a proxy report had been given in the November 1984 CPS showed 99 percent agreement between the proxy report and the information given by the follow-up respondent (U.S. Census Bureau 1990).

addition to the voter identification requirements, the models include other socioeconomic, demographic, and political environment factors that might have influenced turnout in 2004.[26] The dependent variable in these analyses is whether a respondent said he or she voted in the November 2004 election.[27]

In the model, three of the voter identification requirements have a statistically significant correlation with whether survey respondents said they had voted in 2004. That is, compared to states that require voters only to state their names, the requirement to sign one's name, provide a non-photo ID, or photo ID in the maximum requirements or affidavit in the minimum is associated with lower turnout.

Of the other state factors, only the competitiveness of the presidential race showed a significant, correlation with increased turnout. In terms of demographic influences, African-American voters were more likely than white voters or other voters to say they had cast a ballot, while Asian-Americans were less likely than white or other voters to say they had turned out. Hispanic voters were not statistically different from white or other voters in terms of reported turnout. Consistent with previous research, income, and marital status all were positive predictors of voting. Women also were more likely to say they voted than men. Among the age categories, those ages 45 to 64 and 65 and older were more likely than those ages 18 to 24 to say they voted. Respondents who had earned a high school diploma, attended some college, graduated from college or attended graduate school were all more likely to say they voted than those who had not finished high school.

While the probit models provide statistical evidence for the relationship of voter identification requirements and other variables to turnout, probit coefficients do not lend themselves to intuitive interpretation.[28] Table 3 below shows predicted probabilities (calculated from the probit

---

[26] The models are estimated using probit analysis, which calculates the effects of independent variables on the probability that an event occurred – in this case whether a respondent said he or she voted and using robust standard errors to control for correlated error terms for observations from within the same state.

[27] The U.S. Census Bureau reported, based on the November 2004 CPS, that 89 percent of those who identified themselves as registered voters said they voted in 2004 (U.S. Census Bureau 2005). Previous research has shown that, generally speaking, some survey respondents overstate their incidence of voting. Researchers speculate that over-reports may be due to the social desirability that accompanies saying one has done his or her civic duty, or a reluctance to appear outside the mainstream of American political culture (U.S. Census Bureau 1990). It is also possible that voting is an indication of civic engagement that predisposes voters to agree to complete surveys at a higher rate than non-voters (Flanigan and Zingale 2002). Hence the voter turnout rates reported in the CPS tend to be up to 10 percentage points higher than the actual turnout rate for the nation (Flanigan and Zingale 2002). Even with this caveat, however, the CPS serves as a widely accepted source of data on voting behavior.

[28] A probit model is a popular specification of a generalized linear regression model, using the probit link function.

coefficients) of voting for each level of voter identification requirements while holding all other independent variables in the models at their means.[29]

Table 3. Predicted probability of voter turnout – all voters

	Maximum requirement	Minimum requirement
State name	91.7%	91.5%
Sign name	89.9%	90.2%
Match signature	Not significant	Not significant
Non-photo ID	89.0%	89.0%
Photo ID	88.8%	—
Affidavit	—	87.%5
Total difference from "state name" to "photo ID" or "affidavit"	**2.9%**	**4.0%**
N	54,973	

Figures represent the predicted probability of registered voters saying they voted as the identification requirement varies from stating one's name to providing photo identification or an affidavit , with all other variables held constant.

Data source: U.S. Census Bureau, Current Population Survey, Voting and Registration Supplement, November 2004.

Taking into account that signature matches were not a predictor of turnout, the differences in predicted probability decline from stating one's name to providing a photo identification or affidavit. Voters in states that required photo identification were 2.7 percent less likely to vote than voters in states where individuals had to give their names.[30] In terms of the minimum requirement, voters in states that required an affidavit at minimum were 4 percent less likely to turn out than voters in states where they had to give their names.

The differences were more pronounced for those with fewer years of education. Constraining the model to show predicted probabilities only for those with less than a high school diploma, the probability of voting was 5.1 percent lower in states that required photo identification as the maximum requirement and 7 percent lower in states that required an affidavit as the minimum

---

[29] In the case of dichotomous independent variables, holding them at their mean amounted to holding them at the percentage of the sample that was coded 1 for the variable (Long 1997).

[30] The voter turnout percentages may seem disproportionately high compared to the turnout rates reported in the aggregate data analysis. It is important to consider that the turnout rates in the aggregate data were a proportion of all citizens of voting-age population, while the turnout rates for the individual-level data are the proportion of only registered voters who said they voted.

requirement compared to states where stating one's name was the maximum or minimum requirement.

Race and ethnicity have generated particular interest in the debate over voter ID requirements.[31] The analysis using the aggregate data shed no light on the association between voter ID requirements and turnout for African-American and Hispanic voters. But in the models using the individual data, some significant relationships emerged for African-American, Hispanic and Asian citizens. For the entire population, the signature, non-photo identification and photo identification requirements all were associated with lower turnout compared to the requirement that voters simply state their names. These correlations translated into reduced probabilities of voting of about 3 to 4 percent for the entire sample, with larger differences for specific subgroups. For example, the predicted probability that Hispanics would vote in states that required non-photo identification was about 10 percentage points lower than in states where Hispanic voters gave their names. The difference was about 6 percent for African-Americans and Asian-Americans, and about 2 percent for white voters.

The model also showed that Hispanic voters were less likely to vote in states that required non-photo identification as opposed to stating one's name. Hispanic voters were 10 percent less likely to vote in non-photo identification states compared to states where voters only had to give their name.

More rigorous voter identification requirements were associated with lower turnout rates for Asian-American voters as well. Asian-American voters were 8.5 percent less likely to vote in states that required non-photo identification compared to states that require voters to state their names under the maximum requirements, and they were 6.1 percent less likely to vote where non-photo identification was the minimum requirement.

Conclusions of the Statistical Analysis

The statistical analysis found that, as voter identification requirements vary, voter turnout varies as well. This finding emerged from both the aggregate data and the individual-level data,

---

[31] Incorporating discrete variables for Hispanics, African-Americans, and Asian-Americans into one model carries the implicit assumption that the remaining variables, including education and income, will influence each of these groups in a similar manner in terms of deciding whether to vote. These assumptions are not always born out by the data (see Leighley and Vedlitz, 1999.) To isolate the effects of voter identification and other variables on voter turnout within specific racial and ethnic groups, the sample is divided into sub-samples and the model re-run to calculate the data discussed and shown in Tables 5, 6, and 7 in Appendix C.

although not always for both the maximum and minimum sets of requirements. The overall relationship between ID requirements and turnout for all registered voters was fairly small, but still statistically significant.

In the aggregate data, the match-signature requirement and the provide-a-non-photo ID requirement were correlated with lower turnout compared to requiring that voters state their names. But the photo-ID requirement did not have an effect that was statistically significant, possibly because in 2004 each state requiring a photo-ID provided an alternative way to cast a regular ballot for voters who lacked that document.

In the model using the individual-level data the signature, non-photo ID, and photo ID requirements were all correlated with lower turnout compared to the requirement that voters simply state their names (in the entire sample and for white voters, but the statistical significance may be an artifact of the very large sample size). That the non-photo identification requirement was the most consistent in terms of statistical significance across the groups is intriguing given the intense debates surrounding photo identification requirements.

Significant questions about the relationship between voter identification requirements and turnout remain unanswered. The data examined in the statistical analysis could not capture the dynamics of how identification requirements might lower turnout, nor could they rule out that other attributes of a state's electoral system might explain the statistically significant correlations that the study found. If ID requirements dampen turnout, is it because individuals are aware of the requirements and stay away from the polls because they cannot or do not want to meet the requirements? Or, do the requirements result in some voters being turned away when they cannot meet the requirements on Election Day , or forced to cast a provisional ballot that is not ultimately counted? The CPS data do not include measures that can answer this question. Knowing more about the "on the ground" experiences of voters concerning identification requirements could guide policy-makers at the state and local level in determining whether and at what point in the electoral cycle a concerted public information campaign might be most effective in helping voters to meet identification requirements. Such knowledge also could help in designing training for election judges to handle questions about, and potential disputes over, voter identification requirements.

Litigation Over Voter ID Requirements

A handful of cases have challenged identification requirements in court in recent years. In general, requirements that voters provide some identifying documentation have been upheld, where photo ID is *not* the only acceptable form. Whether laws requiring photo ID will be upheld is more doubtful. To date, only two cases have considered laws requiring voters to show photo ID (*Common Cause v. Billups* and *Indiana Democratic Party v. Rokita*).. Cases challenging the mandatory disclosure of voters' Social Security numbers on privacy grounds have yielded mixed results.

Non-photo identification. For the most part, courts have looked favorably on requirements that voters present some form of identifying documents if the photo identification is not the only form accepted. In *Colorado Common Cause v. Davidson,* No. 04CV7709, 2004 WL 2360485, at *1 (Colo. Dist. Ct. Oct. 18, 2004), plaintiffs challenged a law requiring all in-person voters to show identification (not just first-time registrants). The court upheld this requirement against a constitutional challenge. Similarly, in *League of Women Voters v. Blackwell,* 340 F. Supp. 2d 823 (N.D. Ohio 2004), the court rejected a challenge to an Ohio directive requiring first-time voters who registered by mail to provide one of the HAVA-permitted forms of identification, in order to have their provisional ballots counted. Specifically, the directive provided that their provisional ballots would be counted if the voter (a) orally recited his driver's license number or the last four digits of his social security number or (b) returned to the polling place before it closed with some acceptable identification (including reciting those identification numbers). *Id.* This was found to be consistent with HAVA.

Photo ID. Since the 2004 election, two states have adopted laws requiring photo identification at the polls in order to have one's vote counted, without an affidavit exception: Georgia and Indiana.[32] Both these requirements were enacted in 2005 and both have been challenged in court. The Georgia law required voters attempting to cast a ballot in person present a valid form of photographic identification. O.C.G.A. § 21-2-417. On October 18, 2005, the District Court granted the plaintiffs' motion for a preliminary injunction, enjoining the application of the new identification requirements on constitutional grounds. In granting the injunction, the court held that plaintiffs' claims under both the Fourteenth Amendment (equal protection) and Twenty-Fourth Amendment (poll tax) had a

---

[32] Indiana's law does allow voters without ID to cast provisional ballots, and then to appear before the county board of elections to execute an affidavit saying that they are indigent and unable to obtain the requisite ID without payment of a fee. But in contrast to other states, voters cannot cast a ballot that will be counted by submitting an affidavit at the polls, affirming that they are the registered voter and are otherwise eligible to vote.

substantial likelihood of succeeding on the merits at trial (*Common Cause v. Billups*, Prelim. Inj. 96, 104). In January 2006, Georgia enacted a modified version of its photo ID law, which the court has not yet ruled on. In the other state that has enacted a photo ID requirement (Indiana), legal challenges have also been filed. (*Indiana Democratic Party v. Rokita* and *Crawford v. Marion County Election Board*). On April 14, 2006, the district court granted defendants' motion for summary judgment, concluding that plaintiffs had failed to produce evidence showing that the state's ID law would have an adverse impact on voters. Another case of significance, for purposes of photo ID requirements, is *American Civil Liberties Union of Minnesota v. Kiffmeyer*, No. 04-CV-4653, 2004 WL 2428690, at *1 (D. Minn. Oct. 28, 2004). In that case, the court enjoined a Minnesota law that allowed the use of tribal photo ID cards, only for an Indian who lived on the reservation. 2004 WL 2428690, at *1. The Court found no rational basis for distinguishing based on whether or not the cardholder lives on the reservation. *Id.* at *1, 3. These decisions indicate that courts are likely to carefully scrutinize the evidence regarding the impact of photo ID requirements.

Privacy. In *Greidinger v. Davis*, 988 F.2d 1344 (4th Cir. 1993), the court struck down on due process grounds a Virginia law requiring disclosure of voters' social security numbers for voter registration. The social security numbers recorded in voter registration lists had been disclosed to the public and political parties that had requested the lists. The court found that the requirement to give the social security number effectively conditioned rights on the consent to an invasion of privacy. It concluded that this public disclosure of the social security numbers was not necessary to achieve the government's interest in preventing fraud. On the other hand, in *McKay v. Thompson*, 226 F.3d 752 (6th Cir. 2000), the court rejected privacy challenges based on both the Constitution and federal statutes, to a Tennessee law requiring social security numbers for voter registration since 1972. 226 F.3d at 755. Second, the NVRA only permits requiring the minimum amount of information necessary to prevent duplicate voter registration and to determine eligibility. The distinction appears to be between the use of Social Security numbers for internal purposes only, which was deemed permissible, and the disclosure of those numbers to the public which was not.

These decisions suggest that the courts will carefully scrutinize the evidence, where states require that voters produce a photo ID in order to cast a regular ballot. The courts have used a

balancing test to weigh the legitimate interest in preventing election fraud against the citizen's right to privacy (protecting social security numbers from public disclosure, for example) and the reasonableness of requirements for identity documents. To provide both the clarity and certainty in administration of elections needed to forestall destabilizing challenges to outcomes, these early decisions suggest that best practice may be to limit requirements for voter identification to the minimum needed to prevent duplicate registration and ensure eligibility.

Developments since 2004

Since the passage of HAVA, with its limited requirements for voter identification, and following the 2004 election, debate over voter ID has taken place in state legislatures across the country. That debate has not been characterized by solid information on the consequences of tightening requirements for voters to identify themselves before being permitted to cast a regular, rather than a provisional, ballot.

Better information might improve the quality of the debate. Answers to the following key questions are not available in a form that might satisfy those on both sides of the argument.

- What is the overall incidence of vote fraud?
- How does fraud take place in the various stage of the process: registration, voting at the polls, absentee voting, or ballot counting?
- What contribution can tighter requirements for voter ID make to reducing vote fraud?
- What would be the other consequences of increasingly demanding requirements for voters to identify themselves? This is the question addressed, within the limits of the available data, in the analysis in this report.

Answering these questions would provide the information needed for more informed judgement in the states as they consider the tradeoffs among the competing goals of ballot integrity, ballot access, and administrative efficiency. The Carter-Baker Commission recognized the tradeoffs when it tied recommendation for national ID to an affirmative effort by government to identify unregistered voters and make it easy for them to register.

State Voter Databases and Voter ID

With the implementation of the HAVA Computerized Statewide Voter Registration List, an application for voter registration for an election for Federal office may not be accepted or processed unless the application includes a driver's license number or last four digits of the

Social Security number on the voter registration form. This information can be used to verify the identity of the registrant through interfacing with lists maintained by the Motor Vehicle office and Social Security office. If registrants do not have either a driver's license or Social Security number, the State will assign a unique identifier number to that person.

Some states are wrestling now with these unresolved issues. In New Jersey, for example, pending legislation would require that voters must be able to confirm their registration through a secure access to the Statewide Voter Registration List. It also requires voters to present ID at the polls in order to cast a regular ballot if the numbers recorded on the registration have not been verified (or if no verifiable number appears on the registration). It recognizes the HAVA requirement that if the number provided by the voter has not been verified and if the voter does not present ID at the polls, that voter may cast a provisional ballot. The bill does not specify they have to provide ID within 48 hours in order for their vote to count, as is the case with first-time mail-in registrants.

As some states gain experience in this area, the EAC would perform a useful service by making timely recommendations of best practices for all states to consider.

Conclusions

The analysis of voter ID requirements is complex. It takes into account important values associated with an electoral process, such as ballot access and integrity. The continuing effort to understand how voter ID requirements may affect turnout and the integrity of the ballot could benefit from additional factual information, including statistical analyses. Our research includes a statistical study of this kind. It indicated that the level of voter turnout in a state is correlated with the stringency of the voter ID requirement imposed by that state. Additional empirical research of this nature, with additional data collected by or for the EAC, would further illuminate the relationship between stricter voter ID rules and turnout, perhaps explaining if awareness of a strict ID requirement tends to discourage would-be voters from going to the polls. Or, additional research may shed light on whether, if voters did go to the polls, stricter Voter ID requirements will divert more voters into the line for provisional ballots. The consequence of increased reliance on provisional ballots can be longer lines at the polls and confusion, without necessarily a clear demonstration that the security of the ballot is correspondingly increased. [33]

---

[33] In this connection, the Brennan Center's response to the Carter-Baker Commission report observes that, "while it might be true that in a close election "a small amount of fraud could make the margin of

The debate over voter ID in the states would be improved by additional research sponsored by the EAC. That might include longitudinal studies of jurisdictions that have changed voter ID requirements, as well as precinct-level analyses that would allow more finely tuned assessment of the correlation between stricter identification requirements and turnouts. Further research could also identify methods to eliminate the need for voters to bring specific identity documents with them to the polls, while assuring that each voter who casts a ballot is eligible and votes only once.

Best Practices to Improve Provisional Voting

CONTENTS

The Research Team

This research report on Provisional Voting in the 2004 election is part of a broader analysis that also includes a study of Voter Identification Requirements, a report on which is forthcoming. Conducting the work was a consortium of The Eagleton Institute of Politics of Rutgers, The State University of New Jersey, and The Moritz College of Law of The Ohio State University.

The Eagleton Institute explores state and national politics through research, education, and public service, linking the study of politics with its day-to-day practice. It focuses attention on how contemporary political systems work, how they change, and how they might work better. Eagleton regularly undertakes projects to enhance political understanding and involvement, often in collaboration with government agencies, the media, non-profit groups, and other academic institutions.

The Moritz College of Law has served the citizens of Ohio and the nation since its establishment in 1891.It has played a leading role in the legal profession through countless contributions made by graduates and faculty. Its contributions to election law have become well known through its Election Law @ Moritz website. *Election Law @ Moritz* illuminates public understanding of election law and its role in our nation's democracy.

The Peer Review Group improved the quality of our work by critiquing drafts of our analysis, conclusions and recommendations. While the Group as a whole and the comments of its members individually contributed generously to the research effort, any errors of fact or weaknesses in inference are the responsibility of the Eagleton-Moritz research team. The members of the Peer Review Group do not necessarily share the views reflected in the policy recommendations of the report.

EXECUTIVE SUMMARY

Background and Methodology

This report to the United States Election Assistance Commission (EAC) presents recommendations for best practices to improve the process of provisional voting. It is based on research conducted by the Eagleton Institute of Politics at Rutgers, the State University of New Jersey, and the Moritz College of Law at Ohio State University under contract to the EAC, dated May 24, 2005.

The Help America Vote Act of 2002 (HAVA, (Public Law 107-252) authorizes the EAC (SEC. 241, 42 USC 15381) to conduct periodic studies of election administration issues. The purpose of these studies is to promote methods for voting and administering elections, including provisional voting, that are convenient, accessible and easy to use; that yield accurate, secure and expeditious voting systems; that afford each registered and eligible voter an equal opportunity to vote and to have that vote counted; and that are efficient. Section 302(a) of HAVA required states to establish provisional balloting procedures by January 2004.[1] The process HAVA outlined left considerable room for variation among the states, arguably including such critical questions as who qualifies as a registered voter eligible to cast a provisional ballot that will be counted and in what jurisdiction (precinct or larger unit) the ballot must be cast in order to be counted.[2]

The general requirement for provisional voting is that, if a registered voter appears at a polling place to vote in an election for Federal office, but either the potential voter's name does not appear on the official list of eligible voters for the polling place, or an election official asserts that the individual is not eligible to vote, that potential voter must be permitted to cast a provisional ballot. In some states, those who should receive a provisional ballot include, in the words of the EAC's Election Day Survey, "first-time voters who registered by mail without identification and cannot provide identification, as required under HAVA. . ."[3] HAVA also provides that those who vote pursuant to a court order keeping the polls open after the established closing hour shall vote by provisional ballot. Election administrators are required by HAVA to notify individuals of their opportunity to cast a provisional ballot.

---

[1] The Election Center's National Task Force Report on Election Reform in July 2001 had described provisional ballots as providing "voters whose registration status cannot be determined at the polls or verified at the election office the opportunity to vote. The validity of these ballots is determined later, thus ensuring that no eligible voter is turned away and those truly ineligible will not have their ballots counted." It recommended "in the absence of election day registration or other solutions to address registration questions, provisional ballots must be adopted by all jurisdictions." See www.electioncenter.org .

[2] The 2004 election saw at least a dozen suits filed on the issue of whether votes cast in the wrong precinct but the correct county should be counted. One federal circuit court decided the issue in *Sandusky County Democratic Party v. Blackwell, 387 F.3d565* (6th Cir. 2004), which held that votes cast outside the correct precinct did not have to be counted. The court relied on the presumption that Congress must be clear in order to alter the state-federal balance; thus Congress, the court concluded would have been clearer had it intended to eliminate state control over polling location (387 F.3d at 578). An alternative argument, that HAVA's definition of "jurisdiction" incorporates the broader definition in the National Voting Rights Act, however, has not been settled by a higher court. But for now states do seem to have discretion in how they define "jurisdiction" for the purpose of counting a provisional ballot.

[3] The definition of who was entitled to a provisional ballot could differ significantly among the states. In California, for example, the Secretary of State directed counties to provide voters with the option of voting on a provisional paper ballot if they felt uncomfortable casting votes on the paperless e-voting machines. "I don't want a voter to not vote on Election Day because the only option before them is a touch-screen voting machine. I want that voter to have the confidence that he or she can vote on paper and have the confidence that their vote was cast as marked," Secretary Shelley said. See http://wired.com/news/evote/0,2645,63298,00.html . (Our analysis revealed no differences in the use of provisional ballots in the counties with these paperless e-voting machines.) In Ohio, long lines at some polling places resulted in legal action directing that voters waiting in line be given provisional ballots to enable them to vote before the polls closed. (Columbus Dispatch, November 3, 2004 .)

Our research began in late May 2005. It focused on six key questions raised by the EAC.

1. How did the states prepare for the onset of the HAVA provisional ballot requirement?
2. How did this vary between states that had previously had some form of provisional ballot and those that did not?
3. How did litigation affect implementation?
4. How effective was provisional voting in enfranchising qualified voters?
5. Did state and local processes provide for consistent counting of provisional ballots?
6. Did local election officials have a clear understanding of how to implement provisional voting?

To answer those questions, we:

1. Surveyed 400 local (mostly county) election officials to learn their views about the administration of provisional voting and to gain insights into their experience in the 2004 election.
2. Reviewed the EAC's Election Day Survey, news and other published reports in all 50 states to understand the local background of provisional voting and develop leads for detailed analysis.[4]
3. Analyzed statistically provisional voting data from the 2004 election to determine associations between the use of provisional voting and such variables as states' experience with provisional voting, use of statewide registration databases, counting out-of-precinct ballots, and use of different approaches to voter identification.
4. Collected and reviewed the provisional voting statutes and regulations in all 50 states.
5. Analyzed litigation affecting provisional voting or growing out of disputes over provisional voting in all states.

Our research is intended to provide EAC with a strategy to engage the states in a continuing effort to strengthen the provisional voting process and increase the consistency with which provisional voting is administered, particularly within a state. As EAC and the states move forward to assess and adopt the recommendations made here, provisional voting merits continuing observation and research. The situation is fluid. As states, particularly those states that did not offer a provisional ballot before 2004, gain greater experience with the process and as statewide voter databases are adopted, the provisional voting process will demand further, research-based refinement.

KEY FINDINGS

Variation among the states

In the 2004 election, nationwide about 1.9 million votes, or 1.6% of turnout, were cast as provisional ballots. More than 1.2 million, or just over 63%, were counted. Provisional ballots accounted for a little more than 1% of the final vote tally. These totals obscure the wide variation in provisional voting among the states.[5]

---

[4] Attachment 1 provides detailed information on how this study classifies the states according to the characteristics of their provisional voting procedures. It also describes how the data used in the statistical analysis may differ from the data in the Election Day Survey, which became available as our research was concluding.

[5] HAVA allows the states considerable latitude in how to implement provisional voting, including deciding who beyond the required categories of voters should receive provisional ballots and how to determine which provisional ballots should be counted.

- Six states accounted for two-thirds of all the provisional ballots cast.[6]
- The percentage of provisional ballots in the total vote varied by a factor of 1,000 – from a high of 7% in Alaska to Vermont's 0.006%.
- The portion of provisional ballots cast that were counted ranged from 96% in Alaska to 6% in Delaware.
- States with voter registration databases counted, on average, 20% of the provisional ballots cast.
- States without databases counted ballots at more than twice that rate: 44%.[7]
- States that provided more time to evaluate provisional ballots counted a greater proportion of those ballots. Those that provided less than one week counted an average of 35.4% of their ballots, while states that permitted more than 2 weeks, counted 60.8%.

An important source of variation among states was a state's previous experience with provisional voting and with the fail-safe voting provision of the National Voting Rights Act. The share of provisional ballots in the total vote was six times greater in states that had used provisional ballots before than in states where the provisional ballot was new. In the 25 states that had some experience with provisional voting before HAVA, a higher portion of the total vote was cast as provisional ballots and a greater percentage of the provisional ballots cast were counted than in the 18 new to provisional balloting.[8] Part of that difference was due to how states had implemented the National Voting Rights Act, particularly in regard to voters who changed address within weeks of the election. Voters in California, for example, who moved within their county must cast a provisional ballot, the information from which is used to update the voter's address. Other states, Tennessee for example, found that some fail-safe voters were reluctant to vote by provisional ballot. As a result, Tennessee abandoned provisional voting for those who moved within counties and allows failsafe voters cast a regular ballot. Relatively fewer provisional ballots would tend to be cast in such states.

Variation within states

Within states, too, there was little consistency among different jurisdictions. Of the 20 states for which we have county-level provisional ballot data, the rate of counting provisional ballots varied by as much as 90% to 100% among counties in the same state. This variation suggests that additional factors (including the training of election judges or poll workers) beyond statewide factors, such as experience or the existence of voter registration databases, also influence the use of provisional ballots.

- In Ohio some counties counted provisional ballots not cast in the assigned precinct even though the state's policy was to count only those ballots cast in the correct precinct.
- Some counties in Washington tracked down voters who would otherwise have had their provisional ballots rejected because they had failed to complete part of their registration form, gave them the chance to correct those omissions, and then counted the provisional ballot.

---

[6] California, New York, Ohio, Arizona, Washington, and North Carolina. The appearance of Arizona, Washington and North Carolina on this list shows that the number of provisional ballots cast depends on factors other than the size of the population.

[7] As the Carter-Baker Commission report put it, "provisional ballots were needed half as often in states with unified databases as in states without." Report on the Commission on Federal Election Reform, "Building Confidence in U. S. Elections," September 2005, p. 16.

[8] See the appendix for our classification of "old" and "new" states and explanation of why the total is less than 50.

Resources available to administer provisional voting varied considerably among and within states. Differences in demographics and resources result in different experiences with provisional voting. For example, the Election Day Survey found that staffing problems appeared to be particularly acute for jurisdictions in the lowest income and education categories. Small, rural jurisdictions and large, urban jurisdictions tended to report higher rates of an inadequate number of poll workers within polling places or precincts.

- Jurisdictions with lower education and income tend to report more inactive voter registrations, lower turnout, and more provisional ballots cast.
- Jurisdictions with higher levels of income and education reported higher average numbers of poll workers per polling place or precinct and reported lower rates of staffing problems per precinct.

In precincts located in districts where many voters live in poverty and have low levels of income and education, the voting process, in general, may be managed poorly. Provisional ballots cannot be expected to work much better. In these areas, the focus should be on broader measures to improve the overall functionality of struggling voting districts, although improving the management of provisional balloting may help at the margin.

The lessons of litigation

Successful legal challenges highlight areas where provisional voting procedures were wanting. A flurry of litigation occurred around the country in October 2004 concerning the so-called "wrong precinct issue" – whether provisional ballots cast by voters in a precinct other than their designated one would be counted for statewide races. Most courts, including the U.S. Court of Appeals for the Sixth Circuit (the only federal appeals court to rule on the issue), rejected the contention that HAVA requires the counting of these wrong-precinct provisional ballots. This litigation was significant nonetheless.

- First, the Sixth Circuit decision established the precedent that voters have the right to sue in federal court to remedy violations of HAVA.
- Second --and significantly– the litigation clarified the right of voters to receive provisional ballots, even though the election officials were certain they would not be counted. The decision also defined an ancillary right – the right to be directed to the correct precinct. There voters could cast a regular ballot that would be counted. If they insisted on casting a provisional ballot in the wrong precinct, they would be on notice that it would be a symbolic gesture only.
- Third, these lawsuits prompted election officials to take better care in instructing precinct officials on how to notify voters about the need to go to the correct precinct in order to cast a countable ballot.

States move to improve their processes

Shortly after the 2004 election, several states came to the conclusion that the administration of their provisional voting procedures needed to be improved, and they amended their statutes. The new legislation highlights areas of particular concern to states about their provisional voting process.

- Florida, Indiana, Virginia, and Washington have clarified or extended the timeline to evaluate the ballots.

- Colorado, New Mexico, North Carolina, and Washington have passed legislation focused on improving the efficacy and consistency of the voting and counting process.
- Colorado, Arkansas, and North Dakota took up the issue of counting provisional ballots cast in the wrong precinct.

The wide variation in the implementation of provisional voting among and within states suggests that EAC can help states strengthen their processes. Research-based recommendations for best, or at least better, practices that draw on the experience gained in the 2004 election can be useful in states' efforts to achieve greater consistency in the administration of provisional voting. The important effect of experience on the administration of the provisional ballot process indicates that the states have much they can learn from each other.

SUMMARY OF RECOMMENDATIONS FOR BEST PRACTICES

State efforts to improve the provisional voting process have been underway since the 2004 election. By recommending best practices, the EAC will offer informed advice while respecting diversity among the states.

Take a quality-improvement approach

Defining what constitutes a successful provisional voting system is difficult. Defining quality requires a broad perspective about how well the system works, how open it is to error recognition and correction, and how well provisional voting processes are connected to the registration and voter identification regimes. A first step is for states to recognize that improving quality begins with seeing the provisional voting process as a system and taking a systems approach to regular evaluation through standardized metrics with explicit goals for performance. EAC can facilitate action by the states by recommending as a best practice that:

- Each state collect data systematically on the provisional voting process to permit evaluation of its voting system and assess changes from one election to the next. The data collected should include: provisional votes cast and counted by county; reasons why provisional ballots were not counted, measures of variance among jurisdictions, and time required to evaluate ballots by jurisdiction

Emphasize the importance of clarity

Above all else, the EAC should emphasize the importance of clarity in the rules by which each state governs provisional voting. As state legislators and election officials prepare for the 2006 election, answers to the questions listed in the recommendations section of this report could be helpful. Among those questions are:

- Does the provisional voting system distribute, collect, record, and tally provisional ballots with sufficient accuracy to be seen as procedurally legitimate by both supporters and opponents of the winning candidate?
- Do the procedural requirements of the system permit cost-efficient operation?
- How great is the variation in the use of provisional voting in counties or equivalent levels of voting jurisdiction within the state? Is the variation great enough to cause concern that the system may not be administered uniformly across the state?

Court decisions suggest areas for action

The court decisions following the 2004 election also suggest procedures for states to incorporate into their procedures for provisional voting. EAC should recommend to the states that they:

- Promulgate clear standards for evaluating provisional ballots, and provide training for the officials who will apply those standards.
- Provide effective materials to be used by local jurisdictions in training poll workers on such procedures as how to locate polling places for potential voters who show up at the wrong place.
- Make clear that the only permissible requirement to obtain a provisional ballot is an affirmation that the voter is registered in the jurisdiction and eligible to vote in an election for federal office. Poll workers need appropriate training to understand their duty to give such voters a provisional ballot.

<u>Assess each stage of the provisional voting process</u>

Beyond the procedures suggested by court decisions, states should assess each stage of the provisional voting process. They can begin by assessing the utility and clarity of the information for voters on their websites and by considering what information might be added to sample ballots mailed to voters before elections. The better voters understand their rights and obligations, the easier the system will be to manage, and the more legitimate the appearance of the process.

Avoiding error at the polling place will allow more voters to cast a regular ballot and all others who request it to cast a provisional ballot. Our recommendations for best practices to avoid error at the polling place include:

- The layout and staffing of the multi-precinct polling place is important. States should ensure that training materials distributed to every jurisdiction make poll workers familiar with the options available to voters.
- The provisional ballot should be of a design or color sufficiently different from a regular ballot to avoid confusion over counting and include take-away information for the voter on the steps in the ballot evaluation process.
- Because provisional ballots offer a fail-safe, supplies of the ballots at each polling place should be sufficient for all the potential voters likely to need them. Best practice for states should provide guidelines (as do Connecticut and Delaware) to estimate the supply of provisional ballots needed at each polling place.

The clarity of criteria for evaluating voter eligibility is critical to a sound process for deciding which of the cast provisional ballots should be counted.

- State statutes or regulations should define a reasonable period for voters who lack the HAVA-specified ID or other information bearing on their eligibility to provide it in order to facilitate the state's ability to verify that the person casting the provisional ballot is the same one who registered. At least 11 states allow voters to provide ID or other information one to 13 days after voting. Kansas allows voters to proffer their ID by electronic means or by mail, as well as in person.
- More provisional voters have their ballots counted in those states that count ballots cast outside the correct precinct. While HAVA arguably leaves this decision up to the states, pointing out the effect of the narrower definition on the portion of ballots counted could be useful to the states in deciding this question. States should be aware, however, of the additional burden placed on the ballot-evaluation process when out-of-precinct ballots

are considered. And tradeoffs are involved if out-of-precinct voters are unable to vote for the local offices that might appear on the ballot in their district of residence.

- If a state does require voters to appear at their assigned precinct, where the same polling site serves more than one precinct, a voter's provisional ballot should count so long as the voter cast that ballot at the correct polling site even if at the wrong precinct within that location. While the best practice might be for poll workers to direct the voter to correct precinct poll workers' advice is not always correct, and the voter should be protect against ministerial error.
- Officials should follow a written procedure, and perhaps a checklist, to identify the reason why a provisional ballot is rejected. Colorado's election rules offer particularly clear guidance to the official evaluating a provisional ballot.

In verifying provisional ballots, the time by which election officials must make their eligibility determinations is particularly important in presidential elections because of the need to certify electors to the Electoral College. Our research did not identify an optimum division of the five weeks available.

- The best practice here is for states to consider the issue and make a careful decision about how to complete all steps in the evaluation of ballots and challenges to those determinations within the five weeks available.

After the election, timely information to voters about the disposition of their provisional ballot can enable voters to determine if they are registered for future elections and, if not, what they need to do to become registered.

- Best practice for the states is to establish mechanisms to ensure that voters casting provisional ballots are informed whether they are now registered for future elections and, if not, what they need to do to become registered.

Final observation

The detailed examination of each stage in the provisional voting process can lay the foundation each state needs to improve its system. Efforts to improve provisional voting may be most effective as part of a broader effort by state and local election officials to strengthen their systems. Collecting and analyzing data about those systems will enable states to identify which aspects of the registration and electoral system are most important in shunting voters into the provisional ballot process. Responsible officials can then look to their registration system, identification requirements or poll worker training as ways to reduce the need for voters to cast their ballots provisionally.

Provisional Voting in 2004

In the 2004 election, nationwide about 1.9 million votes, or 1.6% of turnout, were cast as provisional ballots. More than 1.2 million or just over 63% were counted. Provisional ballots accounted for a little more than 1% of the final vote tally.

These totals obscure the wide variation in provisional voting among the states.[9] Six states accounted for two-thirds of all the provisional ballots cast.[10] State by state, the percentage of provisional ballots in the total vote varied by a factor of 1,000 – from a high of 7% in Alaska to Vermont's 0.006%. The portion of provisional ballots cast that were actually counted also displayed wide variation, ranging from 96% in Alaska to 6% in Delaware. States with voter registration databases counted, on average, 20% of the provisional ballots cast. Those without databases counted provisional ballots at more than twice that rate, 44%.

An important source of variation was a state's previous experience with provisional voting. The share of provisional ballots in the total vote was six times greater in states that had used provisional ballots before than in states where the provisional ballot was new. In the 25 states that had some experience with provisional voting before HAVA, a higher portion of the total vote was cast as provisional ballots and a greater percentage of the provisional ballots cast were counted than in the 18 new to provisional balloting.[11]

- The percentage of the total vote cast as provisional ballots averaged more than 2% in the 25 experienced states. This was 4 times the rate in states new to provisional voting, which averaged 0.47%.[12]
- The experienced states counted an average of 58% of the provisional ballots cast, nearly double the proportion in the new states, which counted just 33% of cast provisional ballots.
- The combined effect of these two differences was significant. In experienced states 1.53% of the total vote came from counted provisional ballots. In new states, provisional ballots accounted for only 0.23% of the total vote.

Those voting with provisional ballots in experienced states had their ballots counted more frequently than those in the new states. This experience effect is evidence that there is room for improvement in provisional balloting procedures, especially in those states new to the process.[13] That conclusion gains support from the perspectives of the local election officials revealed in the survey conducted as a part of this research. Local (mostly county level) election officials from "experienced" states were more likely to:

---

[9] HAVA allows the states considerable latitude in how to implement provisional voting, including deciding who beyond the required categories of voters should receive provisional ballots and how to determine which provisional ballots should be counted.

[10] California, New York, Ohio, Arizona, Washington, and North Carolina. The appearance of Arizona, Washington and North Carolina on this list shows that the number of provisional ballots cast depends on factors other than the size of the population.

[11] See the appendix for our classification of "old" and "new" states and explanation of why the total is less than 50.

[12] To compensate for the wide differences in vote turnout among the 50 states the average figures here are calculated as the mean of the percent cast or counted rather than from the raw numbers of ballots cast or counted.

[13] Managing the provisional voting process can strain the capacity election administrators. For example, Detroit, counted 123 of the 1,350 provisional ballots cast there in 2004. A recent study concluded that Detroit's " 6-day time limit to process provisional ballots was very challenging and unrealistic. To overcome this challenge, *the entire department's employees were mobilized to process provisional ballots.*" (emphasis added.) GAO Report-05-997, "Views of Selected Local Officials on Managing Voter Registration and Ensuring Citizens Can Vote," September 2005.

- Be prepared to direct voters to their correct precincts with maps;
- Regard provisional voting as easy to implement;
- Report that provisional voting sped up and improved polling place operations
- Conclude that the provisional voting process helped officials maintain accurate registration databases.

Officials from "new" states, on the other hand, were more likely to agree with the statement that provisional voting created unnecessary problems for election officials and poll workers.

If experience with provisional voting does turn out to be a key variable in performance, that is good news. As states gain experience with provisional ballots their management of the process could become more consistent and more effective over subsequent elections. Further information from the EAC on best practices and the need for more consistent management of the election process could sharpen the lessons learned by experience. The EAC can facilitate the exchange of experience among the states and can offer all states information on more effective administration of provisional voting.

Concluding optimistically that experience will make all the difference, however, may be unwarranted. Only if the performance of the "new" states was the result of administrative problems stemming from inexperience will improvement be automatic as election officials move along the learning curve. Two other possibilities exist. Our current understanding of how provisional voting worked in 2004 is not sufficient to determine unambiguously which view is correct.

1. "New" states may have a political culture different from "old" states. That is, underlying features of the "new" states political system may be the reason they had not adopted some form of provisional voting before HAVA. The "new" states may strike a different balance among the competing objectives of ballot access, ballot security and practical administration. They may ascribe more responsibility to the individual voter to take such actions as registering early, finding out where the right precinct is, or re-registering after changing address. They may value keeping control at the local level, rather than ceding authority to state or federal directives. The training they offer poll workers about provisional ballots may not be as frequent or effective as in other states. If the inconsistent performance in the "new" states arises out of this kind of political culture, improving effectiveness in the use of the provisional ballots -- as measured by intrastate consistency in administration— will be harder and take longer to achieve.[14]
2. "Old" states may devote fewer resources to updating their registration files or databases because they consider provisional ballots as a reasonable fail safe way for voters with registration problems a way to cast a ballot. The adoption of statewide voter registration databases in compliance with HAVA therefore may reduce the variation in the use of provisional ballots among the states.

Other influences decreasing consistency among the states include:

---

[14] Despite differing political cultures among states and the latitude HAVA provides states, the statute does, indeed impose some degree of uniformity on issues that Congress thought essential. For example, before HAVA, took effect, "no state gave the voter the right to find out the status of their ballot after the election. " Now all offer that opportunity. See Bali and Silver, "The Impact of Politics, Race and Fiscal Strains on State Electoral Reforms after Election 2000," manuscript, Department of Political Science, Michigan State University. Resisting HAVA's mandates through foot-dragging lacks any legitimate foundation in law or policy.

- The more rigorous the verification requirements, the smaller the percentage of provisional ballots that were counted. Some states verified provisional ballots by comparing the voter's signature to a sample, some matched such identifying data as address, birth date, or social security number, others required voters who lacked ID at the polling place to return later with the ID to evaluate the provisional ballot, and some required provisional voters to execute an affidavit. [15]
    - In the 4 states that simply matched signatures, nearly 3.5% of the total turnout consisted of provisional ballots, and just under three-fourths of those ballots (73%) were counted.
    - In the 14 states that required voters to provide such additional information as address or date of birth just over 1.5% of the total turnout consisted of provisional ballots, and 55% of those ballots were counted.
    - In the 14 states that required an affidavit (attesting, for example, that the voter was legally registered and eligible to vote in the jurisdiction) just over one-half of a percent (0.6%) of turnout came from provisional ballots, and less than one-third of those (30%) were counted. (But note that HAVA requires all voters to certify that they are eligible and registered in order to cast a provisional ballot, which is functionally an affidavit. The 14 states described here used an explicit affidavit form.)
    - In the 10 states that required voters to return later with identifying documents just under 1.5% of the total turnout came from provisional ballots, and more than half (52%) of these were counted. Voters apparently found this requirement less onerous than the affidavit, even though it required a separate trip to a government office
- Voter registration databases provided information that reduced the number of provisional ballots counted.[16] In states using provisional voting for the first time, states with registered-voter databases counted only 20% of the ballots that were cast. States without such databases counted more than double that rate (44%). As HAVA's requirement for adoption of statewide databases spreads across the country, this variation among states is likely to narrow. Real-time access to a continually updated, statewide list of registered voters should reduce the number of provisional ballots used and reduce the percentage counted since most of those who receive them will be less likely to be actually registered in the state.
- States that counted out-of-precinct ballots counted 56% of the provisional ballots cast. States that counted only ballots cast in the proper precinct counted an average of 42% of provisional ballots. [17]
    - In experienced states, the disparity was even more pronounced: just over half of provisional ballots cast were counted in states requiring in-district ballots, while more than two-thirds were counted in those allowing out-of-precinct ballots.
    - If all states had counted out-of-precinct ballots, perhaps 290,000 more provisional ballots would have been counted across the country.[18]

---

[15] See Table 2 in Appendix 2 for information on the verification method used in each state.

[16] The Election Day Survey found that states using statewide voter registration databases reported a lower incidence of casting provisional ballots than states without voter registration databases, suggesting that better administration of voter registration rolls might be associated with fewer instances where voters would be required to cast a provisional ballot due to a problem with their voter registration.

[17] The Election Day Survey concluded that : "Jurisdictions with jurisdiction-wide provisional ballot acceptance reported higher rates of provisional ballots cast, 2.09 percent of registration or 4.67 percent of ballots cast in polling places, than those with in-precinct-only acceptance, 0.72 and 1.18 percent, respectively. Predictably, those jurisdictions with more permissive jurisdiction-wide acceptance reported higher rates of counting provisional ballots, 71.50 percent, than other jurisdictions, 52.50 percent."

- States that provide a longer the time to evaluate provisional ballots counted a higher proportion of those ballots. [19]
    - Fourteen states permitted less than one week to evaluate provisional ballots, 15 states permitted between one and two weeks, and 14 states permitted greater than two weeks[20].
    - Those states that permitted less than one week counted an average of 35.4% of their ballots.
    - States that permitted between one and two weeks counted 47.1%.
    - States that permitted more than 2 weeks, counted 60.8% of the provisional ballots cast[21].
    - The effect of allowing more time for evaluation is felt most strongly in states where more than 1% of the overall turnout was of provisional ballots. In states where provisional ballots were used most heavily, those that permitted less than one week to evaluate ballots counted 58.6% while those that permitted one to two weeks counted 65.0% of ballots, and those states that permitted greater than three weeks verified the highest proportion of provisional ballots, at 73.8%.

Variation Within States

Not only was there little consistency among states in the use of provisional ballots, there was also little consistency within states. This was true in both new and old states. Of the 20 states for which we have county-level provisional ballot data, the rate of counting provisional ballots varied by as much as 90% to 100% among counties in the same state. This suggests that additional factors beyond statewide factors, such as verification requirements or the time provided for ballot evaluation, also influence the provisional voting process. Reacting to the lack of consistency within states, the Carter-Baker Commission recommended that "states, not counties or municipalities, should establish uniform procedures for the verification and counting of provisional ballots, and that procedure should be applied uniformly throughout the state."[22]

Electionline reported that:

- In Ohio some counties counted provisional ballots not cast in the assigned precinct even though the state's policy was to count only those ballots cast in the correct precinct.
- Some counties in Washington tracked down voters who would otherwise have had their provisional ballots rejected because they had failed to complete part of their registration form, gave them the chance to correct those omissions, and then counted the

---

[18] This estimate is a rough approximation. States that recognize out-of-precinct ballots counted, on average, 56% of the provisional votes cast. Applying that ratio to the 1.9 million provisional ballots cast nationwide would result in 1.1 million provisional ballots that would have been counted if all states accepted out-of-precinct votes. States that did not recognize out-of-precinct ballots counted 42% of the provisional ballots cast, or about 813,000 ballots, for a difference of about 290,000 votes.

[19] See Appendix, Relationship Between Time Allotted to Verify Provisional Ballots and the Level of Ballots that are Verified, David Andersen, The Eagleton Institute of Politics

[20] Many thanks to Ben Shepler, of the Moritz College of Law, for assembling complete data on the time requirements states permitted for the counting of provisional ballots.

[21] 43 states are included in this analysis, including Washington D.C. The 7 election-day registration states are omitted, as is Mississippi, which never provided data on provisional ballots. North Carolina is also omitted from the regressions, as it does not have a statewide policy on how it verifies provisional ballots.

[22] Recommendation 2.3.2 of the Report of the Commission on Federal Election Reform, "Building Confidence in U.S. Elections," September 2005, p.16. The report also observed that, ". . .different procedures for counting provisional ballots within and between states led to legal challenges and political protests. Had the margin of victory for the presidential contest been narrower, the lengthy dispute that followed the 2000 election could have been repeated."

provisional ballot. This would probably not have come to light except for the sharp examination caused by the very close election for governor.

Resources available to administer provisional voting varied considerably among and within states. The result is that differences in demographics and resources result in different experiences with provisional voting. For example, the Election Day Survey found that:

- Jurisdictions with lower education and income tend to report more inactive voter registrations, lower turnout, and more provisional ballots cast.
- Jurisdictions with higher levels of income and education reported higher average numbers of poll workers per polling place or precinct and reported lower rates of staffing problems per precinct.
- Staffing problems appeared to be particularly acute for jurisdictions in the lowest income and education categories. Small, rural jurisdictions and large, urban jurisdictions tended to report higher rates of an inadequate number of poll workers within polling places or precincts.
- Predominantly non-Hispanic, Black jurisdictions reported a greater percentage of polling places or precincts with an inadequate number of poll workers. Predominantly non-Hispanic, Native American jurisdictions reported the second highest percentage of staffing problems.

The conclusions to be drawn from these findings are clear. In voting districts with lower education levels, poverty, and inadequately staffed polling places, the voting process is unlikely to function well. More people will end up casting provisional ballots. That makes the provisional voting process especially important in such districts. But if jurisdictions struggle with regular voting, how well are they likely to do with the more complicated provisional balloting process? In precincts where the voting process, in general, is managed poorly, provisional ballots cannot be expected to work much better. In these areas, the focus should be on broader measures to improve the overall functionality of struggling voting districts, although improving the management of provisional balloting may help at the margin.

Effectiveness of Provisional Voting

The certainty of our conclusions about the effectiveness of provisional voting is limited because of the complexity of the problem and a lack of important information. An ideal assessment of how well provisional ballots worked in 2004 would require knowing the decisions of local officials in 200,000 precincts on how to inform voters about provisional voting; their performance in providing a provisional ballot to those qualified to receive one, and their decisions whether to count a provisional ballot. Information needed about the eligibility or registration status of provisional voters is also not available.

We see no automatic correlation between the quality of a state's voting system and either the number of provisional ballots cast or counted. Low numbers could reflect accurate statewide voting data and good voter education. Or they could suggest that provisional ballots were not made easily available. High numbers could be seen as signifying an effective provisional voting system or a weak registration process. But we do know that in 2004 provisional ballots allowed 1.2 million citizens to vote, citizens who would otherwise have been turned away from the polls.

Since we do not know how many registered voters who might have voted but could not, we cannot estimate with any precision how effective provisional voting was in 2004. The Cal Tech – MIT Voting Technology Project, however, estimated that 4 – 6 million votes were lost in the

2000 presidential election for the reasons shown in Table 1 below. The estimate is an approximation, but it may provide data good enough for a general assessment of the size of the pool of potential voters who might have been helped by the provisional ballot process.

Estimates of Votes Lost In 2000 Presidential Election

Votes Lost (Millions)	***Cause***
1.5 – 2	Faulty equipment and confusing ballots
1.5 – 3	Registration mix-ups
<1	Polling place operations
?	Absentee ballot administration

Table 1 Cal Tech – MIT Voting Technology Project Estimates
4 – 6 million votes are lost in presidential elections due to the causes shown in the table. Registration mix-ups (e.g., name not on list) and polling place operations (e.g., directed to wrong precinct) are the causes most likely to be remedied by provisional voting.

The table shows that the universe of voters who could be helped by provisional voting might be 2.5 – 3 million voters. In 2004, about 1.2 million provisional voters were counted. A rough estimate of the effectiveness of provisional voting in 2004, then, might be 40% to 50% (ballots counted/votes lost)[23]. Whatever the precise figure, it seems reasonable to conclude that there is considerable room for improvement in the administration of provisional voting.

Legislative Response

Indeed, several states[24] came to the conclusion that the administration of their provisional voting procedures needed to be improved and amended their statutes after the 2004 election. State legislation adopted since the election points to particular areas of concern.

- Not enough time to examine and count the provisional ballots. Florida, Indiana, Virginia, and Washington all have clarified or extended the timeline to evaluate the ballots. But taking more time can prove a problem, particularly in presidential elections with the looming deadline to certify the vote for the Electoral College.[25]

---

[23] Another interpretation of the data should be considered. The Census Bureau's Current Population Survey (CPS) developed the category of "registration mix-ups" to assess the states' registration systems. After each election the CPS asks people if they were registered and if they voted. The CPS gives breakdowns of reasons why people did not vote. Survey responders tend to deflect blame when answering questions about voting. In the narrow context of provisional ballots, 'registration problems' would cover only voters who went to the polls where the determination that they were not registered was wrong or they were registered, but in the wrong precinct. If they were in the wrong precinct, provisional voting can help them in only 17 states. In 2004, only 6.8% of those not voting and registered blamed registration problems, while 6.9% reported so in 2000.

[24] Twelve states made statutory or regulatory changes: Arizona, Arkansas, Colorado, Florida, Georgia, Indiana, Louisiana, Montana, New Mexico, North Carolina, Virginia and Wyoming. See Table 4 in Appendix 2.

[25] The resources available to evaluate and count provisional ballots within a tight schedule may not be easily available. The General Accounting Office reports that Detroit, where 1,350 provisional ballots were cast and 123 counted, found the 6-day time frame for processing provisional ballots "very challenging and unrealistic. To overcome this challenge, the *entire department's employees were mobilized to process provisional ballots.*" The report also found that in Los Angeles County, "staff had to prepare duplicate ballots to remove ineligible or invalid contests when

- Lack of uniform rules for counting ballots and effective training of the election officials in interpreting and applying those rules to determine the validity of ballots. Colorado, New Mexico, North Carolina, and Washington have all passed legislation focused on improving the efficacy and consistency of the voting and counting process.

Litigation

Successful legal challenges to the process highlight areas where provisional voting procedures were wanting. A flurry of litigation occurred around the country in October 2004 concerning the so-called "wrong precinct issue" – whether provisional ballots cast by voters in a precinct other than their designated one would be counted for statewide races. These lawsuits were largely unsuccessful in their stated goal: most courts, including the U.S. Court of Appeals for the Sixth Circuit (the only federal appeals court to rule on the issue), rejected the contention that HAVA requires the counting of these wrong-precinct provisional ballots.

This litigation was significant nonetheless.

- First, the Sixth Circuit decision established the precedent that voters have the right to sue in federal court to remedy violations of HAVA.
- Second –and significantly– the litigation clarified the right of voters to receive provisional ballots, even though the election officials were certain they would not be counted. The decision also defined an ancillary right –the right to be directed to the correct precinct. There voters could cast a regular ballot that would be counted. If they insisted on casting a provisional ballot in the wrong precinct, they would be on notice that it would be a symbolic gesture only.
- Third, these lawsuits prompted election officials to take better care in instructing precinct officials on how to notify voters about the need to go to the correct precinct in order to cast a countable ballot – although the litigation regrettably came too late to be truly effective in this regard. In many states, on Election Day 2004, the procedures in place for notifying voters about where to go were less than ideal, reflecting less-than-ideal procedures for training poll workers on this point.

There was also pre-election litigation over the question whether voters who had requested an absentee ballot were entitled to cast a provisional ballot. In both cases (one in Colorado and one, decided on Election Day, in Ohio), the federal courts ruled that HAVA requires that these voters receive a provisional ballot. Afterwards, it is for state officials under state law to determine whether these provisional ballots will be counted, in part by determining if these provisional voters already had voted by absentee ballot (in which case one ballot should be ruled ineligible, in order to avoid double voting). These decisions confirm the basic premise that provisional ballots should be available whenever voters believe they are entitled to them, so that their preferences can be recorded, with a subsequent determination whether these preferences count as valid votes.

---

voters cast their ballots at the wrong precinct. To overcome this challenge, staffing was increased to prepare the duplicate ballots." In a close, contested election, "duplicate" ballots would doubtless receive long and careful scrutiny." See Appendix 7, GAO, "Views of Selected Local Election Officials on Managing Voter Registration and Ensuring Eligible Citizens Can Vote," September 2005. (GAO Report-05-997)

RECOMMENDATIONS

Because every provisional ballot counted represents a voter who, if the system had worked perfectly, should have voted by regular ballot, the advent of statewide registration databases is likely to reduce the use provisional ballots. The one area in which such databases may not make a difference is for those who voted by provisional ballot because they did not bring required identification documents to the polling place. The statewide voter registration database will facilitate verifying that ballot, but the voter will still have to vote provisionally. Beyond that exception, even with statewide registries in every state, provisional voting will remain an important failsafe, and voters should have confidence that the failsafe will operate correctly.

The wide variation in the implementation of provisional voting among and particularly within states suggests that EAC can help states strengthen their processes. Research-based recommendations for best, or at least better, practices based on the experience gained in the 2004 election can be useful in states' efforts to achieve greater consistency in the administration of provisional voting.

Recommendations for Best Practices

Recent legislative activity shows that state efforts to improve the provisional voting process are underway. Those states, as well as others that have not yet begun to correct shortcomings that became apparent in 2004, can benefit from considering the best practices described here. By recommending best practices, the EAC will offer informed advice while respecting diversity among the states. One way to strengthen the recommendations and build a constituency for them would be for EAC to ask its advisory committee members to recommend as best practices procedures that have worked in their states.

Self-evaluation of Provisional Voting –4 Key Questions

The first step to achieving greater consistency within each state is to think about provisional voting systematically. As legislators, election officials, and citizens in the states prepare for the 2006 election, they should ask themselves these questions about their provisional voting systems.

1. Does the provisional voting system distribute, collect, record, and tally provisional ballots with sufficient accuracy to be seen as procedurally legitimate by both supporters and opponents of the winning candidate? Does the tally include all votes cast by properly registered voters who correctly completed the steps required?
2. Is the provisional voting system sufficiently robust to perform well under the pressure of a close election when ballot evaluation will be under scrutiny and litigation looms?
3. Do the procedural requirements of the system permit cost-efficient operation? Are the administrative demands of the system reasonably related to the staff and other resource requirements available?
4. How great is the variation in the use of provisional voting in counties or equivalent levels of voting jurisdiction within the state? Is the variation great enough to cause concern that the system may not be administered uniformly across the state?

If the answers to these questions leave room for doubt about the effectiveness of the system or some of its parts, the EAC's recommendation of best practices should provide the starting point for a state's effort to improve its provisional voting system.

Best Practices For Each Step In The Process

We examined each step of the provisional voting process to identify specific areas where the states should focus their attention to reduce the inconsistencies noted in our analysis. We offer recommendations in each area appropriate to the responsibilities that HAVA assigns the EAC for the proper functioning of the provisional voting process.

The Importance of Clarity

The EAC should emphasize above all else the importance of clarity in the rules governing every stage of provisional voting. As the Century Foundation's recent report observed, "Close elections increasingly may be settled in part by the evaluating and counting of provisional ballots. . . To avoid post election disputes over provisional ballots—disputes that will diminish public confidence in the accuracy and legitimacy of the result– well in advance of the election, states should establish, announce, and publicize clear statewide standards for every aspect of the provisional ballot process, from who is entitled to receive a provisional ballot to which ones are counted."[26]

Litigation surrounding the 2004 election resulted in decisions that, if reflected in state statutes or regulations and disseminated in effective training for poll workers, can increase the clarity of provisional ballot procedures, increase predictability, and bolster confidence in the system. By taking the following steps, states can incorporate those court rulings into their procedures.

- Promulgate, ideally by legislation, clear standards for evaluating provisional ballots, and provide training for the officials who will apply those standards. For example, in Washington State, the court determined that an election official's failure in evaluating ballots to do a complete check against all signature records is an error serious enough to warrant re-canvassing.[27] Clear direction by regulation or statute on what records to use in evaluating ballots could have saved precious time and effort and increased the reliability of the provisional voting system.
- States should provide standard information resources for the training of poll workers by local jurisdictions. Training materials might include, for example, maps or databases with instruction on how to locate polling places for potential voters who show up at the wrong place. Usable and useful information in the hands of poll workers can protect voters from being penalized by ministerial errors at the polling place.[28]
- State training materials provided to local jurisdictions should make clear that the only permissible requirement to obtain a provisional ballot is an affirmation that the voter is registered in the jurisdiction and eligible to vote in an election for federal office. [29] Recent legislation in Arizona indicates that recommendations should emphasize HAVA's requirement that persons appearing at the polling place claiming to be registered voters cannot be denied a ballot because they do not have identification with them. Poll

[28] See *Panio v. Sunderland* 824 N.E.2d 488, 490 (NY, 2005) See also Order, *Hawkins v. Blunt*, No.04-4177-CV-C-RED (W.D. Mo. October 12, 2004). While rejecting the notion that all ballots cast in the wrong precinct should be counted, the court ruled that provisional votes cast in the wrong precinct should be thrown out provided that the voter had been directed to the correct precinct. This meant that provisional votes cast in the wrong precinct (and even the wrong polling place) would count if there were no evidence that the voter had been directed to a different polling place. The court placed a duty upon election officials to make sure the voters were in the correct locations. Note that this question would not arise in a state that counted ballots cast in the wrong polling place but within the correct county.

[29] *Sandusky County Democratic Party v. Blackwell,* 387 F.3d 565, 774 (6th Cir. 2004)

workers may need appropriate training to understand their duty to give such voters a provisional ballot. [30]

A. Registration and Pre-Election Information for Voters

Providing crisp, clear information to voters before the election is important to the success of the provisional voting process. The better voters understand their rights and obligations, the easier the system will be to manage, and the more legitimate the appearance of the process. States can begin by assessing the utility and clarity of the information for voters on their websites and by considering what information might be added to sample ballots mailed to voters before elections. Best practices in this area would include:

1. If states require identification at the time of registration, the kind of IDs required should be stated precisely and clearly and be publicly and widely available in a form that all voters can understand. For example, "You must bring your driver's license. If you don't have a driver's license, then you must bring an ID card with your photograph on it and this ID card must be issued by a government agency. " [31]
2. The process to re-enfranchise felons should be clear and straightforward. To avoid litigation over the registration status of felons, best practice should be defined as making re-enfranchisement automatic, or no more burdensome than the process required for any new registrant.[32]
3. State or county websites for voters should offer full, clear information on boundaries of precincts, location of polling places, requirements for identification, and other necessary guidance that will facilitate registration and the casting of a regular ballot. An 800 number should also be provided. Models are available: the statewide databases in Florida and Michigan provide voters with provisional voting information, registration verification and precinct location information.

B. At the Polling Place

Avoiding error at the polling place will allow more voters to cast a regular ballot and all others who request it to cast a provisional ballot.

1. The layout and staffing of the polling place, particularly the multi-precinct polling place is important. Greeters, maps, and prominently posted voter information about provisional ballots, ID requirements, and related topics can help the potential voters cast their ballot in the right place. States should require poll workers to be familiar with the options and provide the resources needed for them to achieve the knowledge needed to be helpful and effective. Colorado has clear regulations on polling place requirements, including HAVA information and voting demonstration display.[33] Many states require training of poll workers. In some states that requirement is recent: after the 2004 election, New Mexico adopted a requirement for poll workers to attend an "election school." [34] A state

---

[30] *The Florida Democratic Party v. Hood*, 342 F. Supp. 2d 1073, 1075-76 (N.D. Fla. 2004). The court explained that provisional voting is designed to correct the situation that occurs when election officials do not have perfect knowledge and when they make incorrect determinations about eligibility (the "fail-safe" notion). Denying voters provisional ballots because of on-the-spot determinations directly contradicts this idea. Even before the cited decision, the Florida Secretary of State's office had determined that any voter who makes the declaration required by federal law is entitled to vote a provisional ballot, even if the voter is in the wrong precinct.

[31] Websites in 29 states describe, with varying degrees of specificity, the identification voters may need. In 18 states voters can learn something about the precinct in which they should vote. And in 6 states (California, District of Columbia, Kentucky, Michigan, North Carolina, and South Carolina) they can verify their registration on the website.

[32] The Century Foundation, op. cit.

[33] 8 Colo. Code Regs. § 1505-1, Rule 7.1.

[34] 2005 N.M. Laws 270 page no. 4-5.

statutory requirement for training could facilitate uniform instruction of poll workers in those states that do not already provide it.

2. The provisional ballot should be of a design or color sufficiently different from a regular ballot to avoid confusion over counting, as occurred in Washington State. The ballot might include a tear-off leaflet with information for voters such as: "Reasons Why Your Provisional Ballot Might Not Be Counted" on one side and "What to Do if My Provisional Ballot Is Not Counted" on the other.
3. Because provisional ballots offer a fail-safe, supplies of the ballots at each polling place should be sufficient for all the potential voters likely to need them. In 2004, some polling places ran out of ballots, with unknown effects on the opportunity to vote. In Middlesex County, New Jersey, for example, on Election Day the Superior Court ordered the county clerk to assure that sufficient provisional ballots were available at several heavily used polling places, and it authorized the clerk "in the event additional provisional ballots are required . . .to photocopy official provisional ballots." [35] At least two states, Connecticut and Delaware, provide guidelines to local election officials on how to estimate the demand for provisional ballots. Connecticut sets the number at 1% of the voters in the district, Delaware at 6%.[36] States that do not offer a practical method to guide the supply of provisional ballots at polling places should consider doing so. The guideline should take into account both the number of voters in the district and the number of provisional ballots actually cast in recent elections.
4. To achieve the procedural clarity needed to forestall disputes, states should establish a clear chain of custody for the handling of provisional ballots from production through distribution, collection and, finally, evaluation. A number of states have clear procedures for at least parts of this chain of custody. All states should examine their chain-of-custody requirements for clarity. Illinois includes the potentially beneficial requirement that ballots be transported by bi-partisan teams, which offers the potential to avoid some charges of election fraud.

C. Evaluating Voter Eligibility and Counting Provisional Ballots

The clarity of criteria for evaluating voter eligibility is critical to a sound process for deciding which of the cast provisional ballots should be counted. Public recognition of the validity of those criteria is important to establishing the legitimacy of the system as a whole. The experience in 2004 in North Carolina, Washington, and Ohio underlines the importance of clear criteria. As the Century Foundation report put it, "Whatever procedures the states choose [to determine if a provisional ballot should be counted], the paramount consideration—as with all others concerning provisional voting—is that they be clear and thus not susceptible to post-election manipulation and litigation."[37] Nonetheless, the *Panio v. Sutherland*[38] decision in New York shows the difficulty of defining the range of administrative errors from which the provisional voters should be held harmless. Even when the standard is "clerical error" judges can differ over what that means exactly. Possibly a state law might be able to clarify a definition by giving examples of clerical errors, but even then the definition is unlikely to be perfect.

---

[35] Voting Order, November 2, 2004, Superior Court of New Jersey, Law Division, Middlesex County.

[36] Connecticut: "Equal to or not less than 1% of the number of electors who are eligible to vote in any given district, or such other number as the municipal clerk and the registrars agree is sufficient to protect voting rights. Conn. Gen. Stat. Ann. § 9-232j.Delaware: Each County Department of Elections Office is required to provide to each election district a number of provisional ballots equal to 6% of registered voters in that district, with a minimum allocation of 15 ballots. Additional supplies to be delivered when the supply becomes "very low." Del.Code Ann. Tit 15 § 4948(e).

[37] The Century Foundation, op. cit.

[38] 4 N.Y.3d 123, 824 N.E.2d 488 (N.Y. 2005) and Memorandum (LaPlante—Foley) Provisional Ballot Cases by State, July 19, 2005.

1. State statutes or regulations should define a reasonable period for voters who lack the HAVA-specified ID or other information bearing on their eligibility to provide it in order to facilitate the state's ability to verify that the person casting the provisional ballot is the same one who registered. While there may be a concern to ensure that the individual who returns with the ID may not be the same individual who cast the provisional ballot, the spirit of HAVA demands that the opportunity to prove identity be provided after Election Day. A signature match can go far in establishing that the individual who voted and the individual returning later with identification is, in fact, the same person. Encouraging a voter who lacks ID on Election Day to return later to help the verification process by providing proper identification will strengthen the system and increase public confidence in the electoral process. Our data indicate that some voters would prefer to return with ID rather than to sign an affidavit, perhaps because of uncertainty about the legal process involved in the affidavit. At least 11 states allow voters to provide ID or other information one to 13 days after voting. Of particular interest is Kansas, which allows voters to proffer their ID by electronic means or by mail, as well as in person.[39]
2. More provisional ballots are counted in those states that verify ballots cast outside the correct precinct. [40] While HAVA arguably leaves this decision up to the states, pointing out the effect of the narrower definition on the portion of ballots counted could be useful to the states in deciding this question. States should be aware, however, of the additional burden placed on the ballot-evaluation process when out-of-precinct ballots are considered. And tradeoffs are involved if out-of-precinct voters are unable to vote for the local offices that might appear on the ballot in their district of residence. One option for states is to involve the voters in the decision by pointing out that voters who cast their provisional ballots in the wrong precinct may not be able to participate in the local election. The voter could then decide to go to the correct precinct or vote provisionally for the higher offices at the top of the ticket only.
3. Alternatively, if a state chooses to require voters to appear at their assigned precinct, where the same polling site serves more than one precinct, a voter's provisional ballot should count so long as the voter cast that ballot at the correct polling site even if at the wrong precinct within that location. [41] Ideally the voter could be directed to the correct machine, but poll worker advice will not always be correct. One way to assess the balance of issues here is to consider that, if a voter in a multi-precinct polling place is sent to the wrong machine, the error is probably the poll worker's, and the voter should not be penalized.

---

[39] In Kansas, the voter can provide ID to a County Election Officer any time before the County Board of Canvassers meets to count provisional ballots. KS. ST. 25-1122(d). ID can be presented in person, OR via mail or electronic means. *Id.* The Board must meet either on the Friday or Monday following a Tuesday election. *Id.* at 25-3104. Deadlines in other states are: Alabama – 5:00 P.M. on the Monday following the election AL ST § 17-10A-2(c)_(1) Florida: until 5:00 P.M. on the third day following the election . Fla. Stat. Ann. § 101.048 (adopted after the 2004 election);Georgia—no later than 2 days after the election. GA ST § 21-2-417; 419. Illinois- 2 days to submit additional information 10 Ill. Comp. Stat. Ann. 5/18A-15(d); Indiana— in 2004 the deadline was the close of the polls IN. ST. §. 3-11.7-5-2(a). The time period was extended to 13 days by the adoption of Indiana Code 3-11-8, Section 25, Subsection (l); Maryland—until the meeting of the Election Board; MD ELEC LAW § 11-303. New Jersey— until the close of business on the second day after the election 19:53C-3(i). Nevada— until 5:00 P.M. on the Friday following the election NV ST 293.3085; New Mexico—until 7:00 P.M. on Election Day NM ADC 1.10.22 (8) (H).

[40] See Andersen, op. cit, pgs. 23 – 24 for an analysis of the significant effect of counting out-of-precinct ballots. The Election Day Survey found that, "Most notably, jurisdictions that permitted jurisdiction-wide acceptance of provisional ballots reported higher rates of provisional ballots being cast, but also reported a much higher incidence of provisional ballots being counted, than other jurisdictions."

[41] Chances are administrative error accounts for the voter being directed to the wrong precinct under these circumstances.

4. Officials should follow a written procedure, and perhaps a checklist, to identify the reason why a provisional ballot is rejected (e.g., check the applicable box "unregistered voter"; "lack of signature match" "wrong precinct," etc.) Those forms should be disclosed publicly when completed. Colorado's election rules offer particularly clear guidance to the official evaluating a provisional ballot.[42]

Colorado Rejection Codes (Any ballot given a rejection code shall not be counted):

RFS	(Rejection federal or state) No federal or state candidates or issues to duplicate.
RNS	(Rejection not signed) Provisional Ballot Affidavit not signed.
RIN	(Rejection incomplete information provided) Required information is incomplete and the designated election official is unable to confirm voter's eligibility.
RNR	(Rejection not registered) Voter did not register by the voter registration deadline or by emergency registration, Colorado voter registration record was not found, or voter was previously cancelled and has not been reinstated pursuant to 1-2-605(10). C.R.S.
REE	(Rejection envelope empty) Provisional ballot envelope is empty.
RAB	(Rejection voter voted absentee) Designated election official has confirmed that voter voted an absentee ballot.
REV	(Rejection based on ballot cast in early voting) Voter voted early.
RIP	(Rejection based on incorrect party) Incorrect Party in Primary Election.
RFE	(Rejection felon not eligible to vote) Individual was convicted of a felony and is either serving a sentence of confinement or detention or is on parole.
RWC	(Rejection elector not registered in county or State of Colorado) Non-county or non-state resident; therefore voter not eligible to vote in the county where the provisional ballot was voted.
RID	(Rejection first time voter has not supplied identification upon registration or thereafter prior to and during time voter voted) First Time Voter who registered by mail or through a voter registration drive, is tagged as id deficient, and did not provide id at the time of voting.
RRD	(Rejection registration deficient) Voter had deficient or incomplete registration and required information was not provided prior to or at the time of filling in the provisional ballot envelope. Voter's eligibility cannot be established.

D. Verification of Provisional Ballots

1. States that use the information on the provisional ballot to permit voters who have changed their addresses to update their registrations should adopt clear procedures on that process and specify how the new information will be communicated between different Boards of Elections.
2. In verifying provisional ballots, the time by which election officials must make their eligibility determinations is particularly important in presidential elections because of the need to certify electors to the Electoral College. States should consider in particular how to divide the time constraints imposed in presidential election by the safe-harbor provisions regarding certification to the Electoral College. Some part of this five-week period will be consumed by the eligibility evaluation, but states should take care to provide a sufficient period of time as well for challenges. If a state consumes 21 days

---

[42] 8 CCR 1505-1, at 26.5.4, adopted august 4, 2005. See also 1-2-509(3) C.R.S.

following the election in the eligibility evaluations, only two weeks will remain for legal challenges to be concluded. Is that sufficient? Or should the state provide the resources needed to complete the eligibility determinations in 10 days or two weeks, leaving three weeks or more for legal challenges in a close election? Our research did not identify an optimum division of the five weeks available. The prudent course here would be to encourage states to consider the issue and then make a careful decision about how to complete all steps in the evaluation of ballots and challenges to those determinations within the five weeks available.

E. Post-election Information for Voters

Timely information to voters about the disposition of their provisional ballot will provide helpful feedback and more important enable voters to determine if they are registered for future elections and, if not, what they need to do to become registered.

1. Establish mechanisms to ensure that voters casting provisional ballots are informed whether they are now registered for future elections and, if not, what they need to do to become registered.

F. State Laws Governing Litigation over Provisional Voting

1. Establish special, streamlined litigation procedures for Election Day complaints that individuals are being denied the right to cast a provisional ballot.

Broader Considerations

G. Integrity and the Appearance of Integrity

1. State laws or regulations providing for non-partisan or bi-partisan bodies to make a public determination of the validity of provisional ballots would increase confidence in the system.
2. To improve transparency, state laws or regulations should require the purging process for registration to be public and with an opportunity for voters to correct an erroneous determination that they should be purged.
3. State laws or regulation should require the evaluation process for provisional ballots to be public, while protecting the names of those who voted provisionally.

H. Continuous Assessment of the Provisional Ballot – Process and Performance

Defining what makes for a successful provisional voting system is difficult. The most successful system is probably not the one with the most provisional votes cast (that could indicate problems with the registration system). Nor is the system with the greatest number counted or with the fewest counted necessarily superior because the evaluation process could be flawed.

Defining quality requires a broad perspective about how well the system works, how open it is to error recognition and correction, and how well provisional voting processes are connected to the registration and voter identification regimes. The EAC should consider engaging one of the national quality organizations or processes, such as Six Sigma[43] or the Baldridge Quality

---

[43] Six Sigma is a measure of quality that strives for near perfection. Six Sigma is a disciplined, data-driven approach and methodology for eliminating defects (driving towards six standard deviations between the mean and the nearest specification limit) in any process – from manufacturing to transactional and from product to service.

process [44] to evaluate the provisional ballot process. Pending such a review, the EAC can recommend that states take the following actions.

1. Recognize that the first step to improving quality is to see the provisional voting process as a system and take a systems approach to regular evaluation through standardized metrics with explicit goals for performance.
2. States should begin by collecting data systematically on the provisional voting process so that they can evaluate their voting system and assess changes from one election to the next. The effort should start in the 2006 election, and the data collected should include:
    -- Provisional votes cast and counted by jurisdiction, say counties, with details on why the voter had to vote provisionally (lack of ID, not on list, challenged at polling place, issued absentee ballot, etc) and number of ballots actually counted in each category.
    -- Reasons why provisional ballots were not counted, using categories such as those that have been adopted by Colorado, described earlier in this report.
    -- Measures of variance among jurisdictions.
    -- Number of poll workers trained in administration of provisional voting by polling place.
    -- Number of jurisdictions posting information on provisional voting in the polling place.
    -- Time required to evaluate ballots by jurisdiction.

Improving understanding of the provisional voting process through analysis of detailed information will enable state and local election officials to strengthen their systems. By collecting and analyzing this data states can identify which aspects of the registration and electoral system are most important in shunting voters into the provisional ballot process. Responsible officials can then look to their registration system, identification requirements or poll worker training as a way to reduce the need for voters to cast their ballots provisionally.

---

[44] The Baldrige Criteria for Performance Excellence provide a systems perspective for understanding performance management. They reflect validated, leading-edge management practices against which an organization can measure itself. With their acceptance nationally and internationally as the model for performance excellence, the Criteria represent a common language for communication among organizations for sharing best practices. The Criteria are also the basis for the Malcolm Baldrige National Quality Award process.

ATTACHMENT 1 – Data Sources for Classification of the States

Our research on provisional voting divided the various states into several categories to allow an assessment of how different factors may have influenced the process of casting and counting provisional ballots. This analysis was conducted before the release of the Election Day Study, and the categories we used may differ in some respects from its work. The variables used to analyze a state's use of provisional ballots were:

1. New vs. Old (states that used a provisional ballot before the 2004 election)
2. Use of a statewide database of registered voters vs. no use of a statewide database
3. Counting out-of-precinct ballots vs. not counting out-of-precinct ballots
4. Voter identification requirements
5. Method used to verify provisional ballots
6. Levels of provisional ballots cast and counted

We first assigned states within these categories based on classifications done by Electionline.org in its studies. The Electionline data was the only published information available at the time of our research. We reviewed the Electionline data carefully, and, in select cases, updated it with new, detailed information that had become available after its publication. The changes we made are explained below.

--Idaho, Maine, Minnesota, New Hampshire, Wisconsin and Wyoming were excluded from our analysis. They have election-day registration systems, and did not need to use HAVA-compliant provisional ballots.

--North Dakota does not register voters, so it also was excluded from HAVA requirements and did not use provisional voting.

--Mississippi has not reported its provisional voting results and could not be included in our analysis, though it was compliant in 2004.

--Pennsylvania did not report its totals for the Election Day Study, but we obtained information on Pennsylvania and included it in our analysis.

New vs. Old States

We classified states as "new" or "old" based on the 2001 Electionline study of provisional voting,[45] but condensed its classifications into a single dichotomous variable, new/old with all other cases excluded. The Electionline study divided states into five categories of their use of provisional ballots in the 2000 election:

1. Use of provisional ballots (P)
2. Limited use of provisional ballots (LP)
3. Affidavit ballots (A)
4. No system in place (N)
5. Unnecessary/Not Applicable (U/NA)

We included in the list of "Old States" all states listed as using provisional ballots, limited use of provisional ballots or affidavit ballots. States in all three categories would have been familiar with key aspects of provisional voting.. States that had no provisional voting system in place for the 2002 election, and were HAVA compliant in 2004, were listed as "new" states, as 2004 would have been the first year in which they would be offering the option of provisional voting. States that were listed as unnecessary or not applicable were excluded from this study, as they were exempt from the HAVA regulations in 2004 because they either allowed same-day registration or did not register voters.

---

[45] This study can be found at: http://electionline.org/Portals/1/Publications/Provisional%20Voting.pdf.

Rhode Island is the only state categorized as an old state by Electionline that we moved into the list of new states. Electionline's map shows Rhode Island as a state that used provisional voting in 2000, but in the state description, it is listed as having no system in place. We learned from the Rhode Island Board of Elections that the state had previously permitted potential voters to sign an affidavit if they did not appear on a precinct's list of registered voters, but felt they were registered to vote. Based on the signed affidavit, the election official would then contact a county official to see if the voter was on a more complete registration list. If the voter's name was on the complete list, that voter was permitted to cast a regular ballot. As this process did not grant the voter a provisional ballot, but served as a different type of administrative failsafe, we concluded that Rhode Island's first use of provisional voting was in 2004 and, therefore, classified the state as "new" to the system of provisional balloting.

Table 1
CATEGORIZATION OF STATES -- Old and New

Old States	**New States**	**HAVA Exempt or NA**
Alaska	Connecticut	Idaho
Alabama	Delaware	Maine
Arkansas	Georgia	Minnesota
California	Hawaii	New Hampshire

Statewide List of Registered Voters

The Electionline preview of the 2004 Election[46] was the starting point for compiling a list of states that had a statewide database of registered voters. That study listed 34 States that did not have their statewide database systems complete, and 16 that did, including the District of Columbia. North Dakota does not register voters, so does not need to compile such a database. Electionline's criterion for concluding that a state had a statewide list was that the state have participation from all jurisdictions in a statewide system. We added Oklahoma to the list of states with statewide databases because we found it had met the Electionline criteria by the 2004 election, albeit too late for inclusion in the Electionline survey.

Out-of-Precinct Ballots

We based our classification of states that allow the counting of ballots cast outside the correct precinct on the data in the 2004 Electionline preview of the 2004 election[2]. States that evaluated ballots cast in a precinct where the voter was not registered were categorized as "out-of-precinct." States that invalidated such ballots were categorized as "In-precinct only."

Table 2
CATEGORIZATION OF STATES -- Counting Out-Of-Precinct Ballots

Out-of-Precinct	In-Precinct Only	HAVA EXEMPT OR NA
Alaska	Alabama	Idaho
Arkansas	Arizona	Maine
California	Colorado	Mississippi

[46] "Election Preview 2004: What's changed, What Hasn't and Why". This study can be found at: http://electionline.org/Portals/1/Publications/Election.preview.2004.report.final.update.pdf

[47] In Illinois, it is not clear that all counties followed this procedure. Some counties may not have counted out-of-precinct ballots.

Verification Method

We identified four different ways states assessed provisional ballots to determine if they should be counted: signature match, match voter data, signed affidavits, and bringing back identification later. We gathered information about these verification techniques by checking state websites and consulting journalistic accounts. We consulted state legislation to provide further information where needed.

Table 3
CATEGORIZATION OF STATES -- Ballot Evaluation Methods

Signature Match	Data Match	Affidavit	Return with ID	NA
Alaska	Alabama	Connecticut	Indiana	Idaho
California	Arizona	Delaware	Iowa	Maine
Florida	Arkansas	Georgia	Kansas	Mississippi
Oregon	Colorado	Hawaii	Maryland	Minnesota
	DC	Illinois	Michigan	New Hampshire
	Louisiana	Kentucky	Montana	N. Carolina*
	Missouri	Massachusetts	New Jersey	N. Dakota
	Ohio	Nebraska	New Mexico	Wisconsin
	Oklahoma	Nevada	Texas	Wyoming

	Rhode Island	South Dakota		
	S. Carolina	Tennessee		
	Washington	Vermont		
	West Virginia	Virginia		
4	14	14	10	9

---

* North Carolina lacked clear standards to evaluate provisional ballots and is excluded from this analysis.

Data Collection

To assemble our data for analysis, we began by using the data on provisional votes cast and counted reported by Electionline. To increase the accuracy of this data, we surveyed each state's election websites for updated data, and for reported numbers on the county level. We then sent emails to 49 (we excluded Alaska, see below) states and the District of Columbia, requesting updated data on the number of provisional votes cast and counted by county. We received information from 25 states by our cut-off date of August 25, 2005.

Table 4
Updated information by State

Received Updated Data	**Did Not Receive Updated Data**
California	Alabama
District of Columbia	Alaska[48]
Florida	Arizona
Hawaii	Arkansas
Indiana	Colorado
Iowa	Connecticut
Kansas	Delaware
Louisiana	Georgia
Maryland[49]	Idaho
Missouri	Illinois
Montana	Kentucky
Nebraska[50]	Maine
Nevada	Massachusetts
New Jersey	Michigan
New Mexico	Minnesota
Ohio	Mississippi
Oklahoma	New Hampshire
Oregon	New York
Pennsylvania	North Carolina
Rhode Island	North Dakota
South Dakota	South Carolina
Tennessee	Utah
Texas	Vermont
Virginia	Wisconsin
Washington	Wyoming
West Virginia	
26 States	**25 States**

---

[48] Alaska was not contacted via email, as the state does not have voting districts comparable to counties in other states and could not be matched with comparable census data.

[49] Maryland reported provisional ballots that were counted per county, but not number cast.

[50] Nebraska reported an incomplete list of provisional ballots cast and counted by county, but designated counties by number, rather than by name.

Data Differences

The data used in this study differ from the data reported in the Election Day Study for 19 states. The Election Day Study was not completed until well after our statistical analysis of provisional voting was finished. Where there are differences, they are typically very small, usually fewer than 100 votes either cast or counted. Of the 9 states that have differences of more than 100 votes cast or counted, 7 have reported their numbers directly to us and can be considered updated data that EDS had not obtained. For one of those states, New Mexico, EDS had incomplete data, and for another, Pennsylvania, EDS had no data at all. The data that we have collected reflects updated numbers from the states that have changed following recounts and litigation that altered how ballots were evaluated.

Table 5
Data Differences with the Election Day Study

State	EDS Numbers Cast/Counted	Our Numbers Cast/Counted	Differences	Updated Info from State?[51]
Alabama	6,478/1,865	6560/1836	82/29	No
Alaska	23,285/22,498	23,275/22,498	10/0	No
Colorado	51,529/39,086	51,477/39,163	52/77	No
Georgia	12,893/4,489	12,893/3,839	0/650	No
Hawaii	346/25	348/25	2/0	Yes
Iowa	15,406/8,038	15,454/8,048	48/10	Yes
Kansas	45,535/32,079	45,563/31,805	28/274	Yes
Montana	688/378	653/357	35/21	Yes
Nebraska	17,421/13,788	17,003/13,298	418/490	Yes
Nevada	6,153/2,446	6,154/2,447	1/1	Yes
New Mexico	6,410/2,914	15,360/8,767	8,950/5,853	Yes
N. Carolina	77,469/50,370	77,469/42,348	0/8,022	No
Ohio	157,714/123,902	158,642/123,548	928/354	Yes
Pennsylvania	No data	53,698/26,092	53,698/26,092	Yes
Texas	35,282/7,156	36,193/7,770	911/614	Yes
Vermont	121/30	101/37	20/7	No
Virginia	4,608/728	4,609/728	1/0	Yes
Washington	92,402/73,806	86,239/69,273	6,163/4,533	Yes
Wisconsin	374/119	373/120	1/1	No

---

[51] Data not provided by the state itself is taken from Electionline figures.

Subject Re: Final Reports

Many thanks, John.

I have just completed the draft of a letter which addresses all of the matters pertaining to the close-out of the contract.

Look for the letter from Tom Wilkey in the next day or so.

Thanks to everyone for all of their hard work and perseverance over the last year or so.

Regards-

Karen Lynn-Dyson

Subject Final Reports

Karen - We are FedExing our final reports and other deliverables to the EAC this afternoon so you should receive them tomorrow or Monday at the latest. I am attaching the accompanying cover letter from Ruth Mandel. We will look forward to any comments, questions and other thoughts or reactions from the Commissioners and staff. While I am sure we will continue to be in touch over the next weeks and months, I do want to thank you for all your comments, coordination and general assistance.

- John

Deliberative Process Privilege

June 29, 2006

Thomas R. Wilkey, Executive Director
United States Election Assistance Commission
1225 New York Avenue N.W., Suite – 1100
Washington, DC 20005

Dear Mr. Wilkey:

We are sending you today the final report on Provisional Voting and the final draft report on Voter Identification issues. With this submission, we have completed the work required under the contract, which ends this week.

The Provisional Voting report is the same as presented to the Commission's advisory boards, with a brief addition on the effect of the National Voting Rights Act's fail-safe provisions on the states' experience with provisional voting. This addition was suggested during the meetings of the advisory boards. The report is now complete and ready to serve as the basis for guidance or recommendations that the Commission may decide to provide the states on provisional voting.

As you know, the EAC has not yet presented to its advisory boards the final draft Voter ID report we submitted in May. We would be happy to discuss with the Commission ways to reactivate the contract to enable us to present this report to these boards and, if necessary, make revisions so that it, too, can be in the final form that would allow it to serve as a basis for recommendations to the states.

Included with each report are the other deliverables specified by the contract.

We have enjoyed the opportunity to work with the EAC on this research project. Both Rutgers and Ohio State will continue to study these matters, just as we did before undertaking this project. Scholars at both institutions are incorporating the research techniques and findings into their continuing research endeavors.

Rutgers and Ohio State look forward to coordinating a public release of the two reports with the EAC. We anticipate considerable interest among scholars at other universities in the analysis and information contained in the reports, and look forward to seeing others use and build on these reports and their supporting materials to enhance understanding of these important public policies.

Of course, we hope that our ongoing scholarship will continue to be of value to the Commission and that we may have further opportunities to work with the Commission on other projects to improve the functioning of our nation's electoral processes.

Sincerely,

Ruth B. Mandel, Principal Investigator
Director, Eagleton Institute of Politics
Board of Governors Professor of Politics

Subject Voter ID Report and Appendices

Karen,

Attached for review by the Commissioners is the Voter ID Report and its appendices. The appendices are lengthy, but I believe Appendix A should be included in the report sent to the Advisory Boards for review.

Thanks for your forbearance.

Tom O'Neill

Appendices517.doc VoterIDReport05170910.doc

e. Compendium of states' legislation, procedures, and litigation (available as an electronic document)

Appendix A
Summary of Voter Identification Requirements By State

Prepared by
Sara A. Sampson, Reference Librarian,
The Ohio State University Moritz College of Law.

Voter ID Requirements

State	Forms of ID Required 2004	Statutory Language	Statutory Citation
Alabama	Provide ID	(b) Each elector shall provide identification to an appropriate election official prior to voting. A voter required to show identification when voting in person shall present to the appropriate election official either of the following forms of identification: (1) A current valid photo identification. (2) A copy of a current utility bill, bank statement, government check, paycheck, or other government document that shows the name and address of the voter. The term "other government document" may include, but is not limited to, any of the following: a. A valid identification card issued by a branch, department, agency, or entity of the State of Alabama, any other state, or the United States authorized by law to issue personal identification. b. A valid United States passport. c. A valid Alabama hunting or fishing license. d. A valid Alabama permit to carry a pistol or revolver. e. A valid pilot's license issued by the Federal Aviation Administration or other authorized agency of the United States. f. A valid United States military identification card. g. A certified copy of the elector's birth certificate. h. A valid Social Security card. i. Certified naturalization documentation. j. A certified copy of court records showing adoption or name change. k. A valid Medicaid card, Medicare card, or an Electronic Benefits Transfer Card (formerly referred to as a "food stamp card"). (c) For voters required to show identification when voting by mail, the voter shall submit with the ballot a copy of one of the forms of identification listed in subsection (b). (e) An individual required to present identification in accordance with this section who is unable to meet the identification requirements of this section shall be permitted to vote by a challenged or provisional ballot, as provided for by law. (f) In addition, an individual who does not have identification in his or her possession at the polls shall be permitted to vote if the individual is positively identified by two election officials as a voter on the poll list who is eligible to vote and the election official signs the voters list by where the voter signs. Effective Date: June 24, 2003	Ala. Code § 17-11A-1
Alaska	Provide ID	(a) Before being allowed to vote, each voter shall exhibit to an election official one form of identification, including (1) an official voter registration card, driver's license, state identification card, current and valid photo identification, birth certificate, passport, or hunting or fishing license; or (2) an original or a copy of a current utility bill, bank statement, paycheck, government check, or other government document; an item exhibited under this	Alaska Stat. § 15.15.225

		paragraph must show the name and current address of the voter. (b) An election official may waive the identification requirement if the election official knows the identity of the voter. The identification requirement may not be waived for voters who are first-time voters who initially registered by mail or by facsimile or other electronic transmission approved by the director under AS 15.07.050, and did not provide identification as required in AS 15.07.060. (c) A voter who cannot exhibit a required form of identification shall be allowed to vote a questioned ballot. effective June 17, 2003	
Arizona	Provide ID	B. If a statewide voter registration database is not yet operational, for any person who has registered to vote by mail for the first time in this state after January 1, 2003 or who is reregistering by mail after January 1, 2003 after moving from one county to another county in this state, the person shall comply with the following in order to be issued a ballot: 1. The person shall present either one of the following: (a) A current form of identification that bears a photograph of the person and the name of the person. (b) A current utility bill, bank statement, paycheck, government issued check or other government document that shows the name and registration address of the person. 2. If the person does not present a document that complies with paragraph 1, the person is only eligible to vote a provisional ballot as prescribed by § 16-584. Effective Dec. 1, 2003	Ariz. Rev. Stat. Ann. § 16-579
Arkansas	Provide ID	7-5-305. Requirements. (a) Before a person is permitted to vote, the election official shall: (1) Request the voter to identify himself in order to verify the existence of his name on the precinct voter registration list; (2) Request the voter, in the presence of the election official, to state his address and state or confirm his date of birth; (3) Determine that the voter's date of birth and address are the same as those on the precinct voter registration list; (4) If the date of birth given by the voter is not the same as that on the precinct voter registration list, request the voter to provide identification as the election official deems appropriate; (5)(A) If the voter's address is not the same as that on the precinct voter registration list, verify with the county clerk that the address is within the precinct. (B) If the address is within the precinct, request the voter to complete a voter registration application form for the purpose of updating county voter registration record files. (C) If the address is not within the precinct, instruct the voter to contact the county clerk's office to determine the proper precinct; (6) If the voter's name is not the same as that on the precinct voter registration list, request the voter to complete a voter registration application form for purposes of updating county voter registration record files; (7) Request the voter, in the presence of the election official, to sign his name, including his given name, his middle name or initial, if any, and his last name in the space provided on the precinct voter registration list. If a person is unable to sign his signature or make his mark or cross, the election official shall enter his initials and the voter's date of birth in the space for the person's signature on the precinct voter registration list; and	Arkansas Code Annotated § 7-5-305

		(8)(A) Request the voter for purposes of identification to provide a valid driver's license, photo identification card issued by a governmental agency, voter card, social security card, birth certificate, United States passport, employee identification card issued by a governmental agency containing a photograph, employee identification card issued in the normal course of business of the employer, student identification card, Arkansas hunting license, or United States military identification card. (B)(i) If a voter is unable to provide this identification, the election official shall indicate on the precinct voter registration list that the voter did not provide identification. (ii) Following each election, the county board of election commissioners may review the precinct voter registration lists and may provide the information of the voters not providing identification at the polls to the prosecuting attorney. (iii) The prosecuting attorney may investigate possible voter fraud; and (9) Follow the procedures under §§ 7-5-310, 7-5-311, and 7-5-523, if the preson is a disabled voter and presents himself or herself to vote. Effective: July 16, 2003	
California	Sign Name	Any person desiring to vote shall announce his or her name and address in an audible tone of voice, and when one of the precinct officers finds the name in the index, the officer shall in a like manner repeat the name and address. The voter shall then write his or her name and residence address or, if the voter is unable to write, shall have the name and residence address written by another person on a roster of voters provided for that purpose, whereupon a challenge may be interposed as provided in this article. (Enacted in 1994, no amendments since)	Cal. Elec. Code § 14216
Colorado	Provide ID	(1) Except as provided in subsection (4) of this section, any eligible elector desiring to vote shall show his or her identification as defined in section 1-1-104(19.5), write his or her name and address on the signature card, and give the signature card to one of the election judges, * * * (4) An eligible elector who is unable to produce identification may cast a provisional ballot in accordance with article 8.5 of this title. (19.5)(a) "Identification" means: (I) A valid Colorado driver's license; (II) A valid identification card issued by the department of revenue in accordance with the requirements of part 3 of article 2 of title 42, C.R.S.; (III) A valid United States passport; (IV) A valid employee identification card with a photograph of the eligible elector issued by any branch, department, agency, or entity of the United States government or of this state, or by any county, municipality, board, authority, or other political subdivision of this state; (V) A valid pilot's license issued by the federal aviation administration or other authorized agency of the United States; (VI) A valid United States military identification card with a photograph of the eligible elector; (VII) A copy of a current utility bill, bank statement, government check, paycheck, or other government document that shows the name and address of the elector; (VIII) A valid medicare or medicaid card issued by the United States health care	Colo. Rev. Stat. Ann. § 1-7-110; Colo. Rev. Stat. Ann. § 1-1-104

		financing administration; (IX) A certified copy of a birth certificate for the elector issued in the United States; or (X) Certified documentation of naturalization. (b) Any form of identification indicated in paragraph (a) of this subsection (19.5) that shows the address of the eligible elector shall be considered identification only if the address is in the state of Colorado. Effective 5/28/2004	
Connecticut	Provide ID	(a) In each primary, election or referendum, when an elector has entered the polling place, the elector shall announce the elector's street address, if any, and the elector's name to the checkers in a tone sufficiently loud and clear as to enable all the election officials present to hear the same. Each elector who registered to vote by mail for the first time on or after January 1, 2003, and has a "mark" next to the elector's name on the official registry list, as required by section 9-23r, shall present to the checkers, before the elector votes, either a current and valid photo identification that shows the elector's name and address or a copy of a current utility bill, bank statement, government check, paycheck or other government document that shows the name and address of the elector. Each other elector shall (1) present to the checkers the elector's Social Security card or any other preprinted form of identification which shows the elector's name and either the elector's address, signature or photograph, or (2) on a form prescribed by the Secretary of the State, write the elector's residential address and date of birth, print the elector's name and sign a statement under penalty of false statement that the elector is the elector whose name appears on the official checklist. Such form shall clearly state the penalty of false statement. A separate such form shall be used for each elector. If the elector presents a preprinted form of identification under subdivision (1) of this subsection, the checkers shall check the name of such elector on the official checklist. If the elector completes the form under subdivision (2) of this subsection, the assistant registrar of voters shall examine the information on such form and either instruct the checkers to check the name of such elector on the official checklist or notify the elector that the form is incomplete or inaccurate. Effective May 10., 2004	Conn. Gen. Stat. Ann. § 9-261
Delaware	Provide ID	(a) A voter, upon entering the room where an election is being held, shall announce his or her name and address and provide proof of identity, whereupon the clerks shall place a mark or make a notation of his or her name upon the election district record. In the event the voter does not have proof of identity with them, he or she shall sign an affidavit of affirmation that he or she is the person listed on the election district record. Effective: July 9, 2002	15 Del. Code § 4937
D.C.	Sign Name	(i)(1) A person shall be entitled to vote in an election in the District of Columbia if he or she is a duly registered voter. A qualified elector shall be considered duly registered in the District if he or she has met the requirements for voter registration and, on the day of the election, either resides at the address listed on the Board's records or files an election day change of address pursuant to this subsection. (2) Each registered voter who changes his or her place of residence from that listed on the Board's records shall notify the Board, in writing, of the new residence address. A change of address shall be effective on the date the notification was mailed as shown by the United States Postal Service postmark. If not postmarked, the notification shall be effective on the date of receipt by the Board. Change of address notifications from registrants shall be accepted pursuant to subsection (g) of this section, except that any registrant who has not notified the Board of his or her current residence address by the deadline established by subsection (g) of this section may be permitted to vote at the	D.C. Code § 1-1001.07

		polling place that serves the current residence address by filing an election day change of address notice pursuant to paragraph (4) of this subsection. (3) Each registered voter who votes at a polling place on election day shall affirm his or her residence address as it appears on the official registration roll for the precinct. The act of signing a copy of the official registration roll for the precinct shall be deemed affirmation of the voter's address as it appears on the Board's registration records. (Effective April 3, 2001)(not added as part of 2005 amendment)	
Florida	Photo ID	101.043 (1) The precinct register, as prescribed in s. 98.461, shall be used at the polls in lieu of the registration books for the purpose of identifying the elector at the polls prior to allowing him or her to vote. The clerk or inspector shall require each elector, upon entering the polling place, to present a current and valid picture identification as provided in s. 97.0535(3)(a). If the picture identification does not contain the signature of the voter, an additional identification that provides the voter's signature shall be required. The elector shall sign his or her name in the space provided, and the clerk or inspector shall compare the signature with that on the identification provided by the elector and enter his or her initials in the space provided and allow the elector to vote if the clerk or inspector is satisfied as to the identity of the elector. (2) Except as provided in subsection (3), if the elector fails to furnish the required identification, or if the clerk or inspector is in doubt as to the identity of the elector, such clerk or inspector shall follow the procedure prescribed in s. 101.49. **97.0535** (3)(a) The following forms of identification shall be considered current and valid if they contain the name and photograph of the applicant and have not expired: 1. Florida driver's license. 2. Florida identification card issued by the Department of Highway Safety and Motor Vehicles. 3. United States passport. 4. Employee badge or identification. 5. Buyer's club identification. 6. Debit or credit card. 7. Military identification. 8. Student identification. 9. Retirement center identification. 10. Neighborhood association identification. 11. Entertainment identification. 12. Public assistance identification. (b) The following forms of identification shall be considered current and valid if they contain the name and current residence address of the applicant: 1. Utility bill.	West's Fla. Stat. Ann. § 101.043 & West's Fla. Stat. Ann. § 97.0535

		2. Bank statement. 3. Government check. 4. Paycheck. 5. Other government document (excluding voter identification card). Version effective 1/1/2005-12/31/2005	
Georgia	Provide ID	(a) Each elector shall present proper identification to a poll worker at or prior to completion of a voter's certificate at any polling place and prior to such person's admission to the enclosed space at such polling place. Proper identification shall consist of any one of the following: (1) A valid Georgia driver's license; (2) A valid identification card issued by a branch, department, agency, or entity of the State of Georgia, any other state, or the United States authorized by law to issue personal identification; (3) A valid United States passport; (4) A valid employee identification card containing a photograph of the elector and issued by any branch, department, agency, or entity of the United States government, this state, or any county, municipality, board, authority, or other entity of this state; (5) A valid employee identification card containing a photograph of the elector and issued by any employer of the elector in the ordinary course of such employer's business; (6) A valid student identification card containing a photograph of the elector from any public or private college, university, or postgraduate technical or professional school located within the State of Georgia; (7) A valid Georgia license to carry a pistol or revolver; (8) A valid pilot's license issued by the Federal Aviation Administration or other authorized agency of the United States; (9) A valid United States military identification card; (10) A certified copy of the elector's birth certificate; (11) A valid social security card; (12) Certified naturalization documentation; (13) A certified copy of court records showing adoption, name, or sex change; (14) A current utility bill, or a legible copy thereof, showing the name and address of the elector; (15) A bank statement, or a legible copy thereof, showing the name and address of the elector; (16) A government check or paycheck, or a legible copy thereof, showing the name and address of the elector; or (17) A government document, or a legible copy thereof, showing the name and address of the elector. (b) If an elector is unable to produce any of the items of identification listed in subsection (a) of this Code section, he or she shall sign a statement under oath in a form approved by the Secretary of State, separate and distinct from the elector's voter certificate, swearing or affirming that he or she is the person identified on the elector's voter certificate. Such person shall be allowed to vote without undue delay; provided, however, that an elector who registered for the first time in this state by mail and did not provide one of the forms of identification set forth in subsection (a) of this Code section at the time of registration and who is voting for the first time may vote a provisional ballot pursuant to Code Section 21-2-418 upon swearing or affirming that the elector is the person identified in the elector's voter certificate. Such provisional ballot shall only be counted if the registrars are able to verify current and valid identification of the elector as provided in this Code section within the time period for verifying provisional ballots pursuant to Code Section 21-2-419. Falsely swearing or affirming such statement under oath shall be punishable as a felony, and the penalty shall be distinctly set forth on the face of the statement." effective June, 2003	Ga. Code. Ann. § 21-2-417

Hawaii	Photo ID	(b) The voter shall present valid identification to the official in charge of the pollbook.	Haw. Code. R. § 2-51-80 (Paper ballots; voting procedure at the polls), § 2-51-83 (Punchcard ballots; voting procedure at polls), 2-51-85.1 (Marksense ballots; voting procedure at the polls.) – All have same subsection (b)
		Do I Need an I.D. to Vote on Election Day? Yes. Be sure to have an I.D. with a picture and signature (such as a Hawaii driver's license or state I.D. card) when you go to vote. The NVRAC card is not an acceptable form of identification. From the 2004 version of the administrative code.	Haw. Code. R. T. 2, SUBT. 4, CH. 51, Appendix
		§ 11-136 Poll book, identification, voting. Every person upon applying to vote shall sign the person's name in the poll book prepared for that purpose. This requirement may be waived by the chairperson of the precinct officials if for reasons of illiteracy or blindness or other physical disability the voter is unable to write. Every person shall provide identification if so requested by a precinct official. A poll book shall not contain the social security number of any person. After signing the poll book and receiving the voter's ballot, the voter shall proceed to the voting booth to vote according to the voting system in use in the voter's precinct. The precinct official may, and upon request shall, explain to the voter the mode of voting. Last amended 2003.	HRS 11-136
Idaho	Sign Name	(1) An elector desiring to vote shall state his name and address to the judge or clerk in charge of the combination election record and poll book. (2) Before receiving his ballot, each elector shall sign his name in the combination election record and poll book following his name therein. (5) The elector shall then be given the appropriate ballots which have been stamped with the official election stamp and shall be given folding instructions for such ballots. (Last amended in 1972)	Id. St. §34-1106
Illinois	Give Name	Any person desiring to vote shall give his name and, if required to do so, his residence to the judges of election, one of whom shall thereupon announce the same in a loud and distinct tone of voice, clear, and audible; the judges of elections shall check each application for ballot against the list of voters registered in that precinct to whom absentee or early ballots have been issued for that election, which shall be provided by the election authority and which list shall be available for inspection by pollwatchers. A voter applying to vote in the precinct on election day whose name appears on the list as having been issued an absentee or early ballot shall not be permitted to vote in the precinct. All applicable provisions of Articles 4, 5 or 6 shall be complied with and if such name is found on the register of voters by the officer having charge thereof, he	10 Ill. Comp. Stat. 5/17-9

		shall likewise repeat said name, and the voter shall be allowed to enter within the proximity of the voting booths, as above provided. One of the judges shall give the voter one, and only one of each ballot to be voted at the election, on the back of which ballots such judge shall indorse his initials in such manner that they may be seen when each such ballot is properly folded, and the voter's name shall be immediately checked on the register list. In those election jurisdictions where perforated ballot cards are utilized of the type on which write-in votes can be cast above the perforation, the election authority shall provide a space both above and below the perforation for the judge's initials, and the judge shall endorse his or her initials in both spaces. Whenever a proposal for a constitutional amendment or for the calling of a constitutional convention is to be voted upon at the election, the separate blue ballot or ballots pertaining thereto shall, when being handed to the voter, be placed on top of the other ballots to be voted at the election in such manner that the legend appearing on the back thereof, as prescribed in Section 16-6 of this Act, shall be plainly visible to the voter. At all elections, when a registry may be required, if the name of any person so desiring to vote at such election is not found on the register of voters, he or she shall not receive a ballot until he or she shall have complied with the law prescribing the manner and conditions of voting by unregistered voters. If any person desiring to vote at any election shall be challenged, he or she shall not receive a ballot until he or she shall have established his right to vote in the manner provided hereinafter; and if he or she shall be challenged after he has received his ballot, he shall not be permitted to vote until he or she has fully complied with such requirements of the law upon being challenged. Besides the election officer, not more than 2 voters in excess of the whole number of voting booths provided shall be allowed within the proximity of the voting booths at one time. The provisions of this Act, so far as they require the registration of voters as a condition to their being allowed to vote shall not apply to persons otherwise entitled to vote, who are, at the time of the election, or at any time within 60 days prior to such election have been engaged in the military or naval service of the United States, and who appear personally at the polling place on election day and produce to the judges of election satisfactory evidence thereof, but such persons, if otherwise qualified to vote, shall be permitted to vote at such election without previous registration.	
Indiana	Sign Name		West's Annotated Indiana Code § 3-11-8-25
Iowa	Sign Name	1. The board members of their respective precincts shall have charge of the ballots and furnish them to the voters. Any person desiring to vote shall sign a voter's declaration provided by the officials, in substantially the following form: VOTER'S DECLARATION OF ELIGIBILITY I do solemnly swear or affirm that I am a resident of the .... precinct, ... ward or township, city of ...., county of ...., Iowa. I am a registered voter. I have not voted and will not vote in any other precinct in said election. I understand that any false statement in this declaration is a criminal offense punishable as provided by law. Signature of Voter Address Telephone Approved:	Iowa Code § 49.77

		Board Member 2. One of the precinct election officials shall announce the voter's name aloud for the benefit of any persons present pursuant to section 49.104, subsection 2, 3, or 5. Any of those persons may upon request view the signed declarations of eligibility and may review the signed declarations on file so long as the person does not interfere with the functions of the precinct election officials. 3. A precinct election official shall require any person whose name does not appear on the election register as an active voter to show identification. Specific documents which are acceptable forms of identification shall be prescribed by the state commissioner. A precinct election official may require of the voter unknown to the official, identification upon which the voter's signature or mark appears. If identification is established to the satisfaction of the precinct election officials, the person may then be allowed to vote. (From 2004 version of Iowa Annotated Code; effective January 1, 1995)	
Kansas	Sign Name	(b) A person desiring to vote shall provide to the election board: (1) the voter's name; (2) if required, the voter's address; and (3) the voter's signature on the registration or poll book. A signature may be made by mark, initials, typewriter, print, stamp, symbol or any other manner if by placing the signature on the document the person intends the signature to be binding. A signature may be made by another person at the voter's direction if the signature reflects such voter's intention. (Approved April 14, 2004, 2004 Kansas Laws Ch. 93)	Kan. Stat. Ann. § 25-2908(b)
Kentucky	Provide ID	117.227 Confirmation of voter's identity Election officers shall confirm the identity of each voter by personal acquaintance or by a document, such as a motor vehicle operator's license, Social Security card, or credit card. The election officer confirming the identity shall sign the precinct voter roster and list the method of identification. Effective: 7/15/02 31 KAR 4:010. Voter identification cards. Section 1. In addition to the forms of identification specifically provided for by KRS 117.227, any identification card that bears both the picture and signature of the voter, or any identification card that has been issued by the county, and which has been approved in writing by the State Board of Elections, shall be acceptable for confirmation of the voter's identity.	Ky Rev. Stat. Ann. 117.227 31 Ky. Admin. Regs. 4:010.
Louisiana	Photo ID	A. Identification of voters. (1) A person who desires to vote in a primary or general election shall give his name and address to a commissioner, who shall announce the applicant's name and address to the persons at the polling place. (2) Each applicant shall identify himself, in the presence and view of the bystanders, and present to the commissioners a Louisiana driver's license, a Louisiana special identification card issued pursuant to R.S. 40:1321, or other generally recognized picture identification card. If the applicant does not have a Louisiana driver's license, a Louisiana special identification card, or other generally recognized picture identification card, the applicant shall sign an affidavit, which is supplied by the secretary of state, to that effect before the commissioners who shall place the affidavit in the envelope marked "Registrar of Voters" and attach the envelope to the precinct register, and the applicant	La. Rev. Stat. Ann. 18:562

		shall provide further identification by presenting his current registration certificate, giving his date of birth or providing other information stated in the precinct register that is requested by the commissioners. However, an applicant that is allowed to vote without the picture identification required by this Paragraph is subject to challenge as provided in R.S. 18:565. Effective: 1/1/2002	
Maine	Give Name	The voting procedure is as follows. 1. Name announced. A voter who wishes to vote must state the voter's name and, upon request, residence address to an election clerk who shall announce the name in a loud, clear voice. (In effect at time of 2003 amendment: 2003, c. 584, § 9)	Me. Rev. Stat. Ann. tit. 21-A, § 671
Maryland	Sign Name	10-310. (a) For each individual who seeks to vote, an election judge, in accordance with instructions provided by the local board, shall: (1) locate the individual's name in the precinct register and locate the preprinted voting authority card and then authorize the individual to vote a regular ballot; (2)(i) if the individual's name is not found on the precinct register, search the inactive list and if the name is found, authorize the individual to vote a regular ballot; or (ii) if the individual's name is not on the inactive list, refer the individual for provisional ballot voting under § 9-404 of this article; (3) establish the identity of the voter by requesting the voter to state the month and day of the voter's birth and comparing the response to the information listed in the precinct register; (4) verify the address of the voter's residence; (5) if any changes to the voting authority card are indicated by a voter, make the appropriate changes in information on the card or other appropriate form; and (6) have the voter sign the voting authority card and either issue the voter a ballot or send the voter to a machine to vote.	Md. Elec. Law § 10-310
Mass.	Give Name	Each voter desiring to vote at a polling place shall give his name and, if requested, his residence to one of the officers at the entrance to the space within the guard rail, who shall thereupon distinctly announce the same. If such name is found on the voting list, the election officer shall check and repeat the name and shall admit the voter to the space enclosed by the guard rail and, in case official ballots, other than those marked "Challenged Ballots" as provided by section thirty-five A, are used, such voter shall be given one ballot. The use of electronic means such as tape recording equipment or radio broadcasting equipment for the recording or broadcasting of the names of voters not yet checked as having voted shall be prohibited. Last amended in 1981 (5B) Identification. If so authorized by the city or town clerk or registrars of voters, an election officer may request any voter to present written identification. Such requests shall not discriminate in any way, but shall be entirely random, consistent, or based on reasonable suspicion. For the purpose of 950 CMR 52.03(5B), of M.G.L. c. 54, § 76B, and of 950 CMR 52.03(5)(b), suitable written identification includes a driver's license, recent utility bill, rent receipt on a landlord's printed letterhead, lease, duplicate copy of a voter registration affidavit, or any other printed identification which contains the voter's name and address. If voters fail to present suitable written identification when so requested, they must still be allowed to vote, but an election officer or any other person may challenge their right to vote under M.G.L. c. 54, § 85 and 950 CMR 52.03(23).	Mass. Ann. Laws 54 § 76 950 Mass. Code Regs. 52.03
Michigan	Sign Name	(1) At each election, before being given a ballot, each registered elector offering to vote shall identify himself or herself by presenting an official state	Mich. Comp. Laws Ann. §

		identification card issued to that individual pursuant to Act No. 222 of the Public Acts of 1972, being sections 28.291 to 28.295 of the Michigan Compiled Laws, an operator's or chauffeur's license issued to that individual pursuant to the Michigan Vehicle Code, Act No. 300 of the Public Acts of 1949, being sections 257.1 to 257.923 of the Michigan Compiled Laws, or other generally recognized picture identification card and by executing an application showing his or her signature or mark and address of residence in the presence of an election official. If the voter registration cards are used in the precinct, the election official in charge of the precinct registration file shall compare the signature upon the application with the signature upon the registration card. If voter registration lists are used in the precinct, the election inspector shall determine if the name on the application to vote appears on the voter registration list. If the name appears on the voter registration list, the elector shall provide further identification by giving his or her date of birth or other information stated upon the voter registration list. In precincts using voter registration lists, the date of birth may be required to be placed on the application to vote. If the signature or an item of information does not correspond, the vote of the person shall be challenged, and the same procedure shall be followed as provided in this act for the challenging of an elector. If the person offering to vote has signed the registration card or application by making a mark, the person shall identify himself or herself by giving his or her date of birth, which shall be compared with the date of birth stated upon the registration card or voter registration list, or shall give other identification as may be referred to upon the registration card or voter registration list. If the elector does not have an official state identification card, operator's or chauffeur's license as required in this subsection, or other generally recognized picture identification card, the individual shall sign an affidavit to that effect before an election inspector and be allowed to vote as otherwise provided in this act. However, an elector being allowed to vote without the identification required under this subsection is subject to challenge as provided in section 727. (2) If, upon a comparison of the signature or other identification, it is found that the applicant is entitled to vote, the election officer having charge of the registration list shall approve the application and write his or her initials on the application, after which the number on the ballot issued shall be noted on the application. The application shall serve as 1 of the 2 poll lists required to be kept as a record of a person who has voted. The application shall be filed with the township, city, or village clerk. If voter registration cards are used in the precinct, the date of the election shall be noted by 1 of the election officials upon the precinct registration card of each elector voting at an election. If voter registration lists are used in the precinct, the election official shall clearly indicate upon the list each elector voting at that election. The clerk of a city, village, or township shall maintain a record of voting participation for each registered elector. The Attorney General declared that this statute violated the Equal Protection Clause of the Fourteenth Amendment. Op. Atty. Gen. 1997, No. 6930. That decision is binding on all state agencies. (Effective March 31, 1997)	168.523
Minnesota	Sign Name	(a) An individual seeking to vote shall sign a polling place roster which states that the individual is at least 18 years of age, a citizen of the United States, has resided in Minnesota for 20 days immediately preceding the election, maintains residence at the address shown, is not under a guardianship in which the court order revokes the individual's right to vote, has not been found by a court of law to be legally incompetent to vote or convicted of a felony without having civil rights restored, is registered and has not already voted in the election. The roster must also state: "I understand that deliberately providing false information is a felony punishable by not more than five years imprisonment and a fine of not	Minn. Stat. § 204C.10

		more than $10,000, or both." (b) A judge may, before the applicant signs the roster, confirm the applicant's name, address, and date of birth. (c) After the applicant signs the roster, the judge shall give the applicant a voter's receipt. The voter shall deliver the voter's receipt to the judge in charge of ballots as proof of the voter's right to vote, and thereupon the judge shall hand to the voter the ballot. The voters' receipts must be maintained during the time for notice of filing an election contest. (Effective January 1, 2004)	
Mississippi	Sign Name	* * * When any person entitled to vote shall appear to vote, he shall first sign his name in a receipt book or booklet provided for that purpose and to be used at that election only and said receipt book or booklet shall be used in lieu of the list of voters who have voted formerly made by the managers or clerks; whereupon and not before, the initialing manager or, in his absence, the alternate initialing manager shall indorse his initials on the back of an official blank ballot, prepared in accordance with law, and at such place on the back of the ballot that the initials may be seen after the ballot has been marked and folded, and when so indorsed he shall deliver it to the voter, which ballot the voter shall mark in the manner provided by law, which when done the voter shall deliver the same to the initialing manager or, in his absence, to the alternate initialing manager, in the presence of the others, and the manager shall see that the ballot so delivered bears on the back thereof the genuine initials of the initialing manager, or alternate initialing manager, and if so, but not otherwise, the ballot shall be put into the ballot box; and when so done one (1) of the managers or a duly appointed clerk shall make the proper entry on the pollbook. If the voter is unable to write his name on the receipt book, a manager or clerk shall note on the back of the ballot that it was receipted for by his assistance. (Effective January 1, 1987)	Miss. Code Ann. § 23-15-541
Missouri	Provide ID	1. Before receiving a ballot, voters shall identify themselves by presenting a form of personal identification from the following list: (1) Identification issued by the state of Missouri, an agency of the state, or a local election authority of the state; (2) Identification issued by the United States government or agency thereof; (3) Identification issued by an institution of higher education, including a university, college, vocational and technical school, located within the state of Missouri; (4) A copy of a current utility bill, bank statement, government check, paycheck or other government document that contains the name and address of the voter; (5) Driver's license or state identification card issued by another state; or (6) Other identification approved by the secretary of state under rules promulgated pursuant to subsection 3 of this section other identification approved by federal law. Personal knowledge of the voter by two supervising election judges, one from each major political party, shall be acceptable voter identification upon the completion of a secretary of state-approved affidavit that is signed by both supervisory election judges and the voter that attests to the personal knowledge of the voter by the two supervisory election judges. The secretary of state may provide by rule for a sample affidavit to be used for such purpose. (Last amended in 2002)	Mo. Rev. Stat. §115.427.1

Montana	Provide ID	(1) (a) Before an elector is permitted to receive a ballot or vote, the elector shall present to an election judge a current photo identification showing the elector's name. If the elector does not present photo identification, including but not limited to a valid driver's license, a school district or postsecondary education photo identification, or a tribal photo identification, the elector shall present a current utility bill, bank statement, paycheck, notice of confirmation of voter registration issued pursuant to 13-2-207, government check, or other government document that shows the elector's name and current address. (From 2004 version of the Montana Code Annotated; No updates in 2004, only in 2005 [Unrelated section was amended in 2005])	Mont. Code. Ann. §13-13-114(1)(a)
Nebraska	Sign Name	(1) The clerks of election shall have a list of registered voters of the precinct and a sign-in register at the polling place on election day. The list of registered voters shall be used for guidance on election day and may be in the form of a computerized, typed, or handwritten list or precinct registration cards. Registered voters of the precinct shall place and record their signature in the sign-in register before receiving any ballot. The list of registered voters and the sign-in register may be combined into one document. (Last amended in 2003) Official ballots shall be used at all elections. No person shall receive a ballot or be entitled to vote unless and until he or she is registered as a voter except as provided in section 32-914.01, 32-914.02, 32-915, 32-915.01, or 32-936. Except as otherwise specifically provided, no ballot shall be handed to any registered voter at any election until (1) he or she announces his or her name and address to the clerk of election, (2) the clerk has found that he or she is a registered voter at the address as shown by the precinct list of registered voters unless otherwise entitled to vote in the precinct under section 32-328, 32-914.01, 32-914.02, 32-915, or 32-915.01, (3) if the voter registered by mail after January 1, 2003, and has not previously voted in an election for a federal office within the county, the clerk shall ask the registered voter to present a photographic identification which is current and valid or a copy of a utility bill, bank statement, government check, paycheck, or other government document that is current and that shows the name and address of the voter, (4) the clerk has instructed the registered voter to personally write his or her name in the precinct sign-in register on the appropriate line which follows the last signature of any previous voter, and (5) the clerk has listed on the precinct list of registered voters the corresponding line number and name of the registered voter. (Last updated in 2003)	Neb. Rev. Stat. § 32-913 Neb. Rev. Stat. § 32-914
Nevada	Match Sig.	1. Except as otherwise provided in NRS 293.541, if a person's name appears in the election board register or if he provides an affirmation pursuant to NRS 293.525, he is entitled to vote and must sign his name in the election board register when he applies to vote. His signature must be compared by an election board officer with the signature or a facsimile thereof on his original application to register to vote or one of the forms of identification listed in subsection 2. 2. Except as otherwise provided in NRS 293.2725, the forms of identification which may be used individually to identify a voter at the polling place are: (a) The card issued to the voter at the time he registered to vote; (b) A driver's license; (c) An identification card issued by the Department of Motor Vehicles; (d) A military identification card; or	Nev. Rev. Stat.§ 293.277

		(e) Any other form of identification issued by a governmental agency which contains the voter's signature and physical description or picture. Last Amendment Effective Jan. 1, 2004.	
NH	Give Name	A person desiring to vote shall, before being admitted to the enclosed space within the guardrail, announce his or her name to one of the ballot clerks who shall thereupon repeat the name; and, if the name is found on the checklist by the ballot clerk, the ballot clerk shall put a checkmark beside it and again repeat the name. The ballot clerk shall state the address listed on the checklist for the voter, and ask if the address is correct; if the address on the checklist is not correct, the ballot clerk shall correct the address in red on the checklist. The voter, if still qualified to vote in the town or ward and unless challenged as provided for in RSA 659:27-33, shall then be allowed to enter the space enclosed by the guardrail. After the voter enters the enclosed space, the ballot clerk shall give the voter one of each ballot to be voted on in that election which shall be folded as it was upon receipt from the secretary of state. Last Amendment Effective July 2, 2002.	N.H. Rev. Stat. Ann. 659:13
New Jersey	Match Sig.	19:15-17. Comparison of signatures or statements made openly; provisional ballots for newly registered voters without proper identification a. The comparison of signatures of a voter made upon registration and upon election day, and if the voter alleges his inability to write, the comparison of the answers made by such voter upon registration and upon election day, shall be had in full view of the challengers. b. If a voter has registered by mail after January 1, 2003 to vote for the first time in his or her current county of residence and did not provide personal identification when registering pursuant to section 16 of P.L.1974, c. 30 (C.19:31-6.4), the voter shall be permitted to vote starting at the first election held after January 1, 2004 at which candidates are seeking federal office after displaying one of the following items: (1) a current and valid photo identification card; (2) a current utility bill, bank statement, government check or pay check; (3) any other government document that shows the voter's name and current address; or (4) any other identifying document that the Attorney General has determined to be acceptable for this purpose. If the voter does not display one of these documents, the voter shall not be permitted to vote by machine but shall instead be provided with a provisional ballot, pursuant to the provisions of P.L.1999, c. 232 (C.19:53C-1 et seq.). This subsection shall not apply to any voter entitled to vote by absentee ballot under the "Uniformed and Overseas Citizens Absentee Voting Act" (42 U.S.C. 1973ff-1 et seq.) or to any voter who is provided the right to vote other than in person under section 3 of Pub.L.98-435, the "Voting Accessibility for the Elderly and Handicapped Act," or any other voter entitled to vote otherwise than in person under any other federal law. This subsection shall also not apply to any person who registers to vote by appearing in person at any voter registration agency or to any person whose voter registration form is delivered to the county commissioner of registration or to the Attorney General, as the case may be, through a third party by means other than by mail delivery. c. Each county commissioner of registration shall collect and maintain, in the manner prescribed by the Attorney General, the information provided pursuant to subsection b. of this section and section 16 of P.L.1974, c. 30 (C.19:31- 6.4). Access to the personal identification information provided pursuant to subsection b. of this section and section 16 of P.L.1974, c. 30 (C.19:31- 6.4). shall be prohibited, in accordance with subsection a. of section 6 of P.L.2001, c. 404 (C.47:1A-5). Last Amendment Effective July 9, 2004	N.J. Stat. Ann. 19:15-17
New Mexico	Sign Name	D. The judge assigned to the voter list used for confirmation of registration and voting shall determine that each person offering to vote is registered and, in the	N.M. Stat. Ann §1-5-10

		case of a primary election, that the voter is registered in a party designated on the primary election ballot. If the person's registration is confirmed by the presence of his name on the voter list or if the person presents a certificate under the seal and signature of the county clerk showing that he is entitled to vote in the election and to vote in that precinct, the judge shall announce to the election clerks the list number and the name of the voter as shown on the voter list. E. The election clerk shall locate that list number and name on the signature roster and shall require the voter to sign his usual signature or, if unable to write, to make his mark opposite his printed name. If the voter makes his mark, it shall be witnessed by one of the judges of the precinct board. If the signature roster indicates that the voter is required to present a form of identification before voting, the election judge shall ask the voter for a current and valid photo identification or a copy of a current utility bill, bank statement, government check, paycheck or other government document that shows and matches the name and address of the voter as indicated on the signature roster. If the voter does not provide the required identification, he shall be allowed to vote on a provisional paper ballot. G. A voter shall not be permitted to vote until he has properly signed his usual signature or made his mark in the signature roster. (From 2004 version of New Mexico Annotated Statutes, amended in 2005 to require presentation of ID)	(Recompiled as §1-12 -7.1 by L. 2005, Ch. 270, §63, effective July 1, 2005)
New York	Match Sig.	1. A person before being allowed to vote shall be required, except as provided in this chapter, to sign his name on the back of his registration poll record on the first line reserved for his signature at the time of election which is not filled with a previous signature, or on the line of the computer generated registration list reserved for his signature. The two inspectors in charge shall satisfy themselves by a comparison of this signature with his registration signature and by comparison of his appearance with the descriptive material on the face of the registration poll record that he is the person registered. If they are so satisfied they shall enter the other information required for the election on the same line with the voter's latest signature, shall sign their names or initials in the spaces provided therefor, and shall permit the applicant to vote. Any inspector or inspectors not satisfied shall challenge the applicant forthwith. 2. If a person who alleges his inability to sign his name presents himself to vote, the board of inspectors shall permit him to vote, unless challenged on other grounds, provided he had been permitted to register without signing his name. The board shall enter the words "Unable to Sign" in the space on his registration poll record reserved for his signature or on the line of the computer generated registration list reserved for his signature at such election. If his signature appears upon his registration record or upon the computer generated registration list the board shall challenge him forthwith, except that if such a person claims that he is unable to sign his name by reason of a physical disability incurred since his registration, the board, if convinced of the existence of such disability, shall permit him to vote, shall enter the words "Unable to Sign" and a brief description of such disability in the space reserved for his signature at such election. At each subsequent election, if such disability still exists, he shall be entitled to vote without signing his name and the board of inspectors, without further notation, shall enter the words "Unable to Sign" in the space reserved for his signature at such election. 3. The voter's signature made by him upon registration and his signature made at subsequent elections shall be effectively concealed from the voter by a blotter or piece of opaque paper until after the voter shall have completed his signature. 4. In any case where a person who has heretofore voted has placed his voting signature on the back of his registration poll record on the first or any succeeding line or lines at the time or times of an election, instead of on the last line of the	N.Y. Law § 8-304 (McKinney)

		space thereon required to be reserved for such voting signatures and on any lines next running upward therefrom, the inspectors of election shall obliterate such misplaced signature or signatures, initial the obliteration and require such voter to sign his name again in the correct place on such registration poll record. 5. Any person who has heretofore registered and who at such time placed his or her registration signature on the back of the registration poll record otherwise than in the space required to be provided therefor at the bottom of such poll record, shall, before being permitted to vote at any election thereafter, subscribe a new registration signature for himself on the last line at the bottom of such poll record, and, at the same time, if the inspectors of election are satisfied that the signatures were made by the same person, obliterate his original registration signature placed elsewhere than on the bottom of such record. Such obliterations may be made by crossing out the signature so as to completely efface the same or by affixing thereover a piece of gummed tape of a size sufficient only to cover such signature and of a type adequate to fully conceal the same Last Amended 1986	
North Carolina	Give Name	(a) Checking Registration. --A person seeking to vote shall enter the voting enclosure through the appropriate entrance. A precinct official assigned to check registration shall at once ask the voter to state current name and residence address. The voter shall answer by stating current name and residence address. In a primary election, that voter shall also be asked to state, and shall state, the political party with which the voter is affiliated or, if unaffiliated, the authorizing party in which the voter wishes to vote. After examination, that official shall state whether that voter is duly registered to vote in that precinct and shall direct that voter to the voting equipment or to the official assigned to distribute official ballots. If a precinct official states that the person is duly registered, the person shall sign the pollbook, other voting record, or voter authorization document in accordance with subsection (c) of this section before voting.	N.C. Gen. Stat. Ann. § 163-166.7
North Dakota	Provide ID	16.1-05-07 Poll clerks to check identification and verify eligibility -- Poll clerks to request, correct, and update incorrect information contained in the pollbook. 1. Before delivering a ballot to an individual according to section 16.1-13- 22, the poll clerks shall request the individual to show a driver's license issued by the state, another form of identification displaying a photograph of the individual and the individual's date of birth, or another appropriate form of identification prescribed by the secretary of state. If an individual offering to vote fails or refuses to show an appropriate form of identification, the individual may be allowed to vote without being challenged according to section 16.1-05-06 if the individual provides to the election board the individual's date of birth and if a member of the election board or a clerk knows the individual and can personally vouch that the individual is a qualified elector of the precinct. After verifying that the individual's name is contained in the pollbook generated from the central voter file, poll clerks shall verify the individual's residential address and mailing address, if different from the individual's residential address. (From 2003 version of N.D. Century Code; only amendment to this statute that became effective in 2003 was in 2005)	N.D. Cent. Code § 16.1-05-07

Ohio	Match Sig.	When an elector appears in a polling place to vote he shall announce his full name and address to the precinct election officials. He shall then write his name and address at the proper place in the poll lists or signature pollbooks provided therefore, except that if, for any reason, an elector shall be unable to write his name and address in the poll list or signature pollbook, the elector may make his mark at the place intended for his name and a precinct official shall write the name of the elector at the proper place on the poll list or signature pollbook following the elector's mark, upon the presentation of proper identification. The making of such mark shall be attested by the precinct official who shall evidence the same by signing his name on the poll list or signature pollbook as a witness to such mark. The elector's signature in the poll lists or signature pollbooks shall then be compared with his signature on his registration form or a digitized signature list as provided for in section 3503.13 of the Revised Code, and if, in the opinion of a majority of the precinct election officials, the signatures are the signatures of the same person, the clerks shall enter the date of the election on the registration form or shall record the date by such other means as may be prescribed by the secretary of state. If the right of the elector to vote is not then challenged, or, if being challenged, he establishes his right to vote, he shall be allowed to proceed into the voting machine. If voting machines are not being used in that precinct, the judge in charge of ballots shall then detach the next ballots to be issued to the elector from Stub B attached to each ballot, leaving Stub A attached to each ballot, hand the ballots to the elector, and call his name and the stub number on each of the ballots. The clerk shall enter the stub numbers opposite the signature of the elector in the pollbook. The elector shall then retire to one of the voting compartments to mark his ballots. No mark shall be made on any ballot which would in any way enable any person to identify the person who voted the ballot. (Effective at time of last update, 1992 H 182, eff. 4-9-93)	Ohio Rev. Code Ann. § 3505.18
Oklahoma	Sign Name	Each person presenting himself to vote shall announce his name to the judge of the precinct, whereupon the judge shall determine whether said person's name is in the precinct registry. (Last amended in 1990) Persons who have been determined to be eligible to vote shall sign, in the presence of the clerk, the proper precinct registry. Said clerk shall thereupon issue proper ballots to said person. The voter's signature on said precinct registry shall be the best evidence of said voter's having voted at said election. Said precinct registry shall be retained in the office of the county election board for a period of twenty-two (22) months following the election and shall be subject to public inspection during regular office hours. (Last amended in 1990)	Okla. Stat. Ann. tit. 26, § 7-114 Okla. Stat. Ann. tit. 26, § 7-117
Oregon	Match Sig.	All elections in Oregon are Vote by Mail. An Elections Official will compare the signature on your ballot return envelope to the signature on your voter registration card to verify your identity (http://www.uhavavote.org/votingguide/votebymail.html) (unknown date, but use of wayback machine shows that this provision on site on following dates: 7/11/04, 10/20/04 and 10/29/04)	Or. Rev. Stat. § 254.385
Penn.	Match Sig.	(a.3) All electors, including any elector that shows identification pursuant to subsection (a), shall subsequently sign a voter's certificate, and, unless he is a State or Federal employee who has registered under any registration act without declaring his residence by street and number, he shall insert his address therein, and hand the same to the election officer in charge of the district register. Such election officer shall thereupon announce the elector's name so that it may be heard by all members of the election board and by all watchers present in the	25 Pa. Stat. Ann. § 3050

		polling place and shall compare the elector's signature on his voter's certificate with his signature in the district register. If, upon such comparison, the signature upon the voter's certificate appears to be genuine, the elector who has signed the certificate shall, if otherwise qualified, be permitted to vote: Provided, That if the signature on the voter's certificate, as compared with the signature as recorded in the district register, shall not be deemed authentic by any of the election officers, such elector shall not be denied the right to vote for that reason, but shall be considered challenged as to identity and required to make the affidavit and produce the evidence as provided in subsection (d) of this section. When an elector has been found entitled to vote, the election officer who examined his voter's certificate and compared his signature shall sign his name or initials on the voter's certificate, shall, if the elector's signature is not readily legible, print such elector's name over his signature, and the number of the stub of the ballot issued to him or his number in the order of admission to the voting machines, and at primaries a letter or abbreviation designating the party in whose primary he votes shall also be entered by one of the election officers or clerks. As each voter is found to be qualified and votes, the election officer in charge of the district register shall write or stamp the date of the election or primary, the number of the stub of the ballot issued to him or his number in the order of admission to the voting machines, and at primaries a letter or abbreviation designating the party in whose primary he votes, and shall sign his name or initials in the proper space on the registration card of such voter contained in the district register. (In effect at time of, and unaltered by: 2004, Oct. 8, P.L. 807, No. 97, § 5.1 (changes procedure for first time voters, not established voters))	
Rhode Island	Give Name	(a) Each person desiring to vote shall state his or her name and residence, including that person's street address, if he or she has any, to one of the first pair of bi-partisan supervisors, who shall then announce the name and residence in a loud and distinct voice, clear and audible. As each voter's name is announced, the voter shall be handed a ballot application in the following form: BALLOT APPLICATION (Poll List) Senatorial District ______________ Representative District ________ Voting District _________________ Election Date __________________________ I hereby certify that I am a registered and qualified elector in the above voting district of City of and hereby make application for ballots to be voted at this election. ________________________________ (Signature of Voter) ________________________________ (Residence Address) Number Approved ______________________ (Supervisor of Election)	R.I. Gen. Laws § 17-19-24

		(b) The voter shall sign the application in the presence and view of a bipartisan pair. They shall locate the voter's name on the certified voting list for the voting district. Upon finding the voter's name on the certified voting list for the district, they shall initial the ballot application in the place provided next to the word "Approved" and shall enter on the certified list of voters a proper notation that the applicant has voted in the election. They shall then return the ballot application to the voter who shall pass down the line and present it to the clerk. After the voter has handed the approved ballot application to the clerk, the clerk shall provide the voter with the appropriate computer ballot and security sleeve, the warden shall direct the voter to the voting booth which the voter shall use, and unless the voter needs instruction or assistance as provided in this chapter, the voter shall cast his or her vote, and if he or she desires place the voted computer ballot in a security sleeve, and shall proceed to the optical scan precinct count unit and shall personally place his or her voted ballot into the designated ballot slot on the unit, and after doing so, shall leave the enclosure at once. No voter shall remain within the voting booth longer than ten (10) minutes, and if the voter refuses to leave after the lapse of ten (10) minutes, the voter shall be removed from the voting booth by order of the warden. Except for the election officials and the election inspector, not more than two (2) voters in excess of the number of voting booths shall be permitted within the enclosed space at any time. (Last amended 2004, Current through January 2005 Session)	
South Carolina	Photo ID	**§ 7-13-710. Proof of right to vote; signing poll list; comparison of signatures.** When any person presents himself to vote, he shall produce his valid South Carolina driver's license or other form of identification containing a photograph issued by the Department of Motor Vehicles, if he is not licensed to drive, or the written notification of registration provided for by §§ 7-5- 125 and 7-5-180 if the notification has been signed by the elector. If the elector loses or defaces his registration notification, he may obtain a duplicate notification from his county board of registration upon request in person, or by telephone or mail. After presentation of the required identification, his name must be checked by one of the managers on the margin of the page opposite his name upon the registration books, or copy of the books, furnished by the board of registration. The managers shall keep a poll list which must contain one column headed "Names of Voters". Before any ballot is delivered to a voter, the voter shall sign his name on the poll list, which must be furnished to the appropriate election officials by the State Election Commission. At the top of each page the voter's oath appropriate to the election must be printed. The signing of the poll list or the marking of the poll list is considered to be an affirmation of the oath by the voter. One of the managers shall compare the signature on the poll list with the signature on the voter's driver's license, registration notification, or other identification and may require further identification of the voter and proof of his right to vote under this title as he considers necessary. If the voter is unable to write or if the voter is prevented from signing by physical handicap, he may sign his name to the poll list by mark with the assistance of one of the managers. Last amended: 1968	S.C. Code Ann. § 7-13-710
South Dakota	Photo ID	When a voter is requesting a ballot, the voter shall present a valid form of personal identification. The personal identification that may be presented shall be either: (1) A South Dakota driver's license or nondriver identification card; (2) A passport or an identification card, including a picture, issued by an agency of the United States government; (3) A tribal identification card, including a picture; or (4) An identification card, including a picture, issued by a high school or an accredited institution of higher education, including a university, college, or	S.D. Codified Laws § 12-18-6.1

		technical school, located within the State of South Dakota. Last amended March 2004	
Tennessee	Provide ID	Identification of eligible voters (a)(1) A voter shall sign an application for ballot, indicate the primary in which the voter desires to vote, if any, and present it to a registrar. The application for ballot shall include thereon a space for the address of the voter's current residence, and the voter shall write or print such address on the application when the voter signs it. The registrar shall compare the signature and information on the application with the signature and information on the duplicate permanent registration record. The registrar shall make a determination whether the voter's address is different from the address on the voter's permanent registration record or if the registration is in inactive status. If the voter has changed residence, or the voter's registration is inactive, the registrar shall follow the procedures for voting pursuant to § 2-7-140. If, upon comparison of the signature and other identification, it is found that the applicant is entitled to vote, the registrar shall initial the application and shall note on the reverse side of the voter's duplicate permanent registration record the date of the election, the number of the voter's ballot application, and the elections in which the voter votes. If the applicant's signature is illegible, the registrar shall print the name on the application. The registrar shall give the voter the ballot application which is the voter's identification for a paper ballot or ballots or for admission to a voting machine. The voter shall then sign the duplicate poll lists without leaving any lines blank on any poll list sheet. (2) In any computerized county, the county election commission shall have the option of using an application for a ballot as provided in this section, or using the computerized voter signature list. A computerized voter signature list shall include the voter's name, current address of residence, social security number or registration number, birth date and spaces for the voter's signature, elections voted, ballot number and precinct registrar's initials. The following procedures shall be followed in the case of computerized voter signature lists: (A) The voter shall sign the signature list and indicate the election or elections the voter desires to vote in and verify the voter's address in the presence of the precinct registrar; (B) The registrar shall compare the voter's signature and information on the signature list with other evidence of identification supplied by the voter. If, upon comparison of the signature and other evidence of identification, it is found that the applicant is entitled to vote, the registrar shall initial the signature list; (C) If the applicant's signature is illegible, the registrar shall print the name of the applicant on the voter list; and (D) If a voter is unable to present any evidence of identification specified in subsection (c), the voter shall be required to execute an affidavit of identity on a form provided by the county election commission. Last amended 2003	Tenn. Code Ann. § 2-7-112
Texas	Provide ID	(b) On offering to vote, a voter must present the voter's voter registration certificate to an election officer at the polling place. (Last amended in 1997)	Tex. Elec. Code Ann. § 63.001
Utah	Give Name	(1)(a) Any registered voter desiring to vote shall give his name, and, if requested, his residence, to one of the election judges. (b) If an election judge does not know the person requesting a ballot and has reason to doubt that person's identity, the judge shall request identification or have the voter identified by a known registered voter of the district. (3) If the election judge determines that the voter is registered: (a) the election judge in charge of the official register shall: (i) write the ballot number opposite the name of the voter in the official register; and	Utah Code Ann. § 20A-3-104

		(ii) direct the voter to sign his name in the election column in the official register; (b) another judge shall list the ballot number and voter's name in the pollbook; and (c) the election judge having charge of the ballots shall: (i) endorse his initials on the stub; (ii) check the name of the voter on the pollbook list with the number of the stub; (iii) hand the voter a ballot; and (iv) allow the voter to enter the voting booth. (In effect at time of last update prior to 2005: Laws 2003, c. 37, § 1, eff. May 5, 2003)	
Vermont	Give Name	Before a person may be admitted to vote, he or she shall announce his or her name and if requested, his or her place of residence in a clear and audible tone of voice, or present his or her name in writing, or otherwise identify himself or herself by appropriate documentation. The election officials attending the entrance of the polling place shall then verify that the person's name appears on the checklist for the polling place. If the name does appear, and if no one immediately challenges the person's right to vote on grounds of identity or having previously voted in the same election, the election officials shall repeat the name of the person and: (1) If the checklist indicates that the person is a first-time voter in the municipality who registered by mail and who has not provided required identification before the opening of the polls, require the person to present any one of the following: a valid photo identification; a copy of a current utility bill; a copy of a current bank statement; or a copy of a government check, paycheck, or any other government document that shows the current name and address of the voter. If the person is unable to produce the required information, the person shall be afforded the opportunity to cast a provisional ballot, as provided in subchapter 6A of this chapter. The elections official shall note upon the checklist a first-time voter in the municipality who has registered by mail and who produces the required information, and place a mark next to the voter's name on the checklist and allow the voter to proceed to the voting booth for the purpose of voting. (2) If the voter is not a first-time voter in the municipality, no identification shall be required, the clerk shall place a check next to the voter's name on the checklist and allow the voter to proceed to the voting booth for the purpose of voting (Last amended in 2003)	Vt. Stat. Ann. tit. 17, § 2563
Virginia	Provide ID	§ 24.2-643. Qualified voter permitted to vote; procedures at polling place; voter identification A. After the polls are open, each qualified voter at a precinct shall be permitted to vote. The officers of election shall ascertain that a person offering to vote is a qualified voter before admitting him to the voting booth and furnishing an official ballot to him. B. An officer of election shall ask the voter for his full name and current residence address and repeat, in a voice audible to party and candidate representatives present, the full name and address stated by the voter. The officer shall ask the voter to present any one of the following forms of identification: his Commonwealth of Virginia voter registration card, his social security card, his valid Virginia driver's license, or any other identification card issued by a government agency of the Commonwealth, one of its political subdivisions, or the United States; or any valid employee identification card containing a photograph of the voter and issued by an employer of the voter in the ordinary course of the employer's business. If the voter's name is found on the pollbook, if he presents one of the forms of	Va. Code. Ann.

		identification listed above, if he is qualified to vote in the election, and if no objection is made, an officer shall enter, opposite the voter's name on the pollbook, the first or next consecutive number from the voter count form provided by the State Board, or shall enter that the voter has voted if the pollbook is in electronic form; an officer shall provide the voter with the official ballot; and another officer shall admit him to the voting booth. Except as provided in subsection E of this section, if a voter is entitled to vote except that he is unable to present one of the forms of identification listed above, he shall be allowed to vote after signing a statement, subject to felony penalties for false statements pursuant to § 24.2-1016, that he is the named registered voter who he claims to be. A voter who requires assistance in voting by reason of physical disability or inability to read or write, and who requests assistance pursuant to § 24.2-649, may be assisted in preparation of this statement in accordance with that section. The provisions of § 24.2-649 regarding voters who are unable to sign shall be followed when assisting a voter in completing this statement. (Version in effect as of 2004- effective 4/12/2004)	
Washington	Sign Name	29A.44.201. A voter desiring to vote shall give his or her name to the precinct election officer who has the precinct list of registered voters. This officer shall announce the name to the precinct election officer who has the copy of the inspector's poll book for that precinct. If the right of this voter to participate in the primary or election is not challenged, the voter must be issued a ballot or permitted to enter a voting booth or to operate a voting device. For a partisan primary in a jurisdiction using the physically separate ballot format, the voter must be issued a nonpartisan ballot and each party ballot. The number of the ballot or the voter must be recorded by the precinct election officers. If the right of the voter to participate is challenged, RCW 29A.08.810 and 29A.08.820 apply to that voter. (In effect at time of last update prior to 2005: 2004 c 271 § 136, eff. June 10, 2004) 29A.44.210. Any person desiring to vote at any primary or election is required to sign his or her name on the appropriate precinct list of registered voters. If the voter registered using a mark, or can no longer sign his or her name, the election officers shall require the voter to be identified by another registered voter. The precinct election officers shall then record the voter's name. Effective date: July 1, 2004	Wash. Rev. Code § 29A.44.201 & 29A.44.210
West Virginia	Match Sig.	(a) Any person desiring to vote in an election shall, upon entering the election room, clearly state his or her name and residence to one of the poll clerks who shall thereupon announce the same in a clear and distinct tone of voice. If that person is found to be duly registered as a voter at that precinct, he or she shall be required to sign his or her name in the space marked "signature of voter" on the pollbook prescribed and provided for the precinct. If that person is physically or otherwise unable to sign his or her name, his or her mark shall be affixed by one of the poll clerks in the presence of the other and the name of the poll clerk affixing the voter's mark shall be indicated immediately under the affixation. No ballot may be given to the person until he or she so signs his or her name on the pollbook or his or her signature is so affixed thereon. * * * (c) When the voter's signature is properly on the pollbook, the two poll clerks shall sign their names in the places indicated on the back of the official ballot and deliver the ballot to the voter to be voted by him or her without leaving the	W. Va. Code § 3-1-34 (a)

		election room. If he or she returns the ballot spoiled to the clerks, they shall immediately mark the ballot "spoiled" and it shall be preserved and placed in a spoiled ballot envelope together with other spoiled ballots to be delivered to the board of canvassers and deliver to the voter another official ballot, signed by the clerks on the reverse side required by this subsection. The voter shall thereupon retire alone to the booth or compartment prepared within the election room for voting purposes and there prepare his or her ballot using a ballpoint pen of not less than five inches in length or other indelible marking device of not less than five inches in length. In voting for candidates in general and special elections, the voter shall comply with the rules and procedures prescribed in section five, article six of this chapter. (In effect at time of last update prior to 2005: Acts 2003, c. 100, eff. 90 days after March 7, 2003)	
Wisconsin	Give Name	6.79(2)(a) Except as provided in sub. (6), where there is registration, each person, before receiving a voting number, shall state his or her full name and address. Upon the prepared registration list, after the name of each elector, the officials shall enter the serial number of the vote as it is polled, beginning with number one. Each elector shall receive a slip bearing the same serial number. A separate list shall be maintained for electors who are voting under s. 6.15, 6.29 or 6.55(2) or (3) and electors who are reassigned from another polling place under s. 5.25(5)(b). Each such elector shall have his or her full name, address and serial number likewise entered and shall be given a slip bearing such number. (In effect at time of last update prior to 2005: 2003 Act 327, § 4, eff. June 12, 2004)	Wis. Stat. § 6.79
Wyoming	Give Name	(a) Unless a voter is challenged pursuant to W.S. 22-15-101 through 22- 15-109, no identification shall be required when: (i) Voting in person or by mail after having registered in person; or (ii) Voting in person or by mail after having registered by mail and having previously voted in a Wyoming federal election. (In effect at time of last update prior to 2005: Effective dates. -- Laws 2004, ch. 94, § 5, makes the act effective immediately upon completion of all acts necessary for a bill to become law as provided by art. 4, § 8, Wyo. Const. Approved March 5, 2004.)	Wyo. Stat. Ann. § 22-3-118

APPENDIX B –Court Decisions and Literature on Voter Identification and Related Issues

Court Decisions

Summary of Relevant Cases:
Challenges Prevailed:
American Civil Liberties Union of Minnesota v. Kiffmeyer, 2004

- Action for temporary restraining order – granted
- Statute: allowed use of tribal identification cards w/ name, address & photo as a valid identification to register to vote only if the voter lives on the reservation to "complete" a mail-in application (which only affected about 600 voters w/ incomplete applications)
- Claim -14th Amendment EPC: likely to prevail, no rational basis for a distinction between Indians residing on reservations and those not
- Statute: may use certain forms of photo identification lacking address together with a utility bill but not tribal identification cards
- Claim -14th Amendment EPC: likely to prevail

Greidinger v. Davis, 1993

- Statute: mandated disclosure of SS # as a precondition to voter registration (rationale was voter identification, but the numbers were rarely used to verify identity & were disclosed in voter lists to both political parties and the public upon request)
- Claims:
  - 14th Amendment EPC: no classification (applied strict scrutiny)
  - Substantive due process: law invalid; found that the statute conditioned the fundamental right to vote on the consent to an invasion of privacy; this was found to be a substantial burden (applied strict scrutiny)
    - Compelling interests: preventing voter fraud (deemed compelling)
    - Necessary: fails, preventing voter fraud when allowing names for inspection could be achieved by supplying addresses and DOBs or use of voter registration numbers
    - HOWEVER: Court also made it clear that if the registration scheme kept the SS# for internal use only – it would be valid

Challenges Rejected:
League of Women Voters v. Blackwell, 2004.

- Sec. of State Directive: provisional ballots issued if first-time voter, who registered by mail and did not provide ID, cannot produce proper ID at the polls AND that the provisional ballot will only be counted if the voter returns to the poll before it closes w/ ID or can recite SS# or DL#
- Claims – Supremacy Clause & HAVA: ruled that HAVA did not specify how the first-time voters' identifications should be verified and this method was not unreasonable or too burdensome

Colorado Common Clause v. Davidson, 2004

- Statute: required all voters to show ID (most types permitted) before voting
- Claims:
  - HAVA: ruled that HAVA did not preempt more strict state laws & allowed States to be more strict as long as consistent with the purpose of HAVA (both HAVA & CO provisions' purposes were to prevent voter fraud)
  - Substantive due process and equal protection
    - No improper discrimination

    - Preventing voter fraud is a compelling interest since it is irreversible once vote is cast
    - Only marginally more intrusive than HAVA, many types of identification permitted – thus, valid

McKay v. Thompson, 2000

- Statute: mandated disclosure of SS # as a precondition to voter registration
- Claims:
  - Privacy Act, Section 7: ruled that Tennessee voter system exempt from Privacy Act because it is pre-75
  - NVRA, permitting only min. amt. of info. necessary to prevent duplicate registration and determine eligibility: ruled that NVRA does not specifically forbid the use of SS#s & the Privacy Act specifically permits them pre-75
  - Substantive due process: ruled that internal use of SS# not a burden
  - Free Exercise, based on Bible's supposed prohibition on use of universal identifiers: ruled that law is generally applicable and thus valid
  - P&I, Article IV: does not protect in-state citizens
  - P&I, 14th Amend.: no protection for privilege where Congress authorized its infringement

Kemp v. Tucker, 1975

- Statute: required name, occupation, address, sex, race, height, hair color, eye color, and date of birth be listed on voter registration card for identification purposes
- Claims:
  - VRA: ruled that race was not made a "qualification" for voting
  - 15th Amendment: ruled that it did not abridge right to vote on account of race because rejection of application was due to failure to provide information, not race; race only one factor in identification
  - 14th Amendment EPC: ruled there was no distinction among voters

Perez v. Rhiddlehoover, 1966

- Statute: date of birth, place of birth, mother's first or maiden name, color of eyes, sex, race, occupation, and whether owner, tenant or boarder must appear on the registration for identification
- Claims:
  - VRA: ruled that it was not a "test or device" because it applied equally
  - 15th Amendment: same reasons

Cases in Which the Plaintiffs Have Prevailed in Challenging the Statute Requiring Voter Identification:

***American Civil Liberties Union of Minnesota v. Kiffmeyer*, No. 04-CV-4653, 2004 WL 2428690, at *1 (D. Minn. Oct. 28, 2004).**

This was an action just before the November 2004 election for a temporary restraining order, which was granted. The ACLU challenged a Minnesota law allowing the use of tribal identification cards with the name, address, and photograph as a valid identification (equal to a driver's license) for use in "completing" an incomplete mail-in voter registration only if the Indian lives on the reservation. 2004 WL 2428690, at *1. The Court ruled that this distinction would likely violate the Equal Protection Clause because there was no rational basis for differentiating

between the validity of the identification based on whether or not the cardholder lives on the reservation. *Id.* at *1, 3.

Secondly, the ACLU challenged a second statute which allowed the use of certain photo identification lacking the voter's address to be used together with a utility bill or bank statement as valid identification for registration. *Id.* at *3. The statute did not, however, permit using a tribal identification for this same purpose. *Id.* The Court ruled that this likely violated the equal protection clause as well. *Id.*

***Greidinger v. Davis*, 988 F.2d 1344 (4th Cir. 1993).**

This case challenged a Virginia law requiring the social security number for voter registration, which the State subsequently disclosed to the public and political parties upon request in voter registration lists, which included the social security numbers. Failure to provide the social security number resulted in the denial of the registration application. The law was challenged under the Equal Protection Clause and under substantive due process. The Court quickly rejected the equal protection challenge because the law made no classification. 988 F.2d at 1350.

The law was invalidated under substantive due process. *Id.* at 1355. The Court found that the statutory scheme conditioned the fundamental right to vote on the consent to an invasion of privacy, based on concerns of identity theft. *Id.* at 1353-54. The Court found this to be a substantial burden on the right to vote. *Id.* at 1354. The Court recognized that the government's interest in preventing voter fraud was compelling. *Id.* However, the Court found that disclosure of the information to the public and political parties was not necessary to achieve that interest. *Id.* Disclosure of addresses or dates of birth would be sufficient to aid the public in distinguishing between two voters with the same name. *Id.* at 1355. The Court did state that required disclosure of the social security number for internal use only would be valid. *Id.* at 1354 n.10.

Cases in Which the Statute or Practice of Voter Identification Has Been Upheld:

***League of Women Voters v. Blackwell*, 340 F. Supp. 2d 823 (N.D. Ohio 2004).**

The League of Women Voters challenged the Secretary of State's directive that provisional ballots should be issued to all first-time voters who registered by mail without providing identification who cannot show proper identification at the polls. 340 F. Supp. 2d at 828. The Directive also stated that the provisional ballots would only be counted if the voter orally recited his driver's license number or the last four digits of his social security number or returned to the polling place before it closed with some acceptable identification, including reciting those identification numbers. *Id.* The Court stated that HAVA only requires verification of eligibility of first time voters registering by mail; it does not say how that should be done. *Id.* at 831. The Court found the burden on the right to vote to be slight. *Id.* The Directive was found valid under HAVA and the Supremacy Clause because the number of uncounted votes would be small, the requirement was reasonable, and there was adequate notice of the requirement on the registration forms. *Id.* at 829-30.

***Colorado Common Cause v. Davidson*, No. 04CV7709, 2004 WL 2360485, at *1 (Colo. Dist. Ct. Oct. 18, 2004).**

In this case, the validity of three Colorado statutory provisions was challenged. The laws (1) required <u>all</u> in-person voters to show identification (not just first-time registrants); (2) provided that votes cast in the wrong precinct would not be counted; and (3) provided that

provisional ballots would not be counted if the voter applied for an absentee ballot. 2004 WL 2360485, at *1. The plaintiffs also challenged the provisions under HAVA. The identification provision allowed nearly all forms of acceptable identification under HAVA. *Id.* at *6.

The challenge to the identification requirement failed under both challenges. The Court interpreted HAVA as not intended to preempt state laws and as permitting states to be more strict than, but not inconsistent with, HAVA. *Id.* at *10. The Court felt that the purpose of both laws was the same, to reduce voter fraud, and thus, both laws could coexist. As to the Constitutional claim, both equal protection and substantive due process, the Court felt that preventing voter fraud, which is impossible to remedy once a vote is cast, is a compelling interest, and the Court also felt that a voter identification requirement for all voters, with many types of acceptable identification, was only marginally more intrusive than HAVA. *Id.* at 12. The Court also found no improper discrimination between voters. *Id.* Thus, the provision was upheld.

***McKay v. Thompson*, 226 F.3d 752 (6th Cir. 2000).**

The Sixth Circuit ruled that the Privacy Act, the National Voter Registration Act, Substantive Due Process, the Privileges and Immunities Clauses (Fourteenth Amendment & Article IV), and the First Amendment right to free exercise do not prohibit requiring disclosure of social security numbers as a precondition to voter registration.

The Privacy Act, Section 7, mandates that it is unlawful for a government to deny a right or privilege because of a citizen's refusal to disclose his social security number, unless the disclosure was required for a system established prior to 1975. 226 F.3d at 755 (citing Privacy Act of 1974, Pub. L. No. 93-579 (1974)). Since Tennessee required social security numbers for voter registration since 1972, his challenge was rejected. 226 F.3d at 755. Second, the NVRA only permits requiring the minimum amount of information necessary to prevent duplicate voter registration and to determine eligibility. *Id.* at 755-56 (citing 42 U.S.C. §1973gg-3(c)(2)(B)). The Court rejected this challenge because the NVRA does not specifically forbid the use of social security numbers, and the Privacy Act, a more specific statute, grandfathered their use if prior to 1975. 226 F.3d at 756.

Finally, the plaintiff's constitutional claims were all rejected. His substantive due process claim was rejected because internal receipt and use of social security numbers does not burden the fundamental right to vote. *Id.* The free exercise challenge, based on the Bible's supposed prohibition of universal identifiers, was rejected because the law was generally applicable and not directed at particular religious practices. *Id.* The Privileges and Immunities Clause claim was rejected because the Clause does not apply to citizens of the state. *Id.* The Fourteenth Amendment Privileges and Immunities claim, based on the right to vote as unique to U.S. citizenship, was rejected because the Clause provides no protection where Congress has authorized the infringement. *Id.*

***Kemp v. Tucker*, 396 F. Supp. 737 (M.D. Pa. 1975), *aff'd*, 423 U.S. 803.**

A statute was upheld, which required name, occupation, address, sex, race, height, hair color, eye color, and date of birth to be recorded on the voter registration card and allowed registration officials to reject an incomplete application. 396 F. Supp. at 738. Claims were alleged under the Fourteenth Amendment's Equal Protection Clause, the Fifteenth Amendment, and the Voting Rights Act.

As to the Fourteenth and Fifteenth Amendment claims, the Court reasoned that preventing voter fraud is a compelling goal, and identification provisions are "an essential means of achieving the goal." *Id.* at 739. The Court also rejected the equal protection claim because the statutes did not create a distinction at all. *Id.* at 740 n.3. Since race is just one of

several characteristics required, the Court found that it was intended for preventing voter fraud, not some other motive. *Id.* at 740. As to the VRA, the Court rejected the claim that it added race as a qualification for voting as frivolous. *Id.* As to a Fifteenth Amendment claim that it abridged the right to vote on account of race, the Court also made a distinction between rejecting a voter application because of race and rejecting an application because of failure to answer all relevant questions to assist in preventing voter fraud. *Id.* The statute was upheld.

***Perez v. Rhiddlehoover,* 186 So. 2d 686 (La. Ct. App. 1966).**

A voter registration requirement was challenged and upheld. The statute stated that date of birth, place of birth, mother's first or maiden name, color of eyes, sex, race, occupation, and whether owner, tenant or boarder must appear on the registration. 186 So.2d at 690. This information was required for identification of voters, especially when voters had the same name, to prevent duplicate voting. It was challenged under the Voting Rights Act of 1965 Section 4(a) which prohibits denying the right to vote for failure to comply with a "test or device." The Court felt that this requirement was not a test or device for discrimination because it applied equally. *Id.* at 691. The Court also determined that it was not in conflict with the Fifteenth Amendment either. *Id.*

***Friendly House, et al. v. Janet Napolitano et al.,* CV 04-649 TUC DCB**

On November 30, 2004, the Mexican American Legal Defense and Educational Fund (MALDEF) filed suit seeking to halt the implementation of Proposition 200. . Proposition 200 created a number of legal requirements to ensure that public benefits are not available to illegal immigrants. In particular, Proposition 200 requires that a person attempting to register to vote provide one of six specific forms of proof of United States citizenship. Compl. 12-13. Also, any person attempting to vote must present either one form of photo identification or two forms of non-photo identification. *Id.* at 13.

The lawsuit alleges two violations that directly relate to the voting identification restrictions. First, the lawsuit alleges a violation of the Twenty-Fourth and Fourteenth amendments in that a voter must pay a poll tax by spending money to purchase the required identification. *Id.* at 20. Second, the lawsuit alleges violation of the Voting Rights Act. *Id.* at 21. The lawsuit was recently dismissed by the 9th Circuit Court of Appeals for a lack of standing. The Circuit Court found that there was no injury-in-fact, meaning that once an injury occurs the suit will likely be refiled. Additionally, it should be noted that the voter identification issue is only a part of the lawsuit, and much of the focus has been on other aspects of Proposition 200.

Current Litigation Concerning Voter ID Issues[1]

Litigation is filled with uncertainty. Litigation stemming from newly passed voter identification requirements will continue into the foreseeable future. Lawsuits are currently pending over voter identification requirements in Georgia and Indiana. Other states, such as Ohio, are considering new identification requirements that could lead to further litigation. The Georgia lawsuit has already succeeded in getting a preliminary injunction against the law in question, which will likely galvanize interested parties in other states to pursue similar litigation. Of course, if the injunction is eventually overturned at the appellate level it could have a similar chilling affect on future litigation.

This summary major litigation pending in Georgia and Indiana includes a brief assessment of the likelihood of success:

---

[1] As of January 2, 2006

Georgia (*Common Cause/Georgia v. Billups*):

On September 19, 2005, Common Cause of Georgia, in conjunction with several other non-profit organizations, filed suit in Federal District Court against the Georgia Secretary of State and other election officials, challenging the constitutionality of Georgia's new voter identification requirements. The new law requires all voters attempting to cast a ballot in person to present a valid form of photographic identification. O.C.G.A. § 21-2-417. A voter that is unable to provide proper identification is given a provisional ballot. However, that provisional ballot will be counted only if the voter is able to subsequently present valid identification within two days of the election. *Id.*

The lawsuit alleges five separate violations of state and federal law. First, the complaint alleges that the identification requirements infringe on the right to vote guaranteed in the Georgia constitution (Compl. 32)[2]. In addition, the Plaintiffs claim violations of the Federal Civil Rights Act and Voting Rights Act. (Compl. 36,38). Finally, the lawsuit alleges violations of the Fourteenth and Twenty-Fourth amendments to the U.S. Constitution. The complaint claims that the ID requirements constitute an "undue burden" on the right to vote, in violation of the Equal Protection Clause of the Fourteenth Amendment (Compl. 34). The ID requirement does not apply to most absentee voters, and thus the requirement is also over-broad and not narrowly tailored to address the stated purpose of preventing voter fraud (Compl. 34). The complaint further alleges that the cost of obtaining a photo ID constitutes a poll tax, in violation of the Twenty-Fourth Amendment, and that the cost is also a violation of the Fourteenth Amendment because it applies to voters who choose to vote in person, and not to those who vote absentee (Compl. 34,35).

On October 18, 2005, the District Court granted the Plaintiff's motion for a preliminary injunction, enjoining the application of the new identification requirements. In granting the injunction, the court held that both federal constitutional claims had a substantial likelihood of succeeding on the merits at trial (Prelim. Inj. 96, 104). The court also held that, while the two federal statutory claims were plausible, they both lacked sufficient evidence at the time to have a substantial likelihood of success. (Prelim. Inj. 109,111,116). Finally, the court held that the Georgia constitutional claim would be barred by the Eleventh Amendment to the U.S. Constitution. (Prelim. Inj. 77).

The Defendants appealed the motion for preliminary injunction to the Eleventh Circuit, and oral argument is scheduled for March 1, 2006. In addition, some news reports have claimed that the Georgia legislature is considering re-visiting the ID requirements in light of the on-going litigation.[3] As for the merits, in granting the preliminary injunction the District Court has already signaled its belief that the federal constitutional claims are likely meritorious. The Eleventh Circuit may have a different view, but for now the case looks to have a reasonable chance of success.

Indiana (*Indiana Democratic Party v. Rokita* and *Crawford v. Marion County Election Board*):

The Indiana lawsuit is similar to its Georgia counterpart in content, though not in status. In Indiana separate lawsuits, now joined, were filed by the state Democratic Party and the

---

[2] Litigation documents are available at the Election Law @ Moritz website. http://moritzlaw.osu.edu/electionlaw/litigation/index.php

[3] GA Legislature May Revisit Voter ID Law, State Net Capitol Journal, Dec. 19, 2005.

Indiana Civil Liberties Union (ICLU). The Democratic Party's lawsuit is directed against the Indiana Secretary of State, while the ICLU's lawsuit involves the Marion County Board of Elections and the State of Indiana. Like Georgia, Indiana law also requires citizens voting in person to present some form of official photo identification. IC § 3-11-8-25.1. Voters unable to present identification are given a provisional ballot, which is counted if they are able to provide the required identification by Noon on the second Monday following the election. IC § 3-11.7-5-1. Unlike Georgia, Indiana provides state issued identification at no charge. However, there are costs involved in the process, including transportation to the Bureau of Motor Vehicles, and payment for documents such as birth certificates, which are needed to obtain the ID. (Second Am. Compl. 6).

The Democratic Party's complaint raises Fourteenth Amendment claims similar to those in the Georgia lawsuit, including concerns about substantially burdening the right to vote, the enactment of a de-facto poll tax from the costs indirectly associated with obtaining ID, and the lack of applicability to voters who cast an absentee ballot. (Second Am. Compl. 6-9). In addition, the complaint alleges that the substantial burden placed on the right to vote violates the First Amendment protection of expressive or symbolic speech, as well as the freedom of association as applied to Democratic primary elections. (Second Am. Compl. 9-10). Finally, the complaint alleges violations of the Voting Rights Act, National Voter Registration Act, and the Help America Vote Act (Second Am. Compl. 10-11). The ICLU's complaint alleges many of the same violations, but also includes claims of a violation of Indiana's constitutional guarantee of a free and equal election system. (Compl. 15)

The case is currently in the pre-trial phase, with both sides awaiting decisions on their respective motions for summary judgment.[4] The likelihood of success is bolstered by the fact that the Fourteenth amendment constitutional claims have already been found persuasive by at least one other Federal District Court. However, the Indiana law is notably different than its Georgia counterpart in that it provides free identification. While the plaintiffs make a solid argument that related costs still amount to a poll-tax, it is possible that the court could distinguish on this matter.

Unlike the Georgia case, the Indiana lawsuit also claims a violation of the Help America Vote Act. Although the claim is not completely clear, it seems as though the Plaintiffs are arguing that the Indiana statute requires more stringent identification than what is required by HAVA. 42 U.S.C. § 15483(b)(1)-(2). While this is true, it is unclear how this violates the statute. HAVA merely states that certain voters unable to produce HAVA required identification be given a provisional ballot. *Id.* Indiana law meets this requirement. IC § 3-11-8-25.1. Although Indiana law requires more stringent identification for counting the provisional ballot, HAVA leaves theses decisions to state law. 42 U.S.C. § 15482(a).

---

[4] According to an AP article, the Plaintiffs filed some type of brief on December 21—however it is not yet up on the Moritz website and I am unsure how to access it otherwise.

Analysis of Effects of Voter Identification Requirements on Turnout

Tim Vercellotti
Eagleton Institute of Politics
Rutgers University
May 16, 2006

Introduction

A key area of disagreement in the policy debate over voter identification requirements concerns whether such requirements dampen turnout among those eligible to vote. Opponents of voter identification laws argue that they constitute an institutional barrier to voting, particularly among the poor, African-Americans, Hispanics, the elderly and people with disabilities (Baxter and Galloway 2005, Electionline.org 2002, Jacobs 2005, Young 2006). This argument holds that voter identification requirements create an extra demand on voters, and thus may discourage some of them from participating in elections. Further, critics of voter identification requirements contend that the effect is greater based on specific types of requirements. Critics argue that requiring voters to produce some form of government-issued photo identification on Election Day is more demanding than requiring, for example, that they state their names at the polling place because of the various steps needed to procure a photo identification card, such as a driver's license. Supporters of voter identification requirements, on the other hand, argue that the requirements are necessary to combat voter fraud, safeguard the integrity of the electoral process, and engender faith in the electoral process among citizens (Young 2006).

This report examines the potential variation in turnout rates based on the type of voter identification requirement in place in each state on Election Day 2004. This report draws from two sets of data – aggregate turnout data at the county level for each state, as compiled by the Eagleton Institute of Politics, and individual-level survey data included in the November 2004 Current Population Survey conducted by the U.S. Census Bureau. Classification of voter identification requirements comes from a review of state statutes conducted by the Moritz College of Law at the Ohio State University.

Types of voter identification requirements

Based on research by the Moritz College of Law, states had one of five types of requirements in place on Election Day 2004. Upon arrival at polling places, voters had to either: state their names (10 states); sign their names (13 states and the District of Columbia); match their signature to a signature on file with the local election board (seven states); provide a form of identification that did not necessarily include a photo (15 states); or provide a photo identification (five states).[5] It was then possible to code the states according to these requirements, and test the assumption that voter identification requirements would pose an increasingly demanding requirement in this order: stating one's name, signing one's name, matching one's signature to a signature on file, providing a form of identification, and providing a form of photo identification.

---

[5] Oregon conducts elections entirely by mail. Voters sign their mail-in ballots, and election officials match the signatures to signatures on file. For the purposes of this analysis, Oregon is classified as a state that requires a signature match.

But election laws in numerous states offer exceptions to these requirements if individuals lack the necessary form of identification, and laws in those states set a minimum standard that a voter must meet in order to vote using a regular ballot (as opposed to a provisional ballot). Thus it is also possible to categorize states based on the minimum requirement for voting with a regular ballot. In 2004 the categories were somewhat different compared to the maximum requirement, in that none of the states required photo identification as a minimum standard for voting with a regular ballot. Four states, however, required voters to swear an affidavit as to their identity (Florida, Indiana, Louisiana, and North Dakota). The five categories for minimum requirements were: state name (12 states), sign name (14 states and the District of Columbia), match one's signature to a signature on file (six states), provide a non-photo identification (14 states), or swear an affidavit (four states). For the purposes of this analysis I also tested the array of minimum identification requirements to assess whether they posed increasing levels of demand on the voter: state name, sign name, match signature, provide non-photo identification, and, given the potential legal consequences for providing false information, swearing an affidavit.

Estimating turnout among citizens in the voting-age population

This report examines turnout among U.S. citizens of voting age in both the aggregate- and the individual-level data. Determining citizenship status in the individual-level data simply involved restricting the analyses to individuals who identified themselves as citizens in the November 2004 Current Population Survey. (Those who said they were not citizens did not have the opportunity to answer the supplemental voting questions contained in the Current Population Survey.)

In the aggregate data, determining the percentage of the voting-age population that has U.S. citizenship posed a methodological challenge. The Census Bureau gathers information on the citizenship status of adults ages 18 and older only during the decennial census. While the Census Bureau provides annual estimates of the population to account for changes between decennial censuses, the bureau does not offer estimates for the proportion of the adult population who are citizens as part of the annual estimates. To address this issue I estimated the 2004 citizen voting-age population for each county using a method reported in the analysis of the 2004 Election Day Survey conducted for the U.S. Election Assistance Commission (U.S. Election Assistance Commission, 2005). I calculated the percentage of the 2000 voting-age population who were citizens in 2000, and applied that percentage to the July 1, 2004 estimates for voting-age population in each county. In other words, I assumed that the percentage of the voting-age population that had U.S. citizenship in 2004 was similar to the percentage of the voting-age population who were citizens in 2000.[6]

Analysis of aggregate data

If one treats maximum voter identification requirements as a continuous variable, with photo identification as the most demanding requirement, one finds some statistical support for the premise that as the level of required proof increases, turnout declines. Averaging across counties in each state, statewide turnout is negatively correlated with maximum voter

---

[6] McDonald and Popkin (2001) recommend an even more stringent approach to voter turnout calculations. They point out that voting-age population estimates include adults who are ineligible to vote (such as convicted felons), and the estimates overlook eligible citizens living overseas. While estimates of the voting-eligible population are available at the state level, I was unable to find such estimates for individual counties, which provide the unit of analysis for the aggregate data analyzed here.

identification requirements (r = -.30, p < .05). In considering the array of minimum requirements, with affidavit as the most demanding requirement, however, the correlation between voter identification and turnout is negative, but it is not statistically significant (r= -.20, p = .16). This suggests that the relationship between turnout rates and minimum requirements may not be linear. Breaking down the turnout rates by type of requirement reveals in greater detail the relationship between voter identification requirements and voter turnout.

[Table 1 here]

The aggregate data show that 60.9 percent of the estimated citizen voting age population voted in 2004. Differences in voter turnout at the state level in 2004 varied based on voter identification requirements. Taking into account the maximum requirements, an average of 64.2 percent of the voting age population turned out in states that required voters to state their names, compared to 58.1 percent in states that required photo identification. A similar trend emerged when considering minimum requirements. Sixty-three percent of the voting age population turned out in states requiring voters to state their names, compared to 60.1 percent in states that required an affidavit from voters. Given the lack of a clear, consistent linear relationship between turnout and minimum identification requirements, however, I opted to treat the voter identification requirements as a series of dichotomous variables in subsequent analyses.[7]

Voter identification requirements alone do not determine voter turnout. Multivariate models that take into account other predictors of turnout can paint a more complete picture of the relationship between voter identification requirements and turnout. I estimated the effects of voter identification requirements in multivariate models that also took into account the electoral context in 2004 and demographic characteristics of the population in each county.

I coded the voter identification requirements as a series of dummy variables, coding each variable as one if the requirement existed in a given state, and zero otherwise. This yielded five dichotomous variables for maximum requirements (state name, sign name, match signature, non-photo identification, or photo identification), and five dichotomous variables for minimum requirements (state name, sign name, match signature, non-photo identification, or providing an affidavit). I omitted the variable for stating one's name so that it could serve as the reference category in comparison with the other four identification requirements in each of the statistical analyses.

To capture electoral context I included whether the county was in a presidential battleground state (any state in which the margin of victory for the winning candidate was five percent or less), and whether the county was in a state with a competitive race for governor and/or the U.S. Senate (also using the threshold of a margin of victory of five percent or less). Another contextual factor to consider is voter registration requirements, such as the deadline for registration. As states set the deadline farther away from Election Day, the task of remembering to register to vote becomes more challenging. Thus I added a variable to reflect the number of days between each state's registration deadline and the election.[8]

---

[7] Treating maximum voter identification requirements as a continuous variable yielded results in which voter identification requirements were negatively related to aggregate turnout. Those results can be found in Table A-1 in the Appendix to this report.

[8] For states that had Election Day registration or no registration requirement (North Dakota), I assigned a value of zero to this variable.

Drawing from U.S. Census projections for 2003, I included the percentage of the voting-age population in each county that was Hispanic or African-American to control for ethnicity and race. I controlled for age using the 2003 Census projection for the percentage of county residents age 65 and older, and I controlled for socioeconomic status by including the median household income for 2002 in each county.[9]

I estimated a series of random effects models to account for the likelihood that data from counties were correlated within each state (for further explanation of random effects and other multilevel models, see Bryk and Raudenbush 1992, Luke 2004, Singer 1998).[10] I allowed the median income variable to have both fixed and random effects in each state to take into account variation in the cost of living in each state. The dependent variable in each model was voter turnout at the county level, with turnout calculated as the percentage of the estimated citizen voting-age population that voted in the 2004 election.

[Table 2 here]

Turning first to an analysis using the maximum identification requirements, two of the four requirements had a small and negative effect on turnout in 2004: matching one's signature and providing a non-photo identification. Taking into account the reference variable of stating one's name, the results indicate that turnout was lower in states that required signature matches or a non-photo identification than in states that required voters to simply state their name, holding constant the electoral context and demographic variables.

Two contextual factors -- whether the county was in a state that was a battleground state and whether that state had a competitive race for governor and/or U.S. Senate– increased voter turnout. The time between the closing date for registration and the election had a slight negative effect on turnout. As the percentage of Hispanics in the county's population increased, turnout declined. The percentage of senior citizens in the county and household median income had positive effects on turnout. The percentage of African-Americans in the county did not have a significant effect.

The effects of the minimum voter identification requirements were non-existent. None of the dummy variables for voter identification requirements were statistically significant. Being a battleground state and having a competitive statewide race were significant and positive, as was the percentage of senior citizens in the county and household median income. The percentage of Hispanics in the county's population continued to have a negative effect on turnout, as did the number of days between the closing date for registration and the election.

I then sought to test the hypothesis that voter identification requirements dampen turnout among minorities, a claim voiced by some critics of the requirements. To test this idea I incorporated a series of interactions between the maximum and minimum voter identification requirements and the percentage of African-Americans and Hispanics living in the counties. In each case the interactions did not improve the fit of the models to the data. A chi-square test of the difference in the deviance for each model (represented by -2 log likelihood in Table 2),

---

[9] To bring the income figures into a scale comparable to those of the other variables, I used the natural log of median household income.

[10] The data analyses provided evidence that there was, indeed, a clustering of data within each state. The intraclass correlation, bounded by 0 and 1, measures the variation between the states. A random intercept model using only the intercept as a predictor generated an intraclass correlation of .43, indicating considerable variation between the states.

showed no significant improvement by including the interactions ($p > 0.05$). I report the coefficients for the models with the interactions in the Appendix in tables A-2 and A-3.

Analysis of the aggregate data at the county level generates some support for the hypothesis that as the identification requirements for voting vary, so does turnout. Specifically, in terms of the maximum requirements, the results suggest that requiring a signature match or non-photo identification is negatively related to turnout compared to requiring that a voter state his or her name. But the analysis showed that adding interactions between identification requirements and the percentage of the county that was African-American or Hispanic did not improve the fit of the model to the data.

Aggregate data, however, cannot fully capture the individual demographic factors that may figure into the decision to turn out to vote. For example, previous research has found that education is a powerful determinant of turnout (Wolfinger and Rosenstone 1980, but see also Nagler 1991).[11] Married individuals also are more likely to vote than those who are not married (Alvarez and Ansolabehere 2002; Alvarez, Nagler and Wilson 2004; Fisher, Kenny, and Morton 1993). To fully explore the effects of voter identification requirements on turnout, it is important to examine individual-level data as well.

Individual-level analysis

Individual-level turnout data exists in the November 2004 Current Population Survey conducted by the U.S. Census Bureau. The Census Bureau conducts the CPS monthly to measure unemployment and other workforce data, but the bureau adds a battery of voter participation questions to the November survey in even-numbered years to coincide with either a presidential or midterm Congressional election.

One of the advantages of the CPS is the sheer size of the sample. The survey's Voting and Registration Supplement consisted of interviews, either by telephone or in person, with 96,452 respondents.[12] The large sample size permits analyses of smaller groups, such as Black or Hispanic voters or voters with less than a high school education. The analyses reported here are based on reports from self-described registered voters. I omitted those who said they were not registered to vote. I also excluded those who said they cast absentee ballots because the identification requirements for absentee ballots may differ from those required when one votes in person. In addition, I eliminated from the sample respondents who said they were not U.S. citizens because the questionnaire design skipped those individuals past the voter registration and turnout questions in the survey.

The dependent variable in these analyses is whether a respondent said he or she voted in the November 2004 election.[13] As in the analysis of aggregate data, I coded the voter

---

[11] A reviewer for an earlier version of this paper recommended adding an education variable to the aggregate model. One version of the aggregate model not reported here included the percentage of adults in the county who had at least a college degree. The measure was highly collinear with the percentage of residents living below the poverty line, necessitating removal of the college degree variable from the model.

[12] It is important to note that the Census Bureau allows respondents to answer on behalf of themselves and others in the household during the interview. While proxy reporting of voter turnout raises the possibility of inaccurate reports concerning whether another member of the household voted, follow-up interviews with those for whom a proxy report had been given in the November 1984 CPS showed 99 percent agreement between the proxy report and the information given by the follow-up respondent (U.S. Census Bureau 1990).

[13] The U.S. Census Bureau reported, based on the November 2004 CPS, that 89 percent of those who identified themselves as registered voters said they voted in 2004 (U.S. Census Bureau 2005). Previous research has shown

identification requirements as a series of dummy variables, coding each variable as one if the requirement existed in a given state, and zero otherwise. This yielded five dichotomous variables for maximum requirements (state name, sign name, match signature, non-photo identification, or photo identification), and five dichotomous variables for minimum requirements (state name, sign name, match signature, non-photo identification, or providing an affidavit). I omitted the variable for stating one's name so that it could serve as the reference category in comparison with the other four identification requirements in each of the statistical analyses.[14]

In addition to the voter identification requirements, the models include two other state-level factors that might have influenced turnout in 2004: whether the state was considered a battleground state in the presidential election, and whether there was a gubernatorial and/or U.S. Senate race in the state (see Alvarez and Ansolabehere 2002, Alvarez et al. 2004, and Kenny et al. 1993 for similar approaches). As in the aggregate data analysis, the threshold that determined whether the state was a battleground state or had a competitive statewide race was a margin of victory of five percent or less.[15] At the individual level, I controlled for gender, household income, and dummy variables for race/ethnicity, age and education. In terms of race and ethnicity, I created dummy variables to represent whether a voter was Black/non-Hispanic, Hispanic, or Asian (with white/non-Hispanic/other voters as the omitted category for reference purposes). I separated education into five dummy variables: less than high school, high school diploma, some college, college graduate, and graduate training. I omitted the "less than high school" variable from the model for reference purposes. Regarding age, I created four dummy variables to represent 18 to 24 years of age, 29 to 44, 45 to 64, and 65 years and older. I omitted the 18-to-24 category as the reference variable in the model.

Drawing on previous research on voting behavior, I also controlled for whether an individual was employed, or at least a member of the workforce (as opposed to being a full-time student, a homemaker, or retired). Both employment and workforce membership have been shown to be positive predictors of turnout (see Mitchell and Wlezien 1995). Marital status, whether one is a native-born citizen and residential mobility also have emerged as significant predictors of turnout (Alvarez and Ansolabehere 2002, Alvarez et al. 2004, Kenney et al. 1993, Wolfinger and Rosenstone 1980). I included in the model variables for whether a respondent was married (coded 1 if yes, 0 otherwise), and whether one was a native-born citizen (coded 1 if yes, 0 otherwise). I measured residential mobility by coding for whether the respondent had moved to a new address in the six months prior to the interview (coded 1 if yes, 0 otherwise).

Results

---

that, generally speaking, some survey respondents overstate their incidence of voting. Researchers speculate that over-reports may be due to the social desirability that accompanies saying one has done his or her civic duty, or a reluctance to appear outside the mainstream of American political culture (U.S. Census Bureau 1990). It is also possible that voting is an indication of civic engagement that predisposes voters to agree to complete surveys at a higher rate than non-voters (Flanigan and Zingale 2002). Hence the voter turnout rates reported in the CPS tend to be up to 10 percentage points higher than the actual turnout rate for the nation (Flanigan and Zingale 2002). Even with this caveat, however, the CPS serves as a widely accepted source of data on voting behavior.

[14] Earlier versions of this paper included an individual-level analysis that included the five maximum voter identification requirements combined into a continuous variable. The results of that analysis, which found that voter identification requirements had a negative relationship with turnout, can be found in table A-4 in the Appendix.

[15] Given that the individual-level analysis focused on registered voters (as opposed to the citizen voting-age population in the aggregate analysis), I did not include the closing date for registration as a predictor of turnout in the individual-level analysis.

The dependent variable is whether a respondent said he or she voted in the November 2004 election (coded 1 for yes, 0 for no). I estimated models using probit analysis, which calculates the effects of independent variables on the probability that an event occurred – in this case whether a respondent said he or she voted. I estimated the models using robust standard errors to control for correlated error terms for observations from within the same state.

[Table 3 here]

The two models in Table 3 use either the maximum or minimum voter identification requirements in each state. The two models generate similar results. In each model, three of the voter identification requirements exert a statistically significant, negative effect on whether survey respondents said they had voted in 2004. In other words, compared to states that require voters only to state their names, the requirements to sign one's name, provide a non-photo identification, photo identification in the maximum requirements or affidavit in the minimum requires exert a negative influence on turnout.

Of the other state factors, only the competitiveness of the presidential race had a significant effect on turnout. In terms of demographic influences, African-American voters were more likely than white voters or other voters to say they had cast a ballot, while Asian-Americans were less likely than white or other voters to say they had turned out. Hispanic voters were not statistically different from white or other voters in terms of reported turnout. Consistent with previous research, income, and marital status all were positive predictors of voting. Women also were more likely to say they voted than men. Among the age categories, those ages 45 to 64 and 65 and older were more likely than those ages 18 to 24 to say they voted. Respondents who had earned a high school diploma, attended some college, graduated from college or attended graduate school were all more likely to say they voted than those who had finished high school. Respondents who had moved within six months before the interview were less likely to say they had voted.

While the probit models provide statistical support for the influence of voter identification requirements and other variables on turnout, probit coefficients do not lend themselves to intuitive interpretation. Another common approach in studies of election requirements is to examine how the predicted probability of voter turnout would vary as election requirements vary. I used the probit coefficients to calculate the predicted probability of voting at each level of voter identification requirements while holding all other independent variables in the models at their means.[16] I calculated the probabilities taking into account both maximum and minimum requirements.

[Table 4 here]

Taking into account that signature matches were not a predictor of turnout, the differences in predicted probability appear to decline from stating one's name to providing a photo identification or affidavit. Voters in states that required photo identification were 2.7 percent less likely to vote than voters in states where individuals had to give their names.[17] In terms of the

---

[16] In the case of dichotomous independent variables, holding them at their mean amounted to holding them at the percentage of the sample that was coded 1 for the variable (Long 1997).

[17] The voter turnout percentages may seem disproportionately high compared to the turnout rates reported in the aggregate data analysis. It is important to consider that the turnout rates in the aggregate data were a proportion of

minimum requirement, voters in states that required an affidavit at minimum were 4 percent less likely to turn out than voters in states where they had to give their names.

The differences were more pronounced for those lower in education. Constraining the model to show predicted probabilities only for those with less than a high school diploma, the probability of voting was 5.1 percent lower in states that required photo identification as the maximum requirement and 7 percent lower in states that required an affidavit as the minimum requirement compared to states where stating one's name was the maximum or minimum requirement.

Race and ethnicity have generated particular interest in the debate over voter identification requirements. But incorporating dummy variables for Hispanics, African-Americans, and Asian-Americans into one model carries the implicit assumption that the remaining variables, including education and income, will influence each of these groups in a similar manner in terms of deciding whether to vote. These assumptions are not always born out by the data (see Leighley and Vedlitz, 1999.) To isolate the effects of voter identification and other variables on voter turnout within specific racial and ethnic groups, I divided the sample into sub-samples and re-ran the probit models.

[Table 5 here]

The effects of voter identification requirements were similar for white voters compared to the entire sample, which was not surprising given that white voters comprised 81 percent of the sample. Voters in states where the maximum requirement involved signing one's name, providing a non-photo identification or photo identification were less likely to vote than those in a state that required voters to give their names. Taking into consideration the minimum requirements, this was true only for voters in states that require a non-photo identification or an affidavit. White voters in photo identification states were 3.7 percent less likely to vote than were white voters in states where respondents gave their names. The difference in probability was 4.4 percent for voters in states where an affidavit was the minimum requirement.

Voter identification requirements also influenced turnout among Black voters, but to a lesser extent relative to white voters.

[Table 6 here]

Of the maximum voter identification requirements, only the non-photo identification requirement reduced turnout compared to turnout in states that required voters to state their names. The predicted probability of voting was 5.7 percent lower for Black respondents in states that required non-photo identification. In terms of age, only African-Americans age 65 and older were more likely to vote than respondents in the 18 to 24 referent group. Respondents in all levels of education were more likely to vote than respondents without a high school diploma. Gender, income, living in a battleground state, being a part of the workforce and having been born in the United States also were positive predictors. Recent mobility tended to lower the probability of voting. None of the minimum identification requirements had a significant effect on voting, while most of the remaining variables had effects similar to those in the maximum requirement model.

---

all citizens of voting-age population, while the turnout rates for the individual-level data are the proportion of only registered voters who said they voted.

Hispanic voters also were less likely to vote in states that required non-photo identification as opposed to stating one's name.

[Table 7 here]

Using the coefficients from Table 7 to calculate predicted probabilities, for both the maximum and minimum requirements, Hispanic voters were 10 percent less likely to vote in non-photo identification states compared to states where voters only had to give their name. Hispanic voters ages 45 to 64 and 65 and over were more likely to vote than their 18-to-24-year-old counterparts. Education and income also were positive predictors of voting. Interestingly, being a native-born citizen lowered the probability of voting, while native-born citizenship was a positive predictor for African-American voters and was not a predictor at all for white voters. It may be that naturalized citizens of Hispanic descent are more conscious of the value of voting rights than other groups.

Varying voter identification requirements influenced Asian-American voters as well. As with Hispanic and Black voters, Asian-American voters were less likely to turn out in states with non-photo identification requirements than in states where voters gave their names.

[Table 8 here]

Using the probit coefficients to calculate predicted probabilities, Asian-American voters were 8.5 percent less likely to vote in states that required non-photo identification compared to states that require voters to state their names under the maximum requirements, and they were 6.1 percent less likely to vote where non-photo identification was the minimum requirement. Asian-American voters also were 2.2 percent less likely to vote when signatures were the maximum requirement compared to stating one's name.

In terms of other predictors, there were no significant differences in terms of age or income. In contrast to Hispanic voters, where one was a naturalized or natural-born citizen did not affect the probability of voting. Those with high school or college diplomas or graduate training were more likely to turn out than those with less than a high school diploma. Women and married voters also were more likely to turn out than men and voters who were note married.

Discussion and conclusion

The results presented here provide evidence that as voter identification requirements vary, voter turnout does as well. This point emerged from both the aggregate data and the individual-level data, although not always for both the maximum and minimum sets of requirements. The overall effect for all registered voters was fairly small, but still statistically significant.

In the aggregate data, requirements that voters match signatures on file, provide a non-photo identification or photo identification had negative effects on turnout compared to requiring that voters state their names. Interactions with specific groups – African-Americans and Hispanics – did not improve the fit of the aggregate data to the models. But differences emerged among specific groups in the individual-level data. The signature, non-photo identification and photo identification requirements all had negative effects compared to the requirement that voters simply state their names. These effects translated into reduced probabilities of voting of about 3 to 4 percent for the entire sample, with larger differences for specific subgroups. For

example, the predicted probability that Hispanics would vote in states that required non-photo identification was about 10 percentage points lower than in states where Hispanic voters gave their names. The difference was about 6 percent for African-Americans and Asian-Americans, and about 2 percent for white voters (the gap widened to 3.7 percent for white voters when comparing photo identification to simply stating one's name).

That the non-photo identification requirement was the most consistent in terms of statistical significance across the groups is intriguing given the intense debates surrounding photo identification requirements. This begs the question as to why photo identification requirements did not have a greater influence in 2004. It may have been due to the fact that photo identification was a maximum requirement in only five states, and each of those states accepted another type of identification as a minimum requirement.

In examining the effects of voter identification requirements on turnout, there is still much to learn. The data examined in this project could not capture the dynamics of how identification requirements might lower turnout. If these requirements dampen turnout, is it because individuals are aware of the requirements and stay away from the polls because they cannot or do not want to meet the requirements?[18] Or, do the requirements result in some voters being turned away when they cannot meet the requirements on Election Day? The CPS data do not include measures that can answer this question. Knowing more about the "on the ground" experiences of voters concerning identification requirements could guide policy-makers at the state and local level in determining whether and at what point in the electoral cycle a concerted public information campaign might be most effective in helping voters to meet identification requirements. Such knowledge also could help in designing training for election judges to handle questions about, and potential disputes over, voter identification requirements.

---

[18] The individual-level data offer some insight here. If advance knowledge of the voter identification requirements were to dampen turnout, it is reasonable to expect that advance knowledge of those requirements also could discourage some individuals from registering to vote. I ran the same probit models using the November 2004 Current Population Survey data and voter registration as the dependent variable (coded 1 if the respondent said he or she was registered, and 0 if the respondent was not registered). Of all of the voter identification requirements, only requiring signatures or matching signatures had a significant effect on whether a respondent said he or she was registered to vote in 2004. In each instance the effect was negative.

State Statutes and Regulations Affecting Voter Identification

Compiled by The Moritz College of Law, The Ohio State University

Available in electronic form

FINAL DRAFT
For Review by the Standards Board and Board of Advisors

Report to the
U. S. Election Assistance Commission
On
Best Practices to Improve Voter Identification Requirements
Pursuant to the
HELP AMERICA VOTE ACT OF 2002
Public Law 107-252

May 16, 2006

Submitted by

The Eagleton Institute of Politics, Rutgers, The State University of New Jersey

The Moritz College of Law, The Ohio State University

The Research Team

This research report on Voter Identification Requirements in the 2004 election is part of a broader analysis that also includes a study of Provisional Voting, which has already been submitted to the EAC. Conducting the work was a consortium of The Eagleton Institute of Politics of Rutgers, The State University of New Jersey, and The Moritz College of Law of The Ohio State University.

The Eagleton Institute explores state and national politics through research, education, and public service, linking the study of politics with its day-to-day practice. It focuses attention on how contemporary political systems work, how they change, and how they might work better. Eagleton regularly undertakes projects to enhance political understanding and involvement, often in collaboration with government agencies, the media, non-profit groups, and other academic institutions.

The Moritz College of Law has served the citizens of Ohio and the nation since its establishment in 1891.It has played a leading role in the legal profession through countless contributions made by graduates and faculty. Its contributions to election law have become well known through its Election Law @ Moritz website. *Election Law @ Moritz* illuminates public understanding of election law and its role in our nation's democracy.

Peer Review Group

A draft of this report and the statistical analysis in its appendix were critiqued by a Peer Review Group. The comments of its members improved the quality of our work. While the Group as a whole and the comments of its members individually contributed generously to the research effort, any errors of fact or weaknesses in inference are the responsibility of the Eagleton-Moritz research team. The members of the Peer Review Group do not necessarily share the views reflected in our recommendations.

REVISED FINAL DRAFT
For review by the EAC Advisory Boards

REPORT AND RECOMMENDATIONS TO THE EAC VOTER IDENTIFICATION ISSUES

Report Background

The Help America Vote Act of 2002 (HAVA) (Public Law 107-252) authorizes the United States Election Assistance Commission (EAC) (Sec. 241, 42 USC 15381) to conduct periodic studies of election administration issues. The purpose of these studies is to promote methods for voting and administering elections, including provisional voting, that are convenient, accessible and easy to use; that yield accurate, secure and expeditious voting systems; that afford each registered and eligible voter an equal opportunity to vote and to have that vote counted; and that are efficient.

This study provides information on voter identification practices in the 2004 election. It makes recommendations for best practices to evaluate future proposals for voter ID requirements, including the systematic collection and evaluation of information from the states. The research was conducted by the Eagleton Institute of Politics at Rutgers, the State University of New Jersey, and the Moritz College of Law at the Ohio State University under a contract with the EAC, dated May 24, 2005. The work included a review and legal analysis of state statutes, regulations and litigation concerning voter identification and provisional voting as well as a statistical analysis of the relationship of various requirements for voter identification to turnout in the 2004 election. This report is a companion to a report on Provisional Voting submitted to the EAC on November 28, 2005 under the same contract.

EXECUTIVE SUMMARY AND RECOMMENDATIONS

Background and Methods

This report arrives at a time of considerable ferment over the issue of voter identification. The debate across the nation over requiring voters to produce a specific identification document before being permitted to cast a regular (as opposed to a provisional) ballot, has revealed supporters and opponents in polarized camps.

- Proponents of stricter identification requirements base their case on improving the security of the ballot by reducing opportunities for one kind of vote fraud --multiple voting or voting by those who are not eligible. The proponents argue that their goal is to ensure that only those legally entitled to vote do so, and do so only once at each election.

- Opponents seek to forestall more stringent identification requirements, such as for government-issued photo ID, in order to ensure broad access to a regular ballot. They fear that some voters --such as, they argue, racial and ethnic minorities, the young, and elderly voters-- may lack convenient access to the required ID documents, or that such voters may be fearful of submitting their ID documents to official scrutiny and thus stay away from the polls.
- Both sides argue that their preferred policy will engender faith in the electoral process among citizens.

This report considers policy issues associated with the voter ID debate and investigates whether empirical study can suggest a way to estimate the effects of different voter ID requirements on turnout, and important first step in assessing tradeoffs between ballot security and ballot access. The aim is to contribute to the effort to raise the quality of the debate over this contentious topic. The tradeoffs between ballot security and ballot access are crucial. A voting system that requires voters to produce an identity document or documents may prevent the ineligible from voting. It may also prevent eligible voters from casting a ballot. If the ID requirement of a ballot protection system blocks ineligible voters from the polls at the cost of preventing eligible voters who lack the required forms of identification, the integrity of the ballot may not have been improved; the harm may be as great as the benefit.

As part of the project's effort to analyze the relationship between Voter ID requirements, turnout, and their policy implications, a statistical analysis was conducted to examine the potential variation in turnout. This statistical study developed a model to illuminate the relationships between voter ID requirements and turnout. This model's findings and limitations suggest avenues for further research and analysis that may assist the EAC and the states as they explore policies to balance the goals of ballot integrity and ballot access.

The statistical analysis describes one possible way to estimate what might be the incremental effect on voters' access to the ballot of an increase in the rigor of voter identification requirements. We do not offer this statistical analysis as the last word, but rather as a preliminary word on the subject. Its findings must be regarded as tentative; the information that might permit greater certainty is simply not available. Indeed, as our recommendations indicate, the next step to improve understanding of the effects of stricter voter identification on turnout and on vote fraud is to collect more information on both topics systematically and regularly.

Making a statistical estimate of the effect of voting regulations on turnout is difficult. The dynamics of turnout are complex, much studied, and only partially understood. Some agreement exists, however, that three factors that exert substantial influence on voter turnout are:[1] the socioeconomic status of the potential voter; legal requirements to vote; and the political context of the election. By focusing on how voters identify themselves at the polls, this report emphasizes legal requirements. The statistical analysis also consides some of the socioeconomic, racial, and age characteristics of the electorate, as well as the political context in 2004 (such as whether a state was a battleground in the presidential race).

Examining tradeoffs between ballot security and ballot access requires some measure of the effectiveness of voter ID requirements in reducing multiple voting or voting by ineligible voters. The existing evidence on the incidence of vote fraud, especially on the kind of vote fraud that could be reduced by requiring more rigorous voter identification, is not sufficient to evaluate those tradeoffs.[2] Assessing the effectiveness of voter ID as a way to protect the integrity of the ballot should logically include an estimate of the nature and frequency of vote fraud. This research does not include consideration of vote fraud, nor does it estimate the possible effectiveness of various voter ID regimes to counter attempts at vote fraud. Our analysis also cannot take into account how many potential voters who did not turn out under comparatively stricter voter ID requirements might have been ineligible or eligible to vote.

Despite these qualifications regarding the quality of the available data and the limitations of statistical analysis, however, although it used different statistical methods and two different sets of data on turnout in 2004 election, it points to the same general finding. As discussed at greater length in the appendix to this report, stricter voter identification requirements were correlated with reduced turnout in the models employed.[3] As explained below, these models find that a statistically significant relationship exists, even when controlling for other factors (such as whether the election was in a battleground state) that might affect turnout. Without knowing more about the effects of stricter voter ID on reducing multiple voting or voting by ineligible

---

[1] See, for example, Tom William Rice and Patrick J. Kenney, "Voter Turnout in Presidential Primaries." 1985. Political Behavior, 7: 101-112. Identification requirements are not the only legal restrictions on voting. States also differ, for example, in their registration requirements (including how long before the election registration must take place and the identity documents required register).

[2] The EAC has contracted with other researchers to study vote fraud issues.

voters, however, the tradeoffs between ballot security and ballot access cannot be assessed fully.

Methodology

The report includes detailed information on the nature of the statutory requirements across the country in 2004 and on the statutes and court decisions that provide the legal context for the voter ID debate. We gathered information on the requirements in effect in the 50 states and the District of Columbia in that year. Based on our interpretation of state statutes, supplemented in some cases by conversations with state election officials, we divided the states' ID requirements into five categories. We believe each category is more rigorous than the one preceding, based on the demands they make on voters.[4] The categories range from "Stating Name" which we judge to be somewhat less demanding than "Signing Name." "Signature Match" requires poll workers to examine the signature and compare it to a sample, which is slightly more demanding that the voter simply signing. "Present ID" requires voters to offer some documentary evidence of their identity, ranging from a utility bill to a passport. It is more demanding than the previous three categories because it requires that the voter remember to bring this documentation to the polls. (Even a simple ID, such as a utility bill, may not be available to some renters or, say, those in group housing.) We regard a government "Photo ID" as the most rigorous requirement. Such identity documents may not be uniformly and conveniently available to all voters.

For each state, we identified both the "maximum" and "minimum" identification requirements. The term "maximum" refers to the most that voters may be *asked* to do or show at the polling place (putting aside cases in which particular voter's eligibility may be questioned pursuant to a state challenge process). The term "minimum," on the other hand, refers to the most that voters can be *required* to do or show, in order to cast regular ballot (again leaving aside a state challenge process). We have included "maximum" requirements in our analysis, and not simply "minimum" requirements, because simply asking voters to produce particular identifying information may have a deterrent effect, even if voters are ultimately allowed to cast a regular ballot without that identification. For example, in a state where voters are asked to show photo ID at the polling place, but still allowed to vote by completing an affidavit confirming their eligibility, the "maximum" of being asked to show photo ID may deter some voters even though the "minimum" would allow them to vote without photo ID.

---

[4] Even the most relaxed provisions for identification at the polls –anything stricter than the honor system used in North Dakota—will impose some burden on particular voters. Harvard Law Review 119:1146

It is worth emphasizing that, at the time of the 2004 election, there was *no* state that had a "minimum" requirement of showing photo ID – in other words, there was no state that required voters to show photo ID in order to cast a regular ballot. For this reason, our report does not measure the impact of laws, like those recently enacted in Indiana and Georgia, which require voters to show photo ID in order to cast a regular ballot without an affidavit exception.

To examine the potential variation on turnout rates associated with each type of voter ID requirements in effect on Election Day 2004, the statistical analysis drew on two sets of data. These were, first, aggregate turnout data at the county level for each state and, second, the reports of individual voters collected in the November 2004 Current Population Survey by the U. S. Census Bureau. Using two different data sets makes it possible to check the validity of one analysis against the other. It also provides insights not possible using only one of the data sets. The aggregate analysis cannot provide valid estimates on the effects of different ID requirements on particular demographic groups (e.g., the old, the young, African-Americans, the poor, or high school graduates). The Current Population Survey data does permit that kind of analysis, although it has the disadvantage of relying on self-reports by respondents about their registration status and experience in the polling place.

To understand legal issues that have been raised in recent litigation over voter ID requirements, we collected and analyzed the few major cases that have been decided so far on this issue. The decisions so far provide some guidance on the constitutional and other constraints as to voter ID requirements.

Summary of Findings

As voter identification requirements vary, voter turnout varies as well. This finding emerged from both the statistical analysis's aggregate data and the individual-level data, although not always for both the maximum and minimum sets of requirements. The overall relationship between the stringency of ID requirements and turnout was fairly small, but still statistically significant.

In the model used with the aggregate data in the statistical analysis, the match signature requirement, the provide a non-photo ID requirement, and the photo ID requirement were all correlated with lower turnout compared to requiring that voters state their names. With the addition of the registration closing data to the aggregate analysis, photo id is no longer a

significant predictor of turnout. Signature match and non-photo id remain significant and negative predictors in the model.

The reduction in turnout was not the same for all demographic groups in the citizen voting age population.

.

The non-photo identification requirement showed the most significant and consistent correlation with reduced turnout. This result may be surprising given the intense debates surrounding photo identification requirements. The effect of photo ID requirements cannot, however, be assessed from the data the statistical analysis examined, since none of the states had laws in 2004 that conditioned voting on presentation of photo ID. Each of the five states that had photo ID as a "maximum" requirement (i.e., the most that voters could be asked to show at the polls) accepted another type of identification or an affidavit as a "minimum" requirement in the 2004 election (i.e., they were allowed to cast a regular ballot with something less than photo ID).

Significant questions about the relationship of voter identification requirements to turnout remain unanswered. The data examined in this project could not capture the dynamics of how identification requirements might lower turnout. If ID requirements dampen turnout, is it because individuals are aware of the requirements and stay away from the polls because they cannot or do not want to meet the requirements? Or, do the requirements result in some voters being turned away when they cannot meet the requirements on Election Day? Other factors that may also be correlated with stricter ID laws – such as less user-friendly voter registration systems – may actually be causing lower turnout. The CPS data do not include the information needed to answer this question. Knowing more about the "on the ground" experiences of voters concerning identification requirements could guide policy-makers at the state and local level in determining whether and at what point in the electoral cycle a concerted public information campaign might be most effective in helping voters to meet identification requirements. Such knowledge also could help in designing training for election judges to handle questions about, and potential disputes over, voter identification requirements.

Our analysis of litigation suggests that the courts will look more strictly at requirements that voters produce a photo ID in order to cast a regular ballot, than at non-photo ID laws. The courts have used a balancing test to weigh the legitimate interest in preventing election fraud against the citizen's right to privacy (protecting social security numbers from public disclosure, for

example) and the reasonableness of requirements for identity documents. To provide both the clarity and certainty in administration of elections needed to forestall destabilizing challenges to outcomes, a best practice for the states may be to limit requirements for voter identification to the minimum needed to prevent duplicate registration and ensure eligibility.

The current lack of understanding of precisely how voter ID requirements affect turnout could be ameliorated by requiring the collection and reporting of additional data, including the reasons potential voters are required to cast a provisional ballot and the reasons for rejecting provisional ballots during the 2006 and subsequent elections. Also useful would be the results of surveys of voters on their experiences in meeting voter ID requirements and on what type of ballot they cast.[5] And, of course, more information is needed on the incidence and varieties of vote fraud, but that inquiry is outside the scope of this report.

Recommendations for consideration and action by the EAC

The dynamics of Voter ID requirements –how more rigorous voter ID requirements may affect the decision by potential voters to go or stay away from the polls-- are not perfectly understood. This lack of understanding should be recognized in the policy process in the states. The debate over voter ID in the states would be improved by additional research sponsored by the EAC.

The EAC should consider the following actions to improve understanding of the relationship between voter ID requirements and the two important goals of ensuring ballot access and ensuring ballot integrity.

1. Encourage or sponsor further research to clarify the connection between Voter ID requirements and the number of potential voters actually able to cast a ballot that is actually counted.
2. Recommend as a best practice the publication of a "Voting Impact Statement" by states as they assess their voter ID requirements to protect the integrity of the ballot. The analysis will help ensure that efforts to increase ballot security have a neutral effect on electoral participation by eligible voters. The Voter Impact Statement would estimate the number and demographics of 1) eligible, potential voters that may be kept from the polls

---

[5] Arizona held its first election with its new, stricter ID requirements on March 14, 2006. In at least one county (Maricopa) election officials handed a survey to voters that asked if they knew about the voter identification law and if they did, how they found out about it. Edythe Jensen, "New Voter ID Law Goes Smoothly in Chandler," *Arizona Republic*, March 15, 2006. More surveys of this kind can illuminate the dynamics of voter ID and voting in ways that are not possible now because of insufficient data.

or permitted to cast a provisional ballot by a stricter ID requirement; and 2) and assess the number of ineligible voters who will be prevented from voting by the stricter ID requirements.

3. Encourage or require the states in the 2006 election and beyond, to collect and report reliable, credible information on the relationship between ballot access and ballot security. EAC should publish an analysis of this information to provide a sound factual basis for the states to consider as they estimate the incidence of the kinds of vote fraud that more stringent ID requirements may prevent. The analysis should describe the dynamics of the voter ID process in preserving the security of the ballot. EAC can also use this information to encourage the states to assess the effectiveness of programs to ensure that all eligible voters have required ID and are permitted to vote in future elections. Well-designed longitudinal studies in the states can show the results of changing voter ID requirements on electoral participation over time. The studies should include precinct-level data to provide the fine-grained analysis that can provide a solid foundation for policy.
    I. Useful information could be supplied by state-sponsored surveys of voters by local election officials. It would make clear why those who cast a provisional ballot were found ineligible to cast a regular ballot. The answers would illuminate the frequency with which ID issues divert voters into the provisional ballot line.
    II. Surveys to ask voters what they know about the voter id requirements would also provide useful context for evaluating the effect of various voter ID requirements on electoral participation.
    III. Spot checks by state election officials on how the identification process works at polling places could provide information on how closely actual practice tracks statutory or regulatory requirements. Such reports should be available to the public.
4. Encourage states to examine the time period allowed for voters who cast a provisional ballot because they lacked required ID to return with their identification. In eleven states, voters who had to cast a provisional ballot because they lacked the ID required for a regular ballot were permitted to return later with their ID. Their provision of this ID is the critical step in evaluating the ballots. The length of the period in which the voter may return with ID is important. In setting the time period for return, which now varies among the states from the same day to about two weeks, states should consider three factors:

the convenience of the voter, the total time allowed to evaluate ballots[6], and the safe harbor provision in presidential elections.

5. Recommendations to the states from EAC should reflect current judicial trends. Requirements that voters provide some identifying documentation have been upheld, where photo ID is *not* the only acceptable form. Whether laws requiring photo ID will be upheld is more uncertain.

SUMMARY OF RESEARCH

Background and Approach of the Study

Voter ID requirements are just one set of rules governing voting that may affect turnout. Social scientists have long studied how election rules affect participation in elections. The general view today is that the individual citizen makes the choice of whether the vote in a way similar to other decisions that a rational citizen makes, by comparing costs and benefits. The benefits of voting are fairly stable and hard to specify given the remote probability that any one vote will make a difference in an election. But whatever the benefit as perceived by an individual voter, as the costs of voting (for example, time, hassle, acquisition of information) increase, the likelihood that a citizen will vote decrease. Not all groups in the population calculate the cost of participation in the same way, so that election laws (such as registration or identification requirements) may affect different groups differently.

A short summary of some of the social science literature illustrates what may be a broad consensus that the rules of elections affect turnout, but note the important differences in the details of what groups may be most affected.

- Bowler, Brockington and Donovan in "Election Systems and Voter Turnout: Experiments in the United States". *The Journal of Politics*, 63:3 (August 2001) concluded that electoral systems help shape turnout by altering the benefits perceived by voters. For example, cumulative voting systems have 5% greater turnout than plurality systems
- The effect of registration systems has been the subject of many studies over the last 40 years. Kelley, Ayres, and Bowen in "Registration and Voting: Putting First Things First." *American Political Science Review*. 61:2 (June 1967) found that local variations in the

---

[6] Our research on provisional voting reveals that states that provide more than a week to evaluate provisional ballots end up counting substantially more of those ballots than states that provide less than a week.

rate of voting are most directly tied to variations in the rate of registering to vote, and that the rate of registering to vote in localities is most directly related to the laws and administration of the registration process. They concluded that the decline in voting over the past 80 years was due, in part, to the rise of registration laws.

- Brians and Grofman in "Election Day Registration's Effect on U.S. Voter Turnout." *Social Science Quarterly.* 82:1 (March 2001), found that relaxing registration laws produces higher turnout. In particular, they observed that relaxing registration laws is more likely to promote voter turnout among those with <u>medium levels of income</u> and education, rather than those at the lowest levels. Highton in "Easy Registration and Voter Turnout," *Journal of Politics.* 59:2 (May 1997), concluded similarly that registration laws affect voter turnout, but also observed that easier registration promotes turnout among those in <u>lower</u> socio-economic status.

- Mitchell and Wlezien. "The Impact of Legal Constraints on Voter Registration, Turnout, and the Composition of the American Electorate," *Political Behavior.* 17:2 (June 1995) agreed that easier registration promotes higher turnout, but also concluded that higher turnout from easier registration would be unlikely to change the composition of the electorate. Nagler in "The Effect of Registration Laws and Education on U.S. Voter Turnout." *American Political Science Review.* 85:4 (December 1991) found that registration laws decrease voter turnout by depressing the eligible electorate, but that lower educated people are not disproportionately impacted by these laws. But Rosenstone and Raymond E. Wolfinger in "The Effect of Registration Laws on Voter Turnout." *American Political Science Review.* 72:1 (March 1978) found that while registration laws did affect both voter turnout and the composition of the electorate, the sharpest effect of these restrictions was felt in the South and among the least educated.
- Squire, Wolfinger, and Glass in "Residential Mobility and Voter Turnout." *American Political Science Review.* 81:1 (March 1987) found that people who move constitute a major demographic group affected by registration laws. They estimated that altering laws to facilitate voting by recently moved people could increase turnout by 9%. Highton in "Residential Mobility, Community Mobility, and Voter Turnout." *Political Behavior.* 22:2 (June 2000) also found that people who move have lower turnout than stable residents, and estimated that the decline was more a result of registration laws than a loss of social connections.

- Highton and Wolfinger in "Estimating the Effects of the National Voter Registration Act of 1993." *Political Behavior.* 20:2 (June 1998) concluded that the Motor Voter laws led to a significant increase in voting; that eliminating voter purges for not voting also increases voting; and that these effects are felt most heavily by the young (under 30) and the mobile (moved within past 2 years). Knack, in "Does 'Motor Voter' Work? Evidence from State-Level Data." *Journal of Politics.*, 57:3 (August 1995), also found that motor voter does lead to increased registration and voting, but that other parts of NVRA of 1993, like mail-in registrations, agency-based registrations, and limitations on voter purges had not been as influential two years after the passage of the act.

While voter ID may not have been the subject of as much research as the registration process, establishing the eligibility of a person to vote has long been part of the electoral process. Voters may have to identify themselves twice in the electoral process: when registering to vote and then when casting a ballot. The pressures felt by the voter arising from the need to check ID, even so simple a check as a signature match, can be greater at the polls on Election Day than at the time of registration. Poll workers may feel under pressure when faced with long lines and limited time.

Voter ID requirements on Election Day

This analysis focuses on ID requirements on Election Day, but with an appreciation that the ID requirements at time of registration and on Election Day are inter-related. [7] The emphasis in this report is on Voter ID requirements on Election Day and afterwards as election judges evaluate provisional ballots. This is the critical period for the electoral system, the time when ballot access and ballot security are in the most sensitive balance.

The report looks at voter ID issues that go beyond the rather narrow identification requirements in HAVA. Much of the current debate in state legislatures over voter ID ranges beyond HAVA to require more rigorous documentation of identity for all would-be voters, not just those who had not registered in person and are casting a ballot for the first time. Current controversies in the states over voter ID seems to have been sparked in part by the HAVA requirements, but goes beyond those requirements, and sets the context for the analysis here.[8]

---

[7] As the Carter-Baker Commission noted, photo ID requirements for in-person voting do little to address the problem of fraudulent registration by mail, especially in states that do not require third-party organizations that register voters to verify ID. Commission on Federal Election Reform, pp 46-47.

[8] Harvard Law Review 119:1127: "Legislators hoping to stiffen their state antifraud laws have taken their cue from identification provisions buried in HAVA."

We recognize that the previously technical, rather dull subject of voter ID requirements has become fiercely partisan and divisive in many states. The polarization of the debate has raised the stakes over this issue, making dispassionate analysis both more valuable and more rare.[9] Voter ID is often described as the critical step in protecting the integrity of the ballot, the process to ensure that the potential voter is eligible and, if eligible, is permitted to cast one ballot and one ballot only. Truly protecting the integrity of the ballot, however, requires a perspective that takes in the entire voting process. It demands more than preventing the ineligible from voting, and should also ensure that all those who are eligible and want to vote can cast a ballot that counts. The protection effort must embrace all forms of voting, including absentee ballots, and consider each step in the process from registration through vote counting.

A voting system that requires voters to produce an identity document or documents may prevent the ineligible from voting. It may also prevent the eligible from casting a ballot. If the ID requirements block ineligible voters from the polls at the cost of preventing eligible voters who cannot obtain or have left at home the required forms of identification, the integrity of the ballot may not have been improved; the harm may be as great as the benefit. Ultimately, a normative evaluation of whether a state should adopt a stricter voter ID requirement (and, if so, what particular form that new requirement should take) will weigh value judgments as well as available factual evidence. Nonetheless, this report has proceeded on the premise that increased understanding of the factual evidence relating to the imposition of voter ID requirements, based on available data and statistical analysis of that data, can help inform the policy process.

Assessing the effectiveness of voter ID as a way to protect the integrity of the ballot should logically include an estimate of the nature and frequency of vote fraud. The EAC has commissioned a separate analysis of the incidence of vote fraud. Consequently, this research does not include consideration of vote fraud nor the possible effectiveness of various voter ID regimes to counter attempts at vote fraud. As a result, our study of the possible effects of voter

---

[9] "Of the various electoral procedure laws passed in the fifty states since the 2000 and 2004 presidential elections and those still being debated in state legislatures and local media, few arouse more potent partisan feelings than voter identification laws." *Harvard Law Review* 119:1144. John Fund's 2004 book, *Stealing Elections: How Voter Fraud Threaten Our Democracy*, cites (pages 16 – 17) a Rasmussen Research poll that asked respondents if they were more concerned with voting by ineligible participants or with disenfranchisement of eligible voters. Sixty-two percent of Kerry supporters, but only 18 percent of Bush supporters, worried more about *disenfranchisement*; 58 percent of Bush supporters, but only 19 percent of Kerry supporters were more concerned with *voter fraud*.

ID requirements on turnout cannot take into account how many potential voters who did not turn out under comparatively stricter voter ID requirements might have been ineligible or eligible to vote.

In some states, voters lacking required ID, or who have ID that does not reflect their current address, are able to vote only by casting a provisional ballot.[10] Voter ID requirements that require voters to bring a document to the polls --rather than simply sign their names-- may divert more voters to the provisional ballot. Requiring poll workers to request and check ID, can put stress on the already demanding environment of the polling place. Scrutiny of ID can create lines at the polling places. Further delays can result when voters cast a provisional ballot and fill out the ballot envelope. Voters who cast a provisional ballot because they lack their ID on Election Day, and who then fail to return with the needed document or documents, will have their ballot rejected.[11] And, of course, the cost of processing provisional ballots is greater than the cost of regular ballots.

Each of these potential consequences of more elaborate voter identification processes can increase the chance of litigation. Long lines will, at best, discourage voters and at worst make voting seem a hassle, an impression that could keep more citizens (even those with ID) from the polls.

Evaluating the effect of different Voter ID regimes can be most effective when based on clear standards --legal, equitable, practical. The standards outlined here might be described as questions policy-makers should ask about Voter ID requirements. We suggest 7 questions that address important dimensions of the problem.

1. Is the Voter ID system designed on the basis of valid and reliable empirical studies of the incidence of the sorts of vote fraud it is designed to prevent?[12]

---

[10] For example, the Florida voter ID law adopted after the 2004 election and pre-cleared by the Department of Justice, permits voters who cannot meet the ID requirements to sign an affidavit on the envelope of a provisional ballot, which will be counted if the signature matches that on the voter's registration form.

[11] The EAC's Election Day Study found "improper ID," to be the third most common reason for a provisional ballot to be rejected. "Improper ID" was cited by 7 states responding to the survey, compared to 14 mentions for voting in the wrong precinct. *Election Day Study*, Chapter 6, p. 5.

[12] "Often where the battle over voter identification is most heated, real evidence of voter fraud proves scarce: in Georgia, for example, the Secretary of State averred that she had never encountered a single instance of voter impersonation at the polls. State laws might sometimes impose tighter restrictions on in-person voting than on absentee ballots, which yield the greatest incidence of, and provide the easiest avenue for, voter fraud. . ." Harvard Law Review 127:1144 (2006)

2. How effective is the ID requirement in increasing the security of the ballot? How well can it be coordinated with a statewide voter database?[13]
3. How practical is the requirement? (Can it be administered smoothly by the staff and budget likely to be made available? How much additional training of polling place workers might be required?) Is it simple enough or can it be defined with sufficient clarity that poll workers throughout the state can administer it uniformly and with a minimum of local interpretation made on the fly under the pressure of Election Day?[14]
4. How cost-effective is the system? Does it demonstrably increase the security of the ballot affordably, measured in both monetary and other costs? To improve understanding of the non-monetary component of the costs, conducting a voter impact study might be appropriate. The voter impact study would examine, before the adoption of the regulation, the cost of compliance by the voter (such as the cost in time and money of acquiring a photo ID card), any offsetting benefits to voters, and the possible disparate effects of the regulation on various groups of voters.[15] A thorough, objective impact statement that demonstrated the nexus between the identification regime and the integrity of the ballot could provide protection against inevitable legal challenges.
5. If a side effect of the Voter ID regulation is likely to reduce turnout, generally or among particular groups, is it possible to take other steps to ameliorate the adverse consequences?[16]
6. Does it comply with the letter and spirit of Voting Rights Act?
7. The seventh question is the most difficult to answer. How neutral is the effect of the Voter ID requirement on the composition of the qualified and eligible electorate? Might it,

---

[13] See the final section of this report for a brief overview of possible effects of a statewide voter database on voter identification issues.

[14] In New York, in 2004, disparities in training and voting information were made apparent in a study finding elections officials had wildly varying interpretations of what the state's voter identification requirement actually was. Tova Wang, "Warning Bell in Ohio," December 5, 2005. Website, the Foundation for National Progress.

[15] "Absent clear empirical evidence demonstrating widespread individual voter fraud, legislatures need to fashion narrowly tailored voter identification provisions with an eye toward the inevitable and well-grounded constitutional challenges that will arise in the courts. Only as states grow more adept at administering elections will courts likely demonstrate greater willingness to uphold strict identification requirements." Harvard Law Review 127:1144 (2006)

[16] For example, the Carter-Baker Commission coupled its recommendation for a national voter ID card to a call for an affirmative effort by the states to reach out and register the unregistered, that is, to use the new Voter ID regime as a means to enroll more voters. Similarly, Richard Hasen has suggested combining a national voter ID with universal registration. See his "Beyond the Margin of Litigation: Reforming U.S. Election Administration to Avoid Electoral Meltdown," 62 Washington and Lee Law Review 937 (2005).

intentionally or unintentionally, reduce the turnout of particular groups of voters or supporters of one party or another without an offsetting decrease in vote fraud?

Voter ID and Turnout

Based on research for this study by the Moritz College of Law, states had one of five types of maximum requirements in place on Election Day 2004.These are shown in Table 1, *Voter ID Requirements*. The five categories: at the polling place, voters were asked to either: state their names (10 states); sign their names (13 states and the District of Columbia); sign their names, to be matched to a signature on file (seven states); provide a form of identification that did not necessarily include a photo (15 states); or provide a photo identification (five states).[17] Using this information made it possible to code the states according to these requirements, and examine the assumption that voter identification requirements would pose an increasingly demanding requirement in this order: stating one's name, signing one's name, matching one's signature to a signature on file, providing a form of identification, and providing a form of photo identification, however, in all "photo ID" states in 2004, voters without photo ID could cast a regular ballot after signing an affidavit concerning their identity and eligibility or provide other forms of ID). The report refers to this set of ID requirements as "maximum," the most rigorous ID the voter can be asked to present at the polling place in order to cast a regular ballot.[18]

Election laws in several states offer exceptions to these requirements if potential voters lack the necessary form of identification. Laws in those states set a minimum standard – that is the minimum requirement that a voter may be required to satisfy in order to vote using a regular ballot. States can be categorized based on the minimum requirement for voting with a regular ballot. In 2004 the categories were somewhat different compared to the maximum requirement, in that none of the states required photo identification as a minimum standard for voting with a regular ballot. That is, voters who lacked photo ID would still be allowed to vote in all states, if able to meet another requirement. Four states required voters to swear an affidavit as to their identity (Florida, Indiana, Louisiana, and North Dakota). The five categories for minimum requirements were: state name (12 states), sign name (14 states and the District of Columbia), match one's signature to a signature on file (six states), provide a non-photo identification (14 states), or swear an affidavit (four states). The analysis also examined this array of minimum

---

[17] Oregon conducts elections entirely by mail. Voters sign their mail-in ballots, and election officials match the signatures to signatures on file. For the purposes of this analysis, Oregon is classified as a state that requires a signature match.

[18] As noted above, our analysis does not consider additional requirements that particular voters may be subjected to as part of an official challenge process, in the event that their eligibility is called into question.

identification requirements to assess how they correlated with turnout: state name, sign name, match signature, provide non-photo identification, and, given the potential legal consequences for providing false information, swearing an affidavit. As noted above, *no* state had a "minimum" requirement of showing photo ID. This analysis therefore cannot estimate the effect of laws, such as those recently enacted in Indiana and Georgia that require voters to show photo ID in order to cast a regular ballot without an affidavit or other exception.

We recognize the difficulties in summarizing each state's voter ID requirements. The problem is illustrated by the number of footnotes to Table 1 below. The variety of statutory and regulatory details among the states is complex.

Moving beyond the statutes and regulations, we also recognize that the assignment of each state to one category may fail to reflect actual practice at many polling places. As in any system run by fallible humans, the voter ID process is subject to variation in practice.[19] Voters may have been confronted with demands for identification different from the directives in state statutes or regulation. It seems reasonable to conclude, however, that while actual practices may vary, the variance is around each state's legal requirement for ID. The analysis of the effect of state requirements on turnout must be viewed with some caution. We believe that the categories used in this report provide an acceptable level of discrimination among voter identification regimes.

---

[19] One state election official told us that, "We have 110 election jurisdictions in Illinois, and I have reason to believe [the voter ID requirements] are administered little bit differently in each one. We wish it weren't that way, but it probably is."

* States applies only HAVA's ID requirement, applicable to first-time voters who registered by mail and did not provide applicable ID at the time of registration.

[1] Arizona voters who lack a photo ID may present 2 forms of ID with no photograph.

[2] Florida required a photo ID in 2004, but voters without that credential could sign an affidavit concerning their identity and eligibility and cast a regular ballot. Florida subsequently changed its law to require that voters present photo ID to cast a regular ballot, though voters without photo ID may still cast a provisional ballot by signing an affidavit, which ballot should ordinarily be counted.

[3] Louisiana required a photo ID in 2004. Voters without that credential could sign an affidavit concerning their identity and eligibility and cast a regular ballot.

[4] Pennsylvania requires ID of all first-time voters, whether they registered by mail or in-person.

[5] Voters lacking a photo ID could vote by providing another form of ID in 2004.

[6] Voters lacking a photo ID could vote by providing another form of ID in 2004.

[7] Tennessee voters must provide signature and address. In counties without computerized lists, the signature is compared to the registration card. In counties with computerized lists, the signature is compared to a signature on ID presented with the registration.

[8] Texas voters must present a current registration certificate. Those without a certificate can vote provisionally after completing an affidavit.

Relationship of Voter ID requirements to Turnout

The statistical analysis examined the potential variation in turnout rates based on the type of voter identification required in each state on Election Day 2004 using two sets of data: aggregate turnout data at the county level for each state, as compiled by the Eagleton Institute of Politics, and individual-level survey data included in the November 2004 Current Population Survey conducted by the U.S. Census Bureau.

The statistical analysis examined turnout among U.S. citizens of voting age in both the aggregate and the individual-level data. Determining citizenship status in the individual-level data simply involved restricting the analyses to individuals who identified themselves as citizens in the November 2004 Current Population Survey. (Those who said they were not citizens did not have the opportunity to answer the supplemental voting questions contained in the Current Population Survey.)

Findings of the statistical analysis

The analysis looked at the voter identification requirements in two ways, as a continuous variable and as a series of discrete variables. As a continuous variable the maximum voter identification requirements are ranked according to how demanding they were judged to be, with photo ID as the most demanding requirement. As discrete variables, the statistical analysis assume that stating name is the least demanding ID requirement and compare each other requirement to it.

The analysis treating the requirements as a continuous variable offers some statistical support for the premise that as the level of required proof increases, turnout declines. Averaging across counties in each state, statewide turnout is negatively correlated with maximum voter identification requirements ($r = -.30$, $p < .05$). In considering the array of minimum requirements, with affidavit as the most demanding requirement, however, the correlation between voter identification and turnout is negative, but it is not statistically significant ($r= -.20$, $p = .16$). This suggests that the relationship between turnout rates and minimum requirements may not be linear. Breaking down the turnout rates by type of requirement reveals in greater detail the relationship between voter identification requirements and voter turnout.

Table 2 – Variation in 2004 State Turnout Based on Voter Identification Requirements

Maximum Requirement		Minimum Requirement	
Voter Identification Required in the States	Mean Voter Turnout for States in that Category	Voter Identification Required in the States	Mean Voter Turnout for States in that Category
State Name	**64.2 %**	State Name	**63.0 %**
Sign Name	**61.1 %**	Sign Name	**60.4 %**
Match Signature	**60.9 %**	Match Signature	**61.7 %**
Provide Non-Photo ID	**59.3 %**	Provide Non-Photo ID	**59.0 %**
Provide Photo ID	**58.1 %**	Swear Affidavit	**60.1 %**
Average Turnout (All States)	***60.9 %***		

This table displays the mean turnout using the aggregate county level data for each state in 2004.

The aggregate data show that 60.9 percent of the estimated citizen voting age population voted in 2004. Differences in voter turnout at the state level in 2004 varied based on voter identification requirements. Taking into account the maximum requirements, an average of 64.6 percent of the voting age population turned out in states that required voters to state their names, compared to 58.1 percent in states that required photo identification. A similar trend

emerged when considering minimum requirements. Sixty-three percent of the voting age population turned out in states requiring voters to state their names, compared to 60.1 percent in states that required an affidavit from voters. Given the lack of a clear, consistent linear relationship between turnout and minimum identification requirements, however, we opted to treat the voter identification requirements as a series of dichotomous variables in subsequent analyses.[21]

Voter identification requirements are just one factor that may affect voter turnout. Multivariate models that take into account other predictors of turnout can paint a more complete picture of the relationship between voter identification requirements and turnout. This analysis estimated the effects of voter identification requirements in multivariate models that also took into account the electoral context in 2004 and demographic characteristics of the population in each county. While the model takes account of several important variables, statistical models do not capture all the messiness of the real world. It is a simplification of a complex reality, and its results should be treated with appropriate caution.

The model also took into account such variables as:

- Was the county in a presidential battleground state?
- Was the county was in a state with a competitive race for governor and/or the U.S. Senate?
- Percentage of the voting-age population in each county that was Hispanic or African-American [22]
- Percentage of county residents age 65 and older
- Percentage of county residents below the poverty line

Another contextual factor to consider is voter registration requirements, such as the deadline for registration. As states set the deadline farther away from Election Day, the task of remembering to register to vote becomes more challenging. Thus our model takes into account the number of days between each state's registration deadline and the election.

---

[21] The voter identification requirements are coded as a series of dummy variables, coding each variable as one if the requirement existed in a given state, and zero otherwise. This yielded five dichotomous variables for maximum requirements (state name, sign name, match signature, non-photo identification, or photo identification), and five dichotomous variables for minimum requirements (state name, sign name, match signature, non-photo identification, or providing an affidavit). Omitted is the variable for stating one's name so that it could serve as the reference category in comparison with the other four identification requirements in each of the statistical analyses.

[22] The U.S. Census projections for 2003 provided the data for the percentage of the voting-age population in each county that was Hispanic or African-American and for the percentage of county residents age 65 and older.

The dependent variable in each model was voter turnout at the county level, with turnout calculated as the percentage of the citizen voting-age population that voted in the 2004 election.

The results of this modeling suggest that voter identification requirements such as signature matching, a non-photo ID or a photo ID are associated with lower turnout than in states that required voters to simply state their name, holding constant the electoral context and demographic variables.

Contextual factors, such as whether the county was in a battleground state or whether that state had a competitive race for governor and/or U.S. Senate, were associated with increased voter turnout. The time between the closing date for registration and the election was correlated with a slight negative effect on turnout. As the percentage of Hispanics in the county's population increased, turnout declined. The percentage of senior citizens in the county and household median income were associated with higher turnout. The percentage of African-Americans in the county did not have a significant effect in the model. The percentage of senior citizens in the county and household median income showed a positive correlation with turnout. In this aggregate model, the percentage of African-Americans in the county was not associated with a significant difference in turnout.

The relationship of the minimum voter identification requirements to turnout was not demonstrated. None of the dummy variables for voter identification requirements were statistically significant. Being a battleground state and having a competitive statewide race were significant and positive, as was the percentage of senior citizens in the county and household median income. The percentage of Hispanics in the county's population continued to be associated with reduced turnout, as was the number of days between the closing date for registration and the election. [23]

Analysis of the aggregate data at the county level generates some support for the hypothesis that stricter identification requirements are correlated with lower turnout. For the maximum

---

[23] This test incorporated a series of interactions between the maximum and minimum voter identification requirements and the percentage of African-Americans and Hispanics living in the counties. In each case the interactions did not improve the fit of the models to the data. See tables A-1 and A-2 in the appendix of Vercellotti's paper in the appendices.

requirements, a signature match, non-photo identification or photo identification were correlated with lower turnout in 2004, compared to requiring that voters simply state their names.

Aggregate data, however, cannot fully capture the individual demographic factors that may figure into the decision to turn out to vote.[24] Voter identification requirements could have a relationship to the turnout of particular groups of voters, in ways that county-level aggregate data on turnout would not capture. To explore the effects of voter identification requirements on turnout more completely, it is important to examine individual-level data as well.

Individual-level Analysis

Individual-level turnout data exists in the November 2004 Current Population Survey conducted by the U.S. Census Bureau. The Census Bureau conducts the CPS monthly to measure unemployment and other workforce data, but the bureau adds a battery of voter participation questions to the November survey in even-numbered years to coincide with either a presidential or midterm Congressional election.

One of the of the CPS is the sheer size of the sample. The survey's Voting and Registration Supplement consisted of interviews, either by telephone or in person, with 96,452 respondents.[25] The large sample size permits analyses of smaller groups, such as Black or Hispanic voters or voters with less than a high school education. The statistical analysis in relying on the CPS is based on reports from *self-described* registered voters. Omitted are those who said they were not registered to vote, as are those who said they cast absentee ballots because the identification requirements for absentee ballots may differ from those required when one votes in person. Eliminated from the sample are respondents who said they were not U.S. citizens; the questionnaire design skipped those individuals past the voter registration and turnout questions in the survey. In addition to the voter identification requirements, the models include other socioeconomic, demographic, and political environment factors that might have

---

[24] For example, previous research has found that education is a powerful determinant of turnout (Wolfinger and Rosenstone 1980, but see also Nagler 1991).[24] Married people also are more likely to vote than those who are not married (Alvarez and Ansolabehere 2002; Alvarez, Nagler and Wilson 2004; Fisher, Kenny, and Morton 1993).

[25] It is important to note that the Census Bureau allows respondents to answer on behalf of themselves and others in the household during the interview. While proxy reporting of voter turnout raises the possibility of inaccurate reports concerning whether another member of the household voted, follow-up interviews with those for whom a proxy report had been given in the November 1984 CPS showed 99 percent agreement between the proxy report and the information given by the follow-up respondent (U.S. Census Bureau 1990).

influenced turnout in 2004.[26] The dependent variable in these analyses is whether a respondent said he or she voted in the November 2004 election.[27]

In the model, three of the voter identification requirements have a statistically significant correlation with whether survey respondents said they had voted in 2004. That is, compared to states that require voters only to state their names, the requirement to sign one's name, provide a non-photo ID, or photo ID in the maximum requirements or affidavit in the minimum is associated with lower turnout.

Of the other state factors, only the competitiveness of the presidential race showed a significant, correlation with increased turnout. In terms of demographic influences, African-American voters were more likely than white voters or other voters to say they had cast a ballot, while Asian-Americans were less likely than white or other voters to say they had turned out. Hispanic voters were not statistically different from white or other voters in terms of reported turnout. Consistent with previous research, income, and marital status all were positive predictors of voting. Women also were more likely to say they voted than men. Among the age categories, those ages 45 to 64 and 65 and older were more likely than those ages 18 to 24 to say they voted. Respondents who had earned a high school diploma, attended some college, graduated from college or attended graduate school were all more likely to say they voted than those who had not finished high school.

While the probit models provide statistical evidence for the relationship of voter identification requirements and other variables to turnout, probit coefficients do not lend themselves to intuitive interpretation.[28] Table 3 below shows predicted probabilities (calculated from the probit coefficients) of voting for each level of voter identification requirements while holding all other independent variables in the models at their means.[29] .

---

[26] The models are estimated using probit analysis, which calculates the effects of independent variables on the probability that an event occurred – in this case whether a respondent said he or she voted and using robust standard errors to control for correlated error terms for observations from within the same state.

[27] The U.S. Census Bureau reported, based on the November 2004 CPS, that 89 percent of those who identified themselves as registered voters said they voted in 2004 (U.S. Census Bureau 2005). Previous research has shown that, generally speaking, some survey respondents overstate their incidence of voting. Researchers speculate that over-reports may be due to the social desirability that accompanies saying one has done his or her civic duty, or a reluctance to appear outside the mainstream of American political culture (U.S. Census Bureau 1990). It is also possible that voting is an indication of civic engagement that predisposes voters to agree to complete surveys at a higher rate than non-voters (Flanigan and Zingale 2002). Hence the voter turnout rates reported in the CPS tend to be up to 10 percentage points higher than the actual turnout rate for the nation (Flanigan and Zingale 2002). Even with this caveat, however, the CPS serves as a widely accepted source of data on voting behavior.

[28] A probit model is a popular specification of a generalized linear regression model, using the probit link function.

[29] In the case of dichotomous independent variables, holding them at their mean amounted to holding them at the percentage of the sample that was coded 1 for the variable (Long 1997).

Table 3. Predicted probability of voter turnout – all voters

	Maximum requirement	**Minimum requirement**
State name	91.7%	91.5%
Sign name	89.9%	90.2%
Match signature	Not significant	Not significant
Non-photo ID	89.0%	89.0%
Photo ID	88.8%	---
Affidavit	----	87.%5
Total difference from "state name" to "photo ID" or "affidavit"	**2.9%**	**4.0%**
N	54,973	

Figures represent the predicted probability of registered voters saying they voted as the identification requirement varies stating one's name to providing photo identification or an affidavit, with all other variables held constant. N.S. = nonsignificant coefficient in the probit model.

Data source: U.S. Census Bureau, Current Population Survey, Voting and Registration Supplement, November 2004.

Taking into account that signature matches were not a predictor of turnout, the differences in predicted probability decline from stating one's name to providing a photo identification or affidavit. Voters in states that required photo identification were 2.7 percent less likely to vote than voters in states where individuals had to give their names.[30] In terms of the minimum requirement, voters in states that required an affidavit at minimum were 4 percent less likely to turn out than voters in states where they had to give their names.

The differences were more pronounced for those lower in education. Constraining the model to show predicted probabilities only for those with less than a high school diploma, the probability of voting was 5.1 percent lower in states that required photo identification as the maximum requirement and 7 percent lower in states that required an affidavit as the minimum requirement compared to states where stating one's name was the maximum or minimum requirement.

---

[30] The voter turnout percentages may seem disproportionately high compared to the turnout rates reported in the aggregate data analysis. It is important to consider that the turnout rates in the aggregate data were a proportion of all citizens of voting-age population, while the turnout rates for the individual-level data are the proportion of only registered voters who said they voted.

Race and ethnicity have generated particular interest in the debate over voter ID requirements.[31] The analysis using the aggregate data shed no light on the association between voter ID requirements and turnout for African-American and Hispanic voters. But in the models using the individual data, some significant relationships emerged for African-American, Hispanic and Asian citizens. For the entire population, the signature, non-photo identification and photo identification requirements all were associated with lower turnout compared to the requirement that voters simply state their names. These correlations translated into reduced probabilities of voting of about 3 to 4 percent for the entire sample, with larger differences for specific subgroups. For example, the predicted probability that Hispanics would vote in states that required non-photo identification was about 10 percentage points lower than in states where Hispanic voters gave their names. The difference was about 6 percent for African-Americans and Asian-Americans, and about 2 percent for white voters.

The model also showed that Hispanic voters were less likely to vote in states that required non-photo identification as opposed to stating one's name. Hispanic voters were 10 percent less likely to vote in non-photo identification states compared to states where voters only had to give their name.

Varying voter identification requirements were associated with lower turnout rates for Asian-American voters as well. Asian-American voters were 8.5 percent less likely to vote in states that required non-photo identification compared to states that require voters to state their names under the maximum requirements, and they were 6.1 percent less likely to vote where non-photo identification was the minimum requirement.

Conclusions of the Statistical Analysis

The statistical analysis found that, as voter identification requirements vary, voter turnout varies as well. This finding emerged from both the aggregate data and the individual-level data, although not always for both the maximum and minimum sets of requirements. The overall relationship between ID requirements and turnout for all registered voters was fairly small, but still statistically significant.

---

[31] Incorporating discrete variables for Hispanics, African-Americans, and Asian-Americans into one model carries the implicit assumption that the remaining variables, including education and income, will influence each of these groups in a similar manner in terms of deciding whether to vote. These assumptions are not always born out by the data (see Leighley and Vedlitz, 1999.) To isolate the effects of voter identification and other variables on voter turnout within specific racial and ethnic groups, the sample is divided into sub-samples and the model re-run to calculate the data discussed and shown in Tables 5, 6, and 7 in Appendix C.

In the aggregate data, the match signature requirement, the provide a non-photo ID requirement, and the photo ID requirement were all correlated with lower turnout compared to requiring that voters state their names.

The signature, non-photo ID, and photo ID requirements were all correlated with lower turnout compared to the requirement that voters simply state their names. That the non-photo identification requirement was the most consistent in terms of statistical significance across the groups is intriguing given the intense debates surrounding photo identification requirements.

Significant questions about the relationship between voter identification requirements and turnout remain unanswered. The data examined in the statistical analysis could not capture the dynamics of how identification requirements might lower turnout, nor could they rule out that other attributes of a state's electoral system might explain the statistically significant correlations that the study found. If ID requirements dampen turnout, is it because individuals are aware of the requirements and stay away from the polls because they cannot or do not want to meet the requirements? Or, do the requirements result in some voters being turned away when they cannot meet the requirements on Election Day , or forced to cast a provisional ballot that is not ultimately counted? The CPS data do not include measures that can answer this question. Knowing more about the "on the ground" experiences of voters concerning identification requirements could guide policy-makers at the state and local level in determining whether and at what point in the electoral cycle a concerted public information campaign might be most effective in helping voters to meet identification requirements. Such knowledge also could help in designing training for election judges to handle questions about, and potential disputes over, voter identification requirements.

Litigation Over Voter ID Requirements

A handful of cases have challenged identification requirements in court in recent years. In general, requirements that voters provide some identifying documentation have been upheld, where photo ID is *not* the only acceptable form. Whether laws requiring photo ID will be upheld is more doubtful. To date, only two cases have considered laws requiring voters to show photo ID (*Common Cause v. Billups* and *Indiana Democratic Party v. Rokita*).. Cases challenging the mandatory disclosure of voters' Social Security numbers on privacy grounds have yielded mixed results.

Non-photo identification. For the most part, courts have looked favorably on requirements that voters present some form of identifying documents if the photo identification is not the only form accepted. In *Colorado Common Cause v. Davidson*, No. 04CV7709, 2004 WL 2360485, at *1 (Colo. Dist. Ct. Oct. 18, 2004), plaintiffs challenged a law requiring all in-person voters to show identification (not just first-time registrants). The court upheld this requirement against a constitutional challenge. Similarly, in *League of Women Voters v. Blackwell*, 340 F. Supp. 2d 823 (N.D. Ohio 2004), the court rejected a challenge to an Ohio directive requiring first-time voters who registered by mail to provide one of the HAVA-permitted forms of identification, in order to have their provisional ballots counted. Specifically, the directive provided that their provisional ballots would be counted if the voter (a) orally recited his driver's license number or the last four digits of his social security number or (b) returned to the polling place before it closed with some acceptable identification (including reciting those identification numbers). *Id.* This was found to be consistent with HAVA.

Photo ID. Since the 2004 election, two states have adopted laws requiring photo identification at the polls in order to have one's vote counted, without an affidavit exception: Georgia and Indiana.[32] Both these requirements were enacted in 2005 and both have been challenged in court. The Georgia law required voters attempting to cast a ballot in person present a valid form of photographic identification. O.C.G.A. § 21-2-417. On October 18, 2005, the District Court granted the plaintiffs' motion for a preliminary injunction, enjoining the application of the new identification requirements on constitutional grounds. In granting the injunction, the court held that plaintiffs' claims under both the Fourteenth Amendment (equal protection) and Twenty-Fourth Amendment (poll tax) had a substantial likelihood of succeeding on the merits at trial (*Common Cause v. Billups*, Prelim. Inj. 96, 104). In January 2006, Georgia enacted a modified version of its photo ID law, which the court has not yet ruled on. In the other state that has enacted a photo ID requirement (Indiana), legal challenges have also been filed. (*Indiana Democratic Party v. Rokita* and *Crawford v. Marion County Election Board*). On April 14, 2006, the district court granted defendants' motion for summary judgment, concluding that plaintiffs had failed to produce evidence showing that the state's ID law would have an adverse impact on voters. Another case of significance, for purposes of photo ID requirements, is *American Civil Liberties Union of Minnesota v. Kiffmeyer*, No. 04-CV-4653, 2004 WL

---

[32] Indiana's law does allow voters without ID to cast provisional ballots, and then to appear before the county board of elections to execute an affidavit saying that they are indigent and unable to obtain the requisite ID without payment of a fee. But in contrast to other states, voters cannot cast a ballot that will be counted by submitting an affidavit at the polls, affirming that they are the registered voter and are otherwise eligible to vote.

2428690, at *1 (D. Minn. Oct. 28, 2004). In that case, the court enjoined a Minnesota law that allowed the use of tribal photo ID cards, only for an Indian who lived on the reservation. 2004 WL 2428690, at *1. The Court found no rational basis for distinguishing based on whether or not the cardholder lives on the reservation. *Id.* at *1, 3. These decisions indicate that courts are likely to carefully scrutinize the evidence regarding the impact of photo ID requirements.

Privacy. In *Greidinger v. Davis*, 988 F.2d 1344 (4th Cir. 1993), the court struck down on due process grounds a Virginia law requiring disclosure of voters' social security numbers for voter registration. The social security numbers recorded in voter registration lists had been disclosed to the public and political parties that had requested the lists. The court found that the requirement to give the social security number effectively conditioned rights on the consent to an invasion of privacy. It concluded that this public disclosure of the social security numbers was not necessary to achieve the government's interest in preventing fraud. On the other hand, in *McKay v. Thompson*, 226 F.3d 752 (6th Cir. 2000), the court rejected privacy challenges based on both the Constitution and federal statutes, to a Tennessee law requiring social security numbers for voter registration since 1972. 226 F.3d at 755. Second, the NVRA only permits requiring the minimum amount of information necessary to prevent duplicate voter registration and to determine eligibility. The distinction appears to be between the use of Social Security numbers for internal purposes only, which was deemed permissible, and the disclosure of those numbers to the public which was not.

These decisions suggest that the courts will carefully scrutinize the evidence, where states require that voters produce a photo ID in order to cast a regular ballot. The courts have used a balancing test to weigh the legitimate interest in preventing election fraud against the citizen's right to privacy (protecting social security numbers from public disclosure, for example) and the reasonableness of requirements for identity documents. To provide both the clarity and certainty in administration of elections needed to forestall destabilizing challenges to outcomes, these early decisions suggest that best practice may be to limit requirements for voter identification to the minimum needed to prevent duplicate registration and ensure eligibility.

Developments since 2004

Since the passage of HAVA, with its limited requirements for voter identification, and following the 2004 election, debate over voter ID has taken place in state legislatures across the country. That debate has not been characterized by solid information on the consequences of tightening requirements for voters to identify themselves before being permitted to cast a regular, rather than a provisional, ballot.

Better information might improve the quality of the debate. Answers to the following key questions are not available in a form that might satisfy those on both sides of the argument.

- What is the overall incidence of vote fraud?
- How does fraud take place in the various stage of the process: registration, voting at the polls, absentee voting, or ballot counting?
- What contribution can tighter requirements for voter ID make to reducing vote fraud?
- What would be the other consequences of increasingly demanding requirements for voters to identify themselves? This is the question addressed, within the limits of the available data, in the analysis in this report.

Answering these questions would provide the information needed for more informed judgment in the states as they consider the tradeoffs among the competing goals of ballot integrity, ballot access, and administrative efficiency. The Carter-Baker Commission recognized the tradeoffs when it tied recommendation for national ID to an affirmative effort by government to identify unregistered voters and make it easy for them to register.

State Voter Databases and Voter ID

With the implementation of the HAVA Computerized Statewide Voter Registration List, an application for voter registration for an election for Federal office may not be accepted or processed unless the application includes a driver's license number or last four digits of the Social Security number on the voter registration form. This information can be used to verify the identity of the registrant through interfacing with lists maintained by the Motor Vehicle office and Social Security office. If registrants do not have either a driver's license or Social Security number, the State will assign a unique identifier number to that person.

Some states are wrestling now with these unresolved issues. In New Jersey, for example, pending legislation would require that voters must be able to confirm their registration through a secure access to the Statewide Voter Registration List. It also requires voters to present ID at

the polls in order to cast a regular ballot if the numbers recorded on the registration have not been verified (or if no verifiable number appears on the registration). It recognizes the HAVA requirement that if the number provided by the voter has not been verified and if the voter does not present ID at the polls, that voter may cast a provisional ballot. The bill does not specify they have to provide ID within 48 hours in order for their vote to count, as is the case with first-time mail-in registrants.

As some states gain experience in this area, the EAC would perform a useful service by making timely recommendations of best practices for all states to consider.

Conclusions

The analysis of voter ID requirements is complex. It takes into account important values associated with an electoral process, such as ballot access and integrity. The continuing effort to understand how voter ID requirements may affect turnout and the integrity of the ballot could benefit from additional factual information, including statistical analyses. Our research includes a statistical study of this kind. It indicated that the level of voter turnout in a state is correlated with the stringency of the voter ID requirement imposed by that state. Additional empirical research of this nature, with additional data collected by or for the EAC, would further illuminate the relationship between stricter voter ID rules and turnout, perhaps explaining if awareness of a strict ID requirement tends to discourage would-be voters from going to the polls. Or, additional research may shed light on whether, if voters did go to the polls, stricter Voter ID requirements will divert more voters into the line for provisional ballots. The consequence of increased reliance on provisional ballots can be longer lines at the polls and confusion, without necessarily a clear demonstration that the security of the ballot is correspondingly increased. [33]

The debate over voter ID in the states would be improved by additional research sponsored by the EAC. That might include longitudinal studies of jurisdictions that have changed voter ID requirements, as well as precinct-level analyses that would allow more finely tuned assessment of the correlation between stricter identification requirements and turnouts. Further research could also identify methods to eliminate the need for voters to bring specific identity documents

---

[33] In this connection, the Brennan Center's response to the Carter-Baker Commission report observes that, "while it might be true that in a close election "a small amount of fraud could make the margin of difference," it is equally true that the rejection of a much larger number of eligible voters could make a much bigger difference in the outcome." *Response to the Report of the 2005 Commission on Federal Election Reform*, The Brennan Center for Justice at NYU School of Law and Spencer Overton, On Behalf Of The National Network on State Election Reform, September 19, 2005

with them to the polls, while assuring that each voter who casts a ballot is eligible and votes only once.

Subject PV Final Draft for Review by Advisory and Standards Boards

Karen,

Attached is the Final Draft of our report on Provisional Voting for review by the Advisory Board and the Standards Board. I understand from our conversation earlier today that it will be reviewed by the Commissioners at their meeting next week, and, if approved by them, distributed to the boards in advance of their meetings on May 23 and 24. This report will form the basis of our PowerPoint briefing for the boards at those meetings. I will not have hard copies of those PowerPoint presentations for distribution to the boards until the day of the meeting.

We intend to have the Final Draft Voter ID Report to you in time for review by the Commissioners at their second meeting next week.

Thanks for your guidance.

Tom O'Neill

The Peer Review Group improved the quality of our work by critiquing drafts of our analysis, conclusions and recommendations. While the Group as a whole and the comments of its members individually contributed generously to the research effort, any errors of fact or weaknesses in inference are the responsibility of the Eagleton-Moritz research team. The members of the Peer Review Group do not necessarily share the views reflected in the policy recommendations of the report.

EXECUTIVE SUMMARY

Background and Methodology

This report to the United States Election Assistance Commission (EAC) presents recommendations for best practices to improve the process of provisional voting. It is based on research conducted by the Eagleton Institute of Politics at Rutgers, the State University of New Jersey, and the Moritz College of Law at Ohio State University under contract to the EAC, dated May 24, 2005.

The Help America Vote Act of 2002 (HAVA, (Public Law 107-252) authorizes the EAC (SEC. 241, 42 USC 15381) to conduct periodic studies of election administration issues. The purpose of these studies is to promote methods for voting and administering elections, including provisional voting, that are convenient, accessible and easy to use; that yield accurate, secure and expeditious voting systems; that afford each registered and eligible voter an equal opportunity to vote and to have that vote counted; and that are efficient. Section 302(a) of HAVA required states to establish provisional balloting procedures by January 2004.[1] The process HAVA outlined left considerable room for variation among the states, arguably including such critical questions as who qualifies as a registered voter eligible to cast a provisional ballot that will be counted and in what jurisdiction (precinct or larger unit) the ballot must be cast in order to be counted.[2]

The general requirement for provisional voting is that, if a registered voter appears at a polling place to vote in an election for Federal office, but either the potential voter's name does not appear on the official list of eligible voters for the polling place, or an election official asserts that the individual is not eligible to vote, that potential voter must be permitted to cast a provisional ballot. In some states, those who should receive a provisional ballot include, in the words of the EAC's Election Day Survey, "first-time voters who registered by mail without identification and cannot provide identification, as required under HAVA. . ." [3] HAVA also provides that those who vote pursuant to a court order keeping the polls open after the established closing hour shall vote by provisional ballot. Election administrators are required by HAVA to notify individuals of their opportunity to cast a provisional ballot.

---

[1] The Election Center's National Task Force Report on Election Reform in July 2001 had described provisional ballots as providing "voters whose registration status cannot be determined at the polls or verified at the election office the opportunity to vote. The validity of these ballots is determined later, thus ensuring that no eligible voter is turned away and those truly ineligible will not have their ballots counted." It recommended "in the absence of election day registration or other solutions to address registration questions, provisional ballots must be adopted by all jurisdictions. " See www.electioncenter.org .

[2] The 2004 election saw at least a dozen suits filed on the issue of whether votes cast in the wrong precinct but the correct county should be counted. One federal circuit court decided the issue in *Sandusky County Democratic Party v. Blackwell, 387 F.3d565* (6th Cir. 2004), which held that votes cast outside the correct precinct did not have to be counted. The court relied on the presumption that Congress must be clear in order to alter the state-federal balance; thus Congress, the court concluded would have been clearer had it intended to eliminate state control over polling location (387 F.3d at 578). An alternative argument, that HAVA's definition of "jurisdiction" incorporates the broader definition in the National Voting Rights Act, however, has not been settled by a higher court. But for now states do seem to have discretion in how they define "jurisdiction" for the purpose of counting a provisional ballot.

[3] The definition of who was entitled to a provisional ballot could differ significantly among the states. In California, for example, the Secretary of State directed counties to provide voters with the option of voting on a provisional paper ballot if they felt uncomfortable casting votes on the paperless e-voting machines. "I don't want a voter to not vote on Election Day because the only option before them is a touch-screen voting machine. I want that voter to have the confidence that he or she can vote on paper and have the confidence that their vote was cast as marked," Secretary Shelley said. See http://wired.com/news/evote/0,2645,63298,00.html . (Our analysis revealed no differences in the use of provisional ballots in the counties with these paperless e-voting machines.) In Ohio, long lines at some polling places resulted in legal action directing that voters waiting in line be given provisional ballots to enable them to vote before the polls closed. (Columbus Dispatch, November 3, 2004 .)

Our research began in late May 2005. It focused on six key questions raised by the EAC.

1. How did the states prepare for the onset of the HAVA provisional ballot requirement?
2. How did this vary between states that had previously had some form of provisional ballot and those that did not?
3. How did litigation affect implementation?
4. How effective was provisional voting in enfranchising qualified voters?
5. Did state and local processes provide for consistent counting of provisional ballots?
6. Did local election officials have a clear understanding of how to implement provisional voting?

To answer those questions, we:

1. Surveyed 400 local (mostly county) election officials to learn their views about the administration of provisional voting and to gain insights into their experience in the 2004 election.
2. Reviewed the EAC's Election Day Survey, news and other published reports in all 50 states to understand the local background of provisional voting and develop leads for detailed analysis.[4]
3. Analyzed statistically provisional voting data from the 2004 election to determine associations between the use of provisional voting and such variables as states' experience with provisional voting, use of statewide registration databases, counting out-of-precinct ballots, and use of different approached to voter identification.
4. Collected and reviewed the provisional voting statutes and regulations in all 50 states.
5. Analyzed litigation affecting provisional voting or growing out of disputes over provisional voting in all states.

Our research is intended to provide EAC with a strategy to engage the states in a continuing effort to strengthen the provisional voting process and increase the consistency with which provisional voting is administered, particularly within a state. As EAC and the states move forward to assess and adopt the recommendations made here, provisional voting merits continuing observation and research. The situation is fluid. As states, particularly those states that did not offer a provisional ballot before 2004, gain greater experience with the process and as statewide voter databases are adopted, the provisional voting process will demand further, research-based refinement.

KEY FINDINGS

Variation among the states

In the 2004 election, nationwide about 1.9 million votes, or 1.6% of turnout, were cast as provisional ballots. More than 1.2 million, or just over 63%, were counted. Provisional ballots accounted for a little more than 1% of the final vote tally. These totals obscure the wide variation in provisional voting among the states.[5]

---

[4] Attachment 1 provides detailed information on how this study classifies the states according to the characteristics of their provisional voting procedures. It also describes how the data used in the statistical analysis may differ from the data in the Election Day Survey, which became available as our research was concluding.

[5] HAVA allows the states considerable latitude in how to implement provisional voting, including deciding who beyond the required categories of voters should receive provisional ballots and how to determine which provisional ballots should be counted.

- Six states accounted for two-thirds of all the provisional ballots cast.[6]
- The percentage of provisional ballots in the total vote varied by a factor of 1,000 -- from a high of 7% in Alaska to Vermont's 0.006%.
- The portion of provisional ballots cast that were counted ranged from 96% in Alaska to 6% in Delaware.
- States with voter registration databases counted, on average, 20% of the provisional ballots cast.
- States without databases counted ballots at more than twice that rate: 44%.[7]
- States that provided more time to evaluate provisional ballots counted a greater proportion of those ballots. Those that provided less than one week counted an average of 35.4% of their ballots, while states that permitted more than 2 weeks, counted 60.8%.

An important source of variation among states was a state's previous experience with provisional voting. The share of provisional ballots in the total vote was six times greater in states that had used provisional ballots before than in states where the provisional ballot was new. In the 25 states that had some experience with provisional voting before HAVA, a higher portion of the total vote was cast as provisional ballots and a greater percentage of the provisional ballots cast were counted than in the 18 new to provisional balloting.[8]

Variation within states

Within states, too, there was little consistency among different jurisdictions. Of the 20 states for which we have county-level provisional ballot data, the rate of counting provisional ballots varied by as much as 90% to 100% among counties in the same state. This suggests that additional factors (including the training of election judges or poll workers) beyond statewide factors, such as experience or the existence of voter registration databases, also influence the use of provisional ballots.

- In Ohio some counties counted provisional ballots not cast in the assigned precinct even though the state's policy was to count only those ballots cast in the correct precinct.
- Some counties in Washington tracked down voters who would otherwise have had their provisional ballots rejected because they had failed to complete part of their registration form, gave them the chance to correct those omissions, and then counted the provisional ballot.

Resources available to administer provisional voting varied considerably among and within states. Differences in demographics and resources result in different experiences with provisional voting. For example, the Election Day Survey found that staffing problems appeared to be particularly acute for jurisdictions in the lowest income and education categories. Small, rural jurisdictions and large, urban jurisdictions tended to report higher rates of an inadequate number of poll workers within polling places or precincts.

- Jurisdictions with lower education and income tend to report more inactive voter registrations, lower turnout, and more provisional ballots cast.

---

[6] California, New York, Ohio, Arizona, Washington, and North Carolina. The appearance of Arizona, Washington and North Carolina on this list shows that the number of provisional ballots cast depends on factors other than the size of the population.

[7] As the Carter-Baker Commission report put it, "provisional ballots were needed half as often in states with unified databases as in states without." Report on the Commission on Federal Election Reform, "Building Confidence in U. S. Elections," September 2005, p. 16.

[8] See the appendix for our classification of "old" and "new" states and explanation of why the total is less than 50.

- Jurisdictions with higher levels of income and education reported higher average numbers of poll workers per polling place or precinct and reported lower rates of staffing problems per precinct.

In precincts located in districts where many voters live in poverty and have low levels of income and education, the voting process, in general, may be managed poorly. Provisional ballots cannot be expected to work much better. In these areas, the focus should be on broader measures to improve the overall functionality of struggling voting districts, although improving the management of provisional balloting may help at the margin.

The lessons of litigation

Successful legal challenges highlight areas where provisional voting procedures were wanting. A flurry of litigation occurred around the country in October 2004 concerning the so-called "wrong precinct issue" – whether provisional ballots cast by voters in a precinct other than their designated one would be counted for statewide races. Most courts, including the U.S. Court of Appeals for the Sixth Circuit (the only federal appeals court to rule on the issue), rejected the contention that HAVA requires the counting of these wrong-precinct provisional ballots. This litigation was significant nonetheless.

- First, the Sixth Circuit decision established the precedent that voters have the right to sue in federal court to remedy violations of HAVA.
- Second –and significantly– the litigation clarified the right of voters to receive provisional ballots, even though the election officials were certain they would not be counted. The decision also defined an ancillary right –the right to be directed to the correct precinct. There voters could cast a regular ballot that would be counted. If they insisted on casting a provisional ballot in the wrong precinct, they would be on notice that it would be a symbolic gesture only.
- Third, these lawsuits prompted election officials to take better care in instructing precinct officials on how to notify voters about the need to go to the correct precinct in order to cast a countable ballot.

States move to improve their processes

Shortly after the 2004 election, several states came to the conclusion that the administration of their provisional voting procedures needed to be improved, and they amended their statutes. The new legislation highlights areas of particular concern to states about their provisional voting process.

- Florida, Indiana, Virginia, and Washington have clarified or extended the timeline to evaluate the ballots.
- Colorado, New Mexico, North Carolina, and Washington have passed legislation focused on improving the efficacy and consistency of the voting and counting process.
- Colorado, Arkansas, and North Dakota took up the issue of counting provisional ballots cast in the wrong precinct.

The wide variation in the implementation of provisional voting among and within states suggests that EAC can help states strengthen their processes. Research-based recommendations for best, or at least better, practices that draw on the experience gained in the 2004 election can be useful in states' efforts to achieve greater consistency in the administration of provisional voting. The important effect of experience on the administration of the provisional ballot process indicates that the states have much they can learn from each other.

SUMMARY OF RECOMMENDATIONS FOR BEST PRACTICES

State efforts to improve the provisional voting process have been underway since the 2004 election. By recommending best practices, the EAC will offer informed advice while respecting diversity among the states.

Take a quality-improvement approach

Defining what constitutes a successful provisional voting system is difficult. Defining quality requires a broad perspective about how well the system works, how open it is to error recognition and correction, and how well provisional voting processes are connected to the registration and voter identification regimes. A first step is for states to recognize that improving quality begins with seeing the provisional voting process as a system and taking a systems approach to regular evaluation through standardized metrics with explicit goals for performance. EAC can facilitate action by the states by recommending as a best practice that:

- Each state collect data systematically on the provisional voting process to permit evaluation of its voting system and assess changes from one election to the next. The data collected should include: provisional votes cast and counted by county; reasons why provisional ballots were not counted, measures of variance among jurisdictions, and time required to evaluate ballots by jurisdiction

Emphasize the importance of clarity

Above all else, the EAC should emphasize the importance of clarity in the rules by which each state governs provisional voting. As state legislators and election officials prepare for the 2006 election, answers to the questions listed in the recommendation section of this report could be helpful. Among those questions are:

- Does the provisional voting system distribute, collect, record, and tally provisional ballots with sufficient accuracy to be seen as procedurally legitimate by both supporters and opponents of the winning candidate?
- Do the procedural requirements of the system permit cost-efficient operation?
- How great is the variation in the use of provisional voting in counties or equivalent levels of voting jurisdiction within the state? Is the variation great enough to cause concern that the system may not be administered uniformly across the state?

Court decisions suggest areas for action

The court decisions following the 2004 election also suggest procedures for states to incorporate into their procedures for provisional voting. EAC should recommend to the states that they:

- Promulgate clear standards for evaluating provisional ballots, and provide training for the officials who will apply those standards.
- Provide effective materials to be used by local jurisdictions in training poll workers on such procedures as how to locate polling places for potential voters who show up at the wrong place.
- Make clear that the only permissible requirement to obtain a provisional ballot is an affirmation that the voter is registered in the jurisdiction and eligible to vote in an election for federal office. Poll workers need appropriate training to understand their duty to give such voters a provisional ballot.

Assess each stage of the provisional voting process

Beyond the procedures suggested by court decisions, states should assess each stage of the provisional voting process. They can begin by assessing the utility and clarity of the information for voters on their websites and by considering what information might be added to sample ballots mailed to voters before elections. The better voters understand their rights and obligations, the easier the system will be to manage, and the more legitimate the appearance of the process.

Avoiding error at the polling place will allow more voters to cast a regular ballot and all others who request it to cast a provisional ballot. Our recommendations for best practices to avoid error at the polling place include:

- The layout and staffing of the multi-precinct polling place is important. States should ensure that training materials distributed to every jurisdiction make poll workers familiar with the options available to voters.
- The provisional ballot should be of a design or color sufficiently different from a regular ballot to avoid confusion over counting and include take-away information for the voter on the steps in the ballot evaluation process.
- Because provisional ballots offer a fail-safe, supplies of the ballots at each polling place should be sufficient for all the potential voters likely to need them. Best practice would be for states should provide guidelines (as do Connecticut and Delaware) to estimate the supply of provisional ballots needed at each polling place.

The clarity of criteria for evaluating voter eligibility is critical to a sound process for deciding which of the cast provisional ballots should be counted.

- .State statutes or regulations should define a reasonable period for voters who lack the HAVA-specified ID or other information bearing on their eligibility to provide it in order to facilitate the state's ability to verify that the person casting the provisional ballot is the same one who registered. At least 11 states allow voters to provide ID or other information one to 13 days after voting. Kansas allows voters to proffer their ID by electronic means or by mail, as well as in person.
- More provisional voters have their ballots counted in those states that count ballots cast outside the correct precinct. While HAVA arguably leaves this decision up to the states, pointing out the effect of the narrower definition on the portion of ballots counted could be useful to the states in deciding this question. States should be aware, however, of the additional burden placed on the ballot-evaluation process when out-of-precinct ballots are considered. And tradeoffs are involved if out-of-precinct voters are unable to vote for the local offices that might appear on the ballot in their district of residence.
- If a state does require voters to appear at their assigned precinct, where the same polling site serves more than one precinct, a voter's provisional ballot should count so long as the voter cast that ballot at the correct polling site even if at the wrong precinct within that location. While the best practice might be for poll workers to direct the voter to correct precinct poll workers' advice is not always correct, and the voter should be protect against ministerial error.
- Officials should follow a written procedure, and perhaps a checklist, to identify the reason why a provisional ballot is rejected. Colorado's election rules offer particularly clear guidance to the official evaluating a provisional ballot.

In verifying provisional ballots, the time by which election officials must make their eligibility determinations is particularly important in presidential elections because of the need to certify electors to the Electoral College. Our research did not identify an optimum division of the five weeks available.

- The best practice here is for states to consider the issue and make a careful decision about how to complete all steps in the evaluation of ballots and challenges to those determinations within the five weeks available.

After the election, timely information to voters about the disposition of their provisional ballot can enable voters to determine if they are registered for future elections and, if not, what they need to do to become registered.

- Best practice for the states is to establish mechanisms to ensure that voters casting provisional ballots are informed whether they are now registered for future elections and, if not, what they need to do to become registered.

Final observation

The detailed examination of each stage in the provisional voting process can lay the foundation each state needs to improve its system. Efforts to improve provisional voting may be most effective as part of a broader effort by state and local election officials to strengthen their systems. Collecting and analyzing data about those systems will enable states to identify which aspects of the registration and electoral system are most important in shunting voters into the provisional ballot process. Responsible officials can then look to their registration system, identification requirements or poll worker training as ways to reduce the need for voters to cast their ballots provisionally.

Provisional Voting in 2004

In the 2004 election, nationwide about 1.9 million votes, or 1.6% of turnout, were cast as provisional ballots. More than 1.2 million or just over 63% were counted. Provisional ballots accounted for a little more than 1% of the final vote tally.

These totals obscure the wide variation in provisional voting among the states.[9] Six states accounted for two-thirds of all the provisional ballots cast.[10] State by state, the percentage of provisional ballots in the total vote varied by a factor of 1,000 -- from a high of 7% in Alaska to Vermont's 0.006%. The portion of provisional ballots cast that were actually counted also displayed wide variation, ranging from 96% in Alaska to 6% in Delaware. States with voter registration databases counted, on average, 20% of the provisional ballots cast. Those without databases counted provisional ballots at more than twice that rate, 44%.

An important source of variation was a state's previous experience with provisional voting. The share of provisional ballots in the total vote was six times greater in states that had used provisional ballots before than in states where the provisional ballot was new. In the 25 states that had some experience with provisional voting before HAVA, a higher portion of the total vote was cast as provisional ballots and a greater percentage of the provisional ballots cast were counted than in the 18 new to provisional balloting.[11]

- The percentage of the total vote cast as provisional ballots averaged more than 2% in the 25 experienced states. This was 4 times the rate in states new to provisional voting, which averaged 0.47%.[12]
- The experienced states counted an average of 58% of the provisional ballots cast, nearly double the proportion in the new states, which counted just 33% of cast provisional ballots.
- The combined effect of these two differences was significant. In experienced states 1.53% of the total vote came from counted provisional ballots. In new states, provisional ballots accounted for only 0.23% of the total vote.

Those voting with provisional ballots in experienced states had their ballots counted more frequently than those in the new states. This experience effect is evidence that there is room for improvement in provisional balloting procedures, especially in those states new to the process.[13] That conclusion gains support from the perspectives of the local election officials revealed in the survey conducted as a part of this research. Local (mostly county level) election officials from "experienced" states were more likely to:

---

[9] HAVA allows the states considerable latitude in how to implement provisional voting, including deciding who beyond the required categories of voters should receive provisional ballots and how to determine which provisional ballots should be counted.

[10] California, New York, Ohio, Arizona, Washington, and North Carolina. The appearance of Arizona, Washington and North Carolina on this list shows that the number of provisional ballots cast depends on factors other than the size of the population.

[11] See the appendix for our classification of "old" and "new" states and explanation of why the total is less than 50.

[12] To compensate for the wide differences in vote turnout among the 50 states the average figures here are calculated as the mean of the percent cast or counted rather than from the raw numbers of ballots cast or counted.

[13] Managing the provisional voting process can strain the capacity election administrators. For example, Detroit, counted 123 of the 1,350 provisional ballots cast there in 2004. A recent study concluded that Detroit's " 6-day time limit to process provisional ballots was very challenging and unrealistic. To overcome this challenge, *the entire department's employees were mobilized to process provisional ballots.*" (emphasis added.) GAO Report-05-997, "Views of Selected Local Officials on Managing Voter Registration and Ensuring Citizens Can Vote," September 2005.

- Be prepared to direct voters to their correct precincts with maps;
- Regard provisional voting as easy to implement;
- Report that provisional voting sped up and improved polling place operations
- Conclude that the provisional voting process helped officials maintain accurate registration databases.

Officials from "new" states, on the other hand, were more likely to agree with the statement that provisional voting created unnecessary problems for election officials and poll workers.

If experience with provisional voting does turn out to be a key variable in performance, that is good news. As states gain experience with provisional ballots their management of the process could become more consistent and more effective over subsequent elections. Further information from the EAC on best practices and the need for more consistent management of the election process could sharpen the lessons learned by experience. The EAC can facilitate the exchange of experience among the states and can offer all states information on more effective administration of provisional voting.

Concluding optimistically that experience will make all the difference, however, may be unwarranted. Only if the performance of the "new" states was the result of administrative problems stemming from inexperience will improvement be automatic as election officials move along the learning curve. Two other possibilities exist. Our current understanding of how provisional voting worked in 2004 is not sufficient to determine unambiguously which view is correct.

1. "New" states may have a political culture different from "old" states. That is, underlying features of the "new" states political system may be the reason they had not adopted some form of provisional voting before HAVA. The "new" states may strike a different balance among the competing objectives of ballot access, ballot security and practical administration. They may ascribe more responsibility to the individual voter to take such actions as registering early, finding out where the right precinct is, or re-registering after changing address. They may value keeping control at the local level, rather than ceding authority to state or federal directives. The training they offer poll workers about provisional ballots may not be as frequent or effective as in other states. If the inconsistent performance in the "new" states arises out of this kind of political culture, improving effectiveness in the use of the provisional ballots -- as measured by intrastate consistency in administration--- will be harder and take longer to achieve.[14]
2. "Old" states may devote fewer resources to updating their registration files or databases because they consider provisional ballots as a reasonable fail safe way for voters with registration problems a way to cast a ballot. The adoption of statewide voter registration databases in compliance with HAVA therefore may reduce the variation in the use of provisional ballots among the states.

Other influences decreasing consistency among the states include:

---

[14] Despite differing political cultures among states and the latitude HAVA provides states, the statute does, indeed impose some degree of uniformity on issues that Congress thought essential. For example, before HAVA, took effect, "no state gave the voter the right to find out the status of their ballot after the election. " Now all offer that opportunity. See Bali and Silver, "The Impact of Politics, Race and Fiscal Strains on State Electoral Reforms after Election 2000," manuscript, Department of Political Science, Michigan State University. Resisting HAVA's mandates through foot-dragging lacks any legitimate foundation in law or policy.

- The more rigorous the verification requirements, the smaller the percentage of provisional ballots that were counted. Some states verified provisional ballots by comparing the voter's signature to a sample, some matched such identifying data as address, birth date, or social security number, others required voters who lacked ID at the polling place to return later with the ID to evaluate the provisional ballot, ans some required provisional voters to execute an affidavit. [15]
  - In the 4 states that simply matched signatures, nearly 3.5% of the total turnout consisted of provisional ballots, and just under three-fourths of those ballots (73%) were counted.
  - In the 14 states that required voters to provide such additional information as address or date of birth just over 1.5% of the total turnout consisted of provisional ballots, and 55% of those ballots were counted.
  - In the 14 states that required an affidavit (attesting, for example, that the voter was legally registered and eligible to vote in the jurisdiction) just over one-half of a percent (0.6%) of turnout came from provisional ballots, and less than one-third of those (30%) were counted. (But note that HAVA requires all voters to certify that they are eligible and registered in order to cast a provisional ballot, which is functionally an affidavit. The 14 states described here used an explicit affidavit form.)
  - In the 10 states that required voters to return later with identifying documents just under 1.5% of the total turnout came from provisional ballots, and more than half (52%) of these were counted. Voters apparently found this requirement less onerous than the affidavit, even though it required a separate trip to a government office

- Voter registration databases provided information that reduced the number of provisional ballots counted.[16] In states using provisional voting for the first time, states with registered-voter databases counted only 20% of the ballots that were cast. States without such databases counted more than double that rate (44%). As HAVA's requirement for adoption of statewide databases spreads across the country, this variation among states is likely to narrow. Real-time access to a continually updated, statewide list of registered voters should reduce the number of provisional ballots used and reduce the percentage counted since most of those who receive them will be less likely to be actually registered in the state.

- States that counted out-of-precinct ballots counted 56% of the provisional ballots cast. States that counted ballots cast only in the proper precinct counted an average of 42% of provisional ballots. [17]

---

[15] See Table 2 in Appendix 2 for information on the verification method used in each state.

[16] The Election Day Survey found that states using statewide voter registration databases reported a lower incidence of casting provisional ballots than states without voter registration databases, suggesting that better administration of voter registration rolls might be associated with fewer instances where voters would be required to cast a provisional ballot due to a problem with their voter registration.

[17] The Election Day Survey concluded that : "Jurisdictions with jurisdiction-wide provisional ballot acceptance reported higher rates of provisional ballots cast, 2.09 percent of registration or 4.67 percent of ballots cast in polling places, than those with in-precinct-only acceptance, 0.72 and 1.18 percent, respectively. Predictably, those jurisdictions with more permissive jurisdiction-wide acceptance reported higher rates of counting provisional ballots, 71.50 percent, than other jurisdictions, 52.50 percent."

  - In experienced states, the disparity was even more pronounced: 52% of provisional ballots cast were counted in states requiring in-district ballots, while 70% were counted in those allowing out-of-precinct ballots.
  - If all states had counted out-of-precinct ballots, perhaps 290,000 more provisional ballots would have been counted across the country.[18]

- States that provide a longer the time to evaluate provisional ballots counted a higher proportion of those ballots. [19]
  - Fourteen states permitted less than one week to evaluate provisional ballots, 15 states permitted between one and two weeks, and 14 states permitted greater than two weeks[20].
  - Those states that permitted less than one week counted an average of 35.4% of their ballots.
  - States that permitted between one and two weeks counted 47.1%.
  - States that permitted more than 2 weeks, counted 60.8% of the provisional ballots cast[21].
  - The effect of allowing more time for evaluation is felt most strongly in states where more than 1% of the overall turnout was of provisional ballots. In states where provisional ballots were used most heavily, those that permitted less than one week to evaluate ballots counted 58.6% while those that permitted one to two weeks counted 65.0% of ballots, and those states that permitted greater than three weeks verified the highest proportion of provisional ballots, at 73.8%.

Variation Within States

Not only was there little consistency among states in the use of provisional ballots, there was also little consistency within states. This was true in both new and old states. Of the 20 states for which we have county-level provisional ballot data, the rate of counting provisional ballots varied by as much as 90% to 100% among counties in the same state. This suggests that additional factors beyond statewide factors, such as verification requirements or the time provided for ballot evaluation, also influence the provisional voting process. Reacting to the lack of consistency within states, the Carter-Baker Commission) recommended that "states, not counties or municipalities, should establish uniform procedures for the verification and counting of provisional ballots, and that procedure should be applied uniformly throughout the state."[22]

Election Line reported that:

---

[18] This estimate is a rough approximation. States that recognize out-of-precinct ballots counted, on average, 56% of the provisional votes cast. Applying that ratio to the 1.9 million provisional ballots cast nationwide would result in 1.1 million provisional ballots that would have been counted if all states accepted out-of-precinct votes. States that did not recognize out-of-precinct ballots counted 42% of the provisional ballots cast, or about 813,000 ballots, for a difference of about 290,000 votes.

[19] See Appendix __, Relationship Between Time Allotted to Verify Provisional Ballots and the Level of Ballots that are Verified, David Andersen, The Eagleton Institute of Politics

[20] Many thanks to Ben Shepler, of the Moritz College of Law, for assembling complete data on the time requirements states permitted for the counting of provisional ballots.

[21] 43 states are included in this analysis, including Washington D.C. The 7 election-day registration states are omitted, as is Mississippi, which never provided data on provisional ballots. North Carolina is also omitted from the regressions, as it does not have a statewide policy on how it verifies provisional ballots.

[22] Recommendation 2.3.2 of the Report of the Commission on Federal Election Reform, "Building Confidence in U.S. Elections," September 2005, p.16. The report also observed that, ". . .different procedures for counting provisional ballots within and between states led to legal challenges and political protests. Had the margin of victory for the presidential contest been narrower, the lengthy dispute that followed the 2000 election could have been repeated."

- In Ohio some counties counted provisional ballots not cast in the assigned precinct even though the state's policy was to count only those ballots cast in the correct precinct.
- Some counties in Washington tracked down voters who would otherwise have had their provisional ballots rejected because they had failed to complete part of their registration form, gave them the chance to correct those omissions, and then counted the provisional ballot. This would probably not have come to light except for the sharp examination caused by the very close election for governor.

Resources available to administer provisional voting varied considerably among and within states. The result is that differences in demographics and resources result in different experiences with provisional voting. For example, the Election Day Survey found that:

- Jurisdictions with lower education and income tend to report more inactive voter registrations, lower turnout, and more provisional ballots cast.
- Jurisdictions with higher levels of income and education reported higher average numbers of poll workers per polling place or precinct and reported lower rates of staffing problems per precinct.
- Staffing problems appeared to be particularly acute for jurisdictions in the lowest income and education categories. Small, rural jurisdictions and large, urban jurisdictions tended to report higher rates of an inadequate number of poll workers within polling places or precincts.
- Predominantly non-Hispanic, Black jurisdictions reported a greater percentage of polling places or precincts with an inadequate number of poll workers. Predominantly non-Hispanic, Native American jurisdictions reported the second highest percentage of staffing problems.

The conclusions to be drawn from these findings are clear. In voting districts with lower education levels, poverty, and inadequately staffed polling places, the voting process is unlikely to function well. More people will end up casting provisional ballots. That makes the provisional voting process especially important in such districts. But if jurisdictions struggle with regular voting, how well are they likely to do with the more complicated provisional balloting process? In precincts were the voting process, in general, is managed poorly, provisional ballots cannot be expected to work much better. In these areas, the focus should be on broader measures to improve the overall functionality of struggling voting districts, although improving the management of provisional balloting may help at the margin.

Effectiveness of Provisional Voting

The certainty of our conclusions about the effectiveness of provisional voting is limited because of the complexity of the problem and a lack of important information. An ideal assessment of how well provisional ballots worked in 2004 would require knowing the decisions of local officials in 200,000 precincts on how to inform voters about provisional voting; their performance in providing a provisional ballot to those qualified to receive one, and their decisions whether to count a provisional ballot. Information needed about the eligibility or registration status of provisional voters is also not available.

We see no automatic correlation between the quality of a state's voting system and either the number of provisional ballots cast or counted. Low numbers could reflect accurate statewide voting data and good voter education. Or they could suggest that provisional ballots were not made easily available. High numbers could be seen as signifying an effective provisional voting system or a weak registration process. But we do know that in 2004 provisional ballots allowed 1.2 million citizens to vote, citizens who would otherwise have been turned away from the polls.

Since we do not know the total number of registered voters who might have voted but could not makes a precise, quantitative estimate of the effectiveness of provisional voting impossible. The Cal Tech – MIT Voting Technology Project, however, estimated that 4 – 6 million votes were lost in the 2000 presidential election for the reasons shown in Table 1 below. The estimate is an approximation, but it may provide data good enough for a general assessment of the size of the pool of potential voters who might have been helped by the provisional ballot process.

Estimates of Votes Lost In 2000 Presidential Election

Votes Lost (Millions)	*Cause*
1.5 – 2	Faulty equipment and confusing ballots
1.5 – 3	Registration mix-ups
<1	Polling place operations
?	Absentee ballot administration

Table 1 Cal Tech – MIT Voting Technology Project Estimates
4 – 6 million votes are lost in presidential elections due to the causes shown in the table. Registration mix-ups (e.g., name not on list) and polling place operations (e.g., directed to wrong precinct) are the causes most likely to be remedied by provisional voting.

The table shows that the universe of voters who could be helped by provisional voting might be 2.5 – 3 million voters. In 2004, about 1.2 million provisional voters were counted. A rough estimate, then, of the effectiveness of provisional voting in 2004, then, might be 40% to 50% (ballots counted/votes lost)[23]. Whatever the precise figure, it seems reasonable to conclude that there is considerable room for improvement in the administration of provisional voting.

Legislative Response

Indeed, several states[24] came to the conclusion that the administration of their provisional voting procedures needed to be improved and amended their statutes after the 2004 election. State legislation adopted since the election points to particular areas of concern.

---

[23] Another interpretation of the data should be considered. The Census Bureau's Current Population Survey (CPS) developed the category of "registration mix-ups" to assess the states' registration systems. After each election the CPS asks people if they were registered and if they voted. The CPS gives breakdowns of reasons why people did not vote. Survey responders tend to deflect blame when answering questions about voting. In the narrow context of provisional ballots, 'registration problems' would cover only voters who went to the polls where the determination that they were not registered was wrong or they were registered, but in the wrong precinct. If they were in the wrong precinct, provisional voting can help them in only 17 states. In 2004, only 6.8% of those not voting and registered blamed registration problems, while 6.9% reported so in 2000.

[24] Twelve states made statutory or regulatory changes: Arizona, Arkansas, Colorado, Florida, Georgia, Indiana, Louisiana, Montana, New Mexico, North Carolina, Virginia and Wyoming. See Table 4 in Appendix 2.

Not enough time to examine and count the provisional ballots. Florida, Indiana, Virginia, and Washington all have clarified or extended the timeline to evaluate the ballots. But taking more time can prove a problem, particularly in presidential elections with the looming deadline to certify the vote for the Electoral College.[25]

Lack of uniform rules for counting ballots and effective training of the election officials in interpreting and applying those rules to determine the validity of ballots. Colorado, New Mexico, North Carolina, and Washington have all passed legislation focused on improving the efficacy and consistency of the voting and counting process.

Litigation

Successful legal challenges to the process highlight areas where provisional voting procedures were wanting. A flurry of litigation occurred around the country in October 2004 concerning the so-called "wrong precinct issue" – whether provisional ballots cast by voters in a precinct other than their designated one would be counted for statewide races. These lawsuits were largely unsuccessful in their stated goal: most courts, including the U.S. Court of Appeals for the Sixth Circuit (the only federal appeals court to rule on the issue), rejected the contention that HAVA requires the counting of these wrong-precinct provisional ballots.

This litigation was significant nonetheless.

- First, the Sixth Circuit decision established the precedent that voters have the right to sue in federal court to remedy violations of HAVA.
- Second --and significantly-- the litigation clarified the right of voters to receive provisional ballots, even though the election officials were certain they would not be counted. The decision also defined an ancillary right –the right to be directed to the correct precinct. There voters could cast a regular ballot that would be counted. If they insisted on casting a provisional ballot in the wrong precinct, they would be on notice that it would be a symbolic gesture only.
- Third, these lawsuits prompted election officials to take better care in instructing precinct officials on how to notify voters about the need to go to the correct precinct in order to cast a countable ballot – although the litigation regrettably came too late to be truly effective in this regard. In many states, on Election Day 2004, the procedures in place for notifying voters about where to go were less than ideal, reflecting less-than-ideal procedures for training poll workers on this point.

There was also pre-election litigation over the question whether voters who had requested an absentee ballot were entitled to cast a provisional ballot. In both cases (one in Colorado and one, decided on Election Day, in Ohio), the federal courts ruled that HAVA requires that these voters receive a provisional ballot. Afterwards, it is for state officials under state law to

---

[25] The resources available to evaluate and count provisional ballots within a tight schedule may not be easily available. The General Accounting Office reports that Detroit, where 1,350 provisional ballots were cast and 123 counted, found the 6-day time frame for processing provisional ballots "very challenging and unrealistic. To overcome this challenge, the *entire department's employees were mobilized to process provisional ballots.*" The report also found that in Los Angeles County, "staff had to prepare duplicate ballots to remove ineligible or invalid contests when voters cast their ballots at the wrong precinct. To overcome this challenge, staffing was increased to prepare the duplicate ballots." In a close, contested election, "duplicate" ballots would doubtless receive long and careful scrutiny." See Appendix 7, GAO, "Views of Selected Local Election Officials on Managing Voter Registration and Ensuring Eligible Citizens Can Vote," September 2005. (GAO Report-05-997)

determine whether these provisional ballots will be counted, in part by determining if these provisional voters already had voted an absentee ballot (in which case one ballot should be ruled ineligible, in order to avoid double voting). These decisions confirm the basic premise that provisional ballots should be available whenever voters believe they are entitled to them, so that their preferences can be recorded, with a subsequent determination whether these preferences count as valid votes.

RECOMMENDATIONS

Because every provisional ballot counted represents a voter who, if the system had worked perfectly, should have voted by regular ballot, the advent of statewide registration databases is likely to reduce the use provisional ballots. The one area in which such databases may not make a difference is for those who voted by provisional ballot because they did not bring required identification documents to the polling place. The statewide voter registration database will facilitate verifying that ballot, but the voter will still have vote provisionally. Beyond that exception, even with statewide registries in every state, provisional voting will remain an important failsafe, and voters should have confidence that the failsafe will operate correctly.

The wide variation in the implementation of provisional voting among and particularly within states suggests that EAC can help states strengthen their processes. Research-based recommendations for best, or at least better, practices based on the experience gained in the 2004 election can be useful in states' efforts to achieve greater consistency in the administration of provisional voting.

Recommendations for Best Practices

Recent legislative activity shows that state efforts to improve the provisional voting process are underway. Those states, as well as others that have not yet begun to correct shortcomings that became apparent in 2004, can benefit from considering the best practices described here. By recommending best practices, the EAC will offer informed advice while respecting diversity among the states. One way to strengthen the recommendations and build a constituency for them would be for EAC to ask its advisory committee members to recommend as best practices procedures that have worked in their states.

Self-evaluation of Provisional Voting –4 Key Questions

The first need to achieve greater consistency within each state is to think about provisional voting systematically. As legislators, election officials, and citizens in the states prepare for the 2006 election, they should ask themselves these questions about their provisional voting systems.

1. Does the provisional voting system distribute, collect, record, and tally provisional ballots with sufficient accuracy to be seen as procedurally legitimate by both supporters and opponents of the winning candidate? Does the tally include all votes cast by properly registered voters who correctly completed the steps required?

2. Is the provisional voting system sufficiently robust to perform well under the pressure of a close election when ballot evaluation will be under scrutiny and litigation looms?

3. Do the procedural requirements of the system permit cost-efficient operation? Are the administrative demands of the system reasonably related to the staff and other resource requirements available?

4. How great is the variation in the use of provisional voting in counties or equivalent levels of voting jurisdiction within the state? Is the variation great enough to cause concern that the system may not be administered uniformly across the state?

If the answers to these questions leave room for doubt about the effectiveness of the system or some of its parts, the EAC's recommendation of best practices should provide the starting point for a state's effort to improve its provisional voting system.

Best Practices For Each Step In The Process

We examined each step of the provisional voting process to identify specific areas where the states should focus their attention to reduce the inconsistencies noted in our analysis. We offer recommendations in each area appropriate to the responsibilities that HAVA assigns the EAC for the proper functioning of the provisional voting process.

The Importance of Clarity

The EAC should emphasize above all else the importance of clarity in the rules governing every stage of provisional voting. As the Century Foundation's recent report observed, "Close elections increasingly may be settled in part by the evaluating and counting of provisional ballots. . . To avoid post election disputes over provisional ballots—disputes that will diminish public confidence in the accuracy and legitimacy of the result– well in advance of the election, states should establish, announce, and publicize clear statewide standards for every aspect of the provisional ballot process, from who is entitled to receive a provisional ballot to which ones are counted."[26]

Litigation surrounding the 2004 election resulted in decisions that, if reflected in state statutes or regulations and disseminated in effective training for poll workers, can increase the clarity of provisional ballot procedures, increase predictability, and bolster confidence in the system. By taking the following steps, states can incorporate those court rulings into their procedures.

- Promulgate, ideally by legislation, clear standards for evaluating provisional ballots, and provide training for the officials who will apply those standards. For example, in Washington State, the court determined that an election official's failure in evaluating ballots to do a complete check against all signature records is an error serious enough to warrant recanvassing.[27] Clear direction by regulation or statute on what records to use in evaluating ballots could have saved precious time and effort and increased the reliability of the provisional voting system.

- States should provide poll workers standard information resources for the training of poll workers by local jurisdictions. Training materials might include, for example, maps or databases with instruction on how to locate polling places for potential voters who show up at the wrong place. Usable and useful information in the hands of poll workers can protect voters from being penalized by ministerial errors at the polling place.[28]

[26] The Century Foundation, Balancing Access and Integrity, Report of the Working Group on State Implementation of Election Reforms, July 2005.

[27] See *Washington State Republican Party v. King County Division of Records*, 103 P3d 725, 727-728 (Wash. 2004)

[28] See *Panio v. Sunderland* 824 N.E.2d 488, 490 (NY, 2005) See also Order, *Hawkins v. Blunt*, No.04-4177-CV-C-RED (W.D. Mo. October 12, 2004). While rejecting the notion that all ballots cast in the wrong precinct should be counted, the court ruled that provisional votes cast in the wrong precinct should be thrown out provided that the voter had been directed to the correct precinct. This meant that provisional votes cast in the wrong precinct (and even the

- State training materials provided to local jurisdictions should make clear that the only permissible requirement to obtain a provisional ballot is an affirmation that the voter is registered in the jurisdiction and eligible to vote in an election for federal office. [29] Recent legislation in Arizona indicates that recommendations should emphasize HAVA's requirement that persons appearing at the polling place claiming to be registered voters cannot be denied a ballot because they do not have identification with them. Poll workers may need appropriate training to understand their duty to give such voters a provisional ballot. [30]

A. Registration and Pre-Election Information for Voters

Providing crisp, clear information to voters before the election is important to the success of the provisional voting process. The better voters understand their rights and obligations, the easier the system will be to manage, and the more legitimate the appearance of the process. States can begin by assessing the utility and clarity of the information for voters on their websites and by considering what information might be added to sample ballots mailed to voters before elections. Best practices in this area would include:

1. If states require identification at the time of registration, the kind of IDs required should be stated precisely and clearly and be publicly and widely available in a form that all voters can understand. For example, "You must bring your driver's license. If you don't have a driver's license, then you must bring an ID card with your photograph on it and this ID card must be issued by a government agency. " [31]

2. The process to re-enfranchise felons should be clear and straightforward. To avoid litigation over the registration status of felons, best practice should be defined as making re-enfranchisement automatic, or no more burdensome than the process required for any new registrant.[32]

3. State or county websites for voters should offer full, clear information on boundaries of precincts, location of polling places, requirements for identification, and other necessary guidance that will facilitate registration and the casting of a regular ballot. An 800 number should also be provided. Models are available: the statewide databases in Florida and Michigan provide voters with provisional voting information, registration verification and precinct location information.

B. At the Polling Place

---

wrong polling place) would count if there were no evidence that the voter had been directed to a different polling place. The court placed a duty upon election officials to make sure the voters were in the correct locations. Note that this question would not arise in a state that counted ballots cast in the wrong polling place but within the correct county.

[29] *Sandusky County Democratic Party v. Blackwell,* 387 F.3d 565, 774 (6th Cir. 2004)

[30] *The Florida Democratic Party v. Hood,* 342 F. Supp. 2d 1073, 1075-76 (N.D. Fla. 2004). The court explained that provisional voting is designed to correct the situation that occurs when election officials do not have perfect knowledge and when they make incorrect determinations about eligibility (the "fail-safe" notion). Denying voters provisional ballots because of on-the-spot determinations directly contradicts this idea. Even before the cited decision, the Florida Secretary of State's office had determined that any voter who makes the declaration required by federal law is entitled to vote a provisional ballot, even if the voter is in the wrong precinct.

[31] Websites in 29 states describe, with varying degrees of specificity, the identification voters may need. In 18 states voters can learn something about the precinct in which they should vote. And in 6 states (California, District of Columbia, Kentucky, Michigan, North Carolina, and South Carolina) they can verify their registration on the website.

[32] The Century Foundation, op. cit.

Avoiding error at the polling place will allow more voters to cast a regular ballot and all others who request it to cast a provisional ballot.

1. The layout and staffing of the polling place, particularly the multi-precinct polling place is important. Greeters, maps, and prominently posted voter information about provisional ballots, ID requirements, and related topics can help the potential voters cast their ballot in the right place. States should require poll workers to be familiar with the options and provide the resources needed for them to achieve the knowledge needed to be helpful and effective. Colorado has clear regulations on polling place requirements, including HAVA information and voting demonstration display.[33] Many states require training of poll workers. In some states that requirement is recent: after the 2004 election, New Mexico adopted a requirement for poll workers to attend an "election school." [34] A state statutory requirement for training could facilitate uniform instruction of poll workers in those states that do not already provide it.

2. The provisional ballot should be of a design or color sufficiently different from a regular ballot to avoid confusion over counting, as occurred in Washington State. The ballot might include a tear-off leaflet with information for voters such as: "Reasons Why Your Provisional Ballot Might Not Be Counted" on one side and "What to Do if My Provisional Ballot Is Not Counted" on the other.

3. Because provisional ballots offer a fail-safe, supplies of the ballots at each polling place should be sufficient for all the potential voters likely to need them. In 2004, some polling places ran out of ballots, with unknown effects on the opportunity to vote. In Middlesex County, New Jersey, for example, on Election Day the Superior Court ordered the county clerk to assure that sufficient provisional ballots were available at several heavily used polling places, and it authorized the clerk "in the event additional provisional ballots are required . . .to photocopy official provisional ballots." [35] At least two states, Connecticut and Delaware, provide guidelines to local election officials on how to estimate the demand for provisional ballots. Connecticut sets the number at 1% of the voters in the district, Delaware at 6%.[36] States that do not offer a practical method to guide the supply of provisional ballots at polling places should consider doing so. The guideline should take into account both the number of voters in the district and the number of provisional ballots actually cast in recent elections.

4. To achieve the procedural clarity needed to forestall disputes, states should establish a clear chain of custody for the handling of provisional ballots from production through distribution, collection and, finally, evaluation. A number of states have clear procedures for at least parts of this chain of custody. All states should examine their chain-of-custody requirements for clarity. Illinois includes the potentially beneficial requirement that ballots be transported by bi-partisan teams, which offers the potential to avoid some charges of election fraud.

[36] Connecticut: "Equal to or not less than 1% of the number of electors who are eligible to vote in any given district, or such other number as the municipal clerk and the registrars agree is sufficient to protect voting rights. Conn. Gen. Stat. Ann. § 9-232j.Delaware: Each County Department of Elections Office is required to provide to each election district a number of provisional ballots equal to 6% of registered voters in that district, with a minimum allocation of 15 ballots. Additional supplies to be delivered when the supply becomes "very low." Del.Code Ann. Tit 15 § 4948(e).

C. Evaluating Voter Eligibility and Counting Provisional Ballots

The clarity of criteria for evaluating voter eligibility is critical to a sound process for deciding which of the cast provisional ballots should be counted. Public recognition of the validity of those criteria is important to establishing the legitimacy of the system as a whole. The experience in 2004 in North Carolina, Washington, and Ohio underlines the importance of clear criteria. As the Century Foundation report put it, "Whatever procedures the states choose [to determine if a provisional ballot should be counted], the paramount consideration—as with all others concerning provisional voting—is that they be clear and thus not susceptible to post-election manipulation and litigation."[37] Nonetheless, the *Panio v. Sutherland*[38] decision in New York shows the difficulty of defining the range of administrative errors from which the provisional voters should be held harmless. Even when the standard is "clerical error" judges can differ over what that means exactly. Possibly a state law might be able to clarify a definition by giving examples of clerical errors, but even then the definition is unlikely to be perfect.

1. State statutes or regulations should define a reasonable period for voters who lack the HAVA-specified ID or other information bearing on their eligibility to provide it in order to facilitate the state's ability to verify that the person casting the provisional ballot is the same one who registered. While there may be a concern to ensure that the individual who returns with the ID may not be the same individual who cast the provisional ballot, the spirit of HAVA demands that the opportunity to prove identity be provided after Election Day. A signature match can go far in establishing that the individual who voted and the individual returning later with identification is, in fact, the same person. Encouraging a voter who lacks ID on Election Day to return later to help the verification process by providing proper identification will strengthen the system and increase public confidence in the electoral process. Our data indicate that some voters would prefer to return with ID rather than to sign an affidavit, perhaps because of uncertainty about the legal process involved in the affidavit. At least 11 states allow voters to provide ID or other information one to 13 days after voting. Of particular interest is Kansas, which allows voters to proffer their ID by electronic means or by mail, as well as in person.[39]

2. More provisional ballots are counted in those states that verify ballots cast outside the correct precinct. [40] While HAVA arguably leaves this decision up to the states, pointing out the effect of the narrower definition on the portion of ballots counted could be useful to the states in deciding this question. States should be aware, however, of the

[38] 4 N.Y.3d 123, 824 N.E.2d 488 (N.Y. 2005) and Memorandum (LaPlante—Foley) Provisional Ballot Cases by State, July 19, 2005.

[39] In Kansas, the voter can provide ID to a County Election Officer any time before the County Board of Canvassers meets to count provisional ballots. KS. ST. 25-1122(d). ID can be presented in person, OR via mail or electronic means. *Id.* The Board must meet either on the Friday or Monday following a Tuesday election. *Id.* at 25-3104. Deadlines in other states are: Alabama -- 5:00 P.M. on the Monday following the election AL ST § 17-10A-2(c)_(1) Florida: until 5:00 P.M. on the third day following the election . Fla. Stat. Ann. § 101.048 (adopted after the 2004 election);Georgia—no later than 2 days after the election. GA ST § 21-2-417; 419. Illinois- 2 days to submit additional information 10 Ill. Comp. Stat. Ann. 5/18A-15(d); Indiana— in 2004 the deadline was the close of the polls IN. ST. §. 3-11.7-5-2(a). The time period was extended to 13 days by the adoption of Indiana Code 3-11-8, Section 25, Subsection (l); Maryland—until the meeting of the Election Board; MD ELEC LAW § 11-303. New Jersey— until the close of business on the second day after the election 19:53C-3(i). Nevada— until 5:00 P.M. on the Friday following the election NV ST 293.3085; New Mexico—until 7:00 P.M. on Election Day NM ADC 1.10.22 (8) (H).

[40] See Andersen, op. cit, pgs. 23 – 24 for an analysis of the significant effect of counting out-of-precinct ballots. The Election Day Survey found that, "Most notably, jurisdictions that permitted jurisdiction-wide acceptance of provisional ballots reported higher rates of provisional ballots being cast, but also reported a much higher incidence of provisional ballots being counted, than other jurisdictions."

additional burden placed on the ballot-evaluation process when out-of-precinct ballots are considered. And tradeoffs are involved if out-of-precinct voters are unable to vote for the local offices that might appear on the ballot in their district of residence. One option for states is to involve the voters in the decision by pointing out that voters who cast their provisional ballots in the wrong precinct may not be able to participate in the local election. The voter could then decide to go to the correct precinct or vote provisionally for the higher offices at the top of the ticket only.

3. Alternatively, if a state chooses to require voters to appear at their assigned precinct, where the same polling site serves more than one precinct, a voter's provisional ballot should count so long as the voter cast that ballot at the correct polling site even if at the wrong precinct within that location. [41] Ideally the voter could be directed to the correct machine, but poll worker advice will not always be correct. One way to assess the balance of issues here is to consider that, If a voter in a multi-precinct polling place is sent to the wrong machine, the error is probably the poll worker's, and the voter should not be penalized.

4. Officials should follow a written procedure, and perhaps a checklist, to identify the reason why a provisional ballot is rejected (e.g., check the applicable box "unregistered voter"; "lack of signature match" "wrong precinct," etc.) Those forms should be disclosed publicly when completed. Colorado's election rules offer particularly clear guidance to the official evaluating a provisional ballot.[42]

Colorado Rejection Codes (Any ballot given a rejection code shall not be counted):

RFS	(Rejection federal or state) No federal or state candidates or issues to duplicate.
RNS	(Rejection not signed) Provisional Ballot Affidavit not signed.
RIN	(Rejection incomplete information provided) Required information is incomplete and the designated election official is unable to confirm voter's eligibility.
RNR	(Rejection not registered) Voter did not register by the voter registration deadline or by emergency registration, Colorado voter registration record was not found, or voter was previously cancelled and has not been reinstated pursuant to 1-2-605(10). C.R.S.
REE	(Rejection envelope empty) Provisional ballot envelope is empty.
RAB	(Rejection voter voted absentee) Designated election official has confirmed that voter voted an absentee ballot.
REV	(Rejection based on ballot cast in early voting) Voter voted early.
RIP	(Rejection based on incorrect party) Incorrect Party in Primary Election.
RFE	(Rejection felon not eligible to vote) Individual was convicted of a felony and is either serving a sentence of confinement or detention or is on parole.
RWC	(Rejection elector not registered in county or State of Colorado) Non-county or non-state resident; therefore voter not eligible to vote in the county where the provisional ballot was voted.
RID	(Rejection first time voter has not supplied identification upon registration or thereafter prior to and during time voter voted) First Time Voter who

---

[41] Chances are administrative error accounts for the voter being directed to the wrong precinct under these circumstances.

[42] 8 CCR 1505-1, at 26.5.4, adopted august 4, 2005. See also 1-2-509(3) C.R.S.

registered by mail or through a voter registration drive, is tagged as id deficient, and did not provide id at the time of voting.

RRD (Rejection registration deficient) Voter had deficient or incomplete registration and required information was not provided prior to or at the time of filling in the provisional ballot envelope. Voter's eligibility cannot be established.

D. Verification of Provisional Ballots

1. States that use the information on the provisional ballot to permit voters who have changed their addresses to update their registrations should adopt clear procedures on that process and specify how the new information will be communicated between different Boards of Elections

2. In verifying provisional ballots, the time by which election officials must make their eligibility determinations is particularly important in presidential elections because of the need to certify electors to the Electoral College. States should consider in particular how to divide the time allowed them by the safe-harbor provisions that apply in presidential elections to the certification to the Electoral College. Some part of this five-week period will be consumed by the eligibility evaluation, but states should take care to provide a sufficient period of time as well for challenges. If a state consumes 21 days following the election in the eligibility evaluations, only two weeks will remain for legal challenges to be concluded. Is that sufficient? Or should the state provide the resources needed to complete the eligibility determinations in 10 days or two weeks, leaving three weeks or more for legal challenges in a close election? Our research did not identify an optimum division of the five weeks available. The prudent course here would be to encourage states to consider the issue and then make a careful decision about how to complete all steps in the evaluation of ballots and challenges to those determinations within the five weeks available.

E. Post-election Information for Voters

Timely information to voters about the disposition of their provisional ballot will provide helpful feedback and more important enable voters to determine if they are registered for future elections and, if not, what they need to do to become registered.

1. Establish mechanisms to ensure that voters casting provisional ballots are informed whether they are now registered for future elections and, if not, what they need to do to become registered.

F. State Laws Governing Litigation over Provisional Voting

1. Establish special, streamlined litigation procedures for Election Day complaints that individuals are being denied the right to cast a provisional ballot

Broader Considerations

G. Integrity and the Appearance of Integrity

1. State laws or regulations providing for non-partisan or bi-partisan bodies to make a public determination of the validity of provisional ballots would increase confidence in the system.

2. To improve transparency, state laws or regulations should require the purging process for registration to be public and with an opportunity for voters to correct an erroneous determination that they should be purged.

3. State laws or regulation should require the evaluation process for provisional ballots to be public, while protecting the names of those who voted provisionally.

H. Continuous Assessment of the Provisional Ballot -- Process and Performance

Defining what makes for a successful provisional voting system is difficult. The most successful system is probably not the one with the most provisional votes cast (that could indicate problems with the registration system). Nor is the system with the greatest number counted or with the fewest counted necessarily superior because the evaluation process could be flawed.

Defining quality requires a broad perspective about how well the system works, how open it is to error recognition and correction, and how well provisional voting processes are connected to the registration and voter identification regimes. The EAC should consider engaging one of the national quality organizations or processes, such as Six Sigma[43] or the Baldridge Quality process [44] to evaluate the provisional ballot process. Pending such a review, the EAC can recommend that states take the following actions.

1. Recognize that the first step to improving quality is to see the provisional voting process as a system and take a systems approach to regular evaluation through standardized metrics with explicit goals for performance.
2. States should begin by collecting data systematically on the provisional voting process so that they can evaluate their voting system and assess changes from one election to the next. The effort should start in the 2006 election, and the data collected should include:
    - -- Provisional votes cast and counted by jurisdiction, say counties, with details on why the voter had to vote provisionally (lack of ID, not on list, challenged at polling place, issued absentee ballot, etc) and number of ballots actually counted in each category.
    - -- Reasons why provisional ballots were not counted, using categories such as those that have been adopted by Colorado, described earlier in this report.
    - -- Measures of variance among jurisdictions.
    - -- Number of poll workers trained in administration of provisional voting by polling place
    - -- Number of jurisdictions posting information on provisional voting in the polling place
    - -- Time required to evaluate ballots by jurisdiction

---

[43] Six Sigma is a measure of quality that strives for near perfection. Six Sigma is a disciplined, data-driven approach and methodology for eliminating defects (driving towards six standard deviations between the mean and the nearest specification limit) in any process -- from manufacturing to transactional and from product to service.

[44] The Baldrige Criteria for Performance Excellence provide a systems perspective for understanding performance management. They reflect validated, leading-edge management practices against which an organization can measure itself. With their acceptance nationally and internationally as the model for performance excellence, the Criteria represent a common language for communication among organizations for sharing best practices. The Criteria are also the basis for the Malcolm Baldrige National Quality Award process.

Improving understanding of the provisional voting process through analysis of detailed information will enable state and local election officials to strengthen their systems. By collecting and analyzing this data states can identify which aspects of the registration and electoral system are most important in shunting voters into the provisional ballot process. Responsible officials can then look to their registration system, identification requirements or poll worker training as a way to reduce the need for voters to cast their ballots provisionally.

ATTACHMENT 1 – Data Sources for Classification of the States

Our research on provisional voting divided the various states into several categories to allow an assessment of how different factors may have influenced the process of casting and counting provisional ballots. This analysis was conducted before the release of the Election Day Study, and the categories we used may differ in some respects from its work. The variables used to analyze a state's use of provisional ballots:

1. New vs. Old (states that used a provisional ballot before the 2004 election)
2. Use of a statewide database of registered voters vs. no use of a statewide database
3. Counting out-of-precinct ballots vs. not counting out-of-precinct ballots
4. Voter identification requirements
5. Method used to verify provisional ballots
6. Levels of provisional ballots cast and counted

We first assigned states within these categories based on classifications done by Electionline.org in its studies. The Electionline data was the only published information available at the time of our research. We reviewed the Electionline data carefully, and, in select cases, updated it with new, detailed information that had become available after its publication. The changes we made are explained below.

--Idaho, Maine, Minnesota, New Hampshire, Wisconsin and Wyoming were excluded from our analysis. They have election-day registration systems, and did not need to use HAVA-compliant provisional ballots.

--North Dakota does not register voters, so it also was excluded from HAVA requirements and did not use provisional voting.

--Mississippi has not reported its provisional voting results and could not be included in our analysis, though it was compliant in 2004.

--Pennsylvania did not report its totals for the Election Day Study, but we obtained information on Pennsylvania and included it in our analysis.

New vs. Old States

We classified states as "new" or "old" based on the 2001 Electionline study of provisional voting,[45] but condensed its classifications into a single dichotomous variable, new/old with all other cases excluded. The Electionline study divided states into five categories of their use of provisional ballots in the 2000 election:

1. Use of provisional ballots (P)
2. Limited use of provisional ballots (LP)
3. Affidavit ballots (A)
4. No system in place (N)
5. Unnecessary/Not Applicable (U/NA)

We included in the list of "Old States" all states listed as using provisional ballots, limited use of provisional ballots or affidavit ballots. States in all three categories would have been familiar with key aspects of provisional voting.. States that had no provisional voting system in place for the 2002 election, and were HAVA compliant in 2004, were listed as "new" states, as 2004 would have been the first year in which they would be offering the option of provisional voting. States that were listed as unnecessary or not applicable were excluded from this study, as they

---

[45] This study can be found at: http://electionline.org/Portals/1/Publications/Provisional%20Voting.pdf.

were exempt from the HAVA regulations in 2004 because they either allowed same-day registration or did not register voters.

Rhode Island is the only state categorized as an old state by Electionline that we moved into the list of new states. Electionline's map shows Rhode Island as a state that used provisional voting in 2000, but in the state description, it is listed as having no system in place. We learned from the Rhode Island Board of Elections that the state had previously permitted potential voters to sign an affidavit if they did not appear on a precinct's list of registered voters, but felt they were registered to vote. Based on the signed affidavit, the election official would then contact a county official to see if the voter was on a more complete registration list. If the voter's name was on the complete list, that voter was permitted to cast a regular ballot. As this process did not grant the voter a provisional ballot, but served as a different type of administrative failsafe, we concluded that Rhode Island's first use of provisional voting was in 2004 and, therefore, classified the state as "new" to the system of provisional balloting.

Statewide List of Registered Voters

The Electionline preview of the 2004 Election[46] was the starting point for compiling a list of states that had a statewide database of registered voters. That study listed 34 States that did not have their statewide database systems complete, and 16 that did, including the District of Columbia. North Dakota does not register voters, so does not need to compile such a database. Electionline's criterion for concluding that a state had a statewide list was that the state have participation from all jurisdictions in a statewide system. We added Oklahoma to the list of states with statewide databases because we found it had met the Electionline criteria by the 2004 election, albeit too late for inclusion in the Electionline survey.

Out-of-Precinct Ballots

We based our classification of states that allow the counting of ballots cast outside the correct precinct on the data in the 2004 Electionline preview of the 2004 election[2]. States that evaluated ballots cast in a precinct where the voter was not registered were categorized as "out-of-precinct." States that invalidated such ballots were categorized as "In-precinct only."

Table 2

[47] In Illinois, it is not clear that all counties followed this procedure. Some counties may not have counted out-of-precinct ballots.

Verification Method

We identified four different ways states assessed provisional ballots to determine if they should be counted: signature match, match voter data, signed affidavits, and bringing back identification later. We gathered information about these verification techniques by checking state websites and consulting journalistic accounts. We consulted state legislation to provide further information where needed.

Table 3
CATEGORIZATION OF STATES -- Ballot Evaluation Methods

* North Carolina lacked clear standards to evaluate provisional ballots and is excluded from this analysis.

Data Collection

To assemble our data for analysis, we began by using the data on provisional votes cast and counted reported by Electionline. To increase the accuracy of this data, we surveyed each state's election websites for updated data, and for reported numbers on the county level. We then sent emails to 49 (we excluded Alaska, see below) states and the District of Columbia, requesting updated data on the number of provisional votes cast and counted by county. We received information from 25 states by our cut-off date of August 25, 2005.

Table 4

West Virginia	
26 States	**25 States**

---

[48] Alaska was not contacted via email, as the state does not have voting districts comparable to counties in other states and could not be matched with comparable census data.

[49] Maryland reported provisional ballots that were counted per county, but not number cast.

[50] Nebraska reported an incomplete list of provisional ballots cast and counted by county, but designated counties by number, rather than by name.

Data Differences

The data used in this study differ from the data reported in the Election Day Study for 19 states. The Election Day Study was not completed until well after our statistical analysis of provisional voting was finished. Where there are differences, they are typically very small, usually fewer than 100 votes either cast or counted. Of the 9 states that have differences of more than 100 votes cast or counted, 7 have reported their numbers directly to us and can be considered updated data that EDS had not obtained. For one of those states, New Mexico, EDS had incomplete data, and for another, Pennsylvania, EDS had no data at all. The data that we have collected reflects updated numbers from the states that have changed following recounts and litigation that altered how ballots were evaluated.

Table 5
Data Differences with the Election Day Study

State	EDS Numbers Cast/Counted	Our Numbers Cast/Counted	Differences	Updated Info from State?[51]
Alabama	6,478/1,865	6560/1836	82/29	No
Alaska	23,285/22,498	23,275/22,498	10/0	No

Subject Voter ID Report and Appendices

Karen,

Attached is the final draft report on our Voter ID analysis, revised to incorporate the comments made by the EAC at and after our meeting in Washington and the new statistical analysis performed by Tim Vercellotti, which I sent you last Friday. Included in the attached file are about 60 pages of appendices. You may or may not want to distribute all the appendices to the reviewers who will take part in Thursday's conference call. They might find Appendix A useful; it provides a detailed summary of the actual statutory language on Voter ID in each of the states. The other appendices, which are called for as deliverables in the contract, provide worthwhile information for the record, but are not likely to offer material for the reviewers to focus on.

When it comes time to distribute this material to the advisory boards before our meeting with them in May, once again you may want to exercise judgment about how much of it is likely to prove of interest to them.

We look forward to Thursday's teleconference.

Tom O'Neill

VoterIDReport0508.doc

REVISED FINAL DRAFT
05/08/06

REPORT AND RECOMMENDATIONS TO THE EAC VOTER IDENTIFICATION ISSUES

Report Background

This report to the United States Election Assistance Commission (EAC) analyzes the effects of voter identification requirements on turnout in the 2004 election and makes recommendations for best practices to evaluate proposals for voter ID requirements. It is based on research conducted by the Eagleton Institute of Politics at Rutgers, the State University of New Jersey, and the Moritz College of Law at Ohio State University under a contract to the EAC, dated May 24, 2005. The research included a review and legal analysis of state statutes, regulations and litigation concerning voter identification and provisional voting, and a statistical analysis of the effects of various requirements for voter identification on turnout in the 2004 election. This report is a companion to a draft report on Provisional Voting submitted to the EAC on November 28, 2005 under the same contract.

The Help America Vote Act of 2002 (HAVA) (Public Law 107-252) authorizes the EAC (Sec. 241, 42 USC 15381) to conduct periodic studies of election administration issues. The purpose of these studies is to promote methods for voting and administering elections, including provisional voting, that are convenient, accessible and easy to use; that yield accurate, secure and expeditious voting systems; that afford each registered and eligible voter an equal opportunity to vote and to have that vote counted; and that are efficient.

EXECUTIVE SUMMARY AND RECOMMENDATIONS

Methods

To explore the effects of voter ID requirements on electoral participation in 2004, as measured by turnout, we gathered information on the requirements in effect in the 50 states and the District of Columbia in that year. We assigned each state to one of five categories based on its ID requirements. They are progressively more rigorous based on the demands they make on voters.[1] The categories range from "Stating Name" which we judge to be somewhat less demanding than "Signing Name." "Signature Match" requires poll workers to examine the signature and compare it to a sample, which is slightly more demanding that the voter simply signing. "Present ID" requires voters to offer some documentary evidence of their identity,

---

[1] Even the most relaxed provisions for identification at the polls –anything stricter than the honor system used in North Dakota—will impose some burden on particular voters. Harvard Law Review 119:1146

ranging from a utility bill to a passport. It is more demanding than the previous three categories because it requires that the voter remember to bring this documentation to the polls. (Even a simple ID, such as a utility bill, may not be available to some renters or, say, those in group housing.) We regard a government "Photo ID" as the most rigorous requirement. Such identity documents may not be uniformly and conveniently available to all voters.

To examine the potential variation on turnout rates associated with each type of voter ID requirements in effect on Election Day 2004, we drew on two sets of data. These were, first, aggregate turnout data at the county level for each state and, second, the reports of individual voters collected in the November 2004 Current Population Survey by the U. S. Census Bureau. Using two different data sets makes it possible to check the validity of one analysis against the other. It also provides insights not possible using only one of the data sets. The aggregate analysis cannot provide valid estimates on the effects of different ID requirements on particular demographic groups (e.g., the old, the young, African-Americans, the poor, or high school graduates). The Current Population Survey data does permit that kind of analysis, although it has the disadvantage of relying on self-reports by respondents about their registration status and experience in the polling place.

To understand legal issues that have been raised in recent litigation over voter ID requirements, we collected and analyzed the few major cases that have been decided on this issue. The decisions so far suggest the constitutional and other constraints on voter ID requirements.

Findings

Our analysis of data from the 2004 election indicates that the form of identification required of voters affects turnout. Lack of ID can keep voters from the polls or prevent them from casting a regular ballot if they go to the polling place.[2] This finding emerged from both the analysis of aggregate, county-level data and the individual-level data of the Current Population Survey. The overall effect for all registered voters was fairly small, but statistically significant.

Voter turnout in 2004 was lower in states where voter identification requirements were more demanding. The data show a general movement toward lower turnout as voters are required to present levels of proof of their identify.

---

[2] It also seems reasonable to conclude that in states that require an identity document to vote, more voters –those lacking the required ID—will cast provisional ballots. This conclusion is a conjecture because we lack precise information on why voters must cast their ballots provisionally.

The aggregate data show that 60.9 percent of the estimated citizen voting age population turned out in 2004. An average of 64.6 percent turned out in states that required voters to state their names, compared to 58.1 percent in states that required photo identification, a reduction of 6.5 percentage points. That figure, however, probably overstates the effect of voter ID requirements since the inclusion of other factors in the analysis diminishes the extent of influence of voter ID on turnout. After taking account of other factors, the analysis supports the hypothesis that as voter identification requirements increases, turnout declines.

The effects were more pronounced for some specific subgroups. Hispanic voters, the poor and those who did not graduate from high school appear to be less likely to vote as the identification requirement becomes more demanding. The analysis for some other demographic groups illustrate the range of effects predicted for more rigorous voter ID requirements:

Race or Ethnicity

- In the individual-level data for Hispanic voters, the probability of voting dropped by 9.7 percent across the various levels of identification requirements.
- More rigorous ID requirements did not have a statistically significant effect when looking at all African-Americans, but
- African-American voters from households below the poverty line were 7.5 percent less likely to vote as the ID requirements varied from stating one's name to providing photo identification.

Income

- Citizens from poor households were 5.3 percent less likely to vote as the requirements varied from stating one's name to attesting to one's identity in an affidavit.

Education

- Registered voters who had not graduated from high school were 6.7 percent less likely to say they voted as the requirements ranged from stating one's name to providing photo identification.

Age

- Age was also a key factor, with voters ages 18 to 24 being 7.7 percent to 8.9 percent less likely to vote as the requirements ranged from stating one's name to providing a photo identification or affidavit.
- Turnout by young (18-24) African-American voters in states that required a government-issued photo ID was about 10% less likely to vote than in states where they had only to state their name.
- The elderly, while they would be slightly less likely to vote as the requirements changed from stating name to providing photo ID, would not necessarily be affected in the dramatic manner predicted by opponents of photo identification requirements.

Our analysis of litigation suggests that the courts will look strictly at requirements that voters produce a photo ID in order to cast a regular ballot. The courts have used a balancing test to weigh the legitimate interest in preventing election fraud against the citizen's right to privacy (protecting social security numbers from public disclosure, for example) and the reasonableness of requirements for identity documents. To provide both the clarity and certainty in administration of elections needed to forestall destabilizing challenges to outcomes, best practice for the states may be to limit requirements for voter identification to the minimum needed to prevent duplicate registration and ensure eligibility.

Evidence on the incidence of vote fraud, especially on the kind of vote fraud that could be reduced by requiring more rigorous voter identification is not now sufficient to evaluate the tradeoffs between ensuring ballot access and ensuring ballot integrity.[3] Assessing the effectiveness of voter ID as a way to protect the integrity of the ballot should logically include an estimate of the nature and frequency of vote fraud. This research does not include consideration of vote fraud nor the possible effectiveness of various voter ID regimes to counter attempts at vote fraud. As a result, our analysis of the effects of voter ID requirements on turnout cannot take into account how many potential voters who did not turn out under comparatively stricter voter ID requirements might have been ineligible or eligible to vote.

The current lack of understanding of precisely how voter ID requirements affect turnout can be remedied by requiring the collection and reporting of data on the reasons potential voters are required to cast a provisional ballot and the reasons for rejecting provisional ballots during the

---

[3] The EAC has contracted with other researchers to study vote fraud issues.

2006 and subsequent elections. Also useful would be the results of surveys of voters on their experiences in meeting voter ID requirements and on what type of ballot they cast.[4] And, of course, more information is needed on the incidence and varieties of vote fraud, but that inquiry is outside the scope of this report.

A voting system that requires voters to produce an identify document or documents may indeed prevent the ineligible from voting. It may also prevent eligible voters from casting a ballot. If the ID requirement of a ballot protection system blocks ineligible voters from the polls at the cost of preventing eligible voters who lack the required forms of identification, the integrity of the ballot may not have been improved; the harm may be as great as the benefit.

Recommendations for consideration and action by the EAC

The dynamics of Voter ID requirements –how more rigorous voter ID requirements affect the decision by potential voters to go or stay away from the polls-- are not well understood. This lack of understanding should be recognized in the policy process in the states. The debate over voter ID in the states would be improved by additional research sponsored by the EAC.

The EAC should consider the following actions to improve understanding of the relationship between voter ID requirements and the two important goals of ensuring ballot access and ensuring ballot integrity.

1. Encourage or sponsor further research to clarify the connection between Voter ID requirements and the number of potential voters actually able to cast a ballot.
2. Recommend as a best practice the publication of a "Voting Impact Statement" by states as they assess their voter ID requirements to protect the integrity of the ballot. The analysis will help ensure that efforts to increase ballot security have a neutral effect on electoral participation by eligible voters. The Voter Impact Statement would estimate the number and demographics of 1) eligible, potential voters that may be kept from the polls or permitted to cast a provisional ballot by a stricter ID requirement; and 2) and assess the number of ineligible voters who will be prevented from voting by the stricter ID requirements.

---

[4] Arizona held its first election with its new, stricter ID requirements on March 14, 2006. In at least one county (Maricopa) election officials handed a survey to voters that asked if they knew about the voter identification law and if they did, how they found out about it. Edythe Jensen, "New Voter ID Law Goes Smoothly in Chandler," *Arizona Republic*, March 15, 2006. More surveys of this kind can illuminate the dynamics of voter ID and voting in ways that are not possible now because of insufficient data.

3. Encourage or require the states in the 2006 election and beyond, to collect and report reliable, credible information on the relationship between ballot access and ballot security. EAC should publish an analysis of this information to provide a sound factual basis for the states to consider as they estimate the incidence of the kinds of vote fraud that more stringent ID requirements may prevent. The analysis should describe the dynamics of the voter ID process in preserving the security of the ballot. EAC can also use this information to encourage the states to assess the effectiveness of programs to ensure that all eligible voters have required ID and are permitted to vote in future elections.
    I. Useful information could be supplied by state-sponsored surveys of voters by local election officials. It would make clear why those who cast a provisional ballot were found ineligible to cast a regular ballot. The answers would illuminate the frequency with which ID issues divert voters into the provisional ballot line.
    II. Surveys to ask voters what they know about the voter id requirements would also provide useful context for evaluating the effect of various voter ID requirements on electoral participation.
    III. Spot checks by state election officials on how the identification process works at polling places could provide information on how closely actual practice tracks statutory or regulatory requirements. Such reports should be available to the public.
4. Encourage states to examine the time period allowed for voters who cast a provisional ballot because they lacked required ID to return with their identification. In eleven states, voters who had to cast a provisional ballot because they lacked the ID required for a regular ballot were permitted to return later with their ID. Their provision of this ID is the critical step in evaluating the ballots. The length of the period in which the voter may return with ID is important. In setting the time period for return, which now varies among the states from the same day to about two weeks, states should consider three factors: the convenience of the voter, the total time allowed to evaluate ballots[5], and the safe harbor provision in presidential elections.
5. Recommendations to the states from EAC should reflect current judicial trends. Requirements that voters provide some identifying documentation have been upheld, where photo ID is *not* the only acceptable form. Whether laws requiring photo ID will be upheld is

---

[5] Our research on provisional voting reveals that states that provide more than a week to evaluate provisional ballots end up counting substantially more of those ballots than states that provide less than a week.

more doubtful. To date, only one court has considered a law requiring voters to show photo ID (*Common Cause v. Billups*), and that court concluded that this requirement is likely unconstitutional.

SUMMARY OF RESEARCH

Background and Approach of the Study

Establishing the eligibility of a person to vote has long been part of the electoral process. Voters may have to identify themselves twice in the electoral process: when registering to vote and then when casting a ballot. The pressures felt by the voter arising from the need to check ID, even so simple a check as a signature match, can be greater at the polls on Election Day than at the time of registration. Poll workers may feel under pressure when faced with long lines and limited time.

This analysis focuses on ID requirements on Election Day, but with an appreciation that the ID requirements at time of registration and on Election Day are inter-related. [6] The emphasis in this report is on Voter ID requirements on Election Day and afterwards as election judges evaluate provisional ballots. This is the critical period for the electoral system, the time when ballot access and ballot security are in the most sensitive balance.

The report looks broadly at voter ID issues and goes beyond the rather narrow identification requirements in HAVA. Much of the current debate in state legislatures over voter ID ranges beyond HAVA to require more rigorous documentation of identity for all would-be voters, not just those who had not registered in person and are casting a ballot for the first time. Current controversies in the states over voter ID seems to have been sparked in part by the HAVA requirements, but goes beyond those requirements, and sets the context for the analysis here.[7]

We recognize that the previously technical, rather dull subject of voter ID requirements has become fiercely partisan and divisive in many states. The polarization of the debate has raised the stakes over this issue, making dispassionate analysis both more valuable and more rare.[8]

---

[6] As the Carter-Baker Commission noted, photo ID requirements for in-person voting do little to address the problem of fraudulent registration by mail, especially in states that do not require third-party organizations that register voters to verify ID. Commission on Federal Election Reform, pp 46-47.

[7] Harvard Law Review 119:1127: "Legislators hoping to stiffen their state antifraud laws have taken their cue from identification provisions buried in HAVA."

[8] "Of the various electoral procedure laws passed in the fifty states since the 2000 and 2004 presidential elections and those still being debated in state legislatures and local media, few arouse more potent partisan feelings than voter identification laws." *Harvard Law Review* 119:1144. John Fund's 2004 book, *Stealing Elections: How Voter Fraud Threaten Our Democracy*, cites (pages 16 – 17) a Rasmussen Research poll that asked respondents if they were more concerned with voting by ineligible participants or with disenfranchisement of eligible voters. Sixty-two percent of Kerry supporters, but only 18 percent of Bush supporters, worried more about *disenfranchisement*; 58 percent of Bush supporters, but only 19 percent of Kerry supporters were more concerned with *voter fraud*.

Voter ID is often described as the critical step in protecting the integrity of the ballot, the process to ensure that the potential voter is eligible and , if eligible, is permitted to cast one ballot and one ballot only. Truly protecting the integrity of the ballot, however, requires a perspective that takes in the entire voting process. It demands more than preventing the ineligible from voting, and should also ensure that all those who are eligible and want to vote can cast a ballot that counts. The protection effort must embrace all forms of voting, including absentee ballots, and consider each step in the process from registration through vote counting.

A voting system that requires voters to produce an identity document or documents may prevent the ineligible from voting. It may also prevent the eligible from casting a ballot. If the ID requirements block ineligible voters from the polls at the cost of preventing eligible voters who cannot obtain or have left at home the required forms of identification, the integrity of the ballot may not have been improved; the harm may be as great as the benefit.

Assessing the effectiveness of voter ID as a way to protect the integrity of the ballot should logically include an estimate of the nature and frequency of vote fraud. The EAC has informed us that it has commissioned a separate analysis of the incidence of vote fraud. Consequently, this research does not include consideration of vote fraud nor the possible effectiveness of various voter ID regimes to counter attempts at vote fraud. As a result, our analysis of the effects of voter ID requirements on turnout cannot take into account how many potential voters who did not turn out under comparatively stricter voter ID requirements might have been ineligible or eligible to vote.

In some states, voters lacking required ID, or who have ID that does not reflect their current address, are able to vote only by casting a provisional ballot.[9] Voter ID requirements that require voters to bring a document to the polls --rather than simply sign their names-- can divert more voters to the provisional ballot. Requiring poll workers to request and check ID, can put stress on the already demanding environment of the polling place. Scrutiny of ID can create lines at the polling places. Further delays can result when voters cast a provisional ballot and fill out the ballot envelope. Voters who cast a provisional ballot because they lack their ID on Election Day, and who then fail to return with the needed document or documents, will have their ballot

---

[9] For example, the Florida voter ID law adopted after the 2004 election and pre-cleared by the Department of Justice, permits voters who cannot meet the ID requirements to sign an affidavit on the envelope of a provisional ballot, which will be counted if the signature matches that on the voter's registration form.

rejected.[10] And, of course, the cost of processing provisional ballots is greater than the cost of regular ballots.

Each of these potential consequences of more elaborate voter identification processes can increase the chance of litigation. Long lines will, at best, discourage voters and at worst make voting seem a hassle, an impression that could keep more citizens (even those with ID) from the polls. In conducting this analysis, we were sensitive to the observation that the problem with American elections may well be that too many people do not vote rather than that a few people may vote more than once.

Evaluating the effect of different Voter ID regimes can be most effective when based on clear standards --legal, equitable, practical. The standards outlined here can best be described as the questions policy-makes should ask about Voter ID requirements. We suggest 7 questions that address important dimensions of the problem.

1. Is the Voter ID system designed on the basis of valid and reliable empirical studies of the incidence of the sorts of vote fraud it is designed to prevent?[11]
2. How effective is the ID requirement in increasing the security of the ballot? How well can it be coordinated with a statewide voter database?[12]
3. How practical is the requirement? (Can it be administered smoothly by the staff and budget likely to be made available? How much additional training of polling place workers might be required?) Is it simple enough or can it be defined with sufficient clarity that poll workers throughout the state can administer it uniformly and with a minimum of local interpretation made on the fly under the pressure of Election Day?[13]
4. How cost-effective is the system? Does it demonstrably increase the security of the ballot affordably, measured in both monetary and other costs? To improve

---

[10] The EAC's Election Day Study found "improper ID," to be the third most common reason for a provisional ballot to be rejected. "Improper ID" was cited by 7 states responding to the survey, compared to 14 mentions for voting in the wrong precinct. *Election Day Study*, Chapter 6, p. 5.

[11] "Often where the battle over voter identification is most heated, real evidence of voter fraud proves scarce: in Georgia, for example, the Secretary of State averred that she had never encountered a single instance of voter impersonation at the polls. State laws might sometimes impose tighter restrictions on in-person voting than on absentee ballots, which yield the greatest incidence of, and provide the easiest avenue for, voter fraud. . ." Harvard Law Review 127:1144 (2006)

[12] See the final section of this report for a brief overview of possible effects of a statewide voter database on voter identification issues.

[13] In New York, in 2004, disparities in training and voting information were made apparent in a study finding elections officials had wildly varying interpretations of what the state's voter identification requirement actually was. Tova Wang, "Warning Bell in Ohio," December 5, 2005. Website, the Foundation for National Progress.

understanding of the non-monetary component of the costs, conducting a voter impact study might be appropriate. The voter impact study would examine, before the adoption of the regulation, the cost of compliance by the voter (such as the cost in time and money of acquiring a photo ID card), any offsetting benefits to voters, and the possible disparate effects of the regulation on various groups of voters.[14] A thorough, objective impact statement that demonstrated the nexus between the identification regime and the integrity of the ballot could provide protection against inevitable legal challenges.

5. If a side effect of the Voter ID regulation is likely to reduce turnout, generally or among particular groups, is it possible to take other steps to ameliorate the adverse consequences?[15]
6. Does it comply with the letter and spirit of Voting Rights Act?
7. The seventh question is the most difficult to answer. Does the Voter ID requirement have a neutral result on the composition of the qualified and eligible electorate? ID requirements should not be designed to, nor unintentionally, reduce the turnout of particular groups of voters or supporters of one party or another.

Voter ID and Turnout

As of the 2004 election, the states and the District of Columbia could be divided into 5 different Voter ID regimes. These are shown in Table 1, *Voter ID Requirements*. Nine states required that voters give their names; 14 that they sign their names; 8 match the signature to a sample in the registration book; 15 require some form of ID (ranging from a utility bill to a government-issued photo ID), and 5 states in 2004 required a photo ID, although in all those states voters without that credential could cast a regular ballot after signing an affidavit concerning their identity and eligibility or provide other forms of ID.

We recognize the difficulties in summarizing each state's voter ID requirements. The problem is illustrated by the number of footnotes to Table 1 below. The variety of statutory and regulatory details among the states is complex. Moving beyond the statutes and regulations,

---

[14] "Absent clear empirical evidence demonstrating widespread individual voter fraud, legislatures need to fashion narrowly tailored voter identification provisions with an eye toward the inevitable and well-grounded constitutional challenges that will arise in the courts. Only as states grow more adept at administering elections will courts likely demonstrate greater willingness to uphold strict identification requirements." Harvard Law Review 127:1144 (2006)

[15] For example, the Carter-Baker Commission coupled its recommendation for a national voter ID card to a call for an affirmative effort by the states to reach out and register the unregistered, that is, to use the new Voter ID regime as a means to enroll more voters. Similarly, Richard Hasen has suggested combining a national voter ID with universal registration. See his "Beyond the Margin of Litigation: Reforming U.S. Election Administration to Avoid Electoral Meltdown," 62 Washington and Lee Law Review 937 (2005).

we also recognize that the assignment of each state to one category may fail to reflect actual practice at many polling places.

Like any system run by fallible people, the voter ID process is subject to variation in practice.[16] Voters may be confronted with demands for identification different from the directives in state statutes or regulation. Under the pressures of Election Day, there is no sure way to report the wide variety of conditions each voter encounters. It seems reasonable to conclude, however, that while actual practices may vary, the variance is around each state's legal requirement for ID. The analysis of the effect of state requirements on turnout must be viewed with some caution. Nevertheless, we are satisfied that the categories used in this report provide a level of discrimination among voter identification regimes sufficient for the analysis that we have undertaken.

TABLE 1 -- Voter ID Requirements[17]

* States applies only HAVA's ID requirement, applicable for first-time voters who registered by mail and did not provide applicable ID at the time of registration.

[1] Arizona voters who lack a photo ID may present 2 forms of ID with no photograph.

[2] Florida required a photo ID in 2004. Voters without that credential could sign an affidavit concerning their identity and eligibility and cast a regular ballot. Florida subsequently changed its law to require that voters present photo ID to cast a regular ballot, though voters without photo ID may still cast a provisional ballot by signing an affidavit, which ballot should ordinarily be counted.

[3] Louisiana required a photo ID in 2004. Voters without that credential could sign an affidavit concerning their identity and eligibility and cast a regular ballot.

[4] Pennsylvania requires ID of all first-time voters, whether they registered by mail or in-person.

[5] Voters lacking a photo ID could vote by providing another form of ID in 2004.

[6] Voters lacking a photo ID could vote by providing another form of ID in 2004.

[7] Tennessee voters must provide signature and address. In counties without computerized lists, the signature is compared to the registration card. In counties with computerized lists, the signature is compared to a signature on ID presented with the registration.

[8] Texas voters must present a current registration certificate. Those without a certificate can vote provisionally after completing an affidavit.

Effect of Voter ID requirements on Turnout

We examined the potential variation in turnout rates based on the type of voter identification required in each state on Election Day 2004 using two sets of data: aggregate turnout data at the county level for each state, as compiled by the Eagleton Institute of Politics, and individual-level survey data included in the November 2004 Current Population Survey conducted by the U.S. Census Bureau. Classification of voter identification requirements comes from a review of state statutes conducted by the Moritz College of Law at the Ohio State University.

The Voter ID category assigned to each state is shown in Table 1. We analyzed turnout data for each county according to the voter identification requirements of its state. We also assessed self-reported turnout by the sample interviewed in the November 2004 Current Population Survey of the Census Bureau. [18]

Voter turnout at the state level in 2004 varied based on voter identification requirements. An average of 64.6 percent of the citizen voting age population turned out in states that required voters to state their names, compared to 58.1 percent in states that required photo identification. Other factors, of course, also influence turnout. Taking those other factors into account in the county-level analysis makes the effect of the voter ID requirement less dramatic. But the analysis supports the hypothesis that as voter identification requirements become more stringent, turnout declines. The effect is particularly noticeable in counties with concentrations of Hispanic residents or of people living below the poverty line.

The individual-level analysis, based on the CPS, produced a similar result. Voter identification requirements exert a statistically significant, negative effect on whether survey respondents said they had voted in 2004. The probability that a respondent to the survey voted dropped with each level of voter identification requirement, with a total drop of 2.5 percent across the five types of identification.

Methods

Based on research performed for this study by the Moritz College of Law, states had one of five types of requirements in place on Election Day 2004. Upon arrival at polling places, voters had

---

[18] See Appendix for the full report: Tim Vercellotti, "Analysis of Voter Identification Requirements on Turnout," The Eagleton Institute of Politics, Rutgers University, May 4, 2006.

to: state their names (nine states); sign their names (13 states and the District of Columbia); match their signature to a signature on file with the local election board (eight states); provide a form of identification that did not necessarily include a photo (15 states); or provide a photo identification (five states).[19]

We coded the states according to these requirements to test the assumption that voter identification requirements would pose an increasingly demanding requirement in this order: stating one's name, signing one's name, matching one's signature to a signature on file, providing a form of identification, and providing a form of photo identification.

Election laws in many states, however, offer exceptions to these requirements if potential voters lack the necessary form of identification, and laws in those states set a minimum standard that a voter must meet in order to vote using a regular ballot (as opposed to a provisional ballot). In recognition of this fact, we also categorized states based on the *minimum* requirement for voting with a regular ballot.

In 2004 none of the states required photo identification as a minimum standard for voting with a regular ballot. Four states, however, required voters to swear an affidavit as to their identity (Florida, Indiana, Louisiana, and North Dakota The five categories for minimum requirements were: state name (12 states), sign name (14 states and the District of Columbia), match one's signature to a signature on file (six states), provide a non-photo identification (14 states), or swear an affidavit (four states).

We treated the minimum ID in terms of increasing demand on the voter: state name, sign name, match signature, provide non-photo identification, and, given the potential legal consequences for providing false information, swearing an affidavit.

We examined turnout among U.S. citizens of voting age in both the aggregate and the individual-level data. Determining citizenship status in the individual-level data simply involved restricting the analyses to individuals who identified themselves as citizens in the November 2004 Current Population Survey. (Those who said they were not citizens did not have the

---

[19] Oregon conducts elections entirely by mail. Voters sign their mail-in ballots, and election officials match the signatures to signatures on file. For the purposes of this analysis, Oregon is classified as a state that requires a signature match.

opportunity to answer the supplemental voting questions contained in the Current Population Survey.)

The aggregate data posed a greater challenge to determine percentage of the voting-age population that has U.S. citizenship. The Census Bureau gathers information on the citizenship status of adults ages 18 and older only during the decennial census. While the Census Bureau provides annual estimates of the population to account for changes between decennial censuses, the bureau does not offer estimates for the proportion of the adult population who are citizens as part of the annual estimates. To address this issue we estimated the 2004 citizen voting-age population for each county using a method reported. Therefore, we calculated the percentage of the 2000 voting-age population who were citizens in 2000, and applied that percentage to the July 1, 2004 estimates for voting-age population in each county. This method was used in the analysis of the 2004 Election Day Survey conducted for the U.S. Election Assistance Commission.

We classified each state as having one of five types of identification requirements in place on Election Day 2004. Upon arrival at polling places, voters had to either: state their names (9 states); sign their names (13 states and the District of Columbia); match their signature to a signature on file with the local election board (8 states); provide a form of identification that did not necessarily include a photo (15 states); or provide a photo identification (5 states). We then tested the assumption that voter identification requirements would prove to be increasingly demanding on the voter, with providing photo ID the most rigorous. In the statistical analysis, we coded the voter identification requirements on a scale of one to five, with one representing the least demanding form of identification and five representing the most demanding form of identification.

Findings

As the level of required ID proof increases, with photo identification as the most demanding requirement, turnout declines. Averaging across counties in each state, statewide turnout is negatively correlated with maximum voter identification requirements ($r = -.30$, $p < .0001$). In considering the array of minimum requirements, with affidavit as the most demanding requirement, voter identification also is negatively correlated with turnout ($r = -.20$, $p < .0001$). Breaking down the turnout rates by type of requirement reveals in greater detail the relationship between voter identification requirements and voter turnout.

Table 2 – Variation in 2004 State Turnout Based on Voter Identification Requirements

Maximum Requirement		Minimum Requirement	
Voter Identification Required in the States	Mean Voter Turnout for States in that Category	Voter Identification Required in the States	Mean Voter Turnout for States in that Category
State Name	**64.6 %**	State Name	**63.0 %**
Sign Name	**61.1 %**	Sign Name	**60.8 %**
Match Signature	**60.9 %**	Match Signature	**61.7 %**
Provide Non-Photo ID	**59.3 %**	Provide Non-Photo ID	**59.0 %**
Provide Photo ID	**58.1 %**	Swear Affidavit	**60.1 %**
Average Turnout (All States)	***60.9 %***		

The aggregate data show that 60.9 percent of the estimated citizen voting age population voted in 2004. Differences in voter turnout at the state level in 2004 varied based on voter identification requirements. Taking into account the maximum requirements, an average of 64.6 percent of the voting age population turned out in states that required voters to state their names, compared to 58.1 percent in states that required photo identification. A similar trend emerged when considering minimum requirements. Sixty-three percent of the voting age population turned out in states requiring voters to state their names, compared to 60.1 percent in states that required an affidavit from voters.

Voter identification requirements alone do not determine voter turnout. Other factors make a difference in turnout, often a greater difference than the ID requirements. Multivariate models can take into account other predictors of turnout and therefore paint a more complete picture of the relationship between voter identification requirements and turnout. The model used here also took into account such variables as:

- Was the county in a presidential battleground state?
- Was the county was in a state with a competitive race for governor and/or the U.S. Senate?
- Percentage of the voting-age population in each county that was Hispanic or African-American
- Percentage of county residents age 65 and older
- Percentage of county residents below the poverty line

The dependent variable in each model was voter turnout at the county level, with turnout calculated as the percentage of the citizen voting-age population that voted in the 2004 election.

The maximum ID requirements had a small and negative effect on turnout in 2004 controlling for electoral context and demographic factors. Both contextual factors (whether the county was in a state that was a battleground state and whether that state had a competitive race for governor and/or U.S. Senate) increased voter turnout. The more senior citizens and African-Americans in the county, the higher the turnout. The percentage of the population living below the poverty reduced turnout. The effect of the percentage of Hispanic adults in the county on turnout fell just short of statistical significance (p = .05).

The analysis tested the hypothesis that stricter voter ID requirements dampen turnout among minorities. The data revealed no statistically significant effect on turnout for African-Americans in general. But it revealed a significant reduction in turnout for Hispanics and the poor. The analysis using the minimum ID categories produced similar results.

Analysis of the aggregate data at the county level supports the hypothesis that as voter ID requirements grow stricter, turnout declines. This effect is strongest in counties with concentrations of Hispanic residents or families below the poverty line. But aggregate data cannot fully capture the individual demographic factors that may figure into the decision to turn out to vote. For example, previous research has found that education is a powerful determinant of turnout.[20] Married people are more likely to vote than those who are not married. To explore the effects of voter identification requirements on turnout, examining individual-level data is important.

Individual-level Analysis

Information collected for the Census Bureau Current Population Survey in November 2004 makes it possible to examine the influence of voter ID requirements at the individual level. Self-identified registered voters reported their experience at the polls in the survey. Note that the voter turnout rate for the CPS sample, an average of 89%, is much higher than the turnout rates presented in the aggregate data analysis, which average 60.9%. The difference is a result of several factors, including different denominators in calculating the turnout rate – self-reported registered voters in the CPS versus the much larger citizen voting-age population for the

---

[20] Education is an important factor in predicting turnout. One version of the aggregate model not reported here included the percentage of adults in the county who had at least a college degree. The measure was highly collinear with the percentage of residents living below the poverty line, necessitating removal of the college degree variable from the model.

aggregate data. Also some survey respondents overstate their incidence of voting. Nevertheless, the CPS serves as a widely accepted source of data on voting behavior.

One of the advantages of the CPS is the sheer size of the sample. The survey's Voting and Registration Supplement consisted of interviews, either by telephone or in person, with 96,452 respondents.[21] The large sample size permits analyses of smaller groups, such as Black or Hispanic voters or voters with less than a high school education. The analyses reported here are based on reports from self-described registered voters. Excluded are those who said they were not registered to vote and those who said they cast absentee ballots because the identification requirements for absentee ballots may differ from those required when one votes in person. Also excluded are respondents who said they were not U.S. citizens.[22]

The dependent variable in these analyses is whether a respondent reported voting in the November 2004 election. As in the aggregate analysis, stricter voter ID requirements exert a statistically significant, negative effect on whether survey respondents said they had voted in 2004.

Table 3 Predicted probability of voter turnout

ID Category	**Maximum requirement**	**Minimum requirement**
State name	91.2%	91.1%
Sign name	90.6%	90.3%
Match signature	90.0%	89.5%
ID	89.4%	88.7%
Photo ID	88.7%	----
Affidavit	----	87.8%
Difference from lowest to highest	**2.50%**	**3.30%**
N	54,973	

Predicted probability of registered voters saying they voted as the identification requirement varies from the lowest to the highest point in the scale, with all other variables held constant. Data source: U.S. Census Bureau, Current Population Survey, Voting and Registration Supplement, November 2004.

---

[21] The Census Bureau allows respondents to answer on behalf of themselves and others in the household during the interview. While proxy reporting of voter turnout raises the possibility of inaccurate reports, follow-up interviews with those for whom a proxy report had been given in the November 1984 CPS showed 99 percent agreement between the proxy report and the information given by the follow-up respondent.

[22] The CPS did not ask the voting questions of respondents who were not U.S. citizens. The design of the questionnaire skips those questions for non- citizens.

The influence of voter identification requirements, holding all other variables constant, is shown in Table 3 below. The probability of voting dropped with each level of voter identification requirement, with a total drop of 2.5 percent, across the five types of identification for the maximum requirement and 3.3% for the minimum requirements. [23]

Among the key variables of interest in the debate over voter identification requirements are race, age, income, and education. Given the large sample size (54,973 registered voters), it was possible to break the sample into sub-samples along those demographic lines to explore variation in predicted probability by group.

Both the maximum and minimum identification requirements had negative and statistically significant effects for White/Non-Hispanic voters. Allowing the requirements to vary from stating one's name to providing photo identification or an affidavit showed drops of 2.5 percent and 3.2 percent respectively in the predicted probability of voting. The predicted probability of Hispanics voting ranged from 87 percent if stating one's name was the required form of identification to 77.3 percent if a voter would have to provide an affidavit in order to vote, a difference of 9.7 percent.

The effects of voter identification requirements also varied by age, with the greatest variation occurring among voters ages 18 to 24.

- Turnout in states requiring photo ID was predicted as 8.9 percentage points lower than in states where voters simply stated their names.
- The strictest ID requirements reduced the probability that White/Non-Hispanic voters in the 18- to 24-year-old category would turn out by 7.8 to 9.2 percentage points.
- For African-Americans in the 18- to 24-year-old age group the gap was 10.6 percentage points.

Variation also emerged along the lines of income, with the effects of voter identification requirements varying to a greater extent for voters in households below the poverty line compared to those living above the poverty line.[24] Allowing the maximum voting requirement to

---

[23] The voter turnout percentages may seem disproportionately high compared to the turnout rates reported in the aggregate data analysis. It is important to consider that the turnout rates in the aggregate data were a proportion of <u>all</u> citizens of voting-age population, while the turnout rates for the individual-level data are the proportion of only registered voters who said they voted.

[24] Respondents were coded as being above or below the U.S. Census Bureau's 2004 poverty line based on their reported annual household income and size of the household.

vary from the least to the most demanding, the probability that African-American voters below the poverty line said they had voted dropped by 7.5 percent.

The effects of voter identification requirements varied across education levels as well. Registered voters who had less than a high school education had a 77.5 percent probability of voting if the maximum requirement would be stating one's name, and a 70.8 percent probability if they would have to provide photo identification under the maximum requirement, a difference of 6.7 percent. The range of effects of voter identification requirements was smaller among those with higher levels of education (and non-existent for one category – voters with some college education).

Conclusions of the Analysis

As the stringency of voter identification requirements increases, voter turnout declines. This point emerged from both the aggregate data and the individual-level data, although not always for both the maximum and minimum sets of requirements. The overall effect for all registered voters was fairly small, but statistically significant.

The effects of voter identification requirements were more pronounced for specific subgroups. Hispanic voters and the poor appeared to be less likely to vote as the level of required identification became more demanding, according to both the aggregate and the individual-level data.

- In the individual-level data, for Hispanic voters, the probability of voting dropped by 9.7 percent across the various levels of minimum identification requirements.
- Survey respondents living in poor households were 5.3 percent less likely to vote as the requirements varied from stating one's name to attesting to one's identity in an affidavit.
- African-American voters from households below the poverty line were 7.5 percent less likely to vote as the maximum requirements varied from stating one's name to providing photo identification.

Effects of voter requirements also varied with education.

- Registered voters who had not graduated from high school were 6.7 percent less likely to say they voted as the maximum requirements ranged from stating one's name to providing photo identification.

- When considering the minimum requirements, those with less than a high school education were 7.4 percent less likely to say they voted if the requirement was an affidavit as opposed to stating one's name.

Age was also a key factor, with voters ages 18 to 24 being 7.7 percent to 8.9 percent less likely to vote as the requirements ranged from stating one's name to providing a photo identification or affidavit. Breaking down the age group by race, the effects were significant for young White/Non-Hispanic and Black/Non-Hispanic voters.

The results shed additional light on the effects of voter identification requirements on two groups often projected as being particularly sensitive to such requirements: African-American voters and elderly voters.

- The effects on African-American voters were pronounced for two specific sub-samples, African-American voters living below the poverty line and those in the 18- to 24-year-old age group.
- The elderly, while they would be slightly less likely to vote as requirements ranged from least to most demanding, would not necessarily be affected in the dramatic manner predicted by some opposed to photo identification requirements in particular.

The data examined in this project could not capture the dynamics of how identification requirements might lower turnout. Do potential voters who cannot or do not want to meet the identification requirements simply stay away from the polls? Or, do the requirements result in some voters being turned away when they cannot meet the requirements on Election Day? (Proponents of stricter voter ID requirements might argue that some part of the reduction comes from keeping the truly ineligible from voting.)

Our data alone cannot resolve these questions. Knowing more about the "on the ground" experiences of voters concerning identification requirements could guide policy-makers at the state and local level in determining whether and at what point in the electoral cycle a concerted public information campaign might be most effective in helping voters to meet identification requirements. Such knowledge also could help in designing training for election judges to handle questions about, and potential disputes over, voter identification requirements.

It is important to note that the 2004 data do not allow us to draw conclusions about the effect of laws such as those recently passed in Georgia and Indiana, which require government-issued

photo ID. No such laws were in place in 2004, and the five states that then required photo ID at the time allowed voters who signed an affidavit or provided another form of identification to cast a regular ballot.

Litigation Over Voter ID Requirements

A handful of cases have challenged identification requirements in court in recent years. In general, requirements that voters provide some identifying documentation have been upheld, where photo ID is *not* the only acceptable form. Whether laws requiring photo ID will be upheld is more doubtful. To date, only one court has considered a law requiring voters to show photo ID (*Common Cause v. Billups*), and that court concluded that this requirement is likely unconstitutional. Cases challenging the mandatory disclosure of voters' Social Security numbers on privacy grounds have yielded mixed results.

Non-photo identification. For the most part, courts have looked favorably on requirements that voters present some form of identifying documents if the photo identification is not the only form accepted. In *Colorado Common Cause v. Davidson,* No. 04CV7709, 2004 WL 2360485, at *1 (Colo. Dist. Ct. Oct. 18, 2004), plaintiffs challenged a law requiring all in-person voters to show identification (not just first-time registrants). The court upheld this requirement against a constitutional challenge. Similarly, in *League of Women Voters v. Blackwell,* 340 F. Supp. 2d 823 (N.D. Ohio 2004), the court rejected a challenge to an Ohio directive requiring first-time voters who registered by mail to provide one of the HAVA-permitted forms of identification, in order to have their provisional ballots counted. Specifically, the directive provided that their provisional ballots would be counted if the voter (a) orally recited his driver's license number or the last four digits of his social security number or (b) returned to the polling place before it closed with some acceptable identification (including reciting those identification numbers). *Id.* This was found to be consistent with HAVA.

Photo ID. Since the 2004 election, two states have adopted laws requiring photo identification in order to have one's vote counted, without an affidavit exception: Georgia and Indiana. Both these requirements were enacted in 2005 and both have been challenged in court. The Georgia law required voters attempting to cast a ballot in person present a valid form of photographic identification. O.C.G.A. § 21-2-417. On October 18, 2005, the District Court granted the Plaintiff's motion for a preliminary injunction,

enjoining the application of the new identification requirements on constitutional grounds. In granting the injunction, the court held that plaintiffs' claims under both the Fourteenth Amendment (equal protection) and Twenty-Fourth Amendment (poll tax) had a substantial likelihood of succeeding on the merits at trial (*Common Cause v. Billups*, Prelim. Inj. 96, 104). In January 2006, Georgia enacted a modified version of its photo ID law, which the court has not yet ruled on. In the other state that has enacted a photo ID requirement without an affidavit exception (Indiana), legal challenges have also been filed. (*Indiana Democratic Party v. Rokita* and *Crawford v. Marion County Election Board*). Cross-motions for summary judgment are currently pending. Another case of significance, for purposes of photo ID requirements, is *American Civil Liberties Union of Minnesota v. Kiffmeyer,* No. 04-CV-4653, 2004 WL 2428690, at *1 (D. Minn. Oct. 28, 2004). In that case, the court enjoined a Minnesota law that allowed the use of tribal photo ID cards, only for an Indian who lived on the reservation. 2004 WL 2428690, at *1. The Court found no rational basis for distinguishing based on whether or not the cardholder lives on the reservation. *Id.* at *1, 3. The court's decision in this case indicates that courts are likely to look strictly on photo ID requirements.

Privacy. In *Greidinger v. Davis*, 988 F.2d 1344 (4th Cir. 1993), the court struck down on due process grounds a Virginia law requiring disclosure of voters' social security numbers for voter registration. The social security numbers recorded in voter registration lists had been disclosed to the public and political parties that had requested the lists. The court found that the requirement to give the social security number effectively conditioned rights on the consent to an invasion of privacy. It concluded that this public disclosure of the social security numbers was not necessary to achieve the government's interest in preventing fraud. On the other hand, in *McKay v. Thompson*, 226 F.3d 752 (6th Cir. 2000), the court rejected privacy challenges based on both the Constitution and federal statutes, to a Tennessee law requiring social security numbers for voter registration since 1972. 226 F.3d at 755. Second, the NVRA only permits requiring the minimum amount of information necessary to prevent duplicate voter registration and to determine eligibility. The distinction appears to be between the use of Social Security numbers for internal purposes only, which was deemed permissible, and the disclosure of those numbers to the public which was not.

These decisions suggest that the courts will look strictly at requirements that voters produce a photo ID in order to cast a regular ballot. The courts have used a balancing test to weigh the

legitimate interest in preventing election fraud against the citizen's right to privacy (protecting social security numbers from public disclosure, for example) and the reasonableness of requirements for identity documents. To provide both the clarity and certainty in administration of elections needed to forestall destabilizing challenges to outcomes, these early decisions suggest that best practice may be to limit requirements for voter identification to the minimum needed to prevent duplicate registration and ensure eligibility.

Developments since 2004

Since the passage of HAVA, with its limited requirements for voter identification, and following the 2004 election, debate over voter ID has taken place in state legislatures across the country. That debate has not been characterized by solid information on the consequences of tightening requirements for voters to identify themselves before being permitted to cast a regular, rather than a provisional, ballot.

Better information might improve the quality of the debate. Answers to the following key questions are not available in a form that might satisfy those on both sides of the argument.

- What is the overall incidence of vote fraud?
- How does fraud take place in the various stage of the process: registration, voting at the polls, absentee voting, or ballot counting?
- What contribution can tighter requirements for voter ID make to reducing vote fraud?
- What would be the other consequences of increasingly demanding requirements for voters to identify themselves? This is the question addressed, within the limits of the available data, in the analysis in this report.

Answering these questions would provide the information needed for more informed judgment in the states as they consider the tradeoffs among the competing goals of ballot integrity, ballot access, and administrative efficiency. The Carter-Baker Commission recognized the tradeoffs when it tied recommendation for national ID to an affirmative effort by government to identify unregistered voters and make it easy for them to register.

State Voter Databases and Voter ID

With the implementation of the HAVA Computerized Statewide Voter Registration List, an application for voter registration for an election for Federal office may not be accepted or processed unless the application includes a driver's license number or last four digits of the

Social Security number on the voter registration form. This information can be used to verify the identity of the registrant through interfacing with lists maintained by the Motor Vehicle office and Social Security office. If registrants do not have either a driver's license or Social Security number, the State will assign a unique identifier number to that person.

HAVA does not require that the states notify registrants to remedy any failure to provide either of these numbers or to confirm that they have provided a verifiable number. Verification at the time of registration could forestall difficulties at the polling place. HAVA is silent on how the ID might be required at the polling place for new voters whose driving license or Social Security number could not be verified. Errors in recording those numbers are sure to occur.

Some states are wrestling now with these unresolved issues. In New Jersey, for example, pending legislation would require that voters must be able to confirm their registration through a secure access to the SVRL. It also requires voters to present ID at the polls in order to cast a regular ballot if the numbers recorded on the registration have not been verified (or if no verifiable number appears on the registration). It recognizes the HAVA requirement that if the number provided by the voter has not been verified and if the voter does not present ID at the polls, that voter may cast a provisional ballot. The bill does not specify they have to provide ID within 48 hours in order for their vote to count, as is the case with first-time mail-in registrants.

As some states gain experience in this area, the EAC would perform a useful service by making timely recommendations of best practices for all states to consider.

Conclusions

The form of Voter ID required of voters affects turnout. Lack of ID can keep voters from the polls. Or, when they go to the polls, it is reasonable to conclude that stricter Voter ID requirements will divert more voters into the line for provisional ballots. (This conclusion is a conjecture because we lack good data on why voters must cast their ballots provisionally.) The result can be longer lines at the polls and confusion, without a clear demonstration that the security of the ballot is correspondingly increased. [25]

---

[25] In this connection, the Brennan Center's response to the Carter-Baker Commission report observes that, "while it might be true that in a close election "a small amount of fraud could make the margin of difference," it is equally true that the rejection of a much larger number of eligible voters could make a much bigger difference in the outcome." *Response to the Report of the 2005 Commission on Federal*

The dynamics of Voter ID requirements –how the more rigorous Voter ID requirements—affect the decision by potential voters to go or stay away from the polls are not well understood. This lack of understanding should be recognized in the policy process. The debate over voter ID in the states would be improved by additional research sponsored by the EAC. So far as it may be necessary to reduce vote fraud made possible by inadequate voter ID, the research could identify methods to eliminate the need for voters to bring specific identity documents with them to the polls while assuring that each voter who casts a ballot is eligible and votes only once. One way to break the connection between the benefits of photo ID and the need for the voter to bring identification to the polling place, as recommended elsewhere by one of the authors of this report, Edward Foley: keep the information to verify a voter's identity in the records at the polling place. Other approaches could be developed. [26]

Election Reform, The Brennan Center for Justice at NYU School of Law and Spencer Overton, On Behalf Of The National Network on State Election Reform, September 19, 2005

[26] "A potential solution to this problem is to break the connection with the photo requirement and the obligation to produce identification at the polls. Eligible citizens could be required to provide a photograph at the time they *register* to vote, and poll workers would match this photograph with the image of the person standing in front of them. Given the availability of digital photography, the photos of registered voters could be stored in electronic poll books and easily "pulled up" with a click of a computer mouse when voters sign in to vote. . . Of course, to satisfy the concerns of liberals, a requirement to provide a digital photograph at time of registration would have to address the cost and accessibility issues identified earlier. "

- **e.** Compendium of states' legislation, procedures, and litigation (available as an electronic document)

Appendix A
Summary of Voter Identification Requirements By State

Prepared by
Sara A. Sampson, Reference Librarian,
The Ohio State University Moritz College of Law.

Voter ID Requirements

State	Forms of ID Required 2004	Statutory Language	Statutory Citation
Alabama	Provide ID	(b) Each elector shall provide identification to an appropriate election official prior to voting. A voter required to show identification when voting in person shall present to the appropriate election official either of the following forms of identification: (1) A current valid photo identification. (2) A copy of a current utility bill, bank statement, government check, paycheck, or other government document that shows the name and address of the voter. The term "other government document" may include, but is not limited to, any of the following: a. A valid identification card issued by a branch, department, agency, or entity of the State of Alabama, any other state, or the United States authorized by law to issue personal identification. b. A valid United States passport. c. A valid Alabama hunting or fishing license. d. A valid Alabama permit to carry a pistol or revolver. e. A valid pilot's license issued by the Federal Aviation Administration or other authorized agency of the United States. f. A valid United States military identification card. g. A certified copy of the elector's birth certificate. h. A valid Social Security card. i. Certified naturalization documentation. j. A certified copy of court records showing adoption or name change. k. A valid Medicaid card, Medicare card, or an Electronic Benefits Transfer Card (formerly referred to as a "food stamp card"). (c) For voters required to show identification when voting by mail, the voter shall submit with the ballot a copy of one of the forms of identification listed in subsection (b). (e) An individual required to present identification in accordance with this section who is unable to meet the identification requirements of this section shall be permitted to vote by a challenged or provisional ballot, as provided for by law. (f) In addition, an individual who does not have identification in his or her possession at the polls shall be permitted to vote if the individual is positively identified by two election officials as a voter on the poll list who is eligible to vote and the election official signs the voters list by where the voter signs. Effective Date: June 24, 2003	Ala. Code § 17-11A-1
Alaska	Provide ID	(a) Before being allowed to vote, each voter shall exhibit to an election official one form of identification, including (1) an official voter registration card, driver's license, state identification card, current and valid photo identification, birth certificate, passport, or hunting or fishing license; or (2) an original or a copy of a current utility bill, bank statement, paycheck, government check, or other government document; an item exhibited under this	Alaska Stat. § 15.15.225

		paragraph must show the name and current address of the voter. (b) An election official may waive the identification requirement if the election official knows the identity of the voter. The identification requirement may not be waived for voters who are first-time voters who initially registered by mail or by facsimile or other electronic transmission approved by the director under AS 15.07.050, and did not provide identification as required in AS 15.07.060. (c) A voter who cannot exhibit a required form of identification shall be allowed to vote a questioned ballot. effective June 17, 2003	
Arizona	Provide ID	B. If a statewide voter registration database is not yet operational, for any person who has registered to vote by mail for the first time in this state after January 1, 2003 or who is reregistering by mail after January 1, 2003 after moving from one county to another county in this state, the person shall comply with the following in order to be issued a ballot: 1. The person shall present either one of the following: (a) A current form of identification that bears a photograph of the person and the name of the person. (b) A current utility bill, bank statement, paycheck, government issued check or other government document that shows the name and registration address of the person. 2. If the person does not present a document that complies with paragraph 1, the person is only eligible to vote a provisional ballot as prescribed by § 16-584. Effective Dec. 1, 2003	Ariz. Rev. Stat. Ann. § 16-579
Arkansas	Provide ID	7-5-305. Requirements. (a) Before a person is permitted to vote, the election official shall: (1) Request the voter to identify himself in order to verify the existence of his name on the precinct voter registration list; (2) Request the voter, in the presence of the election official, to state his address and state or confirm his date of birth; (3) Determine that the voter's date of birth and address are the same as those on the precinct voter registration list; (4) If the date of birth given by the voter is not the same as that on the precinct voter registration list, request the voter to provide identification as the election official deems appropriate; (5)(A) If the voter's address is not the same as that on the precinct voter registration list, verify with the county clerk that the address is within the precinct. (B) If the address is within the precinct, request the voter to complete a voter registration application form for the purpose of updating county voter registration record files. (C) If the address is not within the precinct, instruct the voter to contact the county clerk's office to determine the proper precinct; (6) If the voter's name is not the same as that on the precinct voter registration list, request the voter to complete a voter registration application form for purposes of updating county voter registration record files; (7) Request the voter, in the presence of the election official, to sign his name, including his given name, his middle name or initial, if any, and his last name in the space provided on the precinct voter registration list. If a person is unable to sign his signature or make his mark or cross, the election official shall enter his initials and the voter's date of birth in the space for the person's signature on the precinct voter registration list; and	Arkansas Code Annotated § 7-5-305

		(8)(A) Request the voter for purposes of identification to provide a valid driver's license, photo identification card issued by a governmental agency, voter card, social security card, birth certificate, United States passport, employee identification card issued by a governmental agency containing a photograph, employee identification card issued in the normal course of business of the employer, student identification card, Arkansas hunting license, or United States military identification card. (B)(i) If a voter is unable to provide this identification, the election official shall indicate on the precinct voter registration list that the voter did not provide identification. (ii) Following each election, the county board of election commissioners may review the precinct voter registration lists and may provide the information of the voters not providing identification at the polls to the prosecuting attorney. (iii) The prosecuting attorney may investigate possible voter fraud; and (9) Follow the procedures under §§ 7-5-310, 7-5-311, and 7-5-523, if the preson is a disabled voter and presents himself or herself to vote. Effective: July 16, 2003	
California	Sign Name	Any person desiring to vote shall announce his or her name and address in an audible tone of voice, and when one of the precinct officers finds the name in the index, the officer shall in a like manner repeat the name and address. The voter shall then write his or her name and residence address or, if the voter is unable to write, shall have the name and residence address written by another person on a roster of voters provided for that purpose, whereupon a challenge may be interposed as provided in this article. (Enacted in 1994, no amendments since)	Cal. Elec. Code § 14216
Colorado	Provide ID	(1) Except as provided in subsection (4) of this section, any eligible elector desiring to vote shall show his or her identification as defined in section 1-1-104(19.5), write his or her name and address on the signature card, and give the signature card to one of the election judges, * * * (4) An eligible elector who is unable to produce identification may cast a provisional ballot in accordance with article 8.5 of this title. (19.5)(a) "Identification" means: (I) A valid Colorado driver's license; (II) A valid identification card issued by the department of revenue in accordance with the requirements of part 3 of article 2 of title 42, C.R.S.; (III) A valid United States passport; (IV) A valid employee identification card with a photograph of the eligible elector issued by any branch, department, agency, or entity of the United States government or of this state, or by any county, municipality, board, authority, or other political subdivision of this state; (V) A valid pilot's license issued by the federal aviation administration or other authorized agency of the United States; (VI) A valid United States military identification card with a photograph of the eligible elector; (VII) A copy of a current utility bill, bank statement, government check, paycheck, or other government document that shows the name and address of the elector; (VIII) A valid medicare or medicaid card issued by the United States health care	Colo. Rev. Stat. Ann. § 1-7-110; Colo. Rev. Stat. Ann. § 1-1-104

023149

		financing administration; (IX) A certified copy of a birth certificate for the elector issued in the United States; or (X) Certified documentation of naturalization. (b) Any form of identification indicated in paragraph (a) of this subsection (19.5) that shows the address of the eligible elector shall be considered identification only if the address is in the state of Colorado. Effective 5/28/2004	
Connecticut	Provide ID	(a) In each primary, election or referendum, when an elector has entered the polling place, the elector shall announce the elector's street address, if any, and the elector's name to the checkers in a tone sufficiently loud and clear as to enable all the election officials present to hear the same. Each elector who registered to vote by mail for the first time on or after January 1, 2003, and has a "mark" next to the elector's name on the official registry list, as required by section 9-23r, shall present to the checkers, before the elector votes, either a current and valid photo identification that shows the elector's name and address or a copy of a current utility bill, bank statement, government check, paycheck or other government document that shows the name and address of the elector. Each other elector shall (1) present to the checkers the elector's Social Security card or any other preprinted form of identification which shows the elector's name and either the elector's address, signature or photograph, or (2) on a form prescribed by the Secretary of the State, write the elector's residential address and date of birth, print the elector's name and sign a statement under penalty of false statement that the elector is the elector whose name appears on the official checklist. Such form shall clearly state the penalty of false statement. A separate such form shall be used for each elector. If the elector presents a preprinted form of identification under subdivision (1) of this subsection, the checkers shall check the name of such elector on the official checklist. If the elector completes the form under subdivision (2) of this subsection, the assistant registrar of voters shall examine the information on such form and either instruct the checkers to check the name of such elector on the official checklist or notify the elector that the form is incomplete or inaccurate. Effective May 10., 2004	Conn. Gen. Stat. Ann. § 9-261
Delaware	Provide ID	(a) A voter, upon entering the room where an election is being held, shall announce his or her name and address and provide proof of identity, whereupon the clerks shall place a mark or make a notation of his or her name upon the election district record. In the event the voter does not have proof of identity with them, he or she shall sign an affidavit of affirmation that he or she is the person listed on the election district record. Effective: July 9, 2002	15 Del. Code § 4937
D.C.	Sign Name	(i)(1) A person shall be entitled to vote in an election in the District of Columbia if he or she is a duly registered voter. A qualified elector shall be considered duly registered in the District if he or she has met the requirements for voter registration and, on the day of the election, either resides at the address listed on the Board's records or files an election day change of address pursuant to this subsection. (2) Each registered voter who changes his or her place of residence from that listed on the Board's records shall notify the Board, in writing, of the new residence address. A change of address shall be effective on the date the notification was mailed as shown by the United States Postal Service postmark. If not postmarked, the notification shall be effective on the date of receipt by the Board. Change of address notifications from registrants shall be accepted pursuant to subsection (g) of this section, except that any registrant who has not notified the Board of his or her current residence address by the deadline established by subsection (g) of this section may be permitted to vote at the	D.C. Code § 1-1001.07

		polling place that serves the current residence address by filing an election day change of address notice pursuant to paragraph (4) of this subsection. (3) Each registered voter who votes at a polling place on election day shall affirm his or her residence address as it appears on the official registration roll for the precinct. The act of signing a copy of the official registration roll for the precinct shall be deemed affirmation of the voter's address as it appears on the Board's registration records. (Effective April 3, 2001)(not added as part of 2005 amendment)	
Florida	Photo ID	101.043 (1) The precinct register, as prescribed in s. 98.461, shall be used at the polls in lieu of the registration books for the purpose of identifying the elector at the polls prior to allowing him or her to vote. The clerk or inspector shall require each elector, upon entering the polling place, to present a current and valid picture identification as provided in s. 97.0535(3)(a). If the picture identification does not contain the signature of the voter, an additional identification that provides the voter's signature shall be required. The elector shall sign his or her name in the space provided, and the clerk or inspector shall compare the signature with that on the identification provided by the elector and enter his or her initials in the space provided and allow the elector to vote if the clerk or inspector is satisfied as to the identity of the elector. (2) Except as provided in subsection (3), if the elector fails to furnish the required identification, or if the clerk or inspector is in doubt as to the identity of the elector, such clerk or inspector shall follow the procedure prescribed in s. 101.49. **97.0535** (3)(a) The following forms of identification shall be considered current and valid if they contain the name and photograph of the applicant and have not expired: 1. Florida driver's license. 2. Florida identification card issued by the Department of Highway Safety and Motor Vehicles. 3. United States passport. 4. Employee badge or identification. 5. Buyer's club identification. 6. Debit or credit card. 7. Military identification. 8. Student identification. 9. Retirement center identification. 10. Neighborhood association identification. 11. Entertainment identification. 12. Public assistance identification. (b) The following forms of identification shall be considered current and valid if they contain the name and current residence address of the applicant: 1. Utility bill.	West's Fla. Stat. Ann. § 101.043 & West's Fla. Stat. Ann. § 97.0535

		2. Bank statement. 3. Government check. 4. Paycheck. 5. Other government document (excluding voter identification card). Version effective 1/1/2005-12/31/2005	
Georgia	Provide ID	(a) Each elector shall present proper identification to a poll worker at or prior to completion of a voter's certificate at any polling place and prior to such person's admission to the enclosed space at such polling place. Proper identification shall consist of any one of the following: (1) A valid Georgia driver's license; (2) A valid identification card issued by a branch, department, agency, or entity of the State of Georgia, any other state, or the United States authorized by law to issue personal identification; (3) A valid United States passport; (4) A valid employee identification card containing a photograph of the elector and issued by any branch, department, agency, or entity of the United States government, this state, or any county, municipality, board, authority, or other entity of this state; (5) A valid employee identification card containing a photograph of the elector and issued by any employer of the elector in the ordinary course of such employer's business; (6) A valid student identification card containing a photograph of the elector from any public or private college, university, or postgraduate technical or professional school located within the State of Georgia; (7) A valid Georgia license to carry a pistol or revolver; (8) A valid pilot's license issued by the Federal Aviation Administration or other authorized agency of the United States; (9) A valid United States military identification card; (10) A certified copy of the elector's birth certificate; (11) A valid social security card; (12) Certified naturalization documentation; (13) A certified copy of court records showing adoption, name, or sex change; (14) A current utility bill, or a legible copy thereof, showing the name and address of the elector; (15) A bank statement, or a legible copy thereof, showing the name and address of the elector; (16) A government check or paycheck, or a legible copy thereof, showing the name and address of the elector; or (17) A government document, or a legible copy thereof, showing the name and address of the elector. (b) If an elector is unable to produce any of the items of identification listed in subsection (a) of this Code section, he or she shall sign a statement under oath in a form approved by the Secretary of State, separate and distinct from the elector's voter certificate, swearing or affirming that he or she is the person identified on the elector's voter certificate. Such person shall be allowed to vote without undue delay; provided, however, that an elector who registered for the first time in this state by mail and did not provide one of the forms of identification set forth in subsection (a) of this Code section at the time of registration and who is voting for the first time may vote a provisional ballot pursuant to Code Section 21-2-418 upon swearing or affirming that the elector is the person identified in the elector's voter certificate. Such provisional ballot shall only be counted if the registrars are able to verify current and valid identification of the elector as provided in this Code section within the time period for verifying provisional ballots pursuant to Code Section 21-2-419. Falsely swearing or affirming such statement under oath shall be punishable as a felony, and the penalty shall be distinctly set forth on the face of the statement." effective June, 2003	Ga. Code. Ann. § 21-2-417

Hawaii	Photo ID	(b) The voter shall present valid identification to the official in charge of the pollbook. *Do I Need an I.D. to Vote on Election Day?* **Yes.** Be sure to have an I.D. with a picture and signature (such as a Hawaii driver's license or state I.D. card) when you go to vote. The NVRAC card is not an acceptable form of identification. From the 2004 version of the administrative code. **§ 11-136 Poll book, identification, voting.** Every person upon applying to vote shall sign the person's name in the poll book prepared for that purpose. This requirement may be waived by the chairperson of the precinct officials if for reasons of illiteracy or blindness or other physical disability the voter is unable to write. Every person shall provide identification if so requested by a precinct official. A poll book shall not contain the social security number of any person. After signing the poll book and receiving the voter's ballot, the voter shall proceed to the voting booth to vote according to the voting system in use in the voter's precinct. The precinct official may, and upon request shall, explain to the voter the mode of voting. Last amended 2003.	Haw. Code. R. § 2-51-80 (Paper ballots; voting procedure at the polls), § 2-51-83 (Punchcard ballots; voting procedure at polls), 2-51-85.1 (Marksense ballots; voting procedure at the polls.) – All have same subsection (b) Haw. Code. R. T. 2, SUBT. 4, CH. 51, Appendix HRS 11-136
Idaho	Sign Name	(1) An elector desiring to vote shall state his name and address to the judge or clerk in charge of the combination election record and poll book. (2) Before receiving his ballot, each elector shall sign his name in the combination election record and poll book following his name therein. (5) The elector shall then be given the appropriate ballots which have been stamped with the official election stamp and shall be given folding instructions for such ballots. (Last amended in 1972)	Id. St. §34-1106
Illinois	Give Name	Any person desiring to vote shall give his name and, if required to do so, his residence to the judges of election, one of whom shall thereupon announce the same in a loud and distinct tone of voice, clear, and audible; the judges of elections shall check each application for ballot against the list of voters registered in that precinct to whom absentee or early ballots have been issued for that election, which shall be provided by the election authority and which list shall be available for inspection by pollwatchers. A voter applying to vote in the precinct on election day whose name appears on the list as having been issued an absentee or early ballot shall not be permitted to vote in the precinct. All applicable provisions of Articles 4, 5 or 6 shall be complied with and if such name is found on the register of voters by the officer having charge thereof, he	10 Ill. Comp. Stat. 5/17-9

		shall likewise repeat said name, and the voter shall be allowed to enter within the proximity of the voting booths, as above provided. One of the judges shall give the voter one, and only one of each ballot to be voted at the election, on the back of which ballots such judge shall indorse his initials in such manner that they may be seen when each such ballot is properly folded, and the voter's name shall be immediately checked on the register list. In those election jurisdictions where perforated ballot cards are utilized of the type on which write-in votes can be cast above the perforation, the election authority shall provide a space both above and below the perforation for the judge's initials, and the judge shall endorse his or her initials in both spaces. Whenever a proposal for a constitutional amendment or for the calling of a constitutional convention is to be voted upon at the election, the separate blue ballot or ballots pertaining thereto shall, when being handed to the voter, be placed on top of the other ballots to be voted at the election in such manner that the legend appearing on the back thereof, as prescribed in Section 16-6 of this Act, shall be plainly visible to the voter. At all elections, when a registry may be required, if the name of any person so desiring to vote at such election is not found on the register of voters, he or she shall not receive a ballot until he or she shall have complied with the law prescribing the manner and conditions of voting by unregistered voters. If any person desiring to vote at any election shall be challenged, he or she shall not receive a ballot until he or she shall have established his right to vote in the manner provided hereinafter; and if he or she shall be challenged after he has received his ballot, he shall not be permitted to vote until he or she has fully complied with such requirements of the law upon being challenged. Besides the election officer, not more than 2 voters in excess of the whole number of voting booths provided shall be allowed within the proximity of the voting booths at one time. The provisions of this Act, so far as they require the registration of voters as a condition to their being allowed to vote shall not apply to persons otherwise entitled to vote, who are, at the time of the election, or at any time within 60 days prior to such election have been engaged in the military or naval service of the United States, and who appear personally at the polling place on election day and produce to the judges of election satisfactory evidence thereof, but such persons, if otherwise qualified to vote, shall be permitted to vote at such election without previous registration.	
Indiana	Sign Name		West's Annotated Indiana Code § 3-11-8-25
Iowa	Sign Name	1. The board members of their respective precincts shall have charge of the ballots and furnish them to the voters. Any person desiring to vote shall sign a voter's declaration provided by the officials, in substantially the following form: VOTER'S DECLARATION OF ELIGIBILITY I do solemnly swear or affirm that I am a resident of the .... precinct, ... ward or township, city of ...., county of ...., Iowa. I am a registered voter. I have not voted and will not vote in any other precinct in said election. I understand that any false statement in this declaration is a criminal offense punishable as provided by law. Signature of Voter Address Telephone Approved:	Iowa Code § 49.77

		Board Member 2. One of the precinct election officials shall announce the voter's name aloud for the benefit of any persons present pursuant to section 49.104, subsection 2, 3, or 5. Any of those persons may upon request view the signed declarations of eligibility and may review the signed declarations on file so long as the person does not interfere with the functions of the precinct election officials. 3. A precinct election official shall require any person whose name does not appear on the election register as an active voter to show identification. Specific documents which are acceptable forms of identification shall be prescribed by the state commissioner. A precinct election official may require of the voter unknown to the official, identification upon which the voter's signature or mark appears. If identification is established to the satisfaction of the precinct election officials, the person may then be allowed to vote. (From 2004 version of Iowa Annotated Code; effective January 1, 1995)	
Kansas	Sign Name	(b) A person desiring to vote shall provide to the election board: (1) the voter's name; (2) if required, the voter's address; and (3) the voter's signature on the registration or poll book. A signature may be made by mark, initials, typewriter, print, stamp, symbol or any other manner if by placing the signature on the document the person intends the signature to be binding. A signature may be made by another person at the voter's direction if the signature reflects such voter's intention. (Approved April 14, 2004, 2004 Kansas Laws Ch. 93)	Kan. Stat. Ann. § 25-2908(b)
Kentucky	Provide ID	117.227 Confirmation of voter's identity Election officers shall confirm the identity of each voter by personal acquaintance or by a document, such as a motor vehicle operator's license, Social Security card, or credit card. The election officer confirming the identity shall sign the precinct voter roster and list the method of identification. Effective: 7/15/02 31 KAR 4:010. Voter identification cards. Section 1. In addition to the forms of identification specifically provided for by KRS 117.227, any identification card that bears both the picture and signature of the voter, or any identification card that has been issued by the county, and which has been approved in writing by the State Board of Elections, shall be acceptable for confirmation of the voter's identity.	Ky Rev. Stat. Ann. 117.227 31 Ky. Admin. Regs. 4:010.
Louisiana	Photo ID	A. Identification of voters. (1) A person who desires to vote in a primary or general election shall give his name and address to a commissioner, who shall announce the applicant's name and address to the persons at the polling place. (2) Each applicant shall identify himself, in the presence and view of the bystanders, and present to the commissioners a Louisiana driver's license, a Louisiana special identification card issued pursuant to R.S. 40:1321, or other generally recognized picture identification card. If the applicant does not have a Louisiana driver's license, a Louisiana special identification card, or other generally recognized picture identification card, the applicant shall sign an affidavit, which is supplied by the secretary of state, to that effect before the commissioners who shall place the affidavit in the envelope marked "Registrar of Voters" and attach the envelope to the precinct register, and the applicant	La. Rev. Stat. Ann. 18:562

		shall provide further identification by presenting his current registration certificate, giving his date of birth or providing other information stated in the precinct register that is requested by the commissioners. However, an applicant that is allowed to vote without the picture identification required by this Paragraph is subject to challenge as provided in R.S. 18:565. Effective: 1/1/2002	
Maine	Give Name	The voting procedure is as follows. 1. Name announced. A voter who wishes to vote must state the voter's name and, upon request, residence address to an election clerk who shall announce the name in a loud, clear voice. (In effect at time of 2003 amendment: 2003, c. 584, § 9)	Me. Rev. Stat. Ann. tit. 21-A, § 671
Maryland	Sign Name	10-310. (a) For each individual who seeks to vote, an election judge, in accordance with instructions provided by the local board, shall: (1) locate the individual's name in the precinct register and locate the preprinted voting authority card and then authorize the individual to vote a regular ballot; (2)(i) if the individual's name is not found on the precinct register, search the inactive list and if the name is found, authorize the individual to vote a regular ballot; or (ii) if the individual's name is not on the inactive list, refer the individual for provisional ballot voting under § 9-404 of this article; (3) establish the identity of the voter by requesting the voter to state the month and day of the voter's birth and comparing the response to the information listed in the precinct register; (4) verify the address of the voter's residence; (5) if any changes to the voting authority card are indicated by a voter, make the appropriate changes in information on the card or other appropriate form; and (6) have the voter sign the voting authority card and either issue the voter a ballot or send the voter to a machine to vote.	Md. Elec. Law § 10-310
Mass.	Give Name	Each voter desiring to vote at a polling place shall give his name and, if requested, his residence to one of the officers at the entrance to the space within the guard rail, who shall thereupon distinctly announce the same. If such name is found on the voting list, the election officer shall check and repeat the name and shall admit the voter to the space enclosed by the guard rail and, in case official ballots, other than those marked "Challenged Ballots" as provided by section thirty-five A, are used, such voter shall be given one ballot. The use of electronic means such as tape recording equipment or radio broadcasting equipment for the recording or broadcasting of the names of voters not yet checked as having voted shall be prohibited. Last amended in 1981	Mass. Ann. Laws 54 § 76
		(5B) Identification. If so authorized by the city or town clerk or registrars of voters, an election officer may request any voter to present written identification. Such requests shall not discriminate in any way, but shall be entirely random, consistent, or based on reasonable suspicion. For the purpose of 950 CMR 52.03(5B), of M.G.L. c. 54, § 76B, and of 950 CMR 52.03(5)(b), suitable written identification includes a driver's license, recent utility bill, rent receipt on a landlord's printed letterhead, lease, duplicate copy of a voter registration affidavit, or any other printed identification which contains the voter's name and address. If voters fail to present suitable written identification when so requested, they must still be allowed to vote, but an election officer or any other person may challenge their right to vote under M.G.L. c. 54, § 85 and 950 CMR 52.03(23).	950 Mass. Code Regs. 52.03
Michigan	Sign Name	(1) At each election, before being given a ballot, each registered elector offering to vote shall identify himself or herself by presenting an official state	Mich. Comp. Laws Ann. §

		identification card issued to that individual pursuant to Act No. 222 of the Public Acts of 1972, being sections 28.291 to 28.295 of the Michigan Compiled Laws, an operator's or chauffeur's license issued to that individual pursuant to the Michigan Vehicle Code, Act No. 300 of the Public Acts of 1949, being sections 257.1 to 257.923 of the Michigan Compiled Laws, or other generally recognized picture identification card and by executing an application showing his or her signature or mark and address of residence in the presence of an election official. If the voter registration cards are used in the precinct, the election official in charge of the precinct registration file shall compare the signature upon the application with the signature upon the registration card. If voter registration lists are used in the precinct, the election inspector shall determine if the name on the application to vote appears on the voter registration list. If the name appears on the voter registration list, the elector shall provide further identification by giving his or her date of birth or other information stated upon the voter registration list. In precincts using voter registration lists, the date of birth may be required to be placed on the application to vote. If the signature or an item of information does not correspond, the vote of the person shall be challenged, and the same procedure shall be followed as provided in this act for the challenging of an elector. If the person offering to vote has signed the registration card or application by making a mark, the person shall identify himself or herself by giving his or her date of birth, which shall be compared with the date of birth stated upon the registration card or voter registration list, or shall give other identification as may be referred to upon the registration card or voter registration list. If the elector does not have an official state identification card, operator's or chauffeur's license as required in this subsection, or other generally recognized picture identification card, the individual shall sign an affidavit to that effect before an election inspector and be allowed to vote as otherwise provided in this act. However, an elector being allowed to vote without the identification required under this subsection is subject to challenge as provided in section 727. (2) If, upon a comparison of the signature or other identification, it is found that the applicant is entitled to vote, the election officer having charge of the registration list shall approve the application and write his or her initials on the application, after which the number on the ballot issued shall be noted on the application. The application shall serve as 1 of the 2 poll lists required to be kept as a record of a person who has voted. The application shall be filed with the township, city, or village clerk. If voter registration cards are used in the precinct, the date of the election shall be noted by 1 of the election officials upon the precinct registration card of each elector voting at an election. If voter registration lists are used in the precinct, the election official shall clearly indicate upon the list each elector voting at that election. The clerk of a city, village, or township shall maintain a record of voting participation for each registered elector. The Attorney General declared that this statute violated the Equal Protection Clause of the Fourteenth Amendment. Op. Atty. Gen. 1997, No. 6930. That decision is binding on all state agencies. (Effective March 31, 1997)	168.523
Minnesota	Sign Name	(a) An individual seeking to vote shall sign a polling place roster which states that the individual is at least 18 years of age, a citizen of the United States, has resided in Minnesota for 20 days immediately preceding the election, maintains residence at the address shown, is not under a guardianship in which the court order revokes the individual's right to vote, has not been found by a court of law to be legally incompetent to vote or convicted of a felony without having civil rights restored, is registered and has not already voted in the election. The roster must also state: "I understand that deliberately providing false information is a felony punishable by not more than five years imprisonment and a fine of not	Minn. Stat. § 204C.10

		more than $10,000, or both." (b) A judge may, before the applicant signs the roster, confirm the applicant's name, address, and date of birth. (c) After the applicant signs the roster, the judge shall give the applicant a voter's receipt. The voter shall deliver the voter's receipt to the judge in charge of ballots as proof of the voter's right to vote, and thereupon the judge shall hand to the voter the ballot. The voters' receipts must be maintained during the time for notice of filing an election contest. (Effective January 1, 2004)	
Mississippi	Sign Name	* * * When any person entitled to vote shall appear to vote, he shall first sign his name in a receipt book or booklet provided for that purpose and to be used at that election only and said receipt book or booklet shall be used in lieu of the list of voters who have voted formerly made by the managers or clerks; whereupon and not before, the initialing manager or, in his absence, the alternate initialing manager shall indorse his initials on the back of an official blank ballot, prepared in accordance with law, and at such place on the back of the ballot that the initials may be seen after the ballot has been marked and folded, and when so indorsed he shall deliver it to the voter, which ballot the voter shall mark in the manner provided by law, which when done the voter shall deliver the same to the initialing manager or, in his absence, to the alternate initialing manager, in the presence of the others, and the manager shall see that the ballot so delivered bears on the back thereof the genuine initials of the initialing manager, or alternate initialing manager, and if so, but not otherwise, the ballot shall be put into the ballot box; and when so done one (1) of the managers or a duly appointed clerk shall make the proper entry on the pollbook. If the voter is unable to write his name on the receipt book, a manager or clerk shall note on the back of the ballot that it was receipted for by his assistance. (Effective January 1, 1987)	Miss. Code Ann. § 23-15-541
Missouri	Provide ID	1. Before receiving a ballot, voters shall identify themselves by presenting a form of personal identification from the following list: (1) Identification issued by the state of Missouri, an agency of the state, or a local election authority of the state; (2) Identification issued by the United States government or agency thereof; (3) Identification issued by an institution of higher education, including a university, college, vocational and technical school, located within the state of Missouri; (4) A copy of a current utility bill, bank statement, government check, paycheck or other government document that contains the name and address of the voter; (5) Driver's license or state identification card issued by another state; or (6) Other identification approved by the secretary of state under rules promulgated pursuant to subsection 3 of this section other identification approved by federal law. Personal knowledge of the voter by two supervising election judges, one from each major political party, shall be acceptable voter identification upon the completion of a secretary of state-approved affidavit that is signed by both supervisory election judges and the voter that attests to the personal knowledge of the voter by the two supervisory election judges. The secretary of state may provide by rule for a sample affidavit to be used for such purpose. (Last amended in 2002)	Mo. Rev. Stat. §115.427.1

Montana	Provide ID	(1) (a) Before an elector is permitted to receive a ballot or vote, the elector shall present to an election judge a current photo identification showing the elector's name. If the elector does not present photo identification, including but not limited to a valid driver's license, a school district or postsecondary education photo identification, or a tribal photo identification, the elector shall present a current utility bill, bank statement, paycheck, notice of confirmation of voter registration issued pursuant to 13-2-207, government check, or other government document that shows the elector's name and current address. (From 2004 version of the Montana Code Annotated; No updates in 2004, only in 2005 [Unrelated section was amended in 2005])	Mont. Code. Ann. §13-13-114(1)(a)
Nebraska	Sign Name	(1) The clerks of election shall have a list of registered voters of the precinct and a sign-in register at the polling place on election day. The list of registered voters shall be used for guidance on election day and may be in the form of a computerized, typed, or handwritten list or precinct registration cards. Registered voters of the precinct shall place and record their signature in the sign-in register before receiving any ballot. The list of registered voters and the sign-in register may be combined into one document. (Last amended in 2003) Official ballots shall be used at all elections. No person shall receive a ballot or be entitled to vote unless and until he or she is registered as a voter except as provided in section 32-914.01, 32-914.02, 32-915, 32-915.01, or 32-936. Except as otherwise specifically provided, no ballot shall be handed to any registered voter at any election until (1) he or she announces his or her name and address to the clerk of election, (2) the clerk has found that he or she is a registered voter at the address as shown by the precinct list of registered voters unless otherwise entitled to vote in the precinct under section 32-328, 32-914.01, 32-914.02, 32-915, or 32-915.01, (3) if the voter registered by mail after January 1, 2003, and has not previously voted in an election for a federal office within the county, the clerk shall ask the registered voter to present a photographic identification which is current and valid or a copy of a utility bill, bank statement, government check, paycheck, or other government document that is current and that shows the name and address of the voter, (4) the clerk has instructed the registered voter to personally write his or her name in the precinct sign-in register on the appropriate line which follows the last signature of any previous voter, and (5) the clerk has listed on the precinct list of registered voters the corresponding line number and name of the registered voter. (Last updated in 2003)	Neb. Rev. Stat. § 32-913 Neb. Rev. Stat. § 32-914
Nevada	Match Sig.	1. Except as otherwise provided in NRS 293.541, if a person's name appears in the election board register or if he provides an affirmation pursuant to NRS 293.525, he is entitled to vote and must sign his name in the election board register when he applies to vote. His signature must be compared by an election board officer with the signature or a facsimile thereof on his original application to register to vote or one of the forms of identification listed in subsection 2. 2. Except as otherwise provided in NRS 293.2725, the forms of identification which may be used individually to identify a voter at the polling place are: (a) The card issued to the voter at the time he registered to vote; (b) A driver's license; (c) An identification card issued by the Department of Motor Vehicles; (d) A military identification card; or	Nev. Rev. Stat.§ 293.277

		(e) Any other form of identification issued by a governmental agency which contains the voter's signature and physical description or picture. Last Amendment Effective Jan. 1, 2004.	
NH	Give Name	A person desiring to vote shall, before being admitted to the enclosed space within the guardrail, announce his or her name to one of the ballot clerks who shall thereupon repeat the name; and, if the name is found on the checklist by the ballot clerk, the ballot clerk shall put a checkmark beside it and again repeat the name. The ballot clerk shall state the address listed on the checklist for the voter, and ask if the address is correct; if the address on the checklist is not correct, the ballot clerk shall correct the address in red on the checklist. The voter, if still qualified to vote in the town or ward and unless challenged as provided for in RSA 659:27-33, shall then be allowed to enter the space enclosed by the guardrail. After the voter enters the enclosed space, the ballot clerk shall give the voter one of each ballot to be voted on in that election which shall be folded as it was upon receipt from the secretary of state. Last Amendment Effective July 2, 2002.	N.H. Rev. Stat. Ann. 659:13
New Jersey	Match Sig.	19:15-17. Comparison of signatures or statements made openly; provisional ballots for newly registered voters without proper identification a. The comparison of signatures of a voter made upon registration and upon election day, and if the voter alleges his inability to write, the comparison of the answers made by such voter upon registration and upon election day, shall be had in full view of the challengers. b. If a voter has registered by mail after January 1, 2003 to vote for the first time in his or her current county of residence and did not provide personal identification when registering pursuant to section 16 of P.L.1974, c. 30 (C.19:31-6.4), the voter shall be permitted to vote starting at the first election held after January 1, 2004 at which candidates are seeking federal office after displaying one of the following items: (1) a current and valid photo identification card; (2) a current utility bill, bank statement, government check or pay check; (3) any other government document that shows the voter's name and current address; or (4) any other identifying document that the Attorney General has determined to be acceptable for this purpose. If the voter does not display one of these documents, the voter shall not be permitted to vote by machine but shall instead be provided with a provisional ballot, pursuant to the provisions of P.L.1999, c. 232 (C.19:53C-1 et seq.). This subsection shall not apply to any voter entitled to vote by absentee ballot under the "Uniformed and Overseas Citizens Absentee Voting Act" (42 U.S.C. 1973ff-1 et seq.) or to any voter who is provided the right to vote other than in person under section 3 of Pub.L.98-435, the "Voting Accessibility for the Elderly and Handicapped Act," or any other voter entitled to vote otherwise than in person under any other federal law. This subsection shall also not apply to any person who registers to vote by appearing in person at any voter registration agency or to any person whose voter registration form is delivered to the county commissioner of registration or to the Attorney General, as the case may be, through a third party by means other than by mail delivery. c. Each county commissioner of registration shall collect and maintain, in the manner prescribed by the Attorney General, the information provided pursuant to subsection b. of this section and section 16 of P.L.1974, c. 30 (C.19:31- 6.4). Access to the personal identification information provided pursuant to subsection b. of this section and section 16 of P.L.1974, c. 30 (C.19:31- 6.4). shall be prohibited, in accordance with subsection a. of section 6 of P.L.2001, c. 404 (C.47:1A-5). Last Amendment Effective July 9, 2004	N.J. Stat. Ann. 19:15-17
New Mexico	Sign Name	D. The judge assigned to the voter list used for confirmation of registration and voting shall determine that each person offering to vote is registered and, in the	N.M. Stat. Ann §1-5-10

		case of a primary election, that the voter is registered in a party designated on the primary election ballot. If the person's registration is confirmed by the presence of his name on the voter list or if the person presents a certificate under the seal and signature of the county clerk showing that he is entitled to vote in the election and to vote in that precinct, the judge shall announce to the election clerks the list number and the name of the voter as shown on the voter list. E. The election clerk shall locate that list number and name on the signature roster and shall require the voter to sign his usual signature or, if unable to write, to make his mark opposite his printed name. If the voter makes his mark, it shall be witnessed by one of the judges of the precinct board. If the signature roster indicates that the voter is required to present a form of identification before voting, the election judge shall ask the voter for a current and valid photo identification or a copy of a current utility bill, bank statement, government check, paycheck or other government document that shows and matches the name and address of the voter as indicated on the signature roster. If the voter does not provide the required identification, he shall be allowed to vote on a provisional paper ballot. G. A voter shall not be permitted to vote until he has properly signed his usual signature or made his mark in the signature roster. (From 2004 version of New Mexico Annotated Statutes, amended in 2005 to require presentation of ID)	(Recompiled as §1-12 -7.1 by L. 2005, Ch. 270, §63, effective July 1, 2005)
New York	Match Sig.	1. A person before being allowed to vote shall be required, except as provided in this chapter, to sign his name on the back of his registration poll record on the first line reserved for his signature at the time of election which is not filled with a previous signature, or on the line of the computer generated registration list reserved for his signature. The two inspectors in charge shall satisfy themselves by a comparison of this signature with his registration signature and by comparison of his appearance with the descriptive material on the face of the registration poll record that he is the person registered. If they are so satisfied they shall enter the other information required for the election on the same line with the voter's latest signature, shall sign their names or initials in the spaces provided therefor, and shall permit the applicant to vote. Any inspector or inspectors not satisfied shall challenge the applicant forthwith. 2. If a person who alleges his inability to sign his name presents himself to vote, the board of inspectors shall permit him to vote, unless challenged on other grounds, provided he had been permitted to register without signing his name. The board shall enter the words "Unable to Sign" in the space on his registration poll record reserved for his signature or on the line of the computer generated registration list reserved for his signature at such election. If his signature appears upon his registration record or upon the computer generated registration list the board shall challenge him forthwith, except that if such a person claims that he is unable to sign his name by reason of a physical disability incurred since his registration, the board, if convinced of the existence of such disability, shall permit him to vote, shall enter the words "Unable to Sign" and a brief description of such disability in the space reserved for his signature at such election. At each subsequent election, if such disability still exists, he shall be entitled to vote without signing his name and the board of inspectors, without further notation, shall enter the words "Unable to Sign" in the space reserved for his signature at such election. 3. The voter's signature made by him upon registration and his signature made at subsequent elections shall be effectively concealed from the voter by a blotter or piece of opaque paper until after the voter shall have completed his signature. 4. In any case where a person who has heretofore voted has placed his voting signature on the back of his registration poll record on the first or any succeeding line or lines at the time or times of an election, instead of on the last line of the	N.Y. Law § 8-304 (McKinney)

		space thereon required to be reserved for such voting signatures and on any lines next running upward therefrom, the inspectors of election shall obliterate such misplaced signature or signatures, initial the obliteration and require such voter to sign his name again in the correct place on such registration poll record. 5. Any person who has heretofore registered and who at such time placed his or her registration signature on the back of the registration poll record otherwise than in the space required to be provided therefor at the bottom of such poll record, shall, before being permitted to vote at any election thereafter, subscribe a new registration signature for himself on the last line at the bottom of such poll record, and, at the same time, if the inspectors of election are satisfied that the signatures were made by the same person, obliterate his original registration signature placed elsewhere than on the bottom of such record. Such obliterations may be made by crossing out the signature so as to completely efface the same or by affixing thereover a piece of gummed tape of a size sufficient only to cover such signature and of a type adequate to fully conceal the same Last Amended 1986	
North Carolina	Give Name	(a) Checking Registration. –A person seeking to vote shall enter the voting enclosure through the appropriate entrance. A precinct official assigned to check registration shall at once ask the voter to state current name and residence address. The voter shall answer by stating current name and residence address. In a primary election, that voter shall also be asked to state, and shall state, the political party with which the voter is affiliated or, if unaffiliated, the authorizing party in which the voter wishes to vote. After examination, that official shall state whether that voter is duly registered to vote in that precinct and shall direct that voter to the voting equipment or to the official assigned to distribute official ballots. If a precinct official states that the person is duly registered, the person shall sign the pollbook, other voting record, or voter authorization document in accordance with subsection (c) of this section before voting.	N.C. Gen. Stat. Ann. § 163-166.7
North Dakota	Provide ID	16.1-05-07 Poll clerks to check identification and verify eligibility -- Poll clerks to request, correct, and update incorrect information contained in the pollbook. 1. Before delivering a ballot to an individual according to section 16.1-13- 22, the poll clerks shall request the individual to show a driver's license issued by the state, another form of identification displaying a photograph of the individual and the individual's date of birth, or another appropriate form of identification prescribed by the secretary of state. If an individual offering to vote fails or refuses to show an appropriate form of identification, the individual may be allowed to vote without being challenged according to section 16.1-05-06 if the individual provides to the election board the individual's date of birth and if a member of the election board or a clerk knows the individual and can personally vouch that the individual is a qualified elector of the precinct. After verifying that the individual's name is contained in the pollbook generated from the central voter file, poll clerks shall verify the individual's residential address and mailing address, if different from the individual's residential address. (From 2003 version of N.D. Century Code; only amendment to this statute that became effective in 2003 was in 2005)	N.D. Cent. Code § 16.1-05-07

Ohio	Match Sig.	When an elector appears in a polling place to vote he shall announce his full name and address to the precinct election officials. He shall then write his name and address at the proper place in the poll lists or signature pollbooks provided therefore, except that if, for any reason, an elector shall be unable to write his name and address in the poll list or signature pollbook, the elector may make his mark at the place intended for his name and a precinct official shall write the name of the elector at the proper place on the poll list or signature pollbook following the elector's mark, upon the presentation of proper identification. The making of such mark shall be attested by the precinct official who shall evidence the same by signing his name on the poll list or signature pollbook as a witness to such mark. The elector's signature in the poll lists or signature pollbooks shall then be compared with his signature on his registration form or a digitized signature list as provided for in section 3503.13 of the Revised Code, and if, in the opinion of a majority of the precinct election officials, the signatures are the signatures of the same person, the clerks shall enter the date of the election on the registration form or shall record the date by such other means as may be prescribed by the secretary of state. If the right of the elector to vote is not then challenged, or, if being challenged, he establishes his right to vote, he shall be allowed to proceed into the voting machine. If voting machines are not being used in that precinct, the judge in charge of ballots shall then detach the next ballots to be issued to the elector from Stub B attached to each ballot, leaving Stub A attached to each ballot, hand the ballots to the elector, and call his name and the stub number on each of the ballots. The clerk shall enter the stub numbers opposite the signature of the elector in the pollbook. The elector shall then retire to one of the voting compartments to mark his ballots. No mark shall be made on any ballot which would in any way enable any person to identify the person who voted the ballot. (Effective at time of last update, 1992 H 182, eff. 4-9-93)	Ohio Rev. Code Ann. § 3505.18
Oklahoma	Sign Name	Each person presenting himself to vote shall announce his name to the judge of the precinct, whereupon the judge shall determine whether said person's name is in the precinct registry. (Last amended in 1990) Persons who have been determined to be eligible to vote shall sign, in the presence of the clerk, the proper precinct registry. Said clerk shall thereupon issue proper ballots to said person. The voter's signature on said precinct registry shall be the best evidence of said voter's having voted at said election. Said precinct registry shall be retained in the office of the county election board for a period of twenty-two (22) months following the election and shall be subject to public inspection during regular office hours. (Last amended in 1990)	Okla. Stat. Ann. tit. 26, § 7-114 Okla. Stat. Ann. tit. 26, § 7-117
Oregon	Match Sig.	All elections in Oregon are Vote by Mail. An Elections Official will compare the signature on your ballot return envelope to the signature on your voter registration card to verify your identity (http://www.uhavavote.org/votingguide/votebymail.html) (unknown date, but use of wayback machine shows that this provision on site on following dates: 7/11/04, 10/20/04 and 10/29/04)	Or. Rev. Stat. § 254.385
Penn.	Match Sig.	(a.3) All electors, including any elector that shows identification pursuant to subsection (a), shall subsequently sign a voter's certificate, and, unless he is a State or Federal employee who has registered under any registration act without declaring his residence by street and number, he shall insert his address therein, and hand the same to the election officer in charge of the district register. Such election officer shall thereupon announce the elector's name so that it may be heard by all members of the election board and by all watchers present in the	25 Pa. Stat. Ann. § 3050

		polling place and shall compare the elector's signature on his voter's certificate with his signature in the district register. If, upon such comparison, the signature upon the voter's certificate appears to be genuine, the elector who has signed the certificate shall, if otherwise qualified, be permitted to vote: Provided, That if the signature on the voter's certificate, as compared with the signature as recorded in the district register, shall not be deemed authentic by any of the election officers, such elector shall not be denied the right to vote for that reason, but shall be considered challenged as to identity and required to make the affidavit and produce the evidence as provided in subsection (d) of this section. When an elector has been found entitled to vote, the election officer who examined his voter's certificate and compared his signature shall sign his name or initials on the voter's certificate, shall, if the elector's signature is not readily legible, print such elector's name over his signature, and the number of the stub of the ballot issued to him or his number in the order of admission to the voting machines, and at primaries a letter or abbreviation designating the party in whose primary he votes shall also be entered by one of the election officers or clerks. As each voter is found to be qualified and votes, the election officer in charge of the district register shall write or stamp the date of the election or primary, the number of the stub of the ballot issued to him or his number in the order of admission to the voting machines, and at primaries a letter or abbreviation designating the party in whose primary he votes, and shall sign his name or initials in the proper space on the registration card of such voter contained in the district register. (In effect at time of, and unaltered by: 2004, Oct. 8, P.L. 807, No. 97, § 5.1 (changes procedure for first time voters, not established voters))	
Rhode Island	Give Name	(a) Each person desiring to vote shall state his or her name and residence, including that person's street address, if he or she has any, to one of the first pair of bi-partisan supervisors, who shall then announce the name and residence in a loud and distinct voice, clear and audible. As each voter's name is announced, the voter shall be handed a ballot application in the following form: BALLOT APPLICATION (Poll List) Senatorial District ____________________ Representative District ____________ Voting District ________________________ Election Date ____________________________________ I hereby certify that I am a registered and qualified elector in the above voting district of City of and hereby make application for ballots to be voted at this election. ____ (Signature of Voter) ____ (Residence Address) Number Approved ____ (Supervisor of Election)	R.I. Gen. Laws § 17-19-24

		(b) The voter shall sign the application in the presence and view of a bipartisan pair. They shall locate the voter's name on the certified voting list for the voting district. Upon finding the voter's name on the certified voting list for the district, they shall initial the ballot application in the place provided next to the word "Approved" and shall enter on the certified list of voters a proper notation that the applicant has voted in the election. They shall then return the ballot application to the voter who shall pass down the line and present it to the clerk. After the voter has handed the approved ballot application to the clerk, the clerk shall provide the voter with the appropriate computer ballot and security sleeve, the warden shall direct the voter to the voting booth which the voter shall use, and unless the voter needs instruction or assistance as provided in this chapter, the voter shall cast his or her vote, and if he or she desires place the voted computer ballot in a security sleeve, and shall proceed to the optical scan precinct count unit and shall personally place his or her voted ballot into the designated ballot slot on the unit, and after doing so, shall leave the enclosure at once. No voter shall remain within the voting booth longer than ten (10) minutes, and if the voter refuses to leave after the lapse of ten (10) minutes, the voter shall be removed from the voting booth by order of the warden. Except for the election officials and the election inspector, not more than two (2) voters in excess of the number of voting booths shall be permitted within the enclosed space at any time. (Last amended 2004, Current through January 2005 Session)	
South Carolina	Photo ID	**§ 7-13-710. Proof of right to vote; signing poll list; comparison of signatures.** When any person presents himself to vote, he shall produce his valid South Carolina driver's license or other form of identification containing a photograph issued by the Department of Motor Vehicles, if he is not licensed to drive, or the written notification of registration provided for by §§ 7-5- 125 and 7-5-180 if the notification has been signed by the elector. If the elector loses or defaces his registration notification, he may obtain a duplicate notification from his county board of registration upon request in person, or by telephone or mail. After presentation of the required identification, his name must be checked by one of the managers on the margin of the page opposite his name upon the registration books, or copy of the books, furnished by the board of registration. The managers shall keep a poll list which must contain one column headed "Names of Voters". Before any ballot is delivered to a voter, the voter shall sign his name on the poll list, which must be furnished to the appropriate election officials by the State Election Commission. At the top of each page the voter's oath appropriate to the election must be printed. The signing of the poll list or the marking of the poll list is considered to be an affirmation of the oath by the voter. One of the managers shall compare the signature on the poll list with the signature on the voter's driver's license, registration notification, or other identification and may require further identification of the voter and proof of his right to vote under this title as he considers necessary. If the voter is unable to write or if the voter is prevented from signing by physical handicap, he may sign his name to the poll list by mark with the assistance of one of the managers. Last amended: 1968	S.C. Code Ann. § 7-13-710
South Dakota	Photo ID	When a voter is requesting a ballot, the voter shall present a valid form of personal identification. The personal identification that may be presented shall be either: (1) A South Dakota driver's license or nondriver identification card; (2) A passport or an identification card, including a picture, issued by an agency of the United States government; (3) A tribal identification card, including a picture; or (4) An identification card, including a picture, issued by a high school or an accredited institution of higher education, including a university, college, or	S.D. Codified Laws § 12-18-6.1

		technical school, located within the State of South Dakota. Last amended March 2004	
Tennessee	Provide ID	Identification of eligible voters (a)(1) A voter shall sign an application for ballot, indicate the primary in which the voter desires to vote, if any, and present it to a registrar. The application for ballot shall include thereon a space for the address of the voter's current residence, and the voter shall write or print such address on the application when the voter signs it. The registrar shall compare the signature and information on the application with the signature and information on the duplicate permanent registration record. The registrar shall make a determination whether the voter's address is different from the address on the voter's permanent registration record or if the registration is in inactive status. If the voter has changed residence, or the voter's registration is inactive, the registrar shall follow the procedures for voting pursuant to § 2-7-140. If, upon comparison of the signature and other identification, it is found that the applicant is entitled to vote, the registrar shall initial the application and shall note on the reverse side of the voter's duplicate permanent registration record the date of the election, the number of the voter's ballot application, and the elections in which the voter votes. If the applicant's signature is illegible, the registrar shall print the name on the application. The registrar shall give the voter the ballot application which is the voter's identification for a paper ballot or ballots or for admission to a voting machine. The voter shall then sign the duplicate poll lists without leaving any lines blank on any poll list sheet. (2) In any computerized county, the county election commission shall have the option of using an application for a ballot as provided in this section, or using the computerized voter signature list. A computerized voter signature list shall include the voter's name, current address of residence, social security number or registration number, birth date and spaces for the voter's signature, elections voted, ballot number and precinct registrar's initials. The following procedures shall be followed in the case of computerized voter signature lists: (A) The voter shall sign the signature list and indicate the election or elections the voter desires to vote in and verify the voter's address in the presence of the precinct registrar; (B) The registrar shall compare the voter's signature and information on the signature list with other evidence of identification supplied by the voter. If, upon comparison of the signature and other evidence of identification, it is found that the applicant is entitled to vote, the registrar shall initial the signature list; (C) If the applicant's signature is illegible, the registrar shall print the name of the applicant on the voter list; and (D) If a voter is unable to present any evidence of identification specified in subsection (c), the voter shall be required to execute an affidavit of identity on a form provided by the county election commission. Last amended 2003	Tenn. Code Ann. § 2-7-112
Texas	Provide ID	(b) On offering to vote, a voter must present the voter's voter registration certificate to an election officer at the polling place. (Last amended in 1997)	Tex. Elec. Code Ann. § 63.001
Utah	Give Name	(1)(a) Any registered voter desiring to vote shall give his name, and, if requested, his residence, to one of the election judges. (b) If an election judge does not know the person requesting a ballot and has reason to doubt that person's identity, the judge shall request identification or have the voter identified by a known registered voter of the district. (3) If the election judge determines that the voter is registered: (a) the election judge in charge of the official register shall: (i) write the ballot number opposite the name of the voter in the official register; and	Utah Code Ann. § 20A-3-104

		(ii) direct the voter to sign his name in the election column in the official register; (b) another judge shall list the ballot number and voter's name in the pollbook; and (c) the election judge having charge of the ballots shall: (i) endorse his initials on the stub; (ii) check the name of the voter on the pollbook list with the number of the stub; (iii) hand the voter a ballot; and (iv) allow the voter to enter the voting booth. (In effect at time of last update prior to 2005: Laws 2003, c. 37, § 1, eff. May 5, 2003)	
Vermont	Give Name	Before a person may be admitted to vote, he or she shall announce his or her name and if requested, his or her place of residence in a clear and audible tone of voice, or present his or her name in writing, or otherwise identify himself or herself by appropriate documentation. The election officials attending the entrance of the polling place shall then verify that the person's name appears on the checklist for the polling place. If the name does appear, and if no one immediately challenges the person's right to vote on grounds of identity or having previously voted in the same election, the election officials shall repeat the name of the person and: (1) If the checklist indicates that the person is a first-time voter in the municipality who registered by mail and who has not provided required identification before the opening of the polls, require the person to present any one of the following: a valid photo identification; a copy of a current utility bill; a copy of a current bank statement; or a copy of a government check, paycheck, or any other government document that shows the current name and address of the voter. If the person is unable to produce the required information, the person shall be afforded the opportunity to cast a provisional ballot, as provided in subchapter 6A of this chapter. The elections official shall note upon the checklist a first-time voter in the municipality who has registered by mail and who produces the required information, and place a mark next to the voter's name on the checklist and allow the voter to proceed to the voting booth for the purpose of voting. (2) If the voter is not a first-time voter in the municipality, no identification shall be required, the clerk shall place a check next to the voter's name on the checklist and allow the voter to proceed to the voting booth for the purpose of voting (Last amended in 2003)	Vt. Stat. Ann. tit. 17, § 2563
Virginia	Provide ID	§ 24.2-643. Qualified voter permitted to vote; procedures at polling place; voter identification A. After the polls are open, each qualified voter at a precinct shall be permitted to vote. The officers of election shall ascertain that a person offering to vote is a qualified voter before admitting him to the voting booth and furnishing an official ballot to him. B. An officer of election shall ask the voter for his full name and current residence address and repeat, in a voice audible to party and candidate representatives present, the full name and address stated by the voter. The officer shall ask the voter to present any one of the following forms of identification: his Commonwealth of Virginia voter registration card, his social security card, his valid Virginia driver's license, or any other identification card issued by a government agency of the Commonwealth, one of its political subdivisions, or the United States; or any valid employee identification card containing a photograph of the voter and issued by an employer of the voter in the ordinary course of the employer's business. If the voter's name is found on the pollbook, if he presents one of the forms of	Va. Code. Ann.

		identification listed above, if he is qualified to vote in the election, and if no objection is made, an officer shall enter, opposite the voter's name on the pollbook, the first or next consecutive number from the voter count form provided by the State Board, or shall enter that the voter has voted if the pollbook is in electronic form; an officer shall provide the voter with the official ballot; and another officer shall admit him to the voting booth. Except as provided in subsection E of this section, if a voter is entitled to vote except that he is unable to present one of the forms of identification listed above, he shall be allowed to vote after signing a statement, subject to felony penalties for false statements pursuant to § 24.2-1016, that he is the named registered voter who he claims to be. A voter who requires assistance in voting by reason of physical disability or inability to read or write, and who requests assistance pursuant to § 24.2-649, may be assisted in preparation of this statement in accordance with that section. The provisions of § 24.2-649 regarding voters who are unable to sign shall be followed when assisting a voter in completing this statement. (Version in effect as of 2004- effective 4/12/2004)	
Washington	Sign Name	29A.44.201. A voter desiring to vote shall give his or her name to the precinct election officer who has the precinct list of registered voters. This officer shall announce the name to the precinct election officer who has the copy of the inspector's poll book for that precinct. If the right of this voter to participate in the primary or election is not challenged, the voter must be issued a ballot or permitted to enter a voting booth or to operate a voting device. For a partisan primary in a jurisdiction using the physically separate ballot format, the voter must be issued a nonpartisan ballot and each party ballot. The number of the ballot or the voter must be recorded by the precinct election officers. If the right of the voter to participate is challenged, RCW 29A.08.810 and 29A.08.820 apply to that voter. (In effect at time of last update prior to 2005: 2004 c 271 § 136, eff. June 10, 2004) 29A.44.210. Any person desiring to vote at any primary or election is required to sign his or her name on the appropriate precinct list of registered voters. If the voter registered using a mark, or can no longer sign his or her name, the election officers shall require the voter to be identified by another registered voter. The precinct election officers shall then record the voter's name. Effective date: July 1, 2004	Wash. Rev. Code § 29A.44.201 & 29A.44.210
West Virginia	Match Sig.	(a) Any person desiring to vote in an election shall, upon entering the election room, clearly state his or her name and residence to one of the poll clerks who shall thereupon announce the same in a clear and distinct tone of voice. If that person is found to be duly registered as a voter at that precinct, he or she shall be required to sign his or her name in the space marked "signature of voter" on the pollbook prescribed and provided for the precinct. If that person is physically or otherwise unable to sign his or her name, his or her mark shall be affixed by one of the poll clerks in the presence of the other and the name of the poll clerk affixing the voter's mark shall be indicated immediately under the affixation. No ballot may be given to the person until he or she so signs his or her name on the pollbook or his or her signature is so affixed thereon. * * * (c) When the voter's signature is properly on the pollbook, the two poll clerks shall sign their names in the places indicated on the back of the official ballot and deliver the ballot to the voter to be voted by him or her without leaving the	W. Va. Code § 3-1-34 (a)

		election room. If he or she returns the ballot spoiled to the clerks, they shall immediately mark the ballot "spoiled" and it shall be preserved and placed in a spoiled ballot envelope together with other spoiled ballots to be delivered to the board of canvassers and deliver to the voter another official ballot, signed by the clerks on the reverse side required by this subsection. The voter shall thereupon retire alone to the booth or compartment prepared within the election room for voting purposes and there prepare his or her ballot using a ballpoint pen of not less than five inches in length or other indelible marking device of not less than five inches in length. In voting for candidates in general and special elections, the voter shall comply with the rules and procedures prescribed in section five, article six of this chapter. (In effect at time of last update prior to 2005: Acts 2003, c. 100, eff. 90 days after March 7, 2003)	
Wisconsin	Give Name	6.79(2)(a) Except as provided in sub. (6), where there is registration, each person, before receiving a voting number, shall state his or her full name and address. Upon the prepared registration list, after the name of each elector, the officials shall enter the serial number of the vote as it is polled, beginning with number one. Each elector shall receive a slip bearing the same serial number. A separate list shall be maintained for electors who are voting under s. 6.15, 6.29 or 6.55(2) or (3) and electors who are reassigned from another polling place under s. 5.25(5)(b). Each such elector shall have his or her full name, address and serial number likewise entered and shall be given a slip bearing such number. (In effect at time of last update prior to 2005: 2003 Act 327, § 4, eff. June 12, 2004)	Wis. Stat. § 6.79
Wyoming	Give Name	(a) Unless a voter is challenged pursuant to W.S. 22-15-101 through 22- 15-109, no identification shall be required when: (i) Voting in person or by mail after having registered in person; or (ii) Voting in person or by mail after having registered by mail and having previously voted in a Wyoming federal election. (In effect at time of last update prior to 2005: Effective dates. -- Laws 2004, ch. 94, § 5, makes the act effective immediately upon completion of all acts necessary for a bill to become law as provided by art. 4, § 8, Wyo. Const. Approved March 5, 2004.)	Wyo. Stat. Ann. § 22-3-118

APPENDIX B –Court Decisions and Literature on Voter Identification and Related Issues

Court Decisions

Summary of Relevant Cases:

Challenges Prevailed:

American Civil Liberties Union of Minnesota v. Kiffmeyer, 2004
- Action for temporary restraining order – granted
- Statute: allowed use of tribal identification cards w/ name, address & photo as a valid identification to register to vote only if the voter lives on the reservation to "complete" a mail-in application (which only affected about 600 voters w/ incomplete applications)
- Claim -14th Amendment EPC: likely to prevail, no rational basis for a distinction between Indians residing on reservations and those not
- Statute: may use certain forms of photo identification lacking address together with a utility bill but not tribal identification cards
- Claim -14th Amendment EPC: likely to prevail

Greidinger v. Davis, 1993
- Statute: mandated disclosure of SS # as a precondition to voter registration (rationale was voter identification, but the numbers were rarely used to verify identity & were disclosed in voter lists to both political parties and the public upon request)
- Claims:
    - 14th Amendment EPC: no classification (applied strict scrutiny)
    - Substantive due process: law invalid; found that the statute conditioned the fundamental right to vote on the consent to an invasion of privacy; this was found to be a substantial burden (applied strict scrutiny)
        - Compelling interests: preventing voter fraud (deemed compelling)
        - Necessary: fails, preventing voter fraud when allowing names for inspection could be achieved by supplying addresses and DOBs or use of voter registration numbers
        - HOWEVER: Court also made it clear that if the registration scheme kept the SS# for internal use only – it would be valid

Challenges Rejected:

League of Women Voters v. Blackwell, 2004.
- Sec. of State Directive: provisional ballots issued if first-time voter, who registered by mail and did not provide ID, cannot produce proper ID at the polls AND that the provisional ballot will only be counted if the voter returns to the poll before it closes w/ ID or can recite SS# or DL#
- Claims – Supremacy Clause & HAVA: ruled that HAVA did not specify how the first-time voters' identifications should be verified and this method was not unreasonable or too burdensome

Colorado Common Clause v. Davidson, 2004
- Statute: required all voters to show ID (most types permitted) before voting
- Claims:
    - HAVA: ruled that HAVA did not preempt more strict state laws & allowed States to be more strict as long as consistent with the purpose of HAVA (both HAVA & CO provisions' purposes were to prevent voter fraud)
    - Substantive due process and equal protection
        - No improper discrimination

  - Preventing voter fraud is a compelling interest since it is irreversible once vote is cast
  - Only marginally more intrusive than HAVA, many types of identification permitted – thus, valid

McKay v. Thompson, 2000

- Statute: mandated disclosure of SS # as a precondition to voter registration
- Claims:
  - Privacy Act, Section 7: ruled that Tennessee voter system exempt from Privacy Act because it is pre-75
  - NVRA, permitting only min. amt. of info. necessary to prevent duplicate registration and determine eligibility: ruled that NVRA does not specifically forbid the use of SS#s & the Privacy Act specifically permits them pre-75
  - Substantive due process: ruled that internal use of SS# not a burden
  - Free Exercise, based on Bible's supposed prohibition on use of universal identifiers: ruled that law is generally applicable and thus valid
  - P&I, Article IV: does not protect in-state citizens
  - P&I, 14th Amend.: no protection for privilege where Congress authorized its infringement

Kemp v. Tucker, 1975

- Statute: required name, occupation, address, sex, race, height, hair color, eye color, and date of birth be listed on voter registration card for identification purposes
- Claims:
  - VRA: ruled that race was not made a "qualification" for voting
  - 15th Amendment: ruled that it did not abridge right to vote on account of race because rejection of application was due to failure to provide information, not race; race only one factor in identification
  - 14th Amendment EPC: ruled there was no distinction among voters

Perez v. Rhiddlehoover, 1966

- Statute: date of birth, place of birth, mother's first or maiden name, color of eyes, sex, race, occupation, and whether owner, tenant or boarder must appear on the registration for identification
- Claims:
  - VRA: ruled that it was not a "test or device" because it applied equally
  - 15th Amendment: same reasons

Cases in Which the Plaintiffs Have Prevailed in Challenging the Statute Requiring Voter Identification:

***American Civil Liberties Union of Minnesota v. Kiffmeyer,* No. 04-CV-4653, 2004 WL 2428690, at *1 (D. Minn. Oct. 28, 2004).**

This was an action just before the November 2004 election for a temporary restraining order, which was granted. The ACLU challenged a Minnesota law allowing the use of tribal identification cards with the name, address, and photograph as a valid identification (equal to a driver's license) for use in "completing" an incomplete mail-in voter registration only if the Indian lives on the reservation. 2004 WL 2428690, at *1. The Court ruled that this distinction would likely violate the Equal Protection Clause because there was no rational basis for differentiating

between the validity of the identification based on whether or not the cardholder lives on the reservation. *Id.* at *1, 3.

Secondly, the ACLU challenged a second statute which allowed the use of certain photo identification lacking the voter's address to be used together with a utility bill or bank statement as valid identification for registration. *Id.* at *3. The statute did not, however, permit using a tribal identification for this same purpose. *Id.* The Court ruled that this likely violated the equal protection clause as well. *Id.*

***Greidinger v. Davis*, 988 F.2d 1344 (4th Cir. 1993).**

This case challenged a Virginia law requiring the social security number for voter registration, which the State subsequently disclosed to the public and political parties upon request in voter registration lists, which included the social security numbers. Failure to provide the social security number resulted in the denial of the registration application. The law was challenged under the Equal Protection Clause and under substantive due process. The Court quickly rejected the equal protection challenge because the law made no classification. 988 F.2d at 1350.

The law was invalidated under substantive due process. *Id.* at 1355. The Court found that the statutory scheme conditioned the fundamental right to vote on the consent to an invasion of privacy, based on concerns of identity theft. *Id.* at 1353-54. The Court found this to be a substantial burden on the right to vote. *Id.* at 1354. The Court recognized that the government's interest in preventing voter fraud was compelling. *Id.* However, the Court found that disclosure of the information to the public and political parties was not necessary to achieve that interest. *Id.* Disclosure of addresses or dates of birth would be sufficient to aid the public in distinguishing between two voters with the same name. *Id.* at 1355. The Court did state that required disclosure of the social security number for internal use only would be valid. *Id.* at 1354 n.10.

<u>Cases in Which the Statute or Practice of Voter Identification Has Been Upheld:</u>

***League of Women Voters v. Blackwell*, 340 F. Supp. 2d 823 (N.D. Ohio 2004).**

The League of Women Voters challenged the Secretary of State's directive that provisional ballots should be issued to all first-time voters who registered by mail without providing identification who cannot show proper identification at the polls. 340 F. Supp. 2d at 828. The Directive also stated that the provisional ballots would only be counted if the voter orally recited his driver's license number or the last four digits of his social security number or returned to the polling place before it closed with some acceptable identification, including reciting those identification numbers. *Id.* The Court stated that HAVA only requires verification of eligibility of first time voters registering by mail; it does not say how that should be done. *Id.* at 831. The Court found the burden on the right to vote to be slight. *Id.* The Directive was found valid under HAVA and the Supremacy Clause because the number of uncounted votes would be small, the requirement was reasonable, and there was adequate notice of the requirement on the registration forms. *Id.* at 829-30.

***Colorado Common Cause v. Davidson*, No. 04CV7709, 2004 WL 2360485, at *1 (Colo. Dist. Ct. Oct. 18, 2004).**

In this case, the validity of three Colorado statutory provisions was challenged. The laws (1) required <u>all</u> in-person voters to show identification (not just first-time registrants); (2) provided that votes cast in the wrong precinct would not be counted; and (3) provided that

provisional ballots would not be counted if the voter applied for an absentee ballot. 2004 WL 2360485, at *1. The plaintiffs also challenged the provisions under HAVA. The identification provision allowed nearly all forms of acceptable identification under HAVA. *Id.* at *6.

The challenge to the identification requirement failed under both challenges. The Court interpreted HAVA as not intended to preempt state laws and as permitting states to be more strict than, but not inconsistent with, HAVA. *Id.* at *10. The Court felt that the purpose of both laws was the same, to reduce voter fraud, and thus, both laws could coexist. As to the Constitutional claim, both equal protection and substantive due process, the Court felt that preventing voter fraud, which is impossible to remedy once a vote is cast, is a compelling interest, and the Court also felt that a voter identification requirement for all voters, with many types of acceptable identification, was only marginally more intrusive than HAVA. *Id.* at 12. The Court also found no improper discrimination between voters. *Id.* Thus, the provision was upheld.

***McKay v. Thompson*, 226 F.3d 752 (6th Cir. 2000).**

The Sixth Circuit ruled that the Privacy Act, the National Voter Registration Act, Substantive Due Process, the Privileges and Immunities Clauses (Fourteenth Amendment & Article IV), and the First Amendment right to free exercise do not prohibit requiring disclosure of social security numbers as a precondition to voter registration.

The Privacy Act, Section 7, mandates that it is unlawful for a government to deny a right or privilege because of a citizen's refusal to disclose his social security number, unless the disclosure was required for a system established prior to 1975. 226 F.3d at 755 (citing Privacy Act of 1974, Pub. L. No. 93-579 (1974)). Since Tennessee required social security numbers for voter registration since 1972, his challenge was rejected. 226 F.3d at 755. Second, the NVRA only permits requiring the minimum amount of information necessary to prevent duplicate voter registration and to determine eligibility. *Id.* at 755-56 (citing 42 U.S.C. §1973gg-3(c)(2)(B)). The Court rejected this challenge because the NVRA does not specifically forbid the use of social security numbers, and the Privacy Act, a more specific statute, grandfathered their use if prior to 1975. 226 F.3d at 756.

Finally, the plaintiff's constitutional claims were all rejected. His substantive due process claim was rejected because internal receipt and use of social security numbers does not burden the fundamental right to vote. *Id.* The free exercise challenge, based on the Bible's supposed prohibition of universal identifiers, was rejected because the law was generally applicable and not directed at particular religious practices. *Id.* The Privileges and Immunities Clause claim was rejected because the Clause does not apply to citizens of the state. *Id.* The Fourteenth Amendment Privileges and Immunities claim, based on the right to vote as unique to U.S. citizenship, was rejected because the Clause provides no protection where Congress has authorized the infringement. *Id.*

***Kemp v. Tucker*, 396 F. Supp. 737 (M.D. Pa. 1975), *aff'd*, 423 U.S. 803.**

A statute was upheld, which required name, occupation, address, sex, race, height, hair color, eye color, and date of birth to be recorded on the voter registration card and allowed registration officials to reject an incomplete application. 396 F. Supp. at 738. Claims were alleged under the Fourteenth Amendment's Equal Protection Clause, the Fifteenth Amendment, and the Voting Rights Act.

As to the Fourteenth and Fifteenth Amendment claims, the Court reasoned that preventing voter fraud is a compelling goal, and identification provisions are "an essential means of achieving the goal." *Id.* at 739. The Court also rejected the equal protection claim because the statutes did not create a distinction at all. *Id.* at 740 n.3. Since race is just one of

several characteristics required, the Court found that it was intended for preventing voter fraud, not some other motive. *Id.* at 740. As to the VRA, the Court rejected the claim that it added race as a qualification for voting as frivolous. *Id.* As to a Fifteenth Amendment claim that it abridged the right to vote on account of race, the Court also made a distinction between rejecting a voter application because of race and rejecting an application because of failure to answer all relevant questions to assist in preventing voter fraud. *Id.* The statute was upheld.

***Perez v. Rhiddlehoover,* 186 So. 2d 686 (La. Ct. App. 1966).**

A voter registration requirement was challenged and upheld. The statute stated that date of birth, place of birth, mother's first or maiden name, color of eyes, sex, race, occupation, and whether owner, tenant or boarder must appear on the registration. 186 So.2d at 690. This information was required for identification of voters, especially when voters had the same name, to prevent duplicate voting. It was challenged under the Voting Rights Act of 1965 Section 4(a) which prohibits denying the right to vote for failure to comply with a "test or device." The Court felt that this requirement was not a test or device for discrimination because it applied equally. *Id.* at 691. The Court also determined that it was not in conflict with the Fifteenth Amendment either. *Id.*

***Friendly House, et al. v. Janet Napolitano et al.,* CV 04-649 TUC DCB**

On November 30, 2004, the Mexican American Legal Defense and Educational Fund (MALDEF) filed suit seeking to halt the implementation of Proposition 200. . Proposition 200 created a number of legal requirements to ensure that public benefits are not available to illegal immigrants. In particular, Proposition 200 requires that a person attempting to register to vote provide one of six specific forms of proof of United States citizenship. Compl. 12-13. Also, any person attempting to vote must present either one form of photo identification or two forms of non-photo identification. *Id.* at 13.

The lawsuit alleges two violations that directly relate to the voting identification restrictions. First, the lawsuit alleges a violation of the Twenty-Fourth and Fourteenth amendments in that a voter must pay a poll tax by spending money to purchase the required identification. *Id.* at 20. Second, the lawsuit alleges violation of the Voting Rights Act. *Id.* at 21. The lawsuit was recently dismissed by the 9th Circuit Court of Appeals for a lack of standing. The Circuit Court found that there was no injury-in-fact, meaning that once an injury occurs the suit will likely be refiled. Additionally, it should be noted that the voter identification issue is only a part of the lawsuit, and much of the focus has been on other aspects of Proposition 200.

Current Litigation Concerning Voter ID Issues[27]

Litigation is filled with uncertainty. Litigation stemming from newly passed voter identification requirements will continue into the foreseeable future. Lawsuits are currently pending over voter identification requirements in Georgia and Indiana. Other states, such as Ohio, are considering new identification requirements that could lead to further litigation. The Georgia lawsuit has already succeeded in getting a preliminary injunction against the law in question, which will likely galvanize interested parties in other states to pursue similar litigation. Of course, if the injunction is eventually overturned at the appellate level it could have a similar chilling affect on future litigation.

This summary major litigation pending in Georgia and Indiana includes a brief assessment of the likelihood of success:

---

[27] As of January 2, 2006

Georgia (*Common Cause/Georgia v. Billups*):

On September 19, 2005, Common Cause of Georgia, in conjunction with several other non-profit organizations, filed suit in Federal District Court against the Georgia Secretary of State and other election officials, challenging the constitutionality of Georgia's new voter identification requirements. The new law requires all voters attempting to cast a ballot in person to present a valid form of photographic identification. O.C.G.A. § 21-2-417. A voter that is unable to provide proper identification is given a provisional ballot. However, that provisional ballot will be counted only if the voter is able to subsequently present valid identification within two days of the election. *Id.*

The lawsuit alleges five separate violations of state and federal law. First, the complaint alleges that the identification requirements infringe on the right to vote guaranteed in the Georgia constitution (Compl. 32)[28]. In addition, the Plaintiffs claim violations of the Federal Civil Rights Act and Voting Rights Act. (Compl. 36,38). Finally, the lawsuit alleges violations of the Fourteenth and Twenty-Fourth amendments to the U.S. Constitution. The complaint claims that the ID requirements constitute an "undue burden" on the right to vote, in violation of the Equal Protection Clause of the Fourteenth Amendment (Compl. 34). The ID requirement does not apply to most absentee voters, and thus the requirement is also over-broad and not narrowly tailored to address the stated purpose of preventing voter fraud (Compl. 34). The complaint further alleges that the cost of obtaining a photo ID constitutes a poll tax, in violation of the Twenty-Fourth Amendment, and that the cost is also a violation of the Fourteenth Amendment because it applies to voters who choose to vote in person, and not to those who vote absentee (Compl. 34,35).

On October 18, 2005, the District Court granted the Plaintiff's motion for a preliminary injunction, enjoining the application of the new identification requirements. In granting the injunction, the court held that both federal constitutional claims had a substantial likelihood of succeeding on the merits at trial (Prelim. Inj. 96, 104). The court also held that, while the two federal statutory claims were plausible, they both lacked sufficient evidence at the time to have a substantial likelihood of success. (Prelim. Inj. 109,111,116). Finally, the court held that the Georgia constitutional claim would be barred by the Eleventh Amendment to the U.S. Constitution. (Prelim. Inj. 77).

The Defendants appealed the motion for preliminary injunction to the Eleventh Circuit, and oral argument is scheduled for March 1, 2006. In addition, some news reports have claimed that the Georgia legislature is considering re-visiting the ID requirements in light of the on-going litigation.[29] As for the merits, in granting the preliminary injunction the District Court has already signaled its belief that the federal constitutional claims are likely meritorious. The Eleventh Circuit may have a different view, but for now the case looks to have a reasonable chance of success.

Indiana (*Indiana Democratic Party v. Rokita* and *Crawford v. Marion County Election Board*):

The Indiana lawsuit is similar to its Georgia counterpart in content, though not in status. In Indiana separate lawsuits, now joined, were filed by the state Democratic Party and the

[29] GA Legislature May Revisit Voter ID Law, State Net Capitol Journal, Dec. 19, 2005.

Indiana Civil Liberties Union (ICLU). The Democratic Party's lawsuit is directed against the Indiana Secretary of State, while the ICLU's lawsuit involves the Marion County Board of Elections and the State of Indiana. Like Georgia, Indiana law also requires citizens voting in person to present some form of official photo identification. IC § 3-11-8-25.1. Voters unable to present identification are given a provisional ballot, which is counted if they are able to provide the required identification by Noon on the second Monday following the election. IC § 3-11.7-5-1. Unlike Georgia, Indiana provides state issued identification at no charge. However, there are costs involved in the process, including transportation to the Bureau of Motor Vehicles, and payment for documents such as birth certificates, which are needed to obtain the ID. (Second Am. Compl. 6).

The Democratic Party's complaint raises Fourteenth Amendment claims similar to those in the Georgia lawsuit, including concerns about substantially burdening the right to vote, the enactment of a de-facto poll tax from the costs indirectly associated with obtaining ID, and the lack of applicability to voters who cast an absentee ballot. (Second Am. Compl. 6-9). In addition, the complaint alleges that the substantial burden placed on the right to vote violates the First Amendment protection of expressive or symbolic speech, as well as the freedom of association as applied to Democratic primary elections. (Second Am. Compl. 9-10). Finally, the complaint alleges violations of the Voting Rights Act, National Voter Registration Act, and the Help America Vote Act (Second Am. Compl. 10-11). The ICLU's complaint alleges many of the same violations, but also includes claims of a violation of Indiana's constitutional guarantee of a free and equal election system. (Compl. 15)

The case is currently in the pre-trial phase, with both sides awaiting decisions on their respective motions for summary judgment.[30] The likelihood of success is bolstered by the fact that the Fourteenth amendment constitutional claims have already been found persuasive by at least one other Federal District Court. However, the Indiana law is notably different than its Georgia counterpart in that it provides free identification. While the plaintiffs make a solid argument that related costs still amount to a poll-tax, it is possible that the court could distinguish on this matter.

Unlike the Georgia case, the Indiana lawsuit also claims a violation of the Help America Vote Act. Although the claim is not completely clear, it seems as though the Plaintiffs are arguing that the Indiana statute requires more stringent identification than what is required by HAVA. 42 U.S.C. § 15483(b)(1)-(2). While this is true, it is unclear how this violates the statute. HAVA merely states that certain voters unable to produce HAVA required identification be given a provisional ballot. *Id.* Indiana law meets this requirement. IC § 3-11-8-25.1. Although Indiana law requires more stringent identification for counting the provisional ballot, HAVA leaves theses decisions to state law. 42 U.S.C. § 15482(a).

---

[30] According to an AP article, the Plaintiffs filed some type of brief on December 21—however it is not yet up on the Moritz website and I am unsure how to access it otherwise.

Subject Revised Voter ID Analysis

Karen,

Attached is Tim Vercellotti's Voter ID analysis revised to use Citizen Voting Age population as the base for turnout calculations and to take account of comments or issues raised by the EAC and our Peer Review Group. This draft is for distribution to the reviewers who will meet by teleconference on May 11, at, we understand, 11:30 a.m.

You are receiving this at the same time that it is being distributed to the Eagleton-Moritz team so that the new reviewers will have a week to prepare for our conversation on the 11th. Early next week you will receive a revised summary paper on Voter ID that incorporates the new data and findings in Tim's revised analysis. That too will be for distribution to the new reviewers.

Analysis of Effects of Voter Identification Requirements on Turnout

Tim Vercellotti
Eagleton Institute of Politics
Rutgers University

May 4, 2006

Introduction

A key area of disagreement in the policy debate over voter identification requirements concerns whether such requirements dampen voter turnout. Opponents of voter identification laws argue that they constitute an institutional barrier to voting, particularly among the poor, African-Americans, Hispanics, the elderly and people with disabilities (Baxter and Galloway 2005, Electionline.org 2002, Jacobs 2005, Young 2006). This argument holds that voter identification requirements create an extra demand on voters, and thus may discourage some of them from participating in elections. Further, critics of voter identification requirements contend that the effect is greater for some specific types of requirements. For example, critics argue that requiring voters to produce government-issued photo identification on Election Day is more demanding than, say, requiring that they state their names at the polling place. Supporters of voter identification requirements, on the other hand, argue that the requirements are necessary to combat voter fraud, safeguard the integrity of the electoral process, and engender faith in the electoral process among citizens (Young 2006).

This report examines the potential variation in turnout rates based on the type of voter identification requirement in place in each state on Election Day 2004. It draws on two sets of data – aggregate turnout data at the county level for each state, as compiled by the Eagleton Institute of Politics, and individual-level survey data included in the November 2004 Current Population Survey conducted by the U.S. Census Bureau. Classification of voter identification requirements comes from a review of state statutes conducted by the Moritz College of Law at the Ohio State University.

Types of voter identification requirements

Based on research performed for this study by the Moritz College of Law, states had one of five types of requirements in place on Election Day 2004. Upon arrival at polling places, voters had to: state their names (nine states); sign their names (13 states and the District of Columbia); match their signature to a signature on file with the local election board (eight states); provide a form of identification that did not necessarily include a photo (15 states); or provide a photo identification (five states).[1] It was then possible to code the states according to these requirements, and test the assumption that voter identification requirements would pose an increasingly demanding requirement in this order: stating one's name, signing one's name, matching one's signature to a signature on file, providing a form of identification, and providing a form of photo identification.

---

[1] Oregon conducts elections entirely by mail. Voters sign their mail-in ballots, and election officials match the signatures to signatures on file. For the purposes of this analysis, Oregon is classified as a state that requires a signature match.

But election laws in numerous states offer exceptions to these requirements if individuals lack the necessary form of identification, and laws in those states set a minimum standard that a voter must meet in order to vote using a regular ballot (as opposed to a provisional ballot). Thus it is also possible to categorize states based on the minimum requirement for voting with a regular ballot. In 2004 the categories were somewhat different compared to the maximum requirement, in that none of the states required photo identification as a minimum standard for voting with a regular ballot. Four states, however, required voters to swear an affidavit as to their identity (Florida, Indiana, Louisiana, and North Dakota The five categories for minimum requirements were: state name (12 states), sign name (14 states and the District of Columbia), match one's signature to a signature on file (six states), provide a non-photo identification (14 states), or swear an affidavit (four states). For the purposes of this analysis I treated the array of minimum identification requirements also in terms of increasing demand on the voter: state name, sign name, match signature, provide non-photo identification, and, given the potential legal consequences for providing false information, swearing an affidavit.

Estimating turnout among citizens in the voting-age population

This report examines turnout among U.S. citizens of voting age in both the aggregate- and the individual-level data. Determining citizenship status in the individual-level data simply involved restricting the analyses to individuals who identified themselves as citizens in the November 2004 Current Population Survey. (Those who said they were not citizens did not have the opportunity to answer the supplemental voting questions contained in the Current Population Survey.)

In the aggregate data, determining the percentage of the voting-age population that has U.S. citizenship posed a methodological challenge. The Census Bureau gathers information on the citizenship status of adults ages 18 and older only during the decennial census. While the Census Bureau provides annual estimates of the population to account for changes between decennial censuses, the bureau does not offer estimates for the proportion of the adult population who are citizens as part of the annual estimates. To address this issue I estimated the 2004 citizen voting-age population for each county using a method reported in the analysis of the 2004 Election Day Survey conducted for the U.S. Election Assistance Commission (U.S. Election Assistance Commission, 2005). I calculated the percentage of the 2000 voting-age population who were citizens in 2000, and applied that percentage to the July 1, 2004 estimates for voting-age population in each county. In other words, I assumed that the percentage of the voting-age population that had U.S. citizenship in 2004 was similar to the percentage of the voting-age population who were citizens in 2000.[2]

---

[2] McDonald and Popkin (2001) recommend an even more stringent approach to voter turnout calculations. They point out that voting-age population estimates include adults who are ineligible to vote (such as convicted felons), and the estimates overlook eligible citizens living overseas. While estimates of the voting-eligible population are available at the state level, I was unable to find such estimates for individual counties, which provide the unit of analysis for the aggregate data analyzed here.

Analysis of aggregate data

If one treats maximum voter identification requirements as an ordinal variable, with photo identification as the most demanding requirement, one finds some statistical support for the premise that as the level of required proof increases, turnout declines. Averaging across counties in each state, statewide turnout is negatively correlated with maximum voter identification requirements ($r = -.30$, $p < .0001$). In considering the array of minimum requirements, with affidavit as the most demanding requirement, voter identification also is negatively correlated with turnout ($r = -.20$, $p < .0001$). Breaking down the turnout rates by type of requirement reveals in greater detail the relationship between voter identification requirements and voter turnout.

[Table 1 here]

The aggregate data show that 60.9 percent of the estimated citizen voting age population voted in 2004. Differences in voter turnout at the state level in 2004 varied based on voter identification requirements. Taking into account the maximum requirements, an average of 64.6 percent of the voting age population turned out in states that required voters to state their names, compared to 58.1 percent in states that required photo identification. A similar trend emerged when considering minimum requirements. Sixty-three percent of the voting age population turned out in states requiring voters to state their names, compared to 60.1 percent in states that required an affidavit from voters.

Voter identification requirements alone, however, do not determine voter turnout. Multivariate models that take into account other predictors of turnout can paint a more complete picture of the relationship between voter identification requirements and turnout. I estimated the effects of voter identification requirements in multivariate models that also took into account the electoral context in 2004 and demographic characteristics of the population in each county. I coded the voter identification requirements on a scale of one to five, with one representing the least demanding form of identification and five representing the most demanding form of identification. To capture electoral context I included whether the county was in a presidential battleground state (any state in which the margin of victory for the winning candidate was five percent or less), and whether the county was in a state with a competitive race for governor and/or the U.S. Senate (also using the threshold of a margin of victory of five percent or less). Drawing from U.S. Census projections for 2003, I included the percentage of the voting-age population in each county that was Hispanic or African-American to control for ethnicity and race. I controlled for age using the 2003 Census projection for the percentage of county residents age 65 and older, and I controlled for socioeconomic status by including the percentage of individuals who fell below the poverty line in each county in the 2000 Census.

I estimated a series of random intercept models to account for the likelihood that data from counties were correlated within each state (for further explanation of random intercept and other multilevel models, see Bryk and Raudenbush 1992, Luke 2004, Singer 1998).[3] The

---

[3] The data analyses provided evidence that there was, indeed, a clustering of data within each state. The intraclass correlation, bounded by 0 and 1, measures the variation between the states. A random intercept model using only the

dependent variable in each model was voter turnout at the county level, with turnout calculated as the percentage of the estimated citizen voting-age population that voted in the 2004 election.

[Table 2 here]

Turning first to an analysis using the maximum identification requirements, those requirements had a small and negative effect on turnout in 2004 controlling for electoral context and demographic factors. Both contextual factors (whether the county was in a state that was a battleground state and whether that state had a competitive race for governor and/or U.S. Senate) increased voter turnout. As the percentage of senior citizens in the county increased, so did turnout. The percentage of African-Americans in the county exerted a positive effect on voter turnout, and the percentage of individuals living below the poverty line had a negative effect. The effect of the percentage of Hispanic adults in the county on turnout fell just short of statistical significance ($p = .05$).

I then sought to test the hypothesis that voter identification requirements dampen turnout among minorities and the poor, a claim voiced by some critics of the requirements. To test this idea I incorporated a series of interactions between the maximum voter identification requirements and the percentage of African-Americans, Hispanics, and poor individuals in the counties. The interaction involving African-Americans was not significant, but those involving Hispanics and poor individuals were significant.[4] In addition, adding the interactions to the model resulted in the percentage of Hispanics in the population having a direct and negative effect on turnout. The interactions suggest that voter identification requirements have a greater effect for Hispanics and those living below the poverty line. A chi-square test of the difference in the deviance for each model (represented by -2 log likelihood in Table 2), shows that the model with interactions provides a better fit to the data ($p < 0.005$).

I also estimated the effects of the minimum voter identification requirements holding constant the effects of electoral context and the demographic variables.

[Table 3 here]

The effects of the minimum requirements fell short of statistical significance ($p = 0.08$). The battleground state variable continued to exert a positive influence on turnout, while the presence of a competitive race for governor and/or U.S. Senate had no statistically significant effect. As in the maximum identification requirement model, as the percentage of the population that is poor increased, turnout declined. As the percentage of elderly increased, so did turnout. The proportion of African-Americans in the population had a positive effect on turnout, while the percentage of Hispanics did not affect turnout.

---

intercept as a predictor generated an intraclass correlation of .43, indicating considerable variation between the states.

[4] The interactions are labeled in Tables 2 and 3 as VID*African-American, VID*Hispanic, and VID*Poverty. To calculate the effects of voter identification requirements for a specific group, one must add the estimates for voter identification, the group, and the interaction. Doing so for Hispanic adults results in an estimate of -0.13 [-0.03 (voter id) - 0.13 (Hispanic) + 0.03 (voter id X Hispanic)].

Adding interactive effects to the model resulted in a statistically significant and negative effect of minimum voter identification requirements on turnout. The percentage of Hispanic adults in the county had a significant and negative effect on turnout, and the percentage of individuals below the poverty line continued to have a negative effect. Interactions between the percentages of Hispanics and those below the poverty line and minimum voter identification requirements also were significant. The percentage of African-Americans in the county and the interaction between African-Americans and voter identification requirements were not significant. A chi-square test for the difference in fit between the two models showed that the model with interactions provides a better fit to the data ($p < .025$).

Analysis of the aggregate data at the county level generates some support for the hypothesis that as the demands of voter identification requirements increase, turnout declines. This is particularly so for counties with concentrations of Hispanic residents or individuals who live below the poverty line. But aggregate data cannot fully capture the individual demographic factors that may figure into the decision to turn out to vote. For example, previous research has found that education is a powerful determinant of turnout (Wolfinger and Rosenstone 1980, but see also Nagler 1991).[5] Married individuals also are more likely to vote than those who are not married (Alvarez and Ansolabehere 2002; Alvarez, Nagler and Wilson 2004; Fisher, Kenny, and Morton 1993). To fully explore the effects of voter identification requirements on turnout, it is important to examine individual-level data as well.

Individual-level analysis

Individual-level turnout data exists in the November 2004 Current Population Survey conducted by the U.S. Census Bureau. The Census Bureau conducts the CPS monthly to measure unemployment and other workforce data, but the bureau adds a battery of voter participation questions to the November survey in even-numbered years to coincide with either a presidential or midterm Congressional election.

One of the advantages of the CPS is the sheer size of the sample. The survey's Voting and Registration Supplement consisted of interviews, either by telephone or in person, with 96,452 respondents.[6] The large sample size permits analyses of smaller groups, such as Black or Hispanic voters or voters with less than a high school education. The analyses reported here are based on reports from self-described registered voters. I omitted those who said they were not registered to vote. I also excluded those who said they cast absentee ballots because the identification requirements for absentee ballots may differ from those required when one votes in person. In addition, I eliminated from the sample respondents who said they were not U.S.

---

[5] A reviewer for an earlier version of this paper recommended adding an education variable to the aggregate model. One version of the aggregate model not reported here included the percentage of adults in the county who had at least a college degree. The measure was highly collinear with the percentage of residents living below the poverty line, necessitating removal of the college degree variable from the model.

[6] It is important to note that the Census Bureau allows respondents to answer on behalf of themselves and others in the household during the interview. While proxy reporting of voter turnout raises the possibility of inaccurate reports concerning whether another member of the household voted, follow-up interviews with those for whom a proxy report had been given in the November 1984 CPS showed 99 percent agreement between the proxy report and the information given by the follow-up respondent (U.S. Census Bureau 1990).

citizens because the questionnaire design skipped those individuals past the voter registration and turnout questions in the survey.

The dependent variable in these analyses is whether a respondent said he or she voted in the November 2004 election.[7] As in the analysis of aggregate data, I coded voter identification requirements for each respondent's state of residence on a scale of one to five, with one representing the least demanding requirement (stating one's name) and five representing the most demanding requirement (photo identification or affidavit).

In addition to the voter identification requirements, the models include two other state-level factors that might have influenced turnout in 2004: whether the state was considered a battleground state in the presidential election, and whether there was a gubernatorial and/or U.S. Senate race in the state (see Alvarez and Ansolabehere 2002, Alvarez et al. 2004, and Kenny et al. 1993 for similar approaches). As in the aggregate data analysis, the threshold that determined whether the state was a battleground state or had a competitive statewide race was a margin of victory of five percent or less. At the individual level, I controlled for gender, age in years, education, household income, and dummy variables representing whether a voter was Black/non-Hispanic, Hispanic, or another non-white race (with white/non-Hispanic voters as the omitted category for reference purposes).[8] Drawing on previous research on voting behavior, I also controlled for whether an individual was employed, or at least a member of the workforce (as opposed to being a full-time student, a homemaker, or retired). Both employment and workforce membership have been shown to be positive predictors of turnout (see Mitchell and Wlezien 1995). Marital status, whether one is a native-born citizen and residential mobility also have emerged as significant predictors of turnout (Alvarez and Ansolabehere 2002, Alvarez et al. 2004, Kenney et al. 1993, Wolfinger and Rosenstone 1980). I included in the model variables for whether a respondent was married (coded 1 if yes, 0 otherwise), and whether one was a native-born citizen (coded 1 if yes, 0 otherwise). I measured residential mobility by coding for whether the respondent had moved to a new address in the six months prior to the interview (coded 1 if yes, 0 otherwise).

Results

The dependent variable is whether a respondent said he or she voted in the November 2004 election (coded 1 for yes, 0 for no). I estimated models using probit analysis, which

---

[7] The U.S. Census Bureau reported, based on the November 2004 CPS, that 89 percent of those who identified themselves as registered voters said they voted in 2004 (U.S. Census Bureau 2005). Previous research has shown that, generally speaking, some survey respondents overstate their incidence of voting. Researchers speculate that over-reports may be due to the social desirability that accompanies saying one has done his or her civic duty, or a reluctance to appear outside the mainstream of American political culture (U.S. Census Bureau 1990). It is also possible that voting is an indication of civic engagement that predisposes voters to agree to complete surveys at a higher rate than non-voters (Flanigan and Zingale 2002). Hence the voter turnout rates reported in the CPS tend to be up to 10 percentage points higher than the actual turnout rate for the nation (Flanigan and Zingale 2002). Even with this caveat, however, the CPS serves as a widely accepted source of data on voting behavior.

[8] Asian-Americans are included in the "other non-white races" category. In response to a request from officials at the U.S. Election Assistance Commission who had read an earlier version of this paper and were curious about the experiences of Asian-Americans, I ran models using Asian-Americans as a separate category in addition to the models presented here. Voter identification requirements did not have a statistically significant effect on whether Asian-American voters said they turned out in the 2004 election.

calculates the effects of independent variables on the probability that an event occurred – in this case whether a respondent said he or she voted. I estimated the models using robust standard errors to control for correlated error terms for observations from within the same state.

[Table 4 here]

The two models in Table 4 use either the maximum or minimum voter identification requirements in each state. The two models generate virtually identical results. Voter identification requirements exert a statistically significant, negative effect on whether survey respondents said they had voted in 2004. Of the other state factors, only the competitiveness of the presidential race had a significant effect on turnout. In terms of demographic influences, African-American voters were more likely than white voters to say they had cast a ballot, while those of other non-white races were less likely than white voters to say they had turned out. Hispanic voters were not statistically different from white voters in terms of reported turnout. Consistent with previous research, age, education, income, and marital status all were positive predictors of voting. Women also were more likely to say they voted than men. Those who had moved within six months before the interview were less likely to say they had voted.

While the probit models provide statistical support for the influence of voter identification requirements and other variables on turnout, probit coefficients do not lend themselves to intuitive interpretation. Another common approach in studies of election requirements is to examine how the predicted probability of voter turnout would vary as election requirements vary. I used the probit coefficients to calculate the predicted probability of voting at each level of voter identification requirements while holding all other independent variables in the models at their means.[9] I calculated the probabilities taking into account both maximum and minimum requirements, with photo identification serving as the most demanding of the maximum requirements and affidavits as the most demanding minimum requirement.

[Table 5 here]

Allowing the voter identification requirement to vary while holding constant all other variables in the model showed that the predicted probability of turnout ranged from 0.912 for stating one's name to 0.887 for photo identification under the maximum requirements. In other words, the probability of voting dropped with each level of voter identification requirement, with a total drop of .025, or 2.5 percent, across the five types of identification.[10] When taking into account the minimum requirement for identification, the probability showed a similar decline, with a slightly larger total drop of 3.3 percent.

Among the key variables of interest in the debate over voter identification requirements are race, age, income, and education. Given the large sample size (54,973 registered voters), it

---

[9] In the case of dichotomous independent variables, holding them at their mean amounted to holding them at the percentage of the sample that was coded 1 for the variable (Long 1997).

[10] The voter turnout percentages may seem disproportionately high compared to the turnout rates reported in the aggregate data analysis. It is important to consider that the turnout rates in the aggregate data were a proportion of all citizens of voting-age population, while the turnout rates for the individual-level data are the proportion of only registered voters who said they voted.

was possible to break the sample into sub-samples along those demographic lines to explore variation in predicted probability by group. I disaggregated the sample by the variable of interest, omitting that variable while I re-ran the probit model with the remaining predictors of voter turnout, including the voter identification requirements.[11] If the analysis showed that the voter identification requirements had a statistically significant effect on turnout, I used the probit coefficients from the model to calculate the predicted probability of voting for each group across the five requirements while holding the other variables in the model constant.

[Table 6 here]

Both the maximum and minimum identification requirements had negative and statistically significant effects for White/Non-Hispanic voters. Allowing the requirements to vary from stating one's name to providing photo identification or an affidavit showed drops of 2.5 percent and 3.2 percent respectively in the predicted probability of voting. The identification requirements had no effect on the probability of Black/Non-Hispanics voting, but the minimum identification requirements had a comparatively sizable effect on voter turnout among Hispanics. The predicted probability of Hispanics voting ranged from 87 percent if stating one's name was the required form of identification to 77.3 percent if a voter would have to provide an affidavit in order to vote, a difference of 9.7 percent.

The effects of voter identification requirements also varied by age, with the greatest variation occurring among voters ages 18 to 24.

[Table 7 here]

Voters in that age group had a predicted probability of 83.9 percent when the maximum requirement was stating one's name, and the probability dropped 8.9 percentage points if voters would have to provide photo identification. The range was from 83.1 percent to 75.4 percent under the minimum requirements. The gap in probability narrowed in older age groups (4.8 percent for the maximum requirements and 5.8 percent for the minimum requirements for those ages 25 to 44; 1.8 percent for the minimum requirements for those ages 45 to 64, and 2.4 percent for the minimum requirements for those ages 65 and older).

Breaking down the 18- to 24-year-old age group by race shed additional light on the effects of voter identification requirements on specific groups.

[Table 8 here]

The gap in predicted probability that White/Non-Hispanic voters in the 18- to 24-year-old category would turn out was 9.2 percent when the identification requirements varied from stating one's name to providing photo identification. The gap was 7.8 percent when taking into account the minimum requirements. The effects of maximum voter identification requirements also were statistically significant for African-Americans in the 18- to 24-year-old age group, with a gap in

---

[11] See Nagler 1991 for a similar approach in analyzing the effects of registration closing dates broken down by education levels.

the predicted probability of voting of 10.6 percent. Maximum and minimum voter identification requirements were not a significant predictor of voting among Hispanics ages 18 to 24.

Variation also emerged along the lines of income, with the effects of voter identification requirements varying to a greater extent for voters in households below the poverty line compared to those living above the poverty line.[12]

[Table 9 here]

While the maximum set of requirements did not have a statistically significant effect for voters living below the poverty line, the minimum set of requirements had a significant and negative effect. The probability of voting was .784 for poor voters if they would have to identify themselves by giving their name, and the probability declined to .731 if they would have to provide an affidavit attesting to their identity. Both the maximum and minimum sets of requirements had a significant and negative effect on voters living above the poverty line, but the difference in probability across the effects was narrower (2.3 percent for the maximum requirements and 3.1 percent for the minimum requirements). Given that political discourse about voter identification requirements includes concerns about the effects of the requirements on poor and minority voters, I also ran probit analyses for sub-samples of white and minority voters who fell below the poverty line. The voter identification requirements did not exert statistically significant effects on turnout among poor White/Non-Hispanic and Hispanic voters, but did have a significant effect on Black/Non-Hispanic voters who were below the poverty line.[13] Allowing the maximum voting requirement to vary from the least to the most demanding, the probability that African-American voters below the poverty line said they had voted dropped by 7.5 percent.

The effects of voter identification requirements varied across education levels as well, with those lowest in education demonstrating the widest variation in probabilities as identification requirements ranged from least to most demanding.

[Table 10 here]

Registered voters who had less than a high school education had a 77.5 percent probability of voting if the maximum requirement would be stating one's name, and a 70.8 percent probability if they would have to provide photo identification under the maximum requirement, a difference of 6.7 percent. The difference from the lowest to the highest requirement among the minimum requirements was 7.4 percent. The difference in probabilities ranged from 3.3 percent for the maximum requirements to 4.5 percent for the minimum requirements for voters with a high school diploma. The range of effects of voter identification requirements was smaller among those with higher levels of education (and non-existent for one category – voters with some college education).

---

[12] I coded respondents as being above or below the U.S. Census Bureau's 2004 poverty line based on respondents' reported annual household income and size of the household.

[13] The lack of significant effects for poor Hispanic voters is in contrast to the results from the aggregate data analysis. The sub-sample of poor Hispanic voters was small (n = 491), which may have contributed to the lack of statistical significance.

Discussion and conclusion

The results presented here provide evidence that as the level of demand associated with voter identification requirements increases, voter turnout declines. This point emerged from both the aggregate data and the individual-level data, although not always for both the maximum and minimum sets of requirements. The overall effect for all registered voters was fairly small, but still statistically significant.

The effects of voter identification requirements were more pronounced for specific subgroups. Hispanic voters and the poor appeared to be less likely to vote as the level of required identification became more demanding, according to both the aggregate and the individual-level data. In the individual-level data, for Hispanic voters, the probability of voting dropped by 9.7 percent across the various levels of minimum identification requirements. Survey respondents living in poor households were 5.3 percent less likely to vote as the requirements varied from stating one's name to attesting to one's identity in an affidavit. African-American voters from households below the poverty line were 7.5 percent less likely to vote as the maximum requirements varied from stating one's name to providing photo identification.

Effects of voter requirements also varied with education. Registered voters who had not graduated from high school were 6.7 percent less likely to say they voted as the maximum requirements ranged from stating one's name to providing photo identification. When considering the minimum requirements, those with less than a high school education were 7.4 percent less likely to say they voted if the requirement was an affidavit as opposed to stating one's name. Age was also a key factor, with voters ages 18 to 24 being 7.7 percent to 8.9 percent less likely to vote as the requirements ranged from stating one's name to providing a photo identification or affidavit. Breaking down the age group by race, the effects were significant for young White/Non-Hispanic and Black/Non-Hispanic voters.

The results shed additional light on the effects of voter identification requirements on two groups often projected as being particularly sensitive to such requirements: African-American voters and elderly voters. The effects on African-American voters were pronounced for two specific sub-samples: African-American voters living below the poverty line and those in the 18- to 24-year-old age group. Also, the elderly, while they would be slightly less likely to vote as requirements ranged from least to most demanding, would not necessarily be affected in the dramatic manner predicted by some opposed to photo identification requirements in particular.

In examining the effects of voter identification requirements on turnout, there is still much to learn. The data examined in this project could not capture the dynamics of how identification requirements might lower turnout. If these requirements dampen turnout, is it because individuals are aware of the requirements and stay away from the polls because they cannot or do not want to meet the requirements?[14] Or, do the requirements result in some voters

---

[14] The individual-level data offer some insight here. If advance knowledge of the voter identification requirements were to dampen turnout, it is reasonable to expect that advance knowledge of those requirements also could discourage some individuals from registering to vote. I ran the same probit models using voter registration as the dependent variable (coded 1 if the respondent said he or she was registered, and 0 if the respondent was not

being turned away when they cannot meet the requirements on Election Day? The CPS data do not include measures that can answer this question. Knowing more about the "on the ground" experiences of voters concerning identification requirements could guide policy-makers at the state and local level in determining whether and at what point in the electoral cycle a concerted public information campaign might be most effective in helping voters to meet identification requirements. Such knowledge also could help in designing training for election judges to handle questions about, and potential disputes over, voter identification requirements.

---

registered). Neither the maximum nor minimum array of voter identification requirements had a statistically significant effect on the probability that a survey respondent was registered to vote.

Subject RE: Schedule for completion of Prov. Voting and Voter ID research

Thanks, Karen.

Just to be sure that our expectations are clear, I'll summarize the perspective behind the schedule we submitted for the recent extension.

A. Provisional Voting

1. We presented our Provisional Voting report to the commissioners several months ago, revised its organization and clarified findings and recommendations in line with the comments of staff and commissioners, and we researched Tom Wilkey's additional question of the effect of the time for review on the evaluation of provisional ballots, which will be included in the final revision.
2. The final draft will be completed by May 5 .
3. Based on discussions with you and the commissioners we look forward to presenting that revised, final report to the Advisory Board on May 24, following whatever additional review the Commission finds appropriate.
4. Our discussions with Commissioners and staff anticipated that we would make some presentation of the provisional voting work at the Commission's public meeting in June, a presentation that might include revisions occasioned by the comments of the Advisory Board.

B. Voter ID

1. We presented our Voter ID research to the Commissioners in April and are now revising it in line with their comments.
2. That revised research paper will be discussed in mid May by reviewers selected by the Commission. That date was set specifically to allow us to prepare a final report that would be ready for review by the Advisory Board on May 24.
3. We anticipate that the Commission will want the comments of its Advisory Board on the

Voter ID report before it receives it in June. (Indeed, we were advised that the Advisory Board members would be most interested in the accuracy of observations or findings specific to their individual states.)

4. The appropriate conclusion for our work is a presentation of findings and recommendations for both Provisional Voting and Voter ID, 2 closely related topics, to the Commission at its public meeting in late June, just a week before the termination of our contract under the extended schedule.

I hope you'll share this outline of our expectations with the others at the Commission involved in assuring a successful completion of this research and analysis.

Tom-

I am certain the provisional voting paper will be presented. The Chairman has asked that the Commissioners have an opportunity to review your corrected and final draft of that document prior to it being presented to the EAC Boards, preferably next week.

Because of the issues surrounding voter identification, I am less certain about the protocol that will be followed. I will ask Tom Wilkey and Julie Hodgkins to offer insights on that matter.

I will also ask them about the protocol to be followed regarding the formal submission and acceptance of both the papers.

Karen,

Thanks for your quick reply.

Am I correct in understanding that the presentation to the Board of Advisors on May 24 will include both the Provisional Voting report and the Voter ID report?

If the Commissioners do not consider the reports at its June meeting, when will it take action to receive and record the reports?

Tom-

Just had a good conversation with our folks in the legal department, who as you know, are responsible for coordinating our public meetings.

Original plans had slotted Eagleton for the presentation of its final reports on provisional voting and voter id, at a June public meeting. Those plans have been revised to have Eagleton, instead, present its findings to the EAC Board of Advisors and Standards Board on May 24th.

The details of the Board of Advisors and Standards Board meetings are being finalized this week and early next. I will be certain to get your more details, as I learn of them.

Also, I will get you the details on who will provide the EAC peer review of the Voter ID work, as soon as I have them.

Regards-

Karen,

Attached is the Powerpoint presentation we will use as the basis for our presentation tomorrow. I will be bringing a copy on a portable drive to install on the computer to be used for the presentation, but thought it might be convenient to have a copy in advance that you could review and that might be loaded onto the presentation computer before we arrive.

See you about 11. Hope you're having (had?) a good weekend.

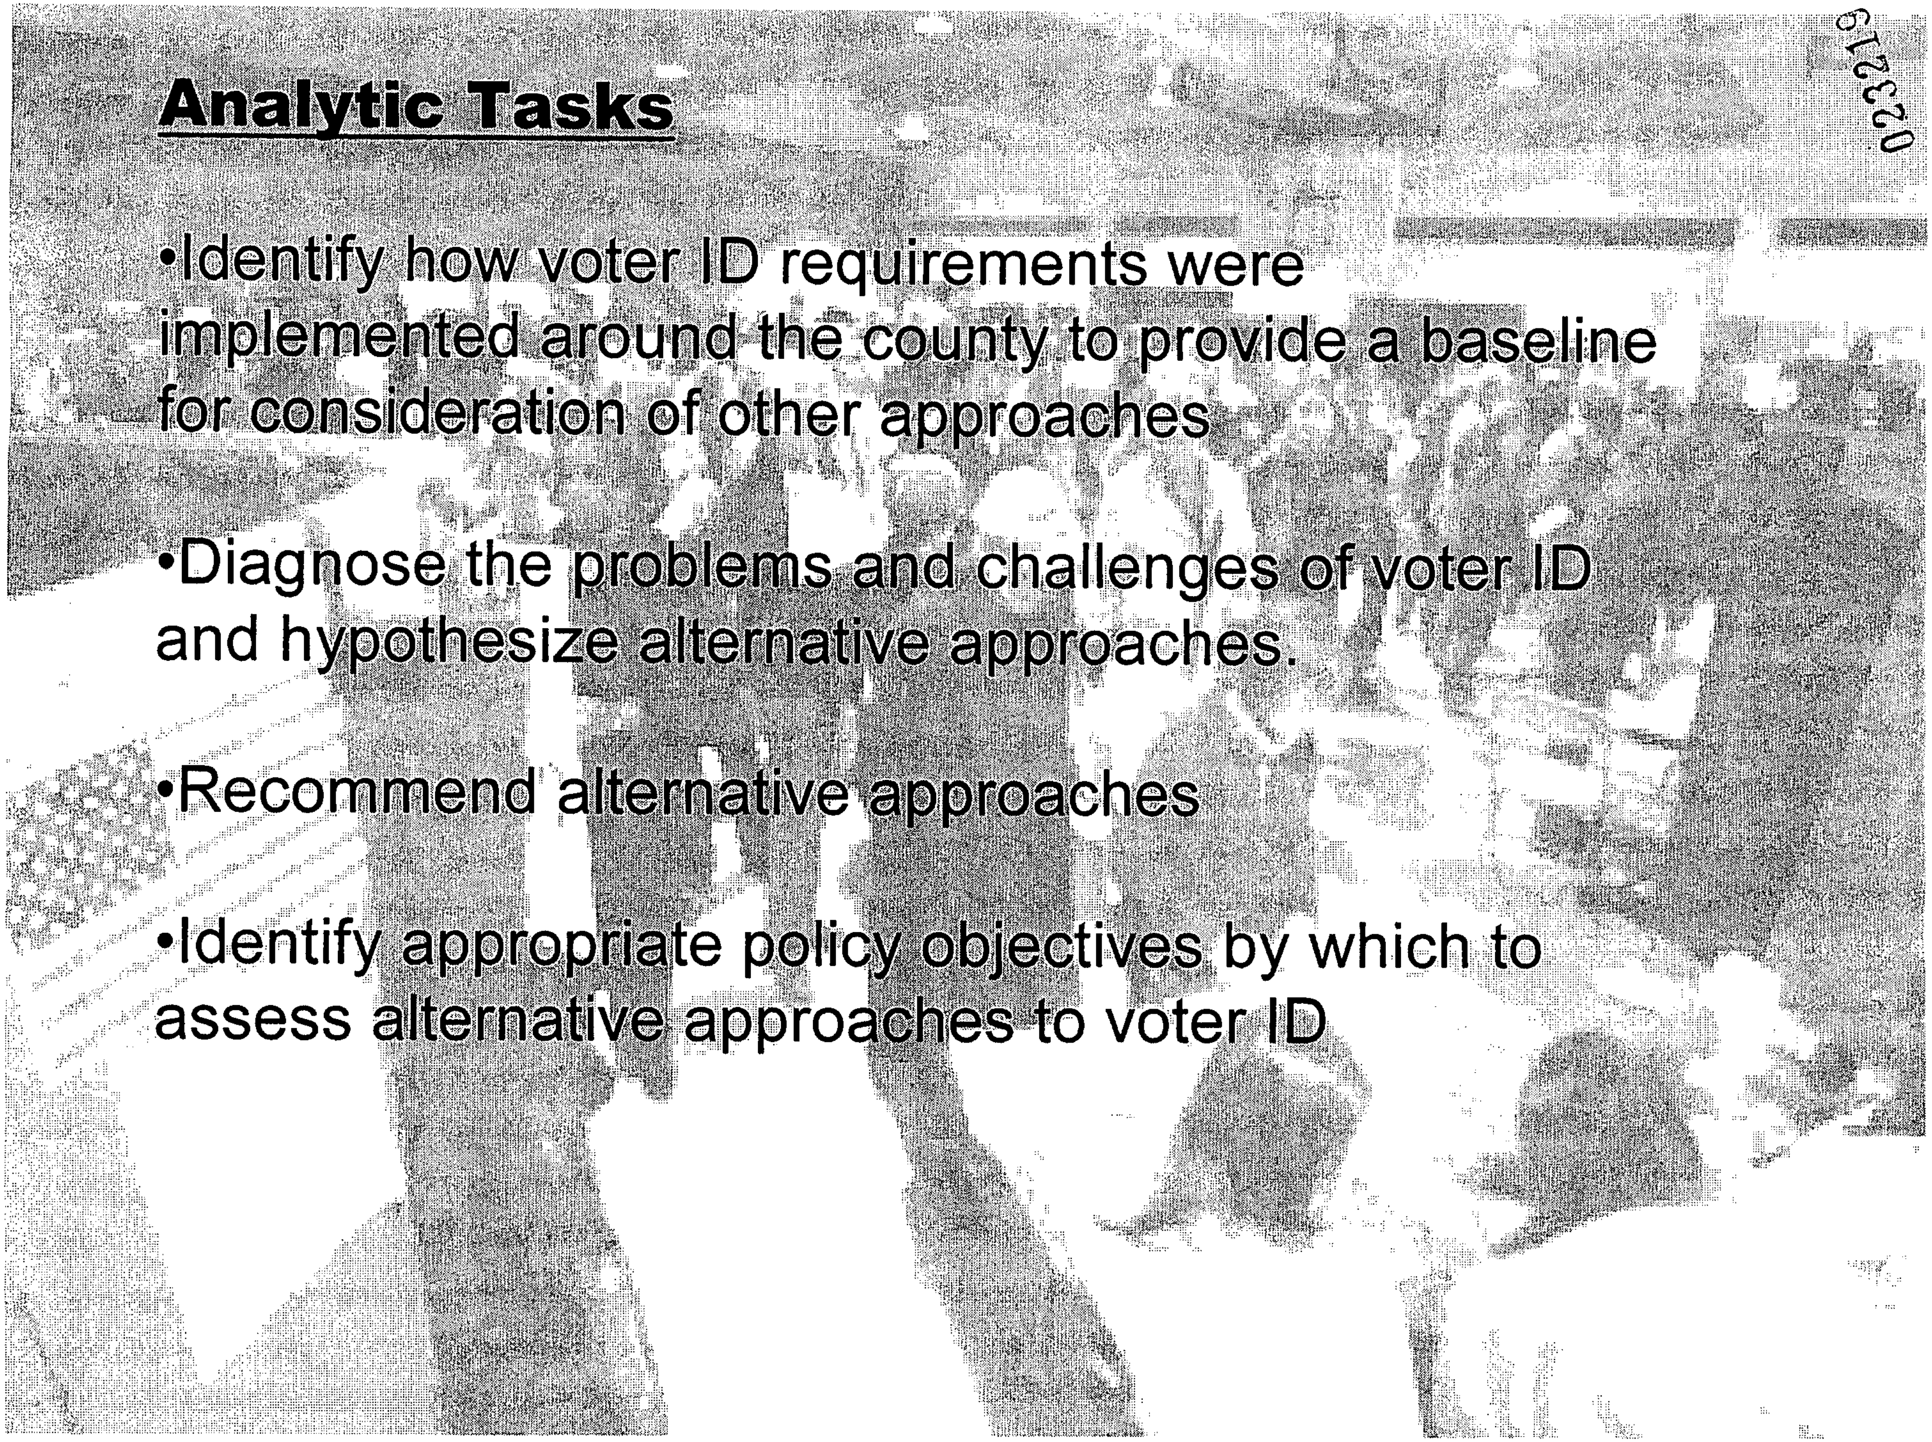
Voter Identification Issues
Analysis
&
Recommendations



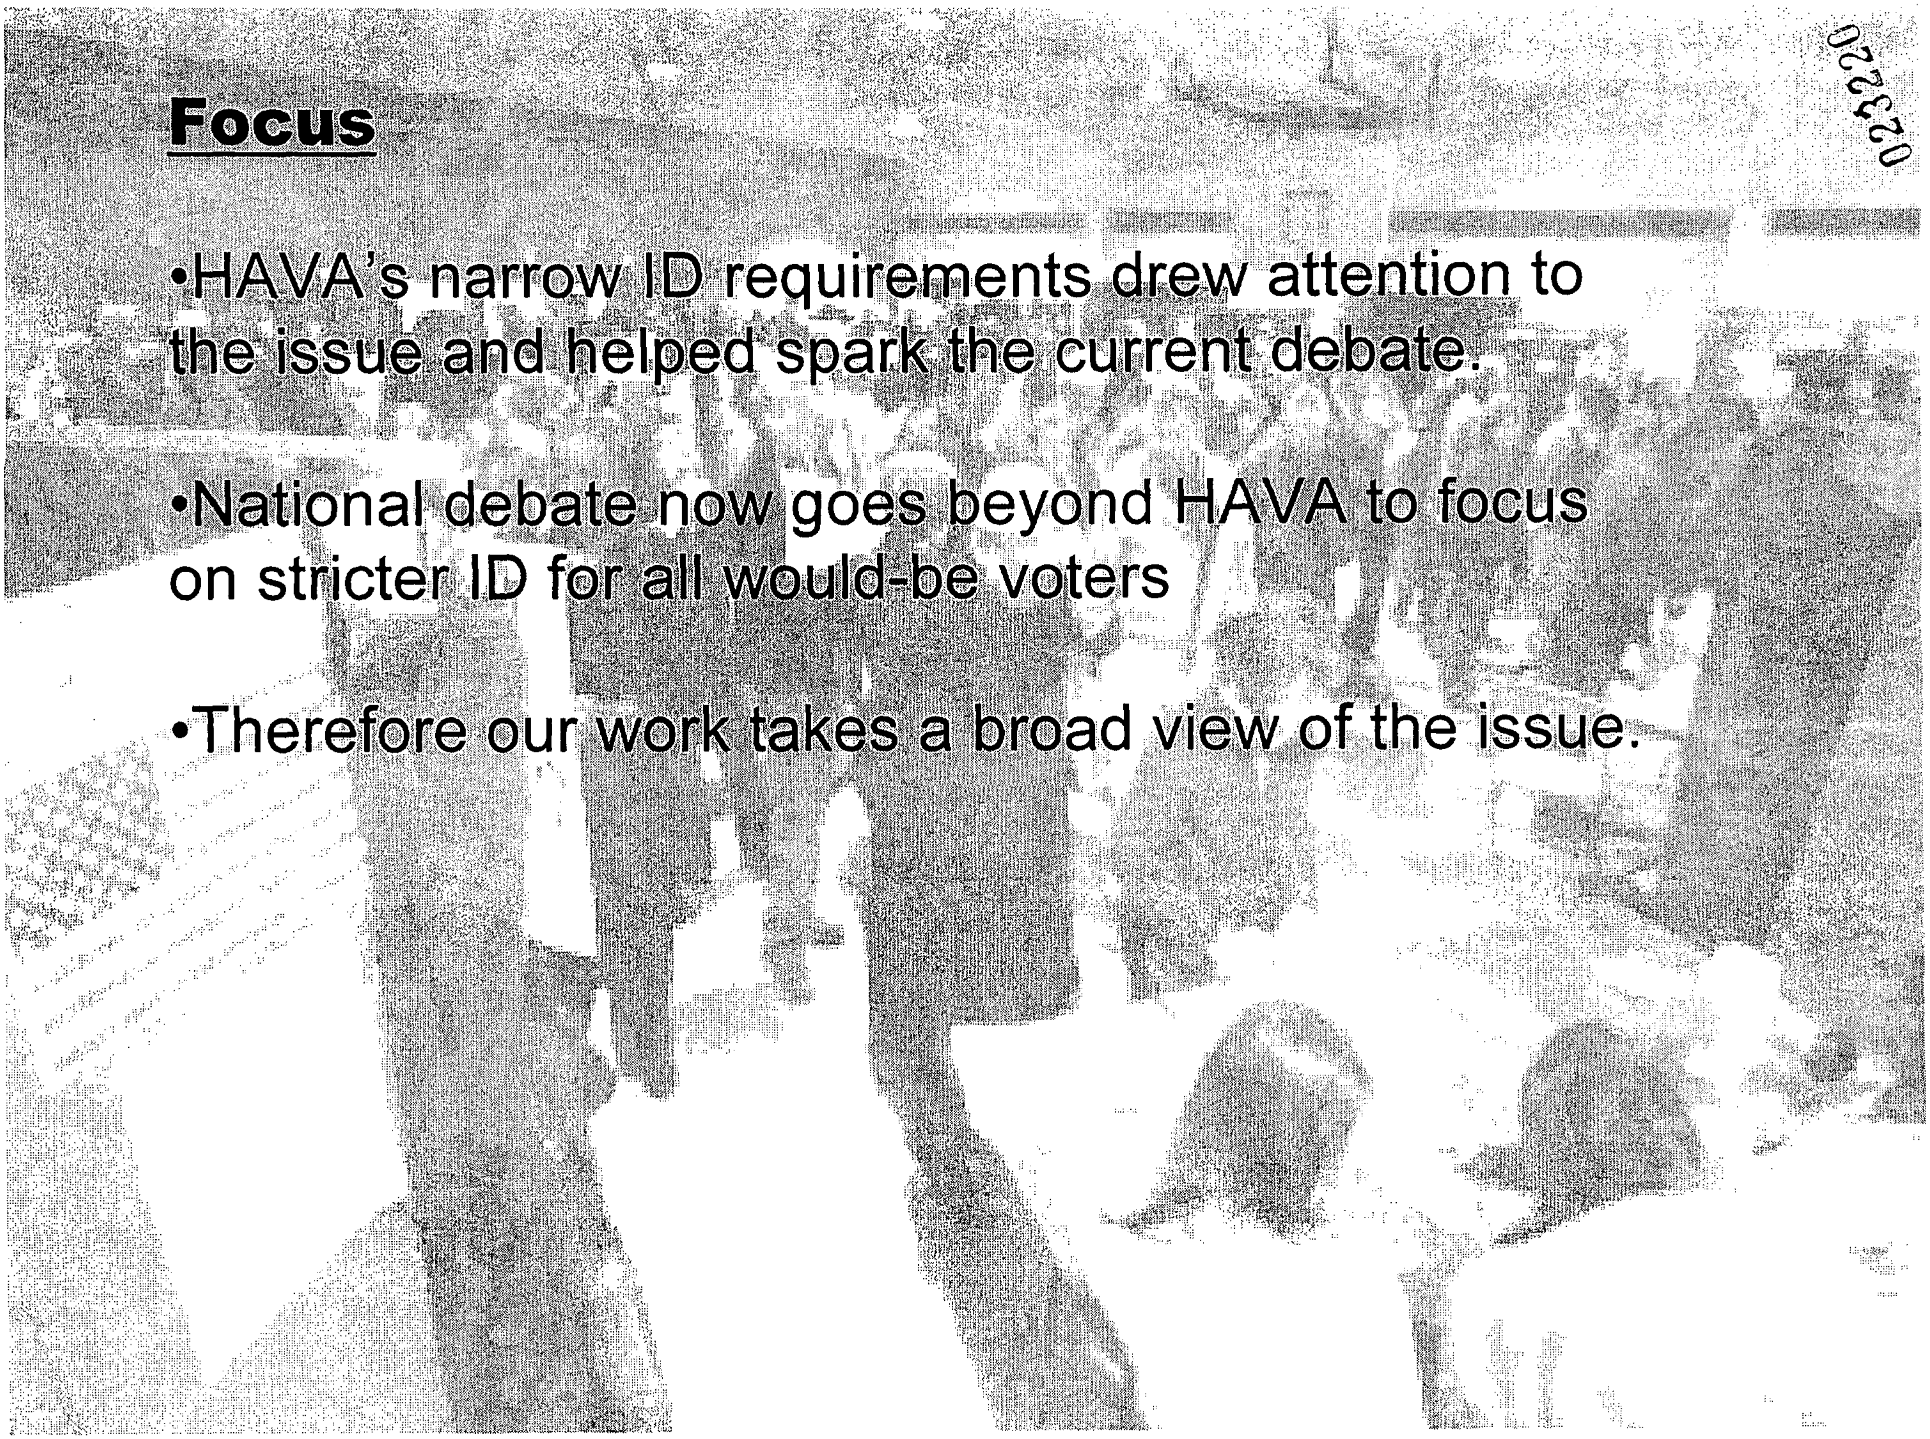
Analytic Tasks

- Identify how voter ID requirements were implemented around the county to provide a baseline for consideration of other approaches

- Diagnose the problems and challenges of voter ID and hypothesize alternative approaches.

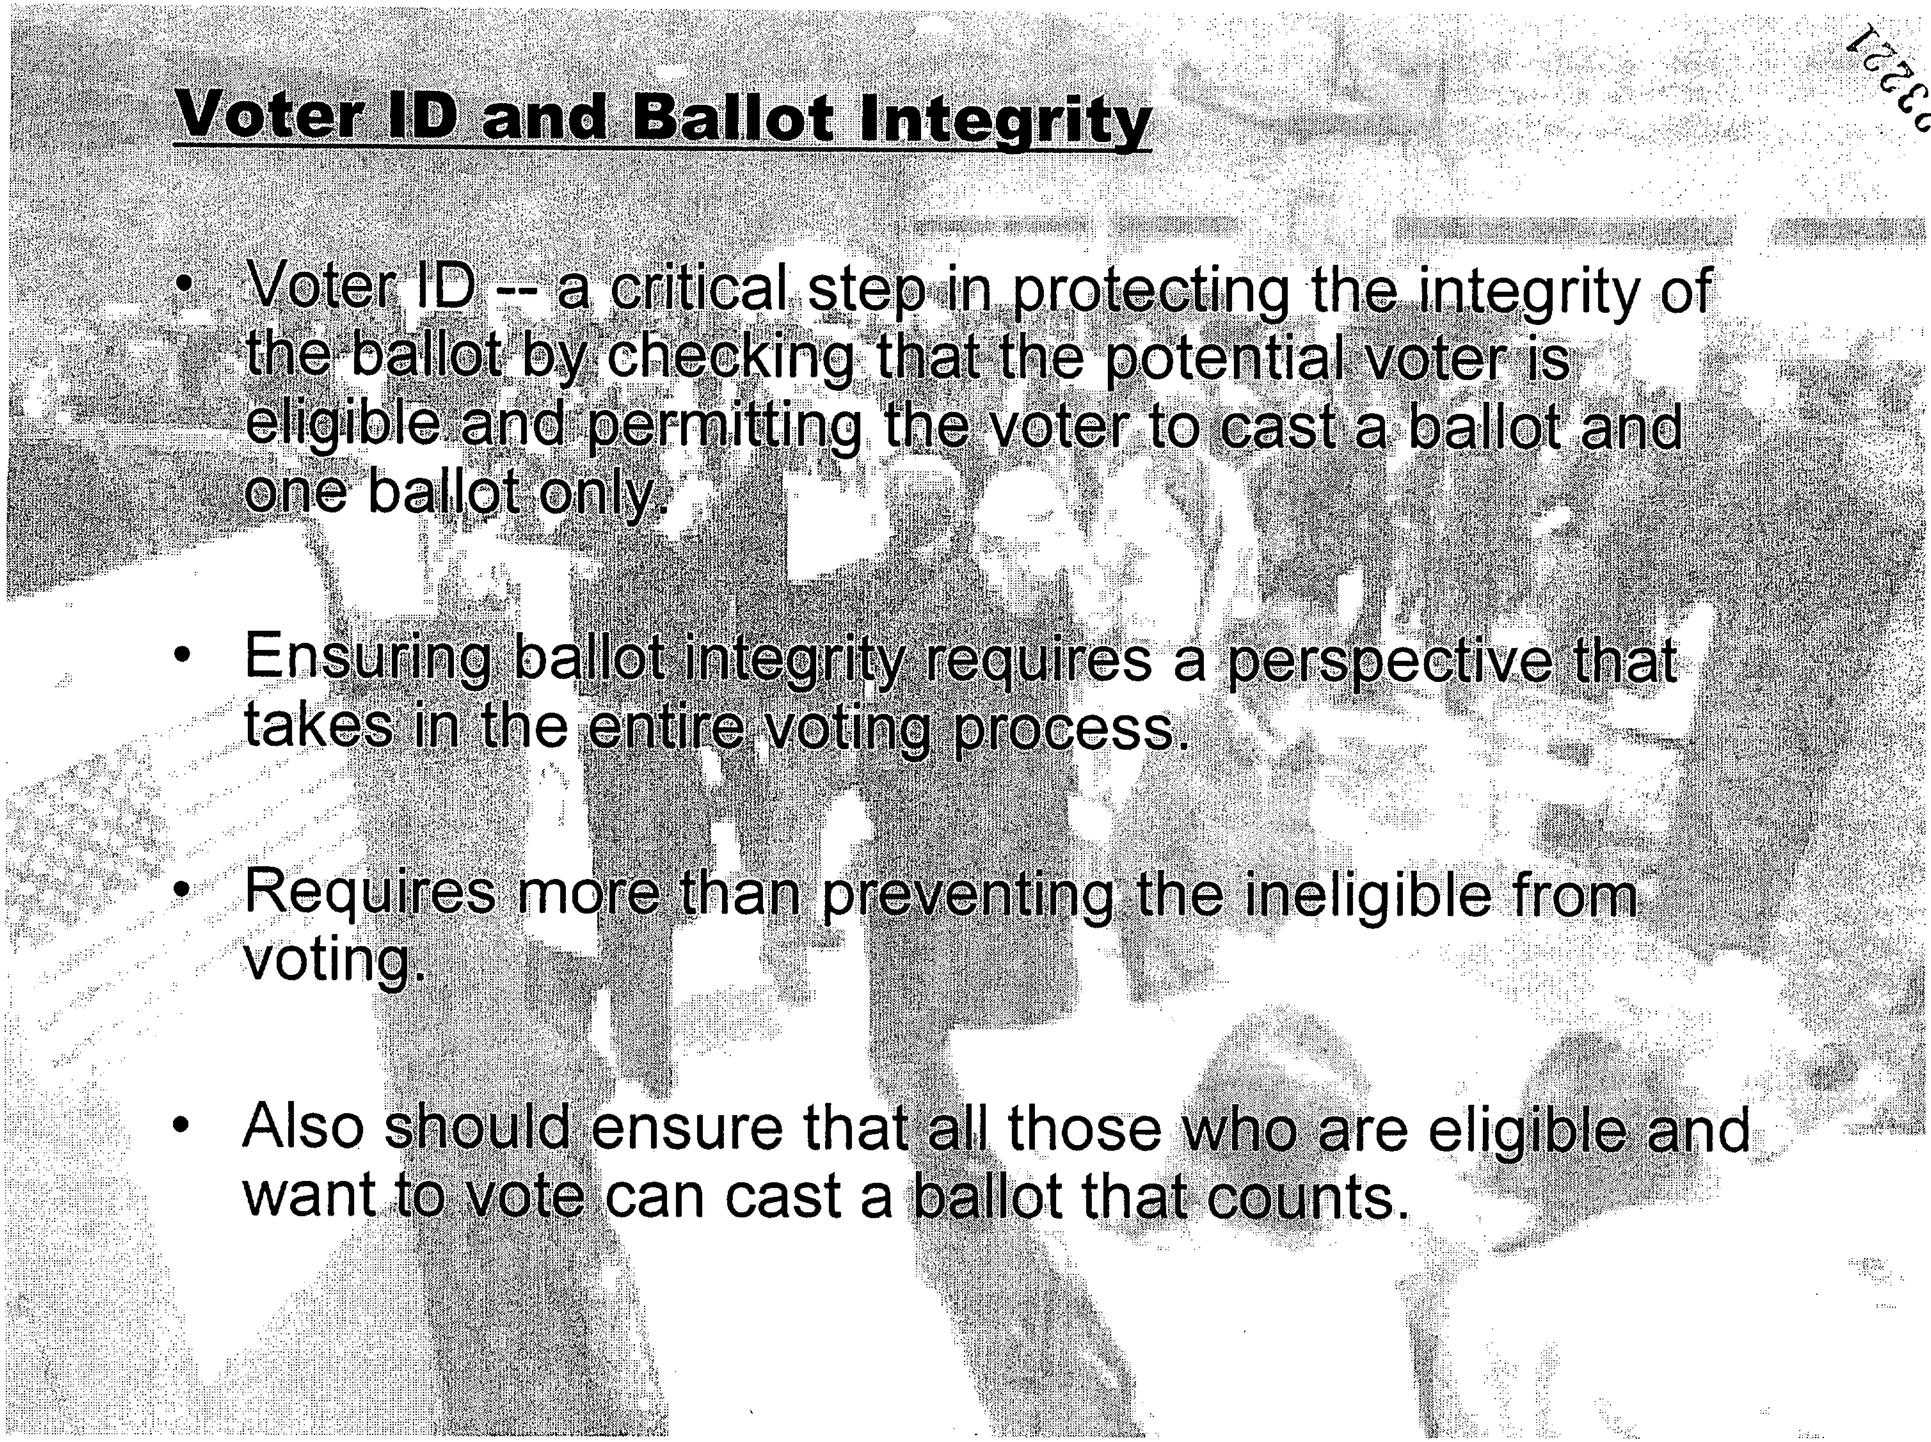
- Recommend alternative approaches

- Identify appropriate policy objectives by which to assess alternative approaches to voter ID



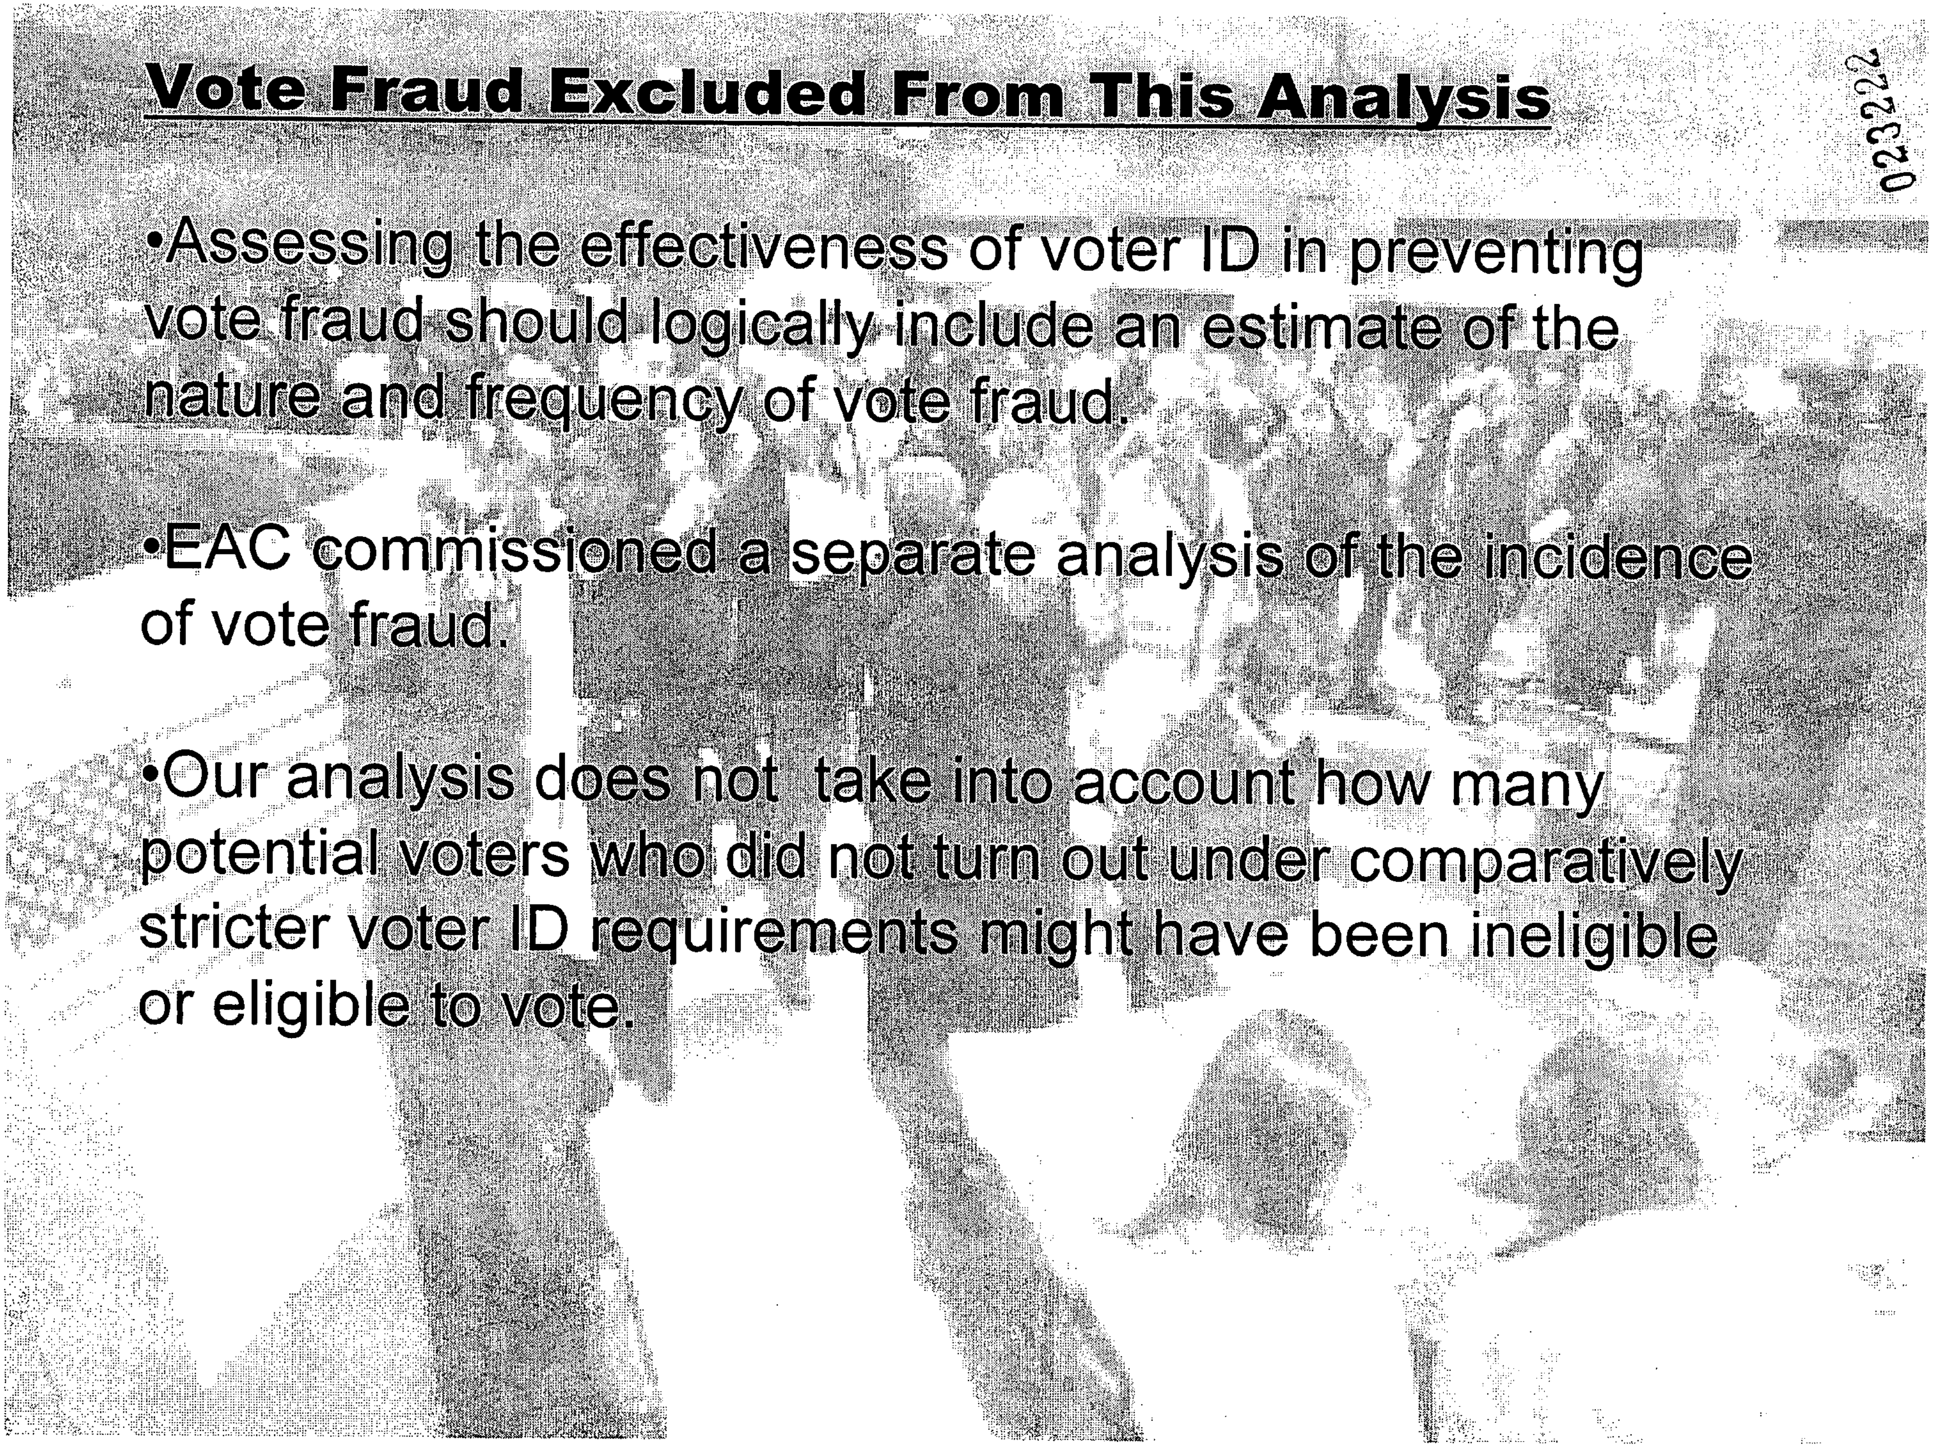
Focus

- HAVA's narrow ID requirements drew attention to the issue and helped spark the current debate.
- National debate now goes beyond HAVA to focus on stricter ID for all would-be voters
- Therefore our work takes a broad view of the issue.



Voter ID and Ballot Integrity

- Voter ID -- a critical step in protecting the integrity of the ballot by checking that the potential voter is eligible and permitting the voter to cast a ballot and one ballot only.
- Ensuring ballot integrity requires a perspective that takes in the entire voting process.
- Requires more than preventing the ineligible from voting.
- Also should ensure that all those who are eligible and want to vote can cast a ballot that counts.

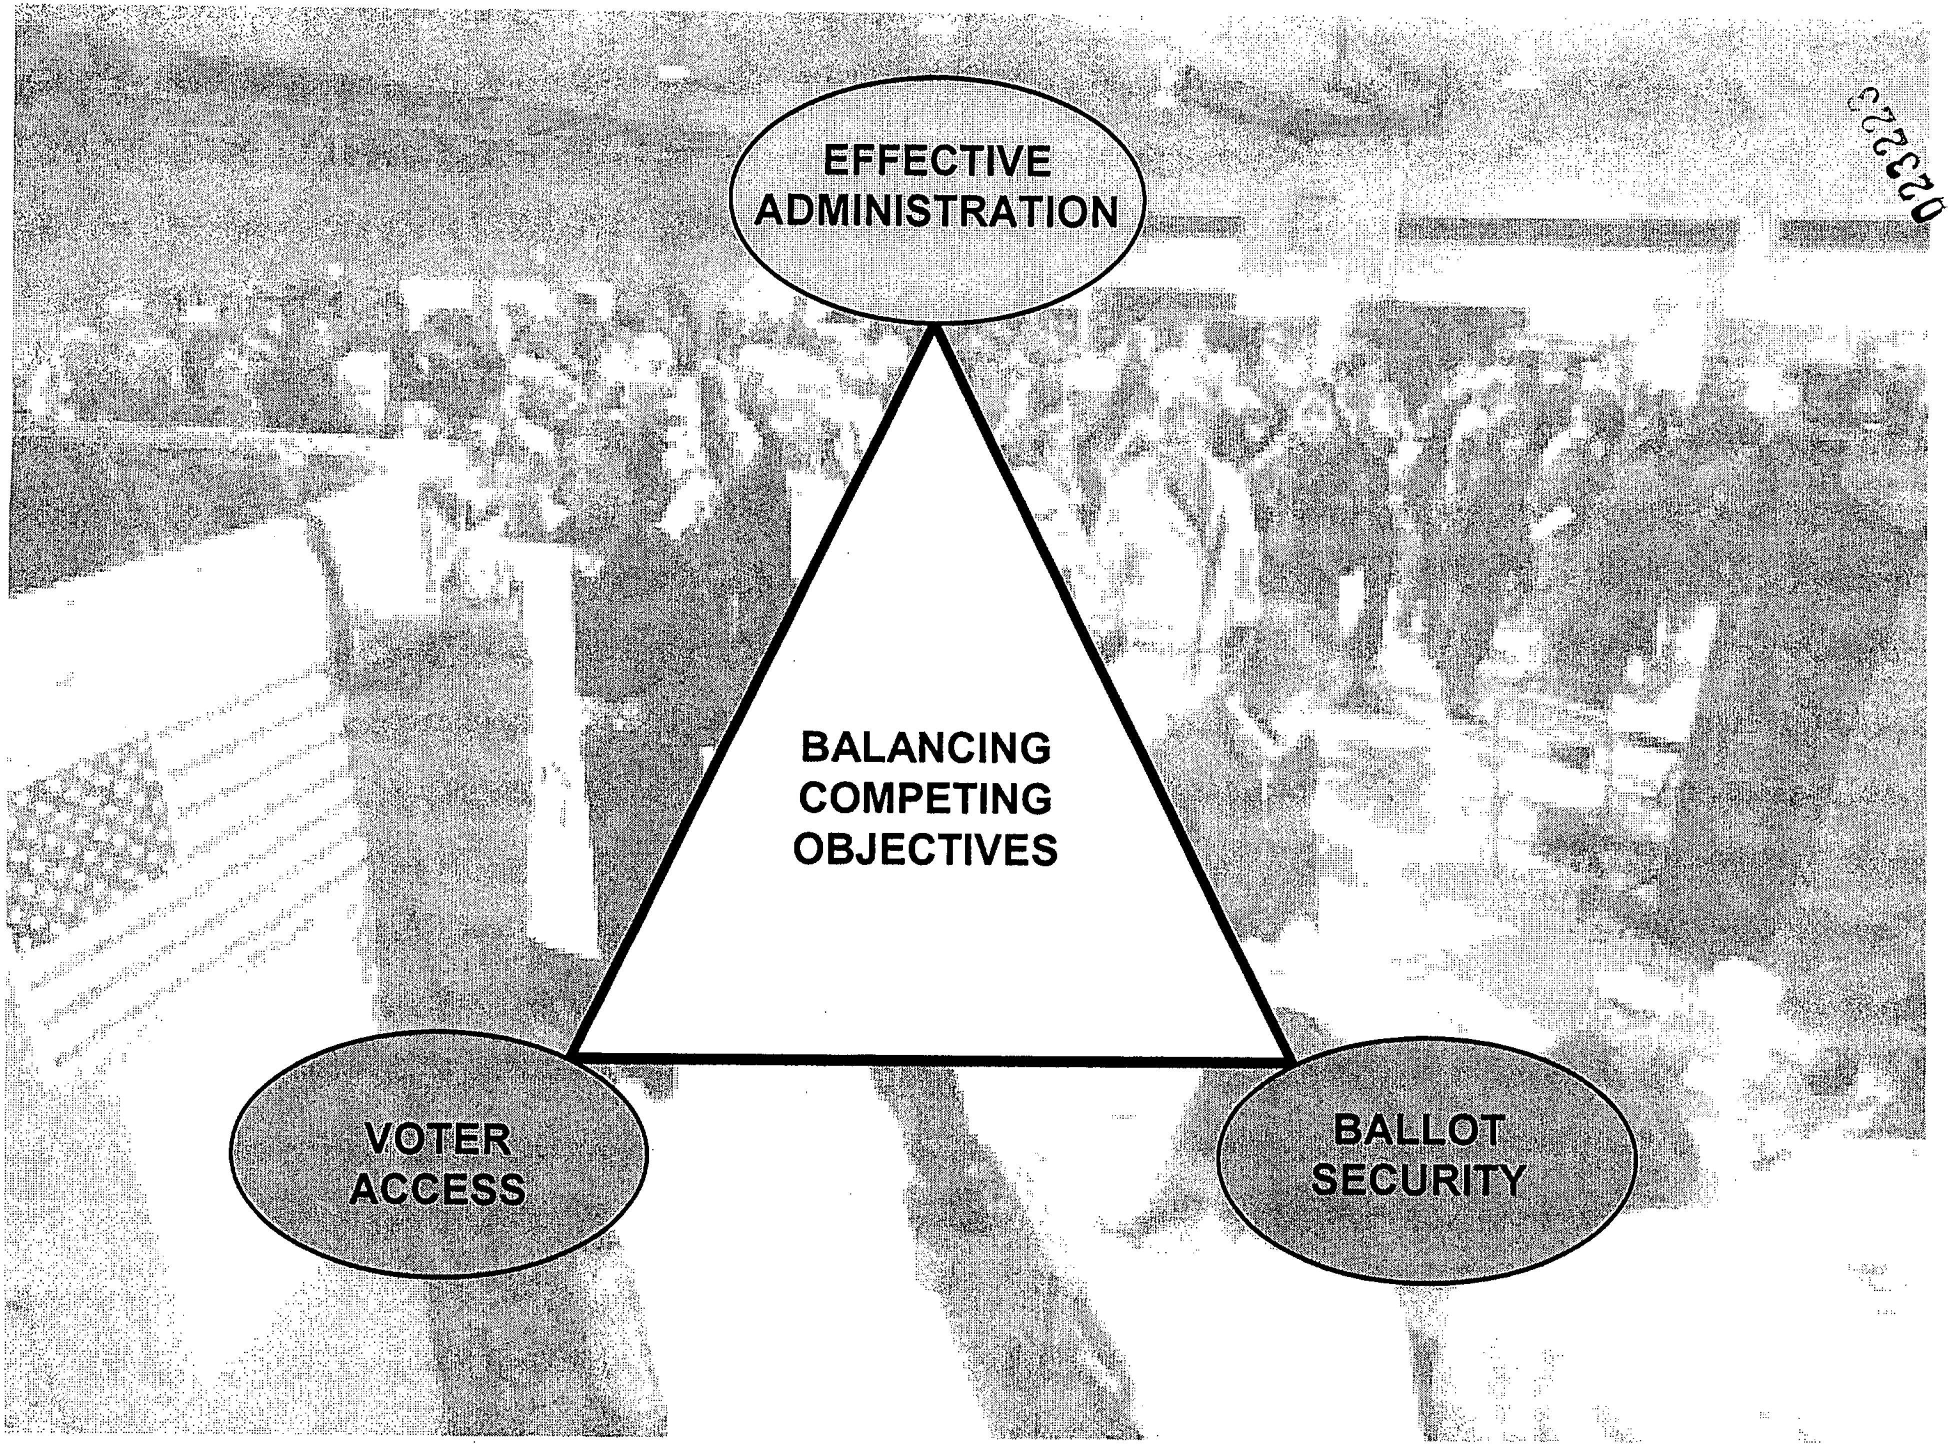


Vote Fraud Excluded From This Analysis

- Assessing the effectiveness of voter ID in preventing vote fraud should logically include an estimate of the nature and frequency of vote fraud.

- EAC commissioned a separate analysis of the incidence of vote fraud.

- Our analysis does not take into account how many potential voters who did not turn out under comparatively stricter voter ID requirements might have been ineligible or eligible to vote.

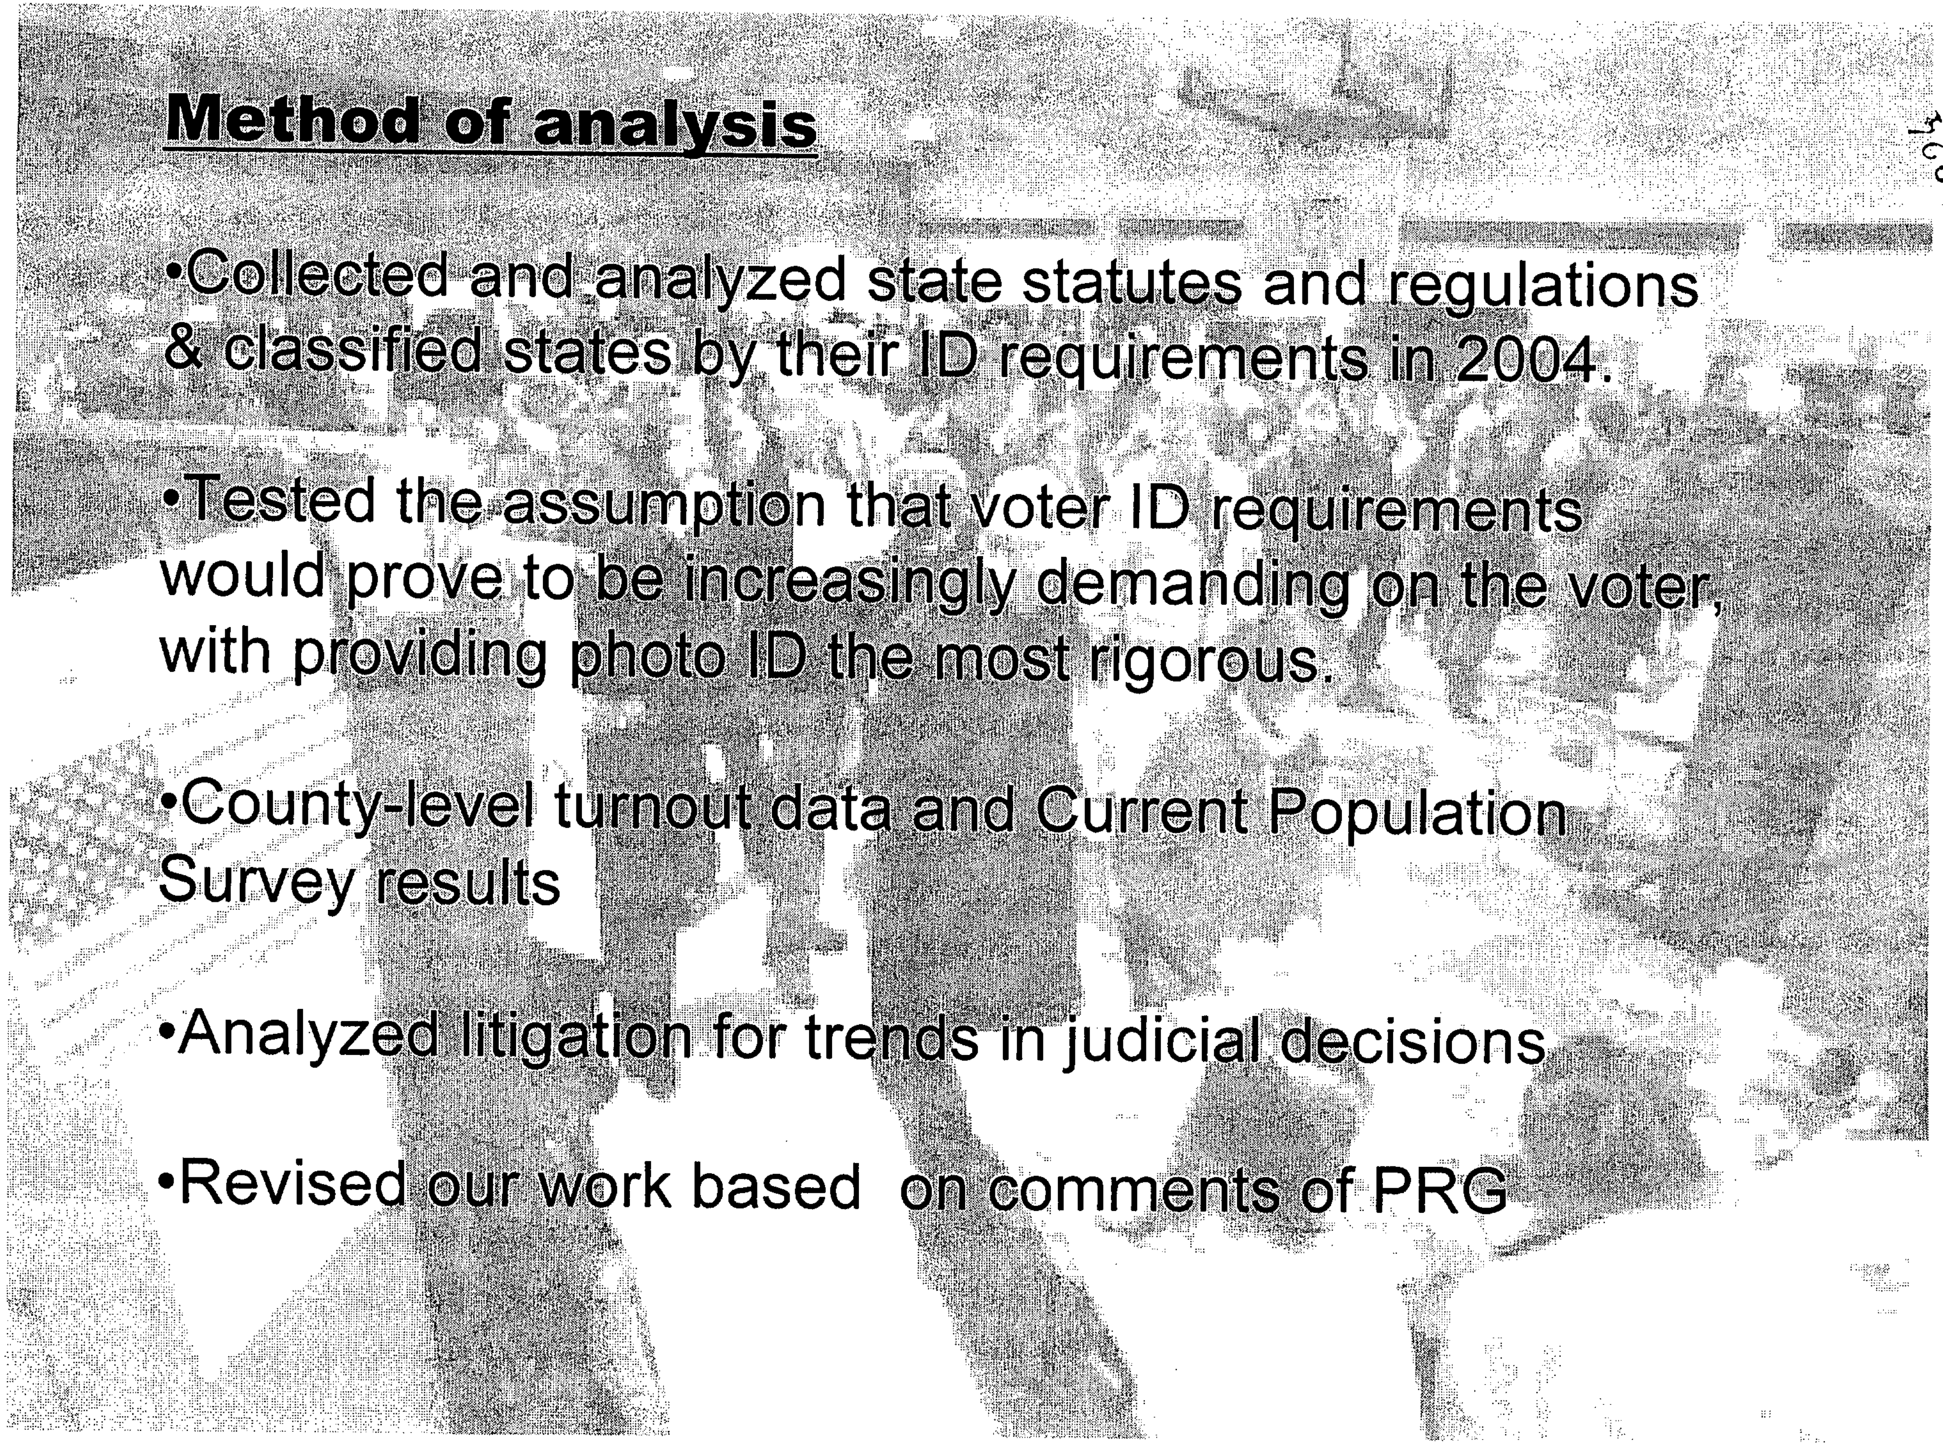


EFFECTIVE ADMINISTRATION

BALANCING COMPETING OBJECTIVES

VOTER ACCESS

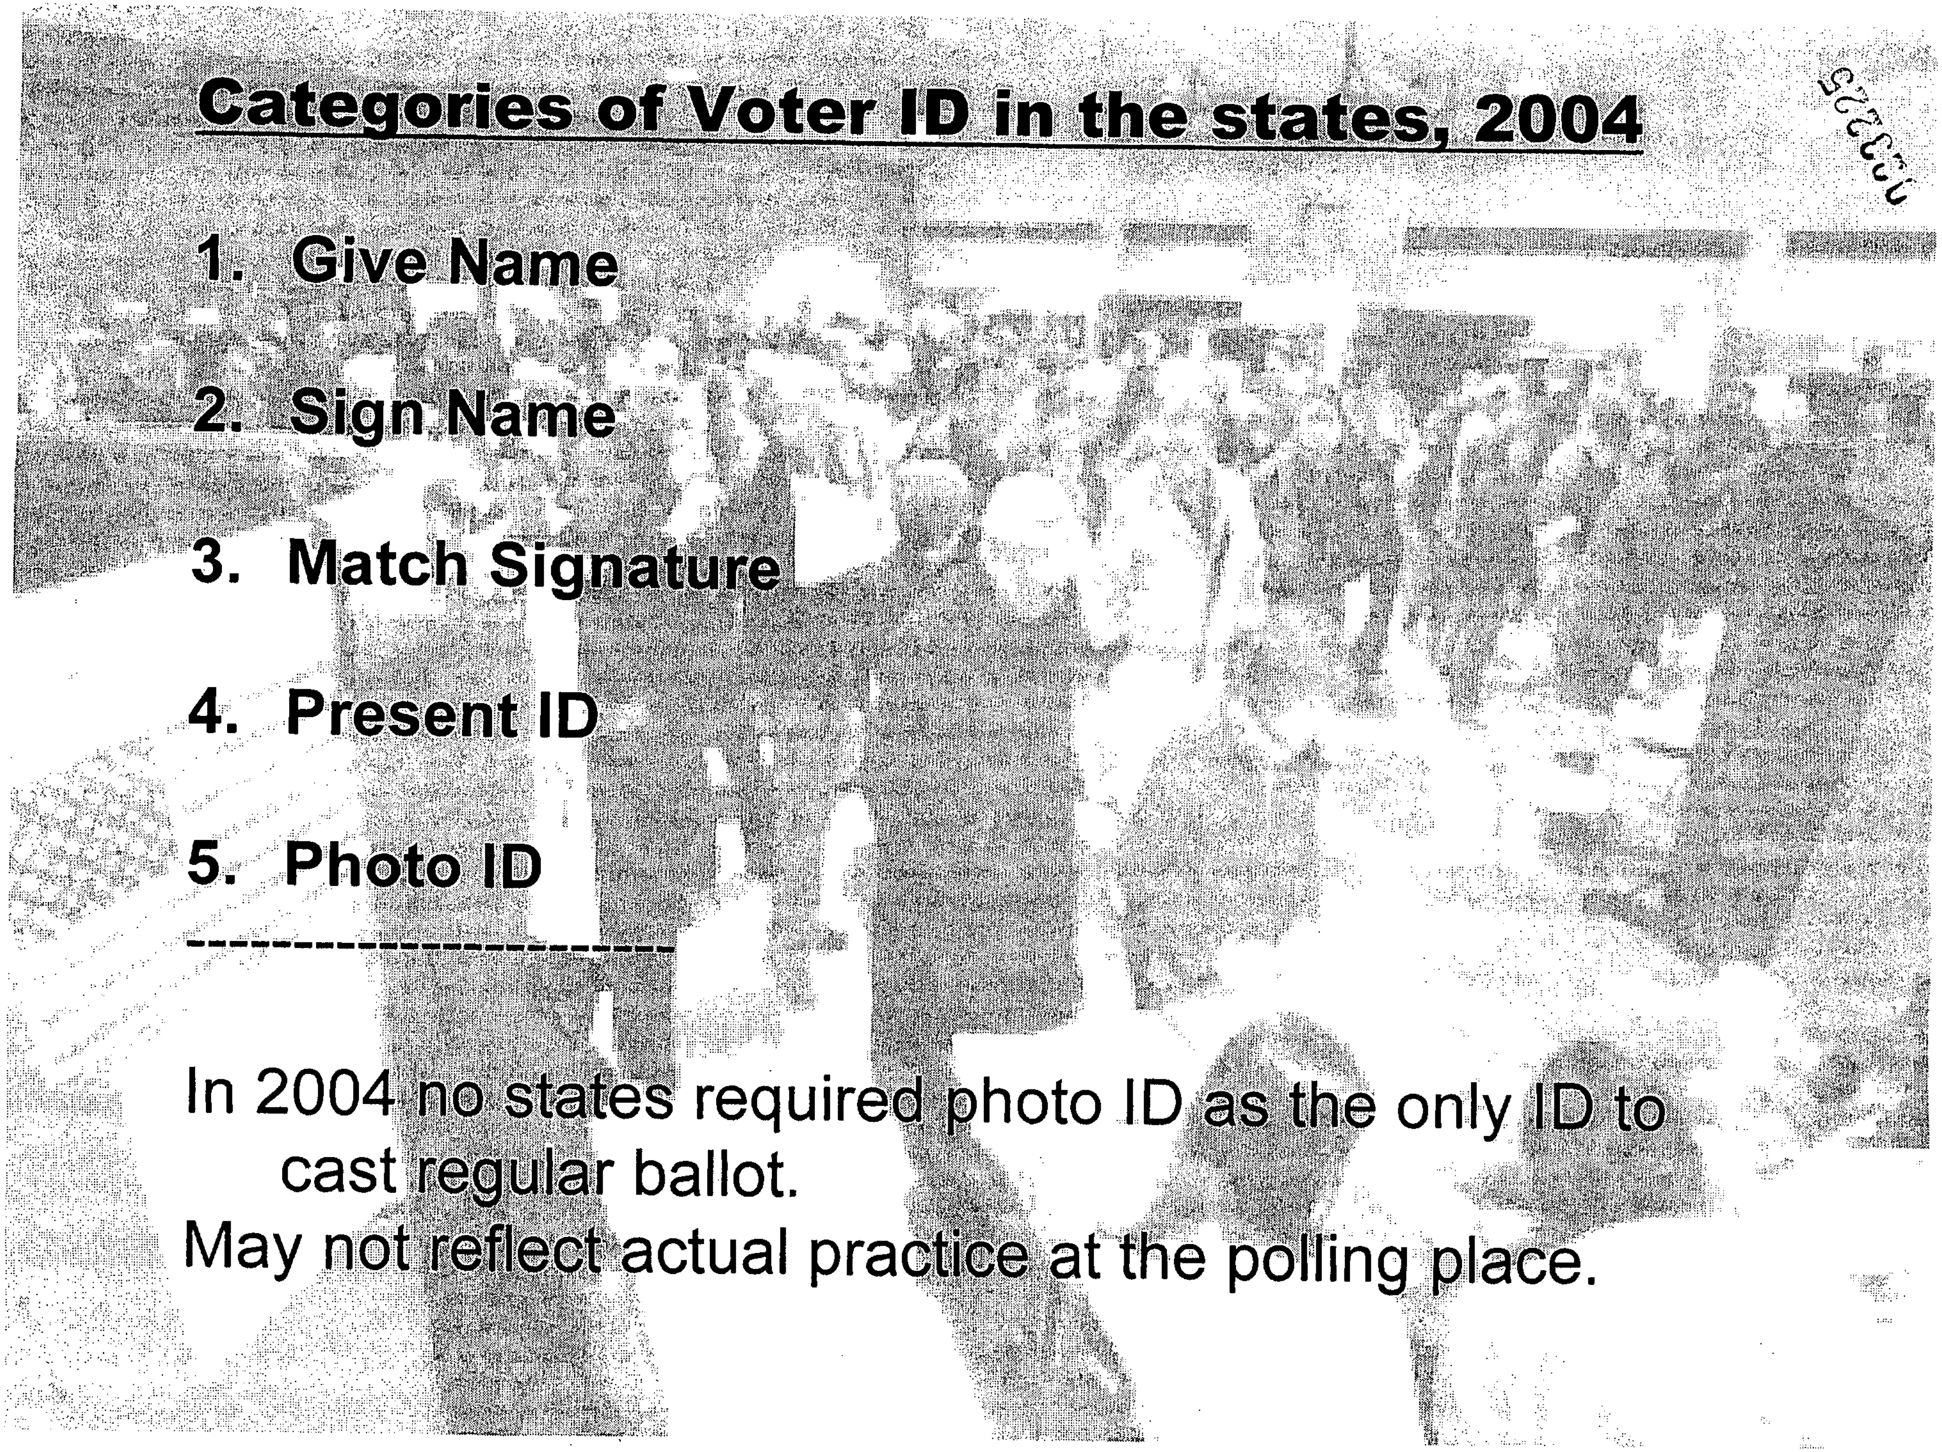
BALLOT SECURITY



Method of analysis

- •Collected and analyzed state statutes and regulations & classified states by their ID requirements in 2004.
- •Tested the assumption that voter ID requirements would prove to be increasingly demanding on the voter, with providing photo ID the most rigorous.
- •County-level turnout data and Current Population Survey results
- •Analyzed litigation for trends in judicial decisions
- •Revised our work based on comments of PRG

Categories of Voter ID in the states, 2004



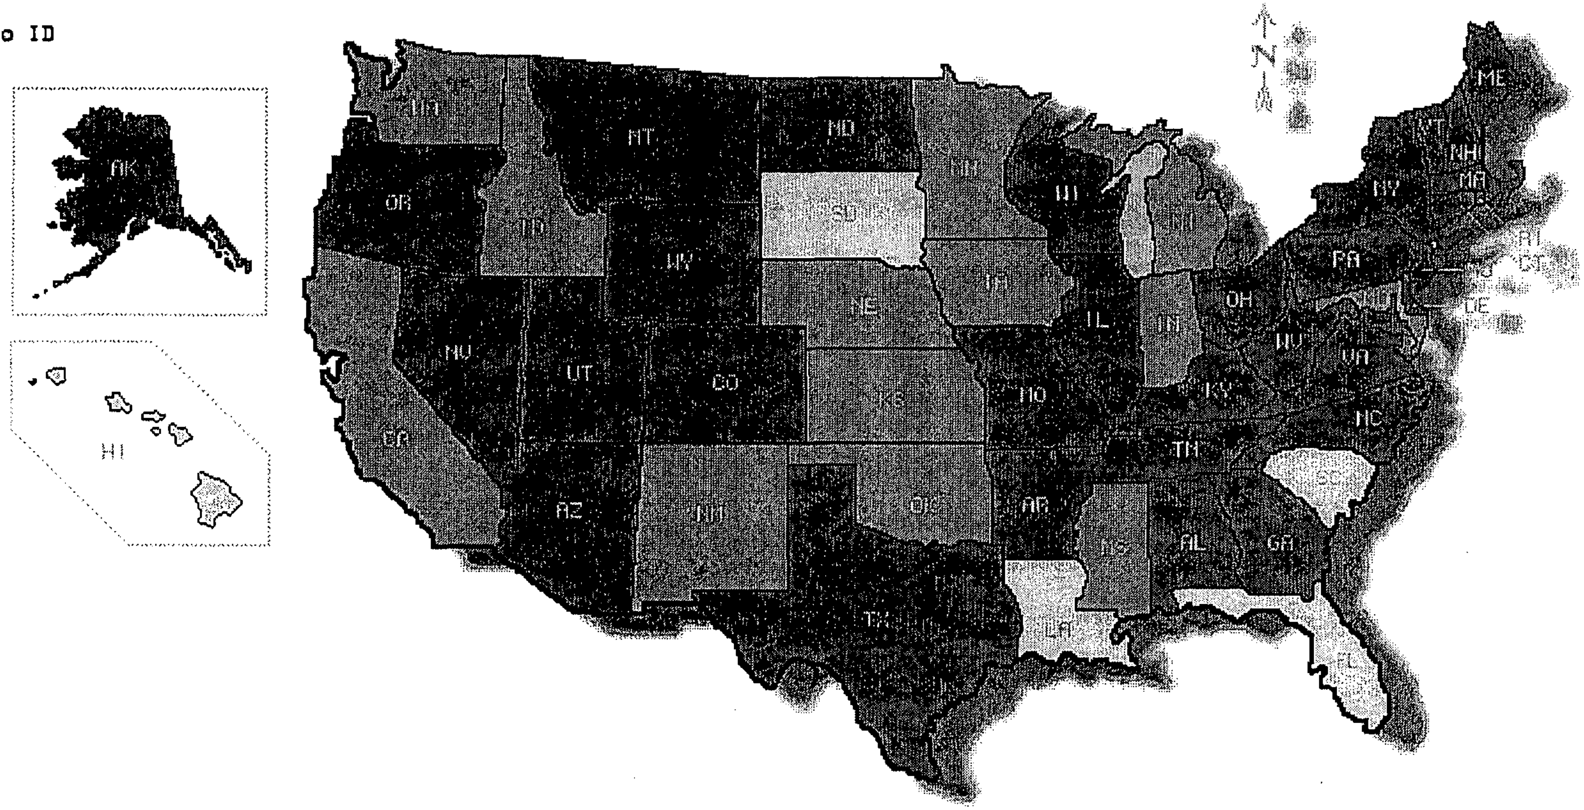
1. **Give Name**
2. **Sign Name**
3. **Match Signature**
4. **Present ID**
5. **Photo ID**

In 2004 no states required photo ID as the only ID to cast regular ballot.

May not reflect actual practice at the polling place.

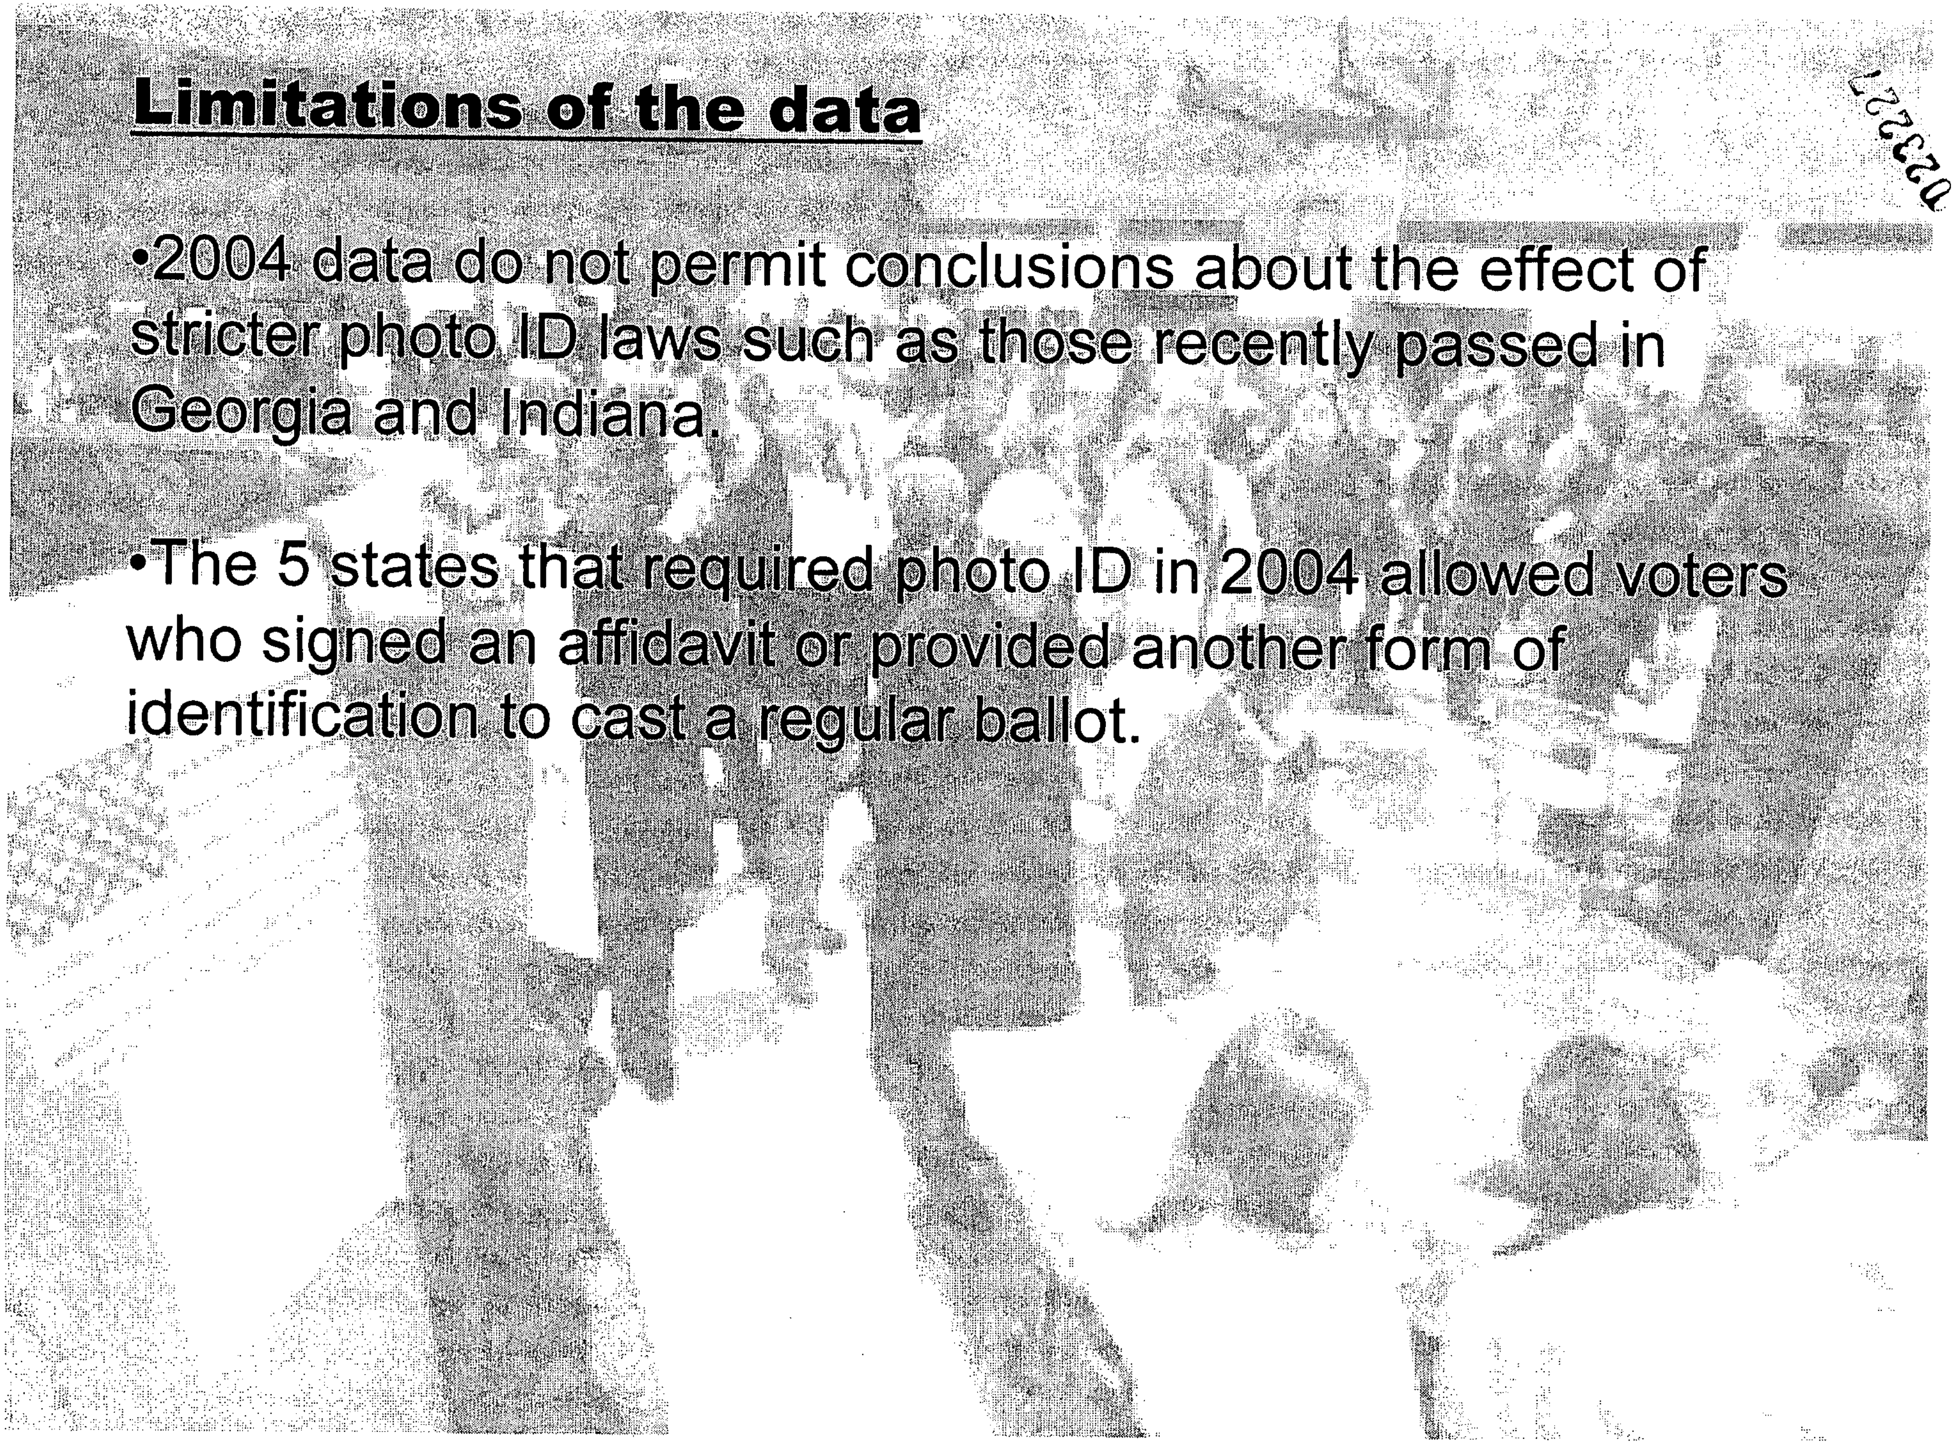
- ● - Give Name
- ● - Sign Name
- ● - Match Signature
- ● - ID
- ● - Photo ID

Voter ID Requirements 2004

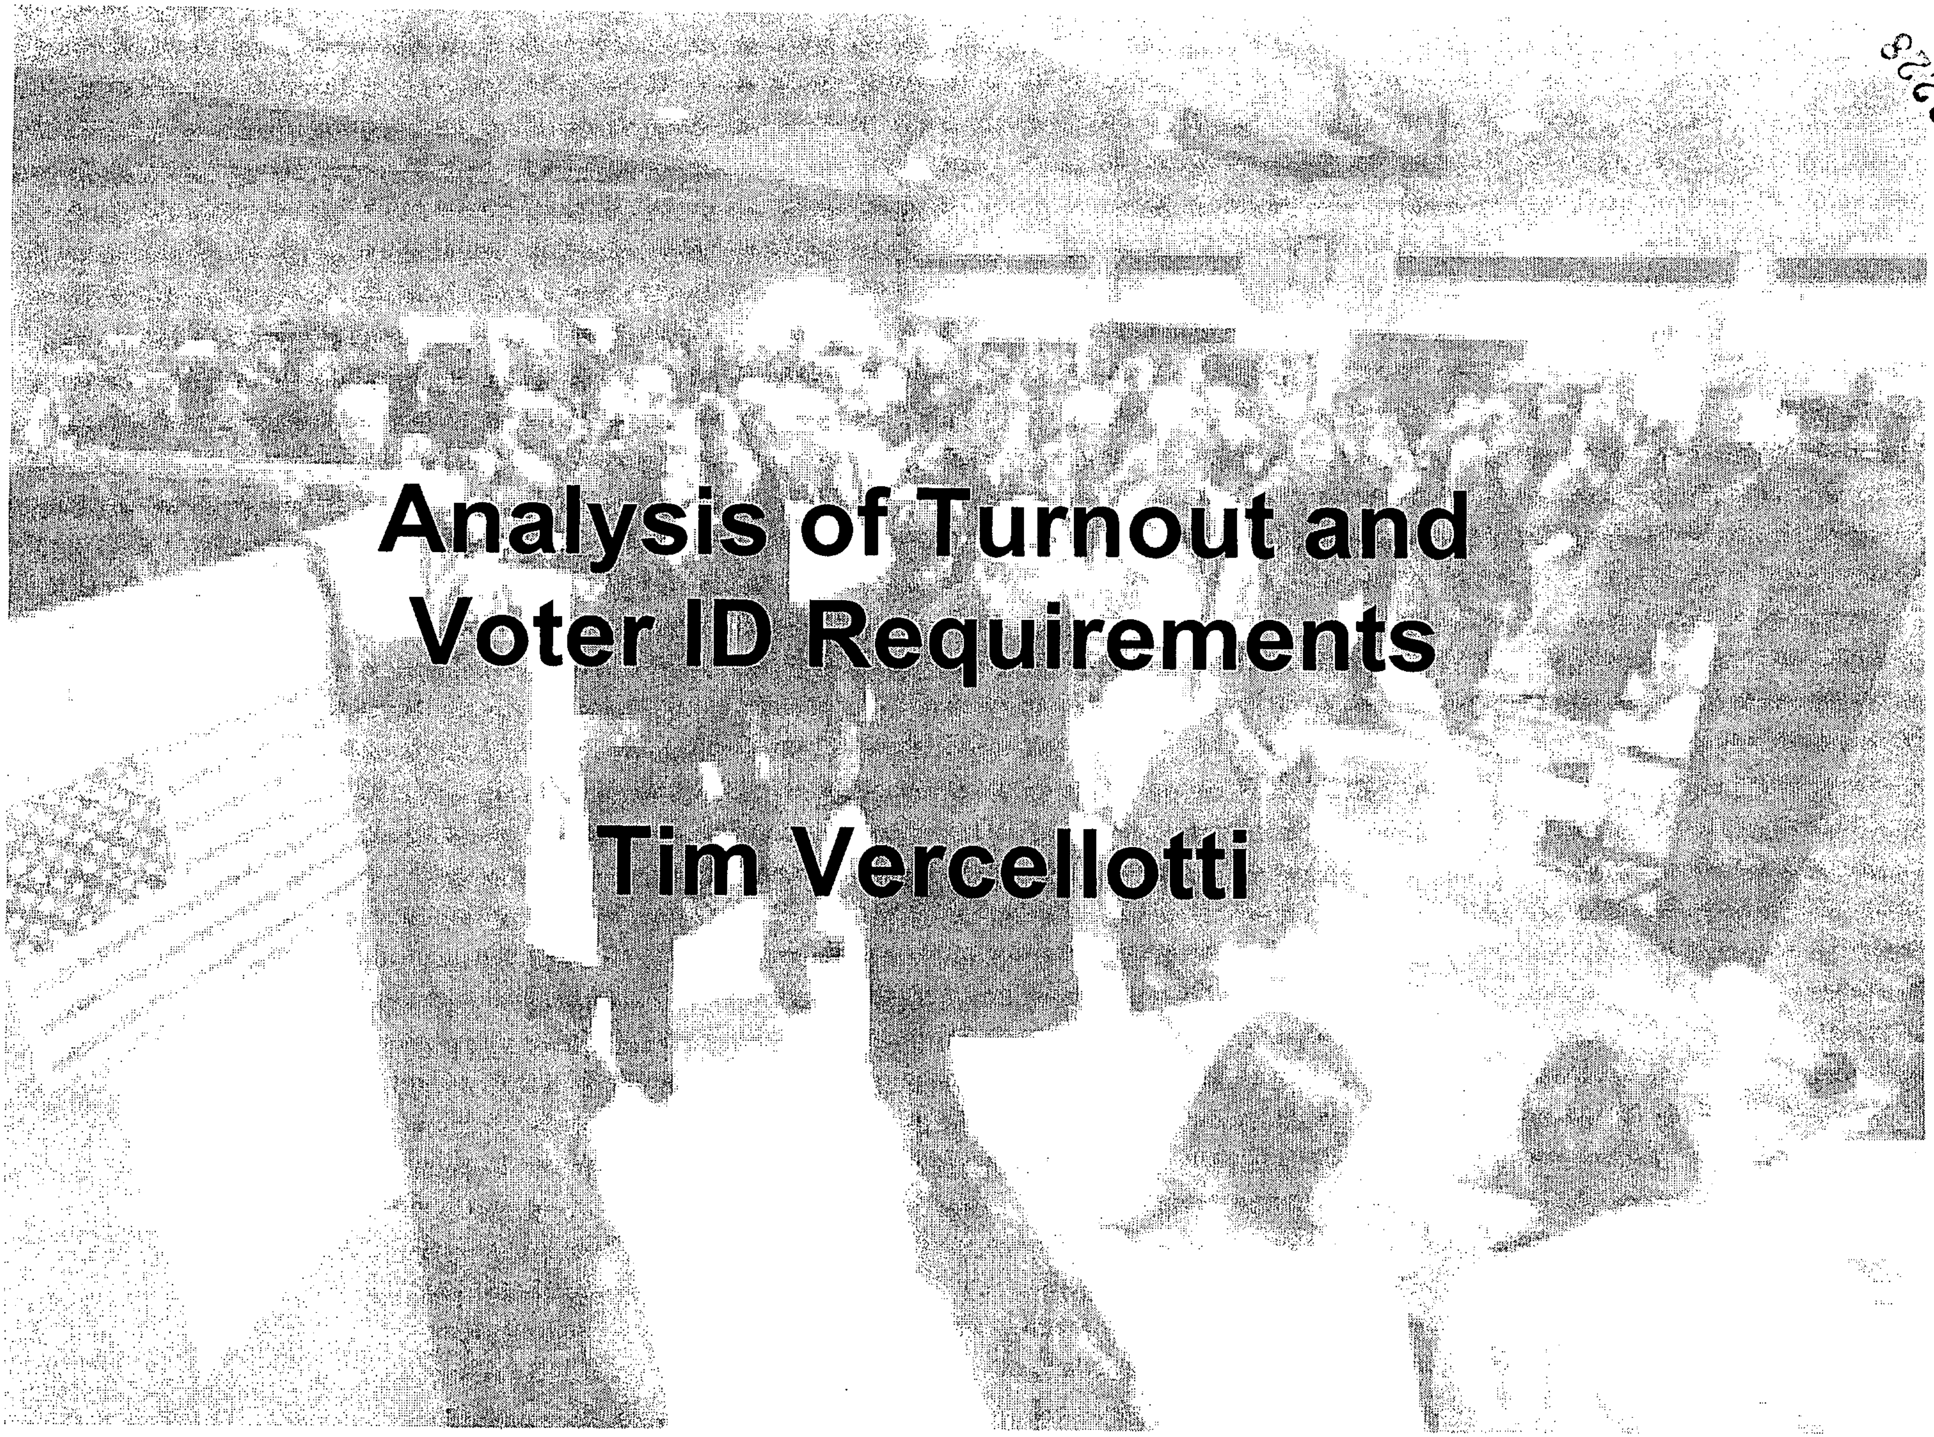


3-27-06

Limitations of the data

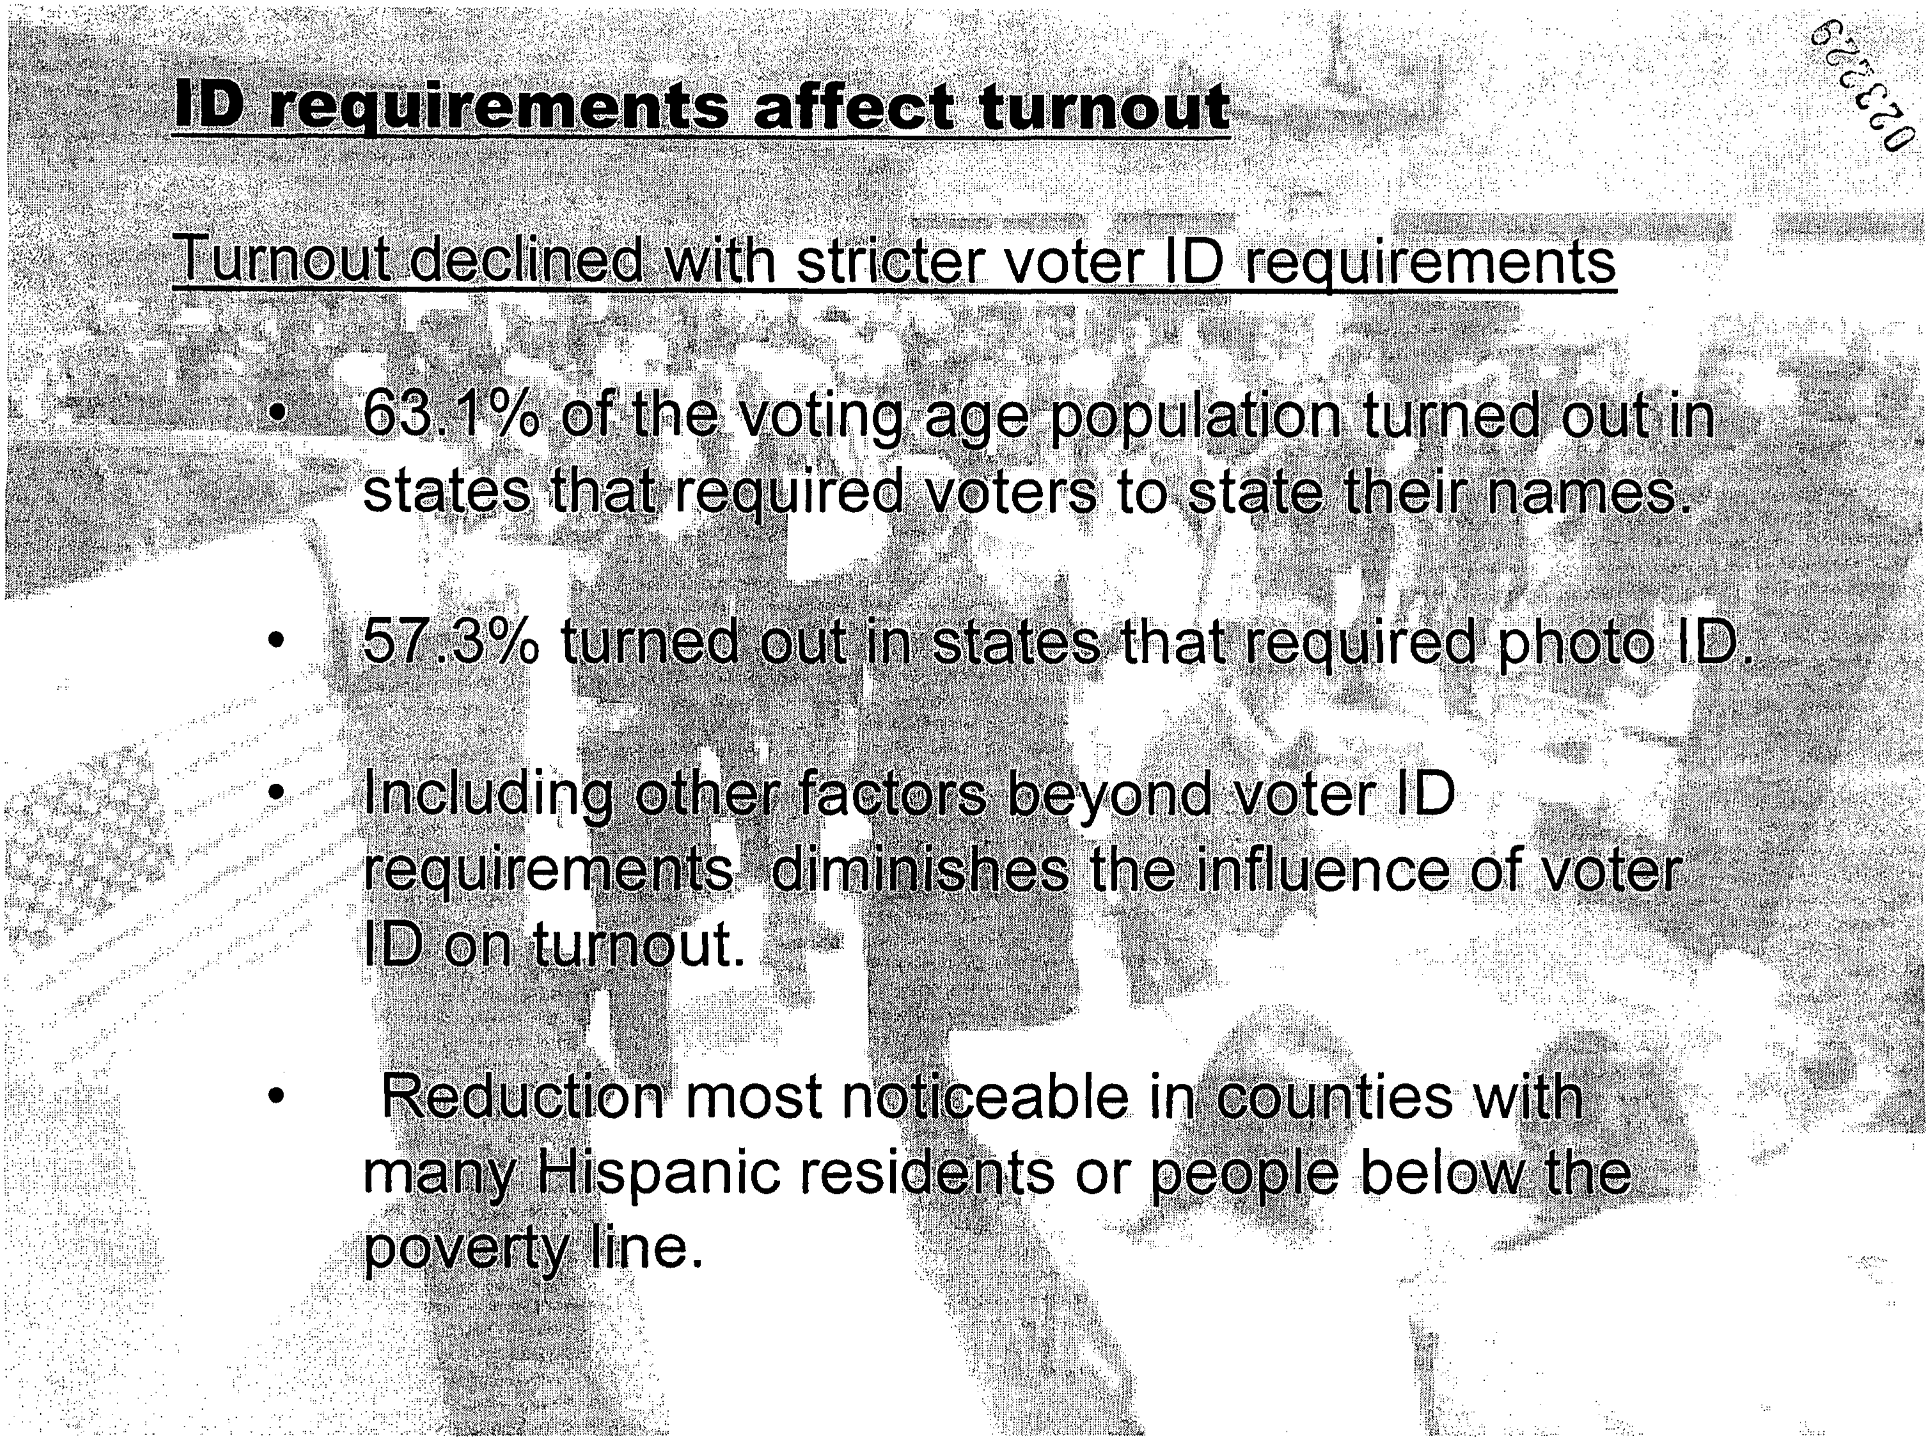


- 2004 data do not permit conclusions about the effect of stricter photo ID laws such as those recently passed in Georgia and Indiana.
- The 5 states that required photo ID in 2004 allowed voters who signed an affidavit or provided another form of identification to cast a regular ballot.



Analysis of Turnout and Voter ID Requirements

Tim Vercellotti

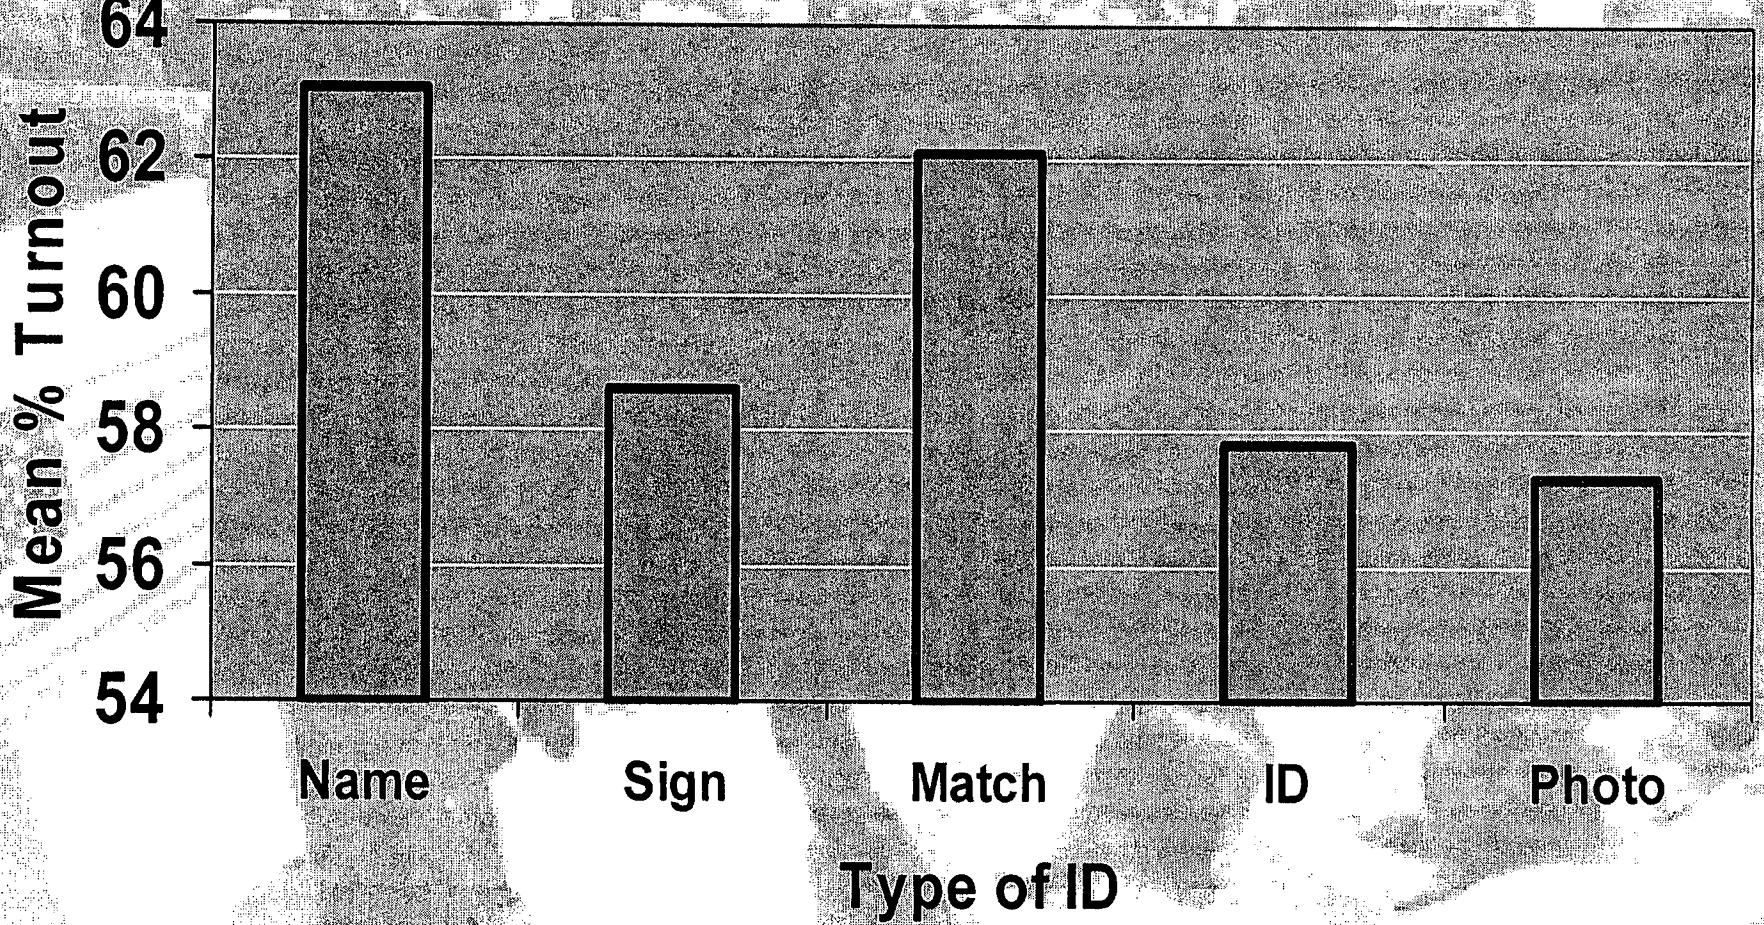


ID requirements affect turnout

Turnout declined with stricter voter ID requirements

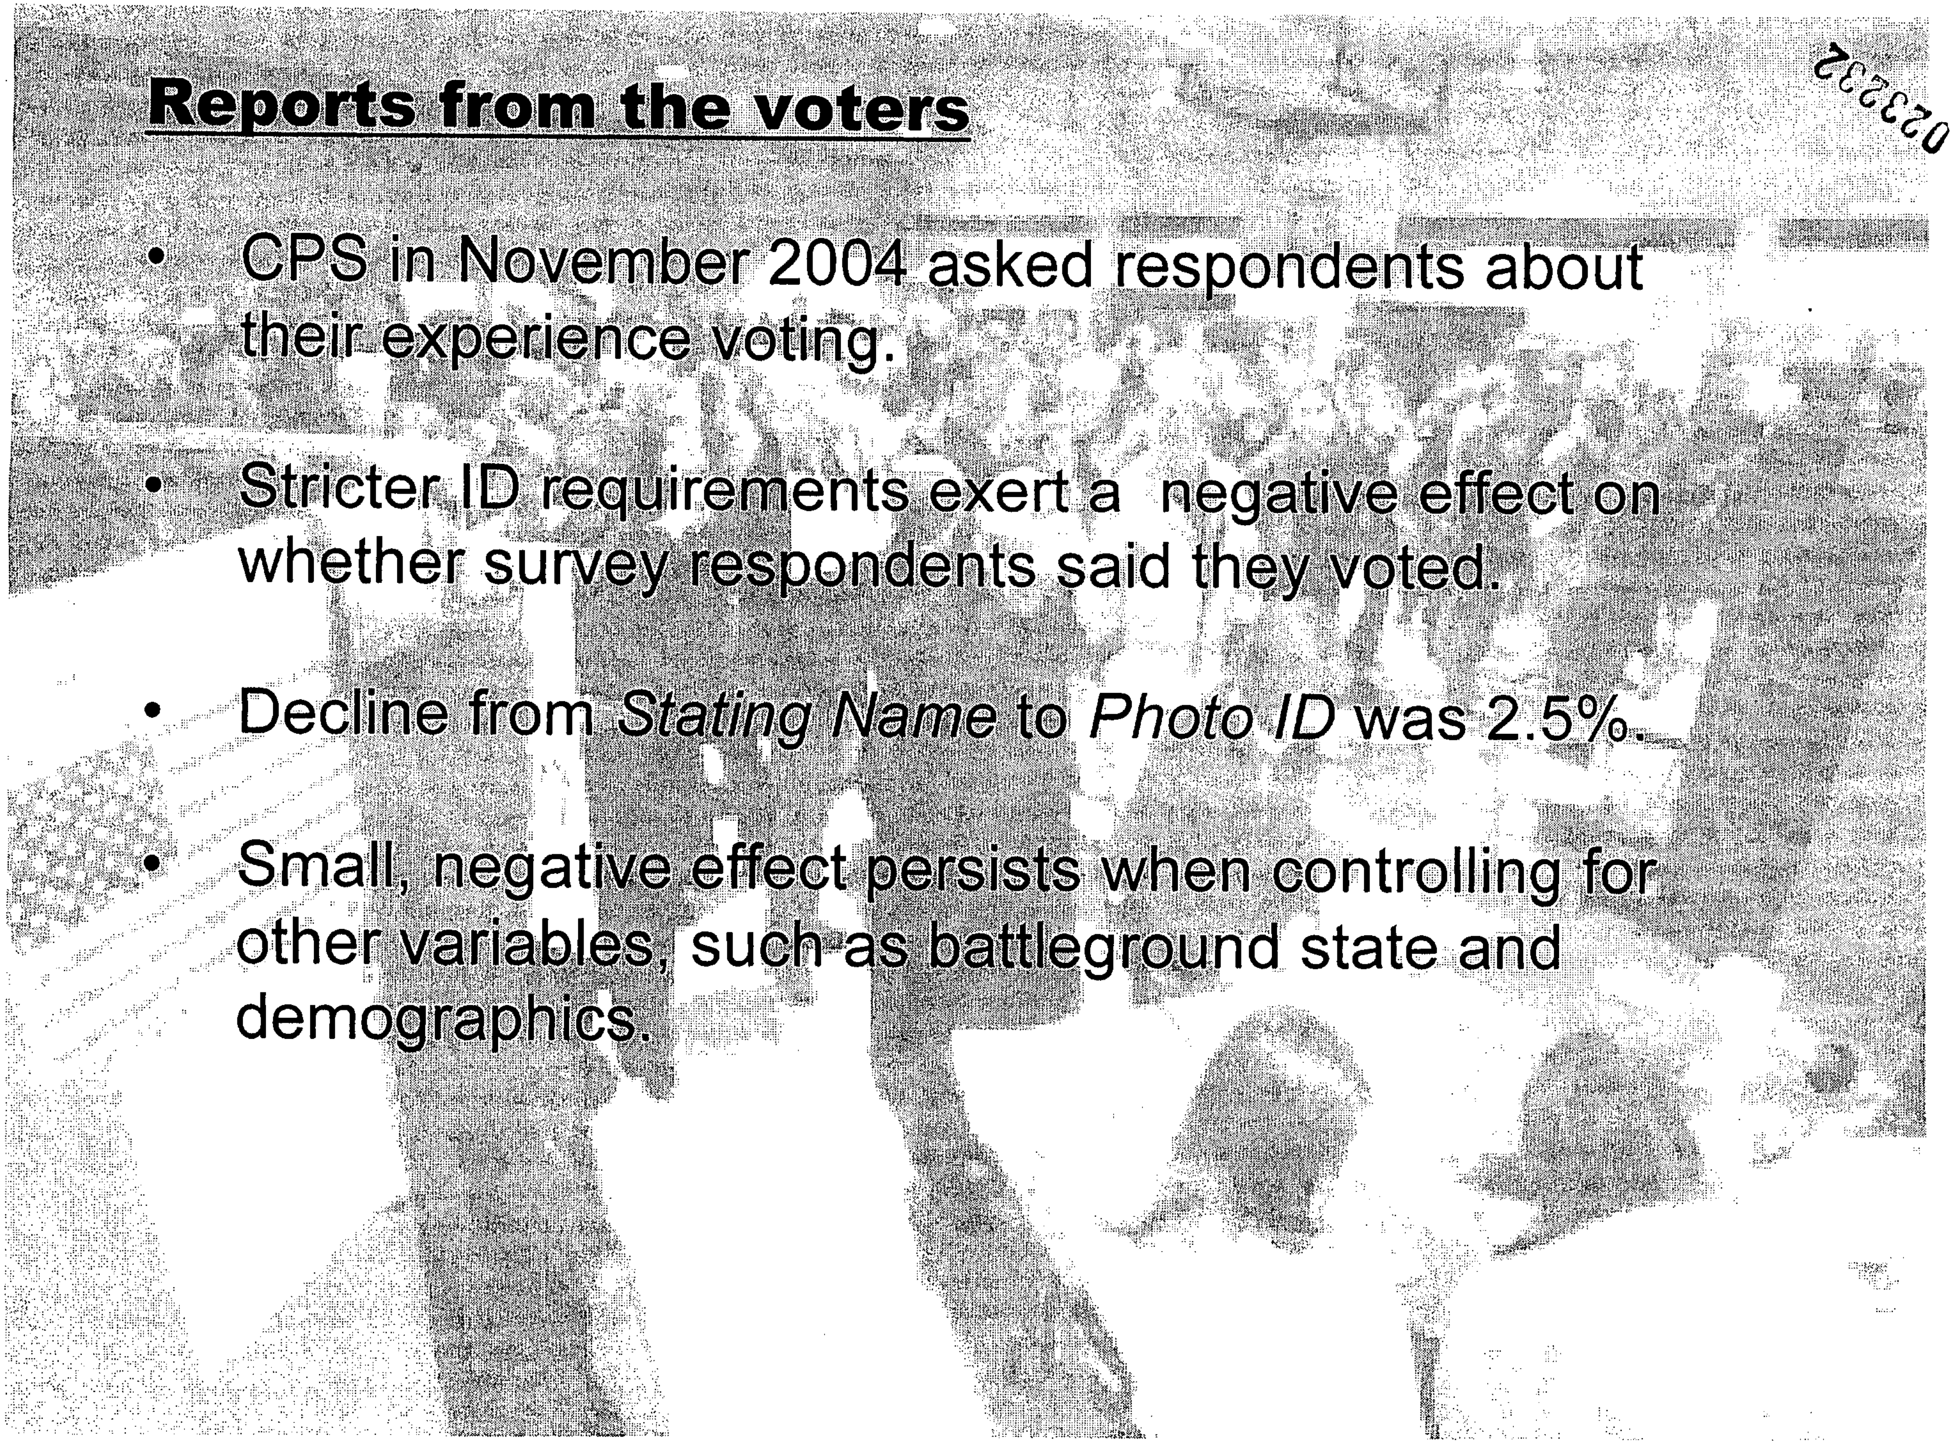
- 63.1% of the voting age population turned out in states that required voters to state their names.
- 57.3% turned out in states that required photo ID.
- Including other factors beyond voter ID requirements diminishes the influence of voter ID on turnout.
- Reduction most noticeable in counties with many Hispanic residents or people below the poverty line.

State Voter ID and Turnout



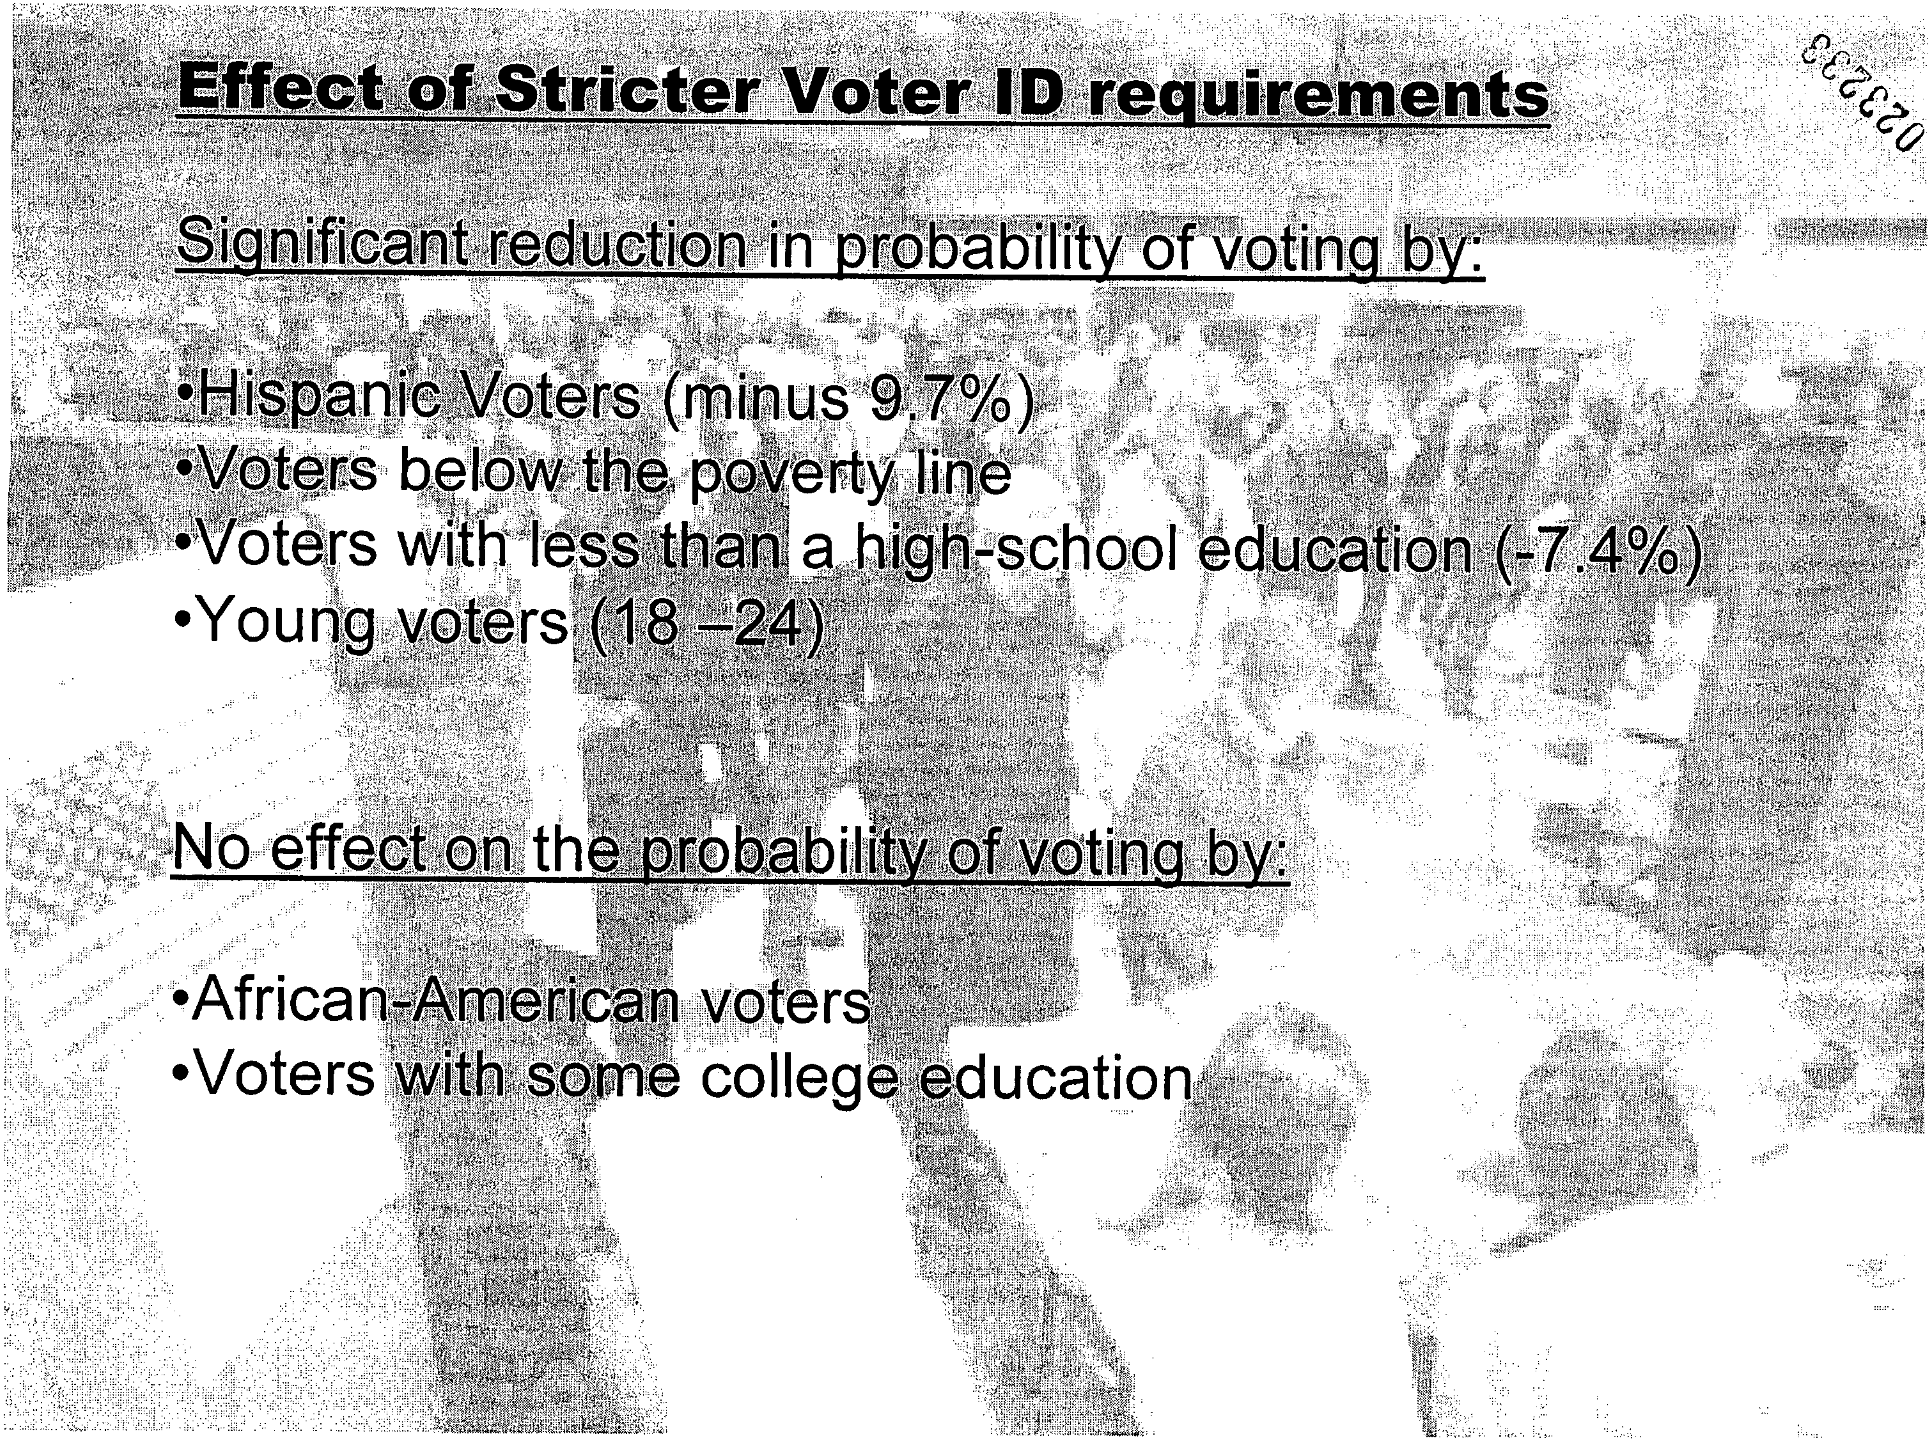
Variation in Turnout Based on Voter ID Requirements

Maximum Requirement		*Minimum Requirement*	
Voter Identification Required in the States	Mean Voter Turnout for States in that Category	*Voter Identification Required in the States*	*Mean Voter Turnout for States in that Category*
State Name	**63.1 %**	*State Name*	***61.3 %***
Sign Name	**58.6 %**	*Sign Name*	***60.4 %***
Match Signature	**62.1 %**	*Match Signature*	***59.2 %***
Provide Non-Photo ID	**57.8 %**	*Provide Non-Photo ID*	***57.6 %***
Provide Photo ID	**57.3 %**	*Swear Affidavit*	***58.7 %***
Average Turnout (All States)	**59.6 %**		



Reports from the voters

- CPS in November 2004 asked respondents about their experience voting.
- Stricter ID requirements exert a negative effect on whether survey respondents said they voted.
- Decline from *Stating Name* to *Photo ID* was 2.5%.
- Small, negative effect persists when controlling for other variables, such as battleground state and demographics.



Effect of Stricter Voter ID requirements

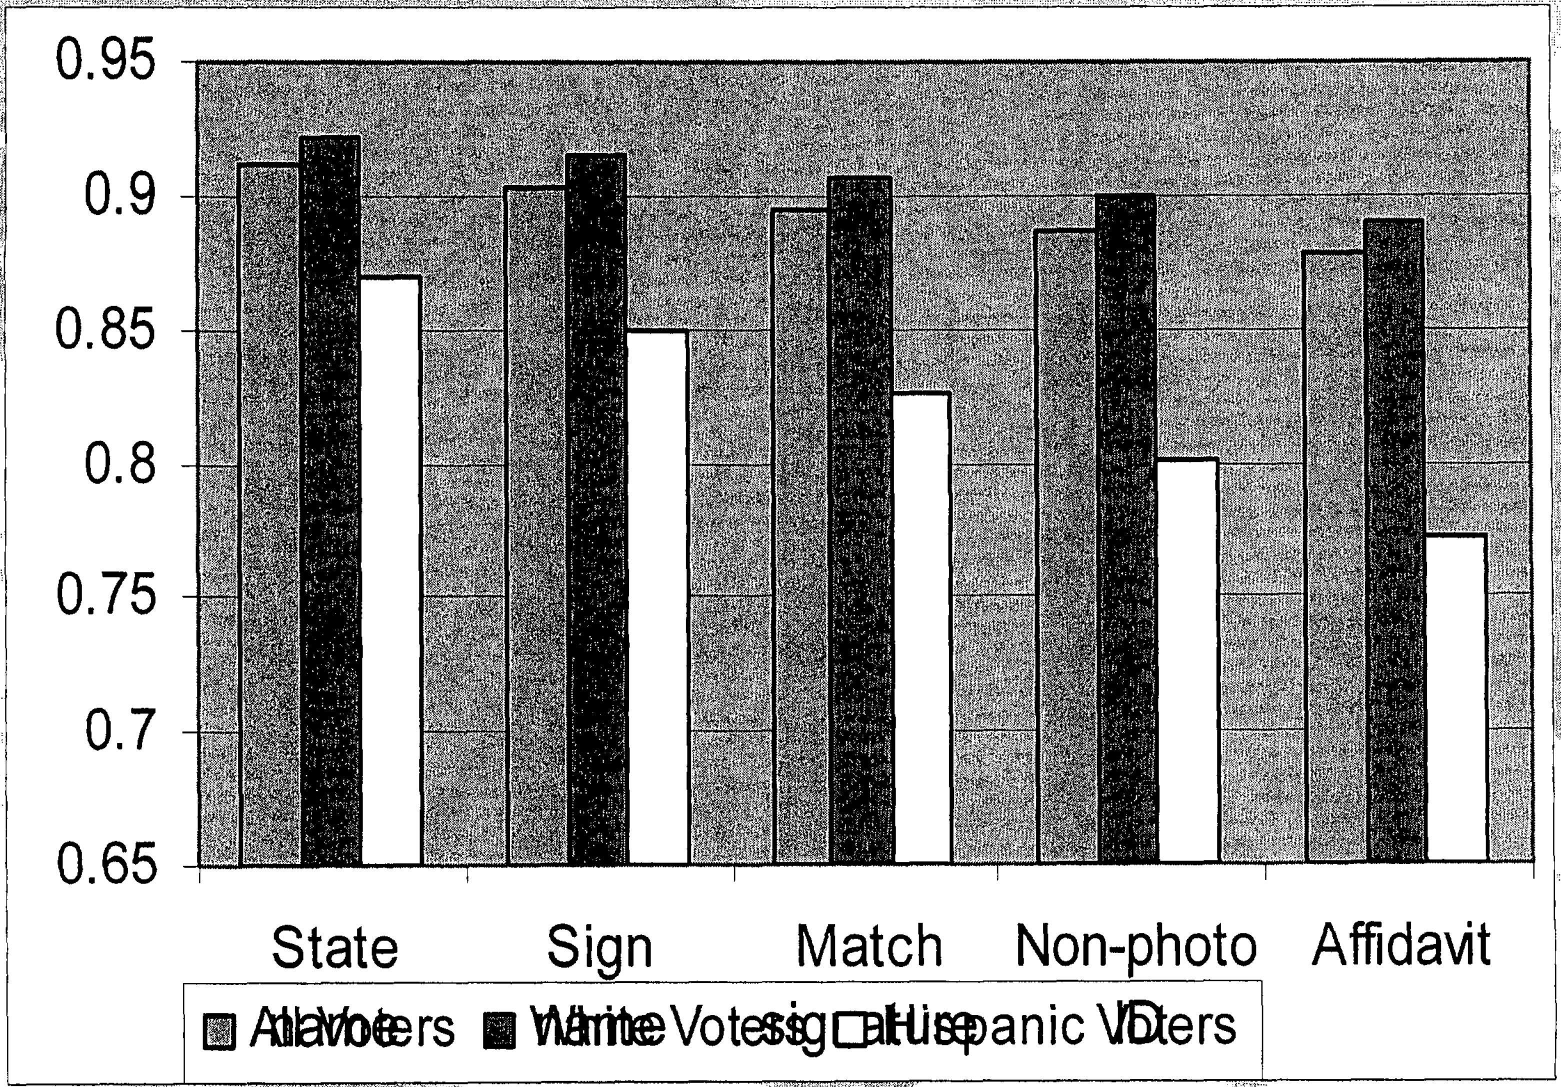
Significant reduction in probability of voting by:

- Hispanic Voters (minus 9.7%)
- Voters below the poverty line
- Voters with less than a high-school education (-7.4%)
- Young voters (18 –24)

No effect on the probability of voting by:

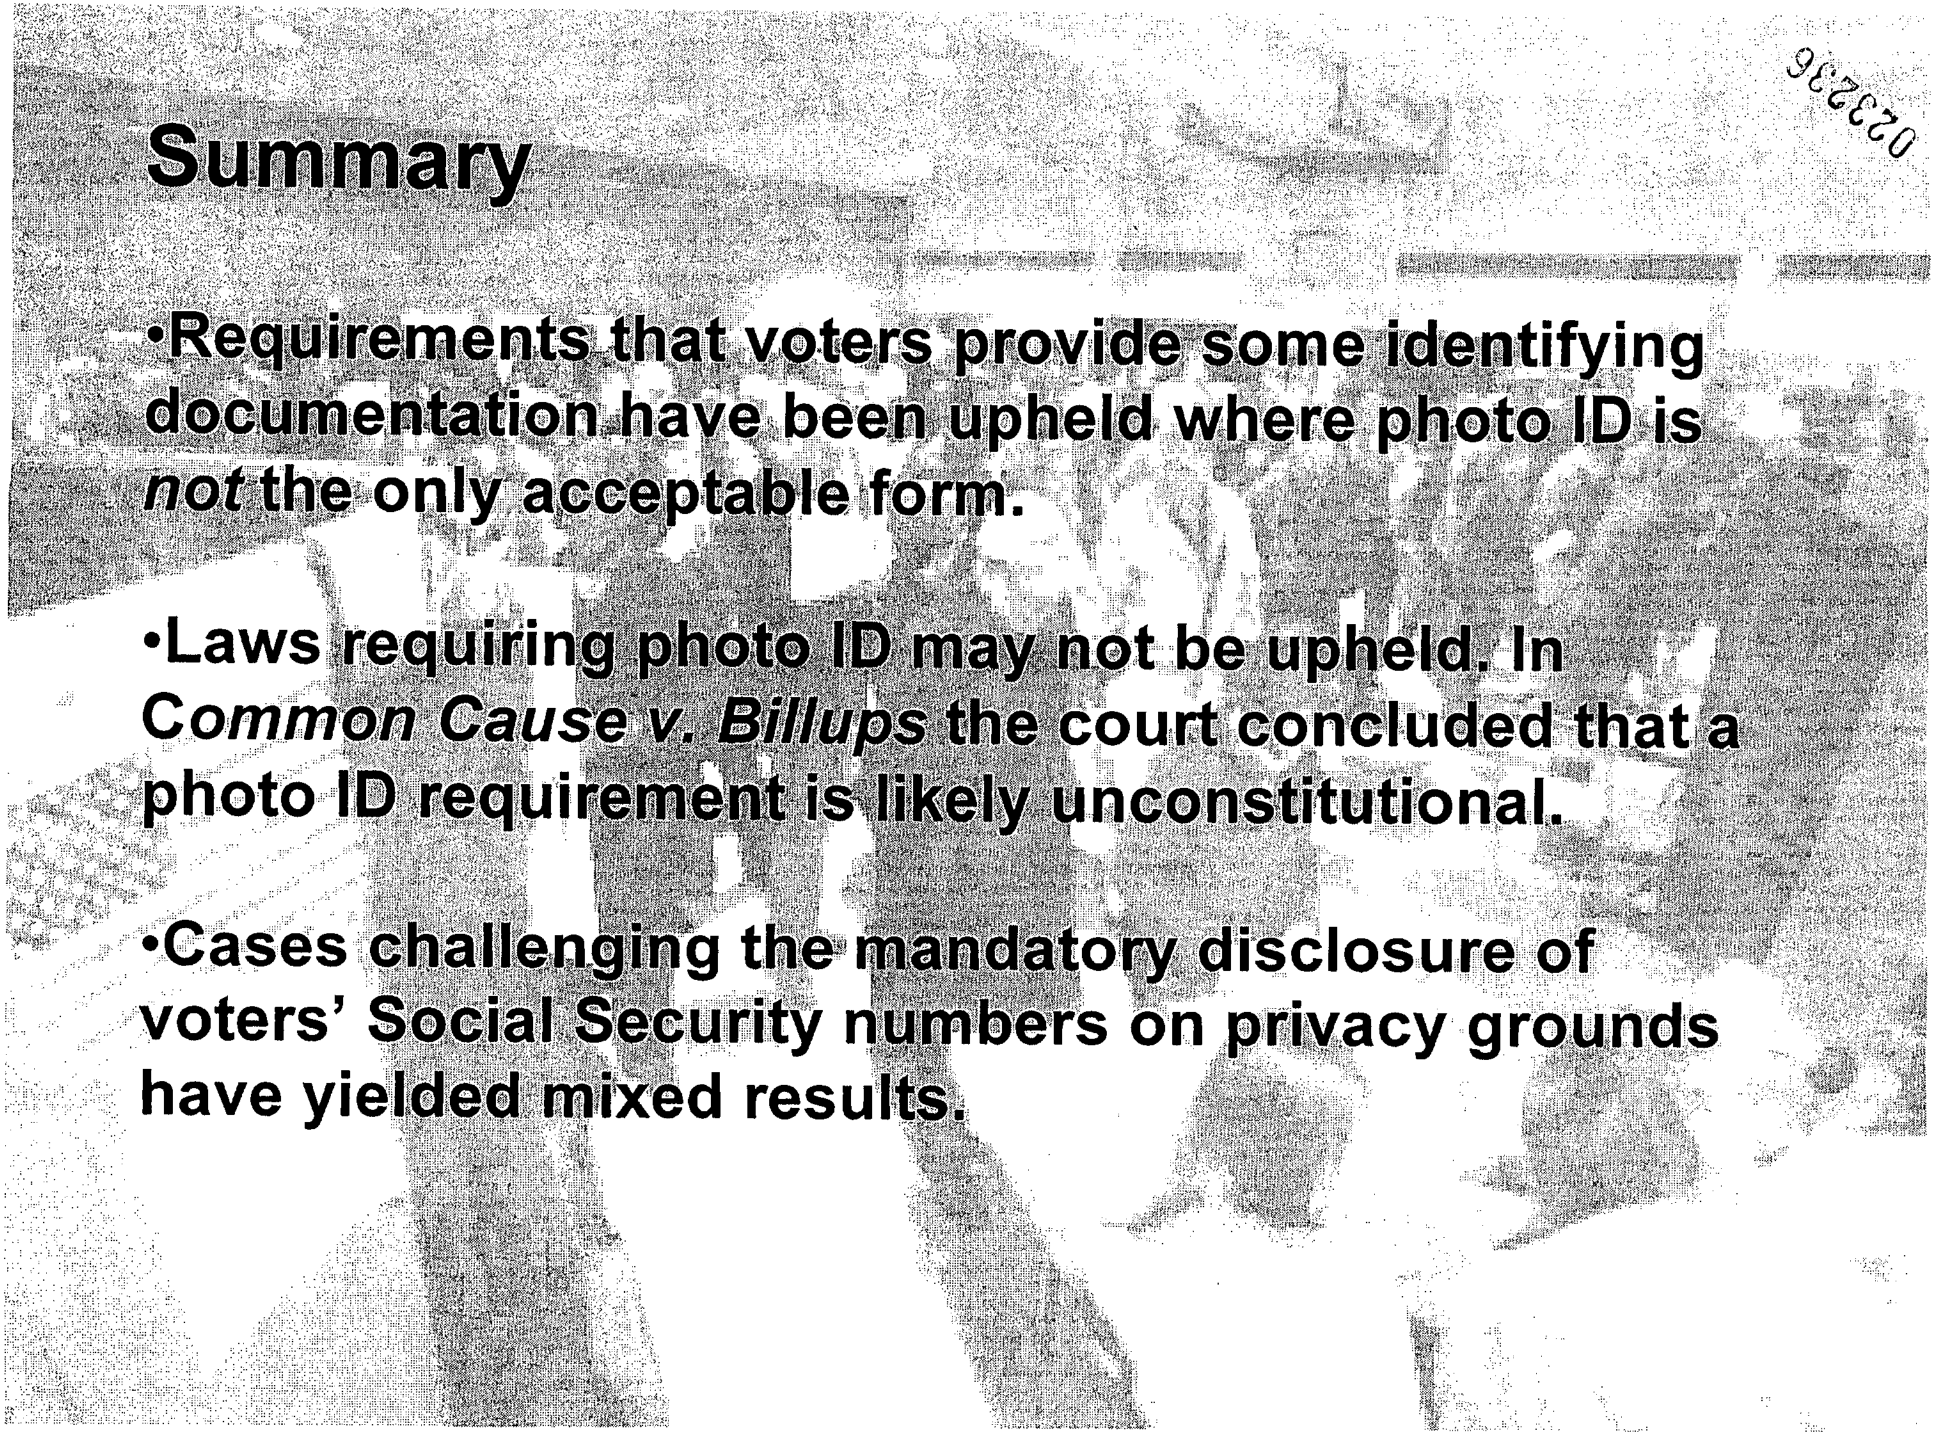
- African-American voters
- Voters with some college education

Voter Turnout By Minimum ID Requirement



Trends in Litigation

Dan Tokaji

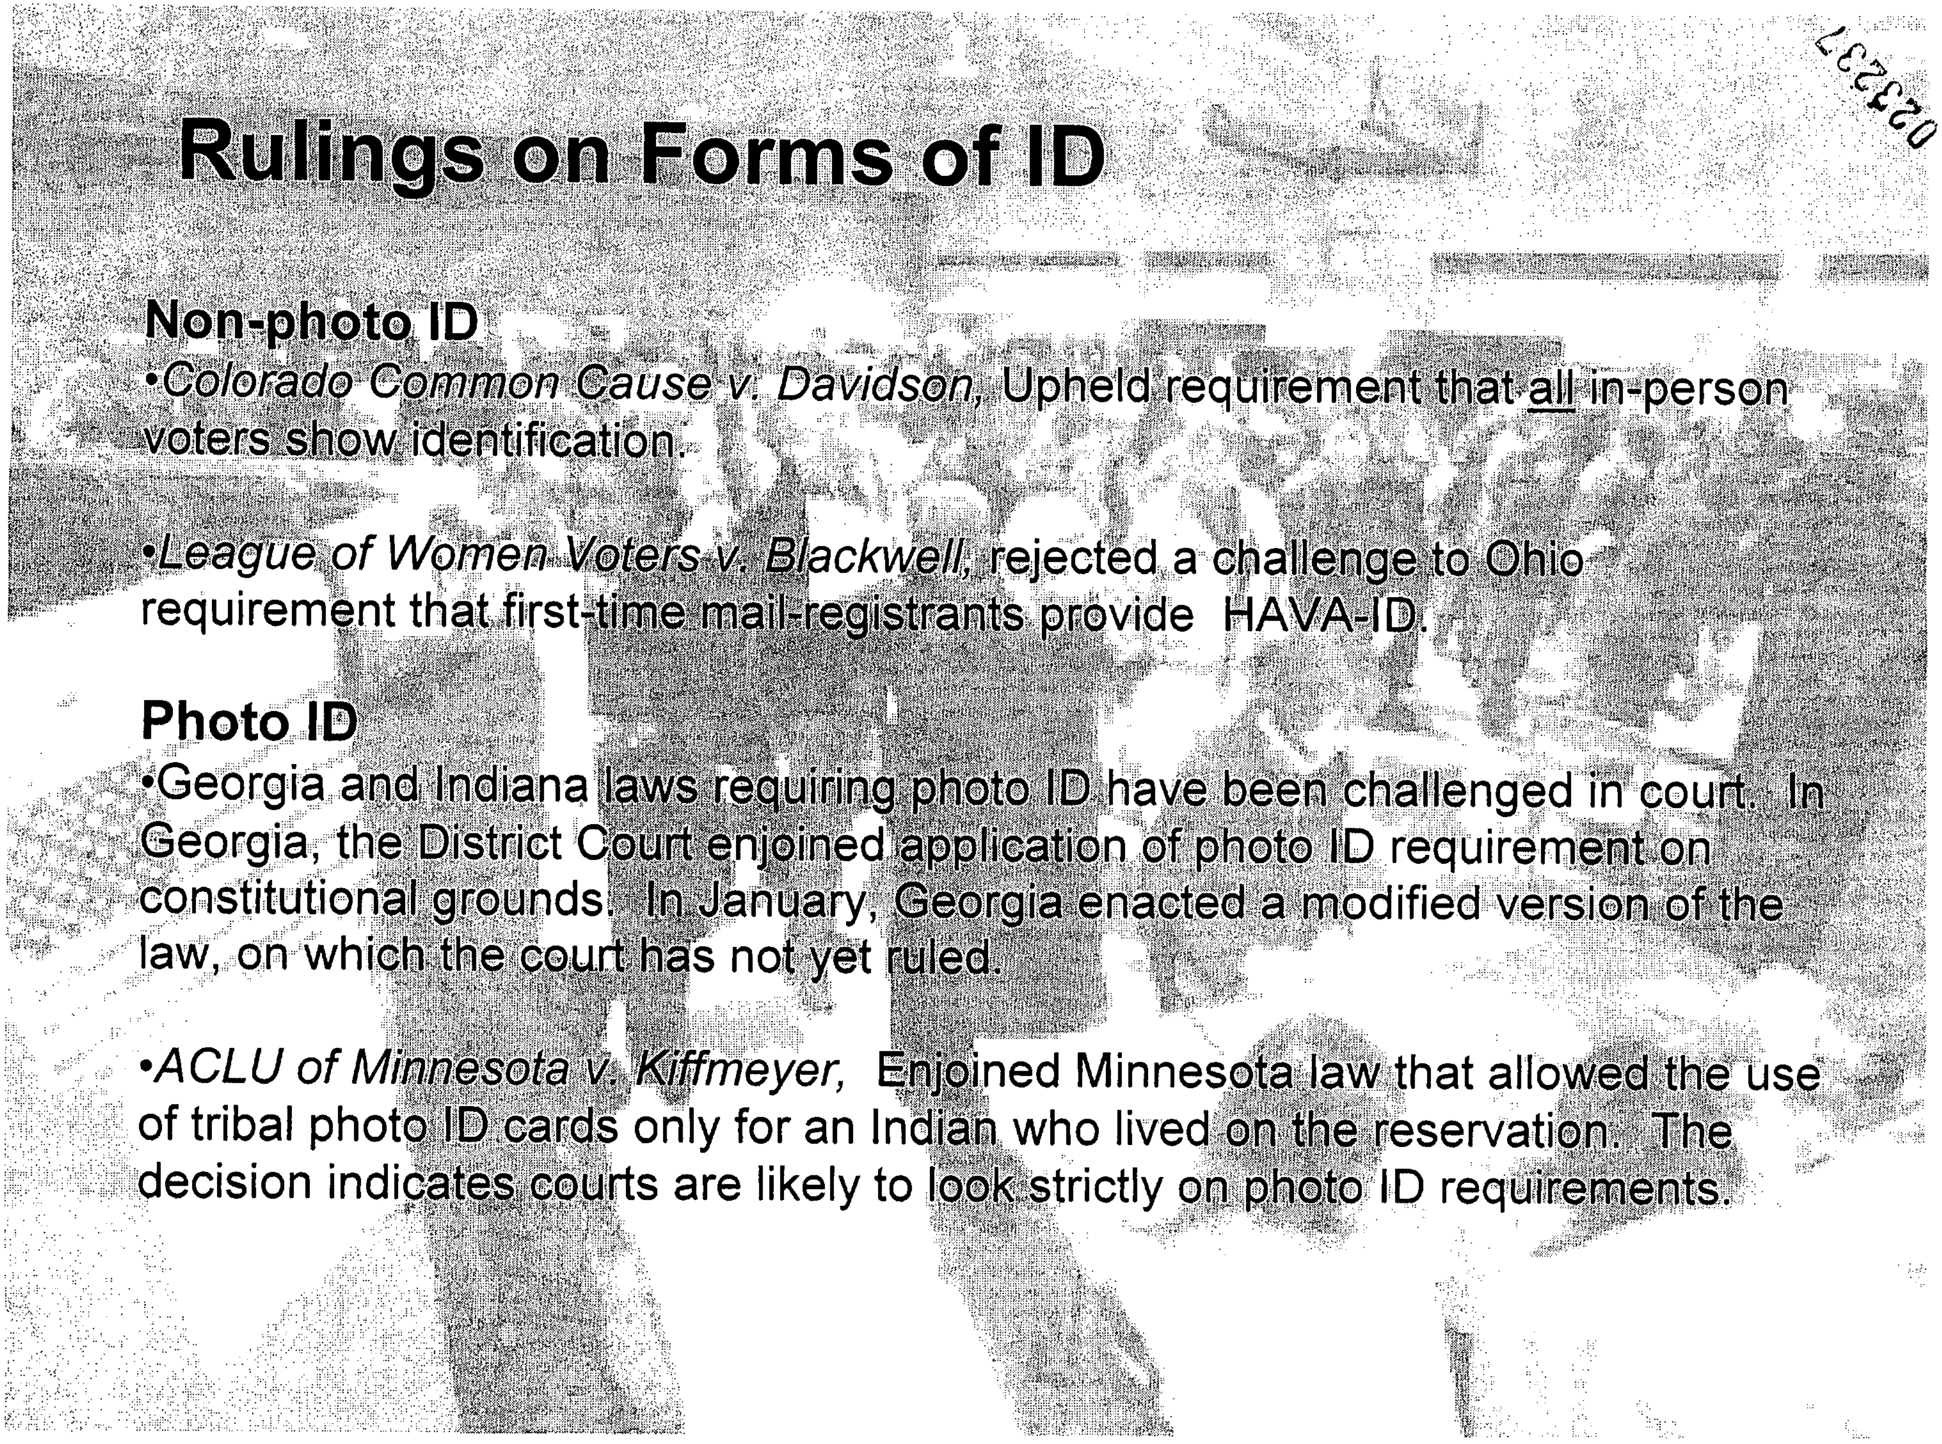


Summary

- Requirements that voters provide some identifying documentation have been upheld where photo ID is *not* the only acceptable form.

- Laws requiring photo ID may not be upheld. In C*ommon Cause v. Billups* the court concluded that a photo ID requirement is likely unconstitutional.

- Cases challenging the mandatory disclosure of voters' Social Security numbers on privacy grounds have yielded mixed results.



Rulings on Forms of ID

Non-photo ID

- *Colorado Common Cause v. Davidson,* Upheld requirement that all in-person voters show identification.

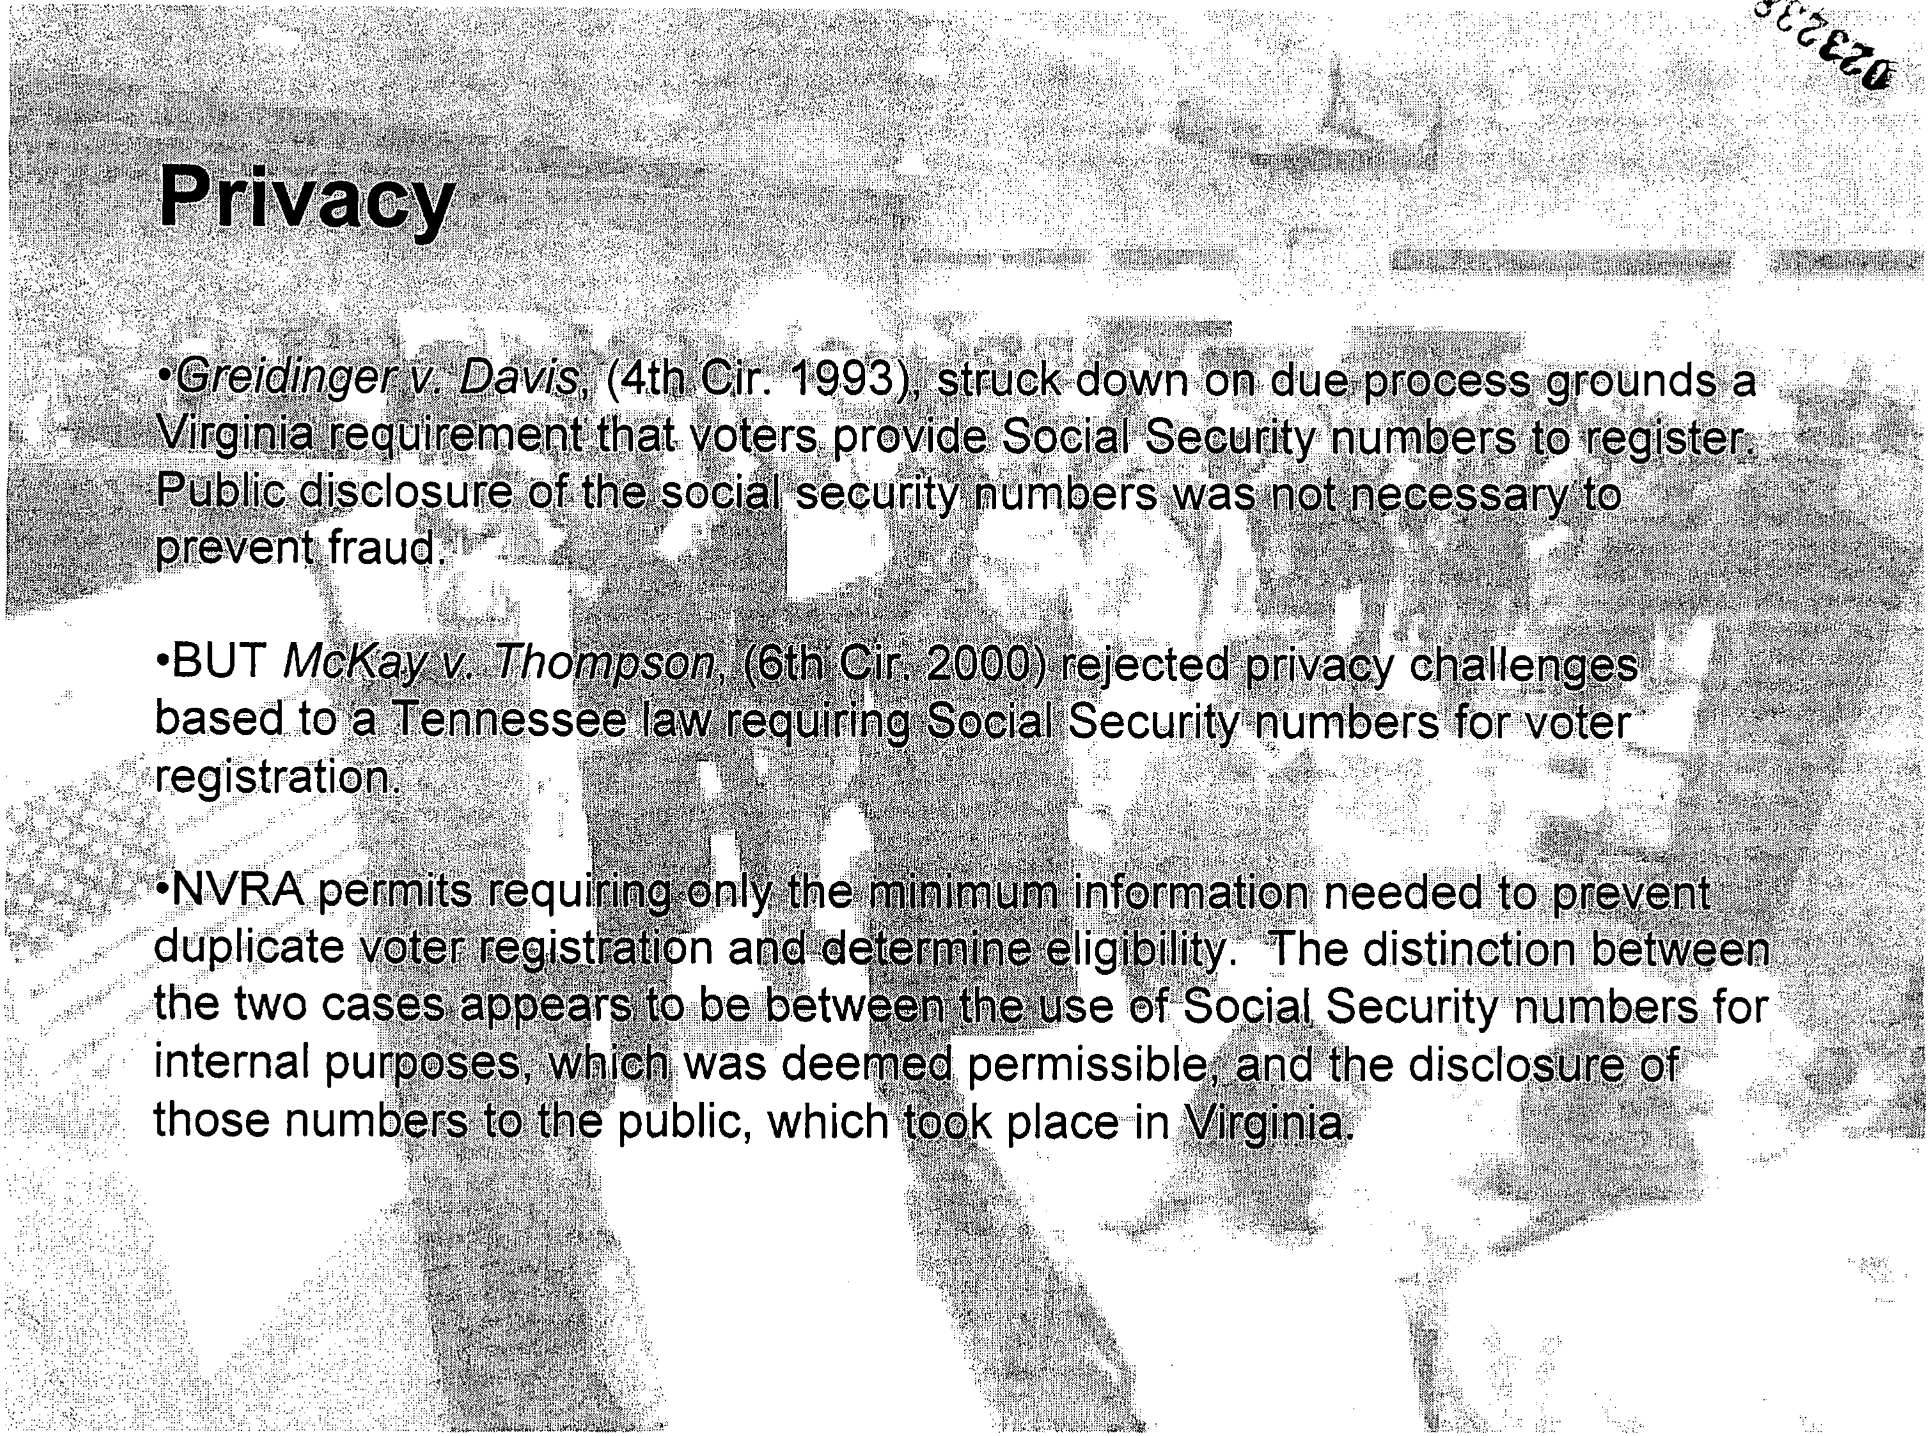
- *League of Women Voters v. Blackwell,* rejected a challenge to Ohio requirement that first-time mail-registrants provide HAVA-ID.

Photo ID

- Georgia and Indiana laws requiring photo ID have been challenged in court. In Georgia, the District Court enjoined application of photo ID requirement on constitutional grounds. In January, Georgia enacted a modified version of the law, on which the court has not yet ruled.

- *ACLU of Minnesota v. Kiffmeyer,* Enjoined Minnesota law that allowed the use of tribal photo ID cards only for an Indian who lived on the reservation. The decision indicates courts are likely to look strictly on photo ID requirements.

Privacy

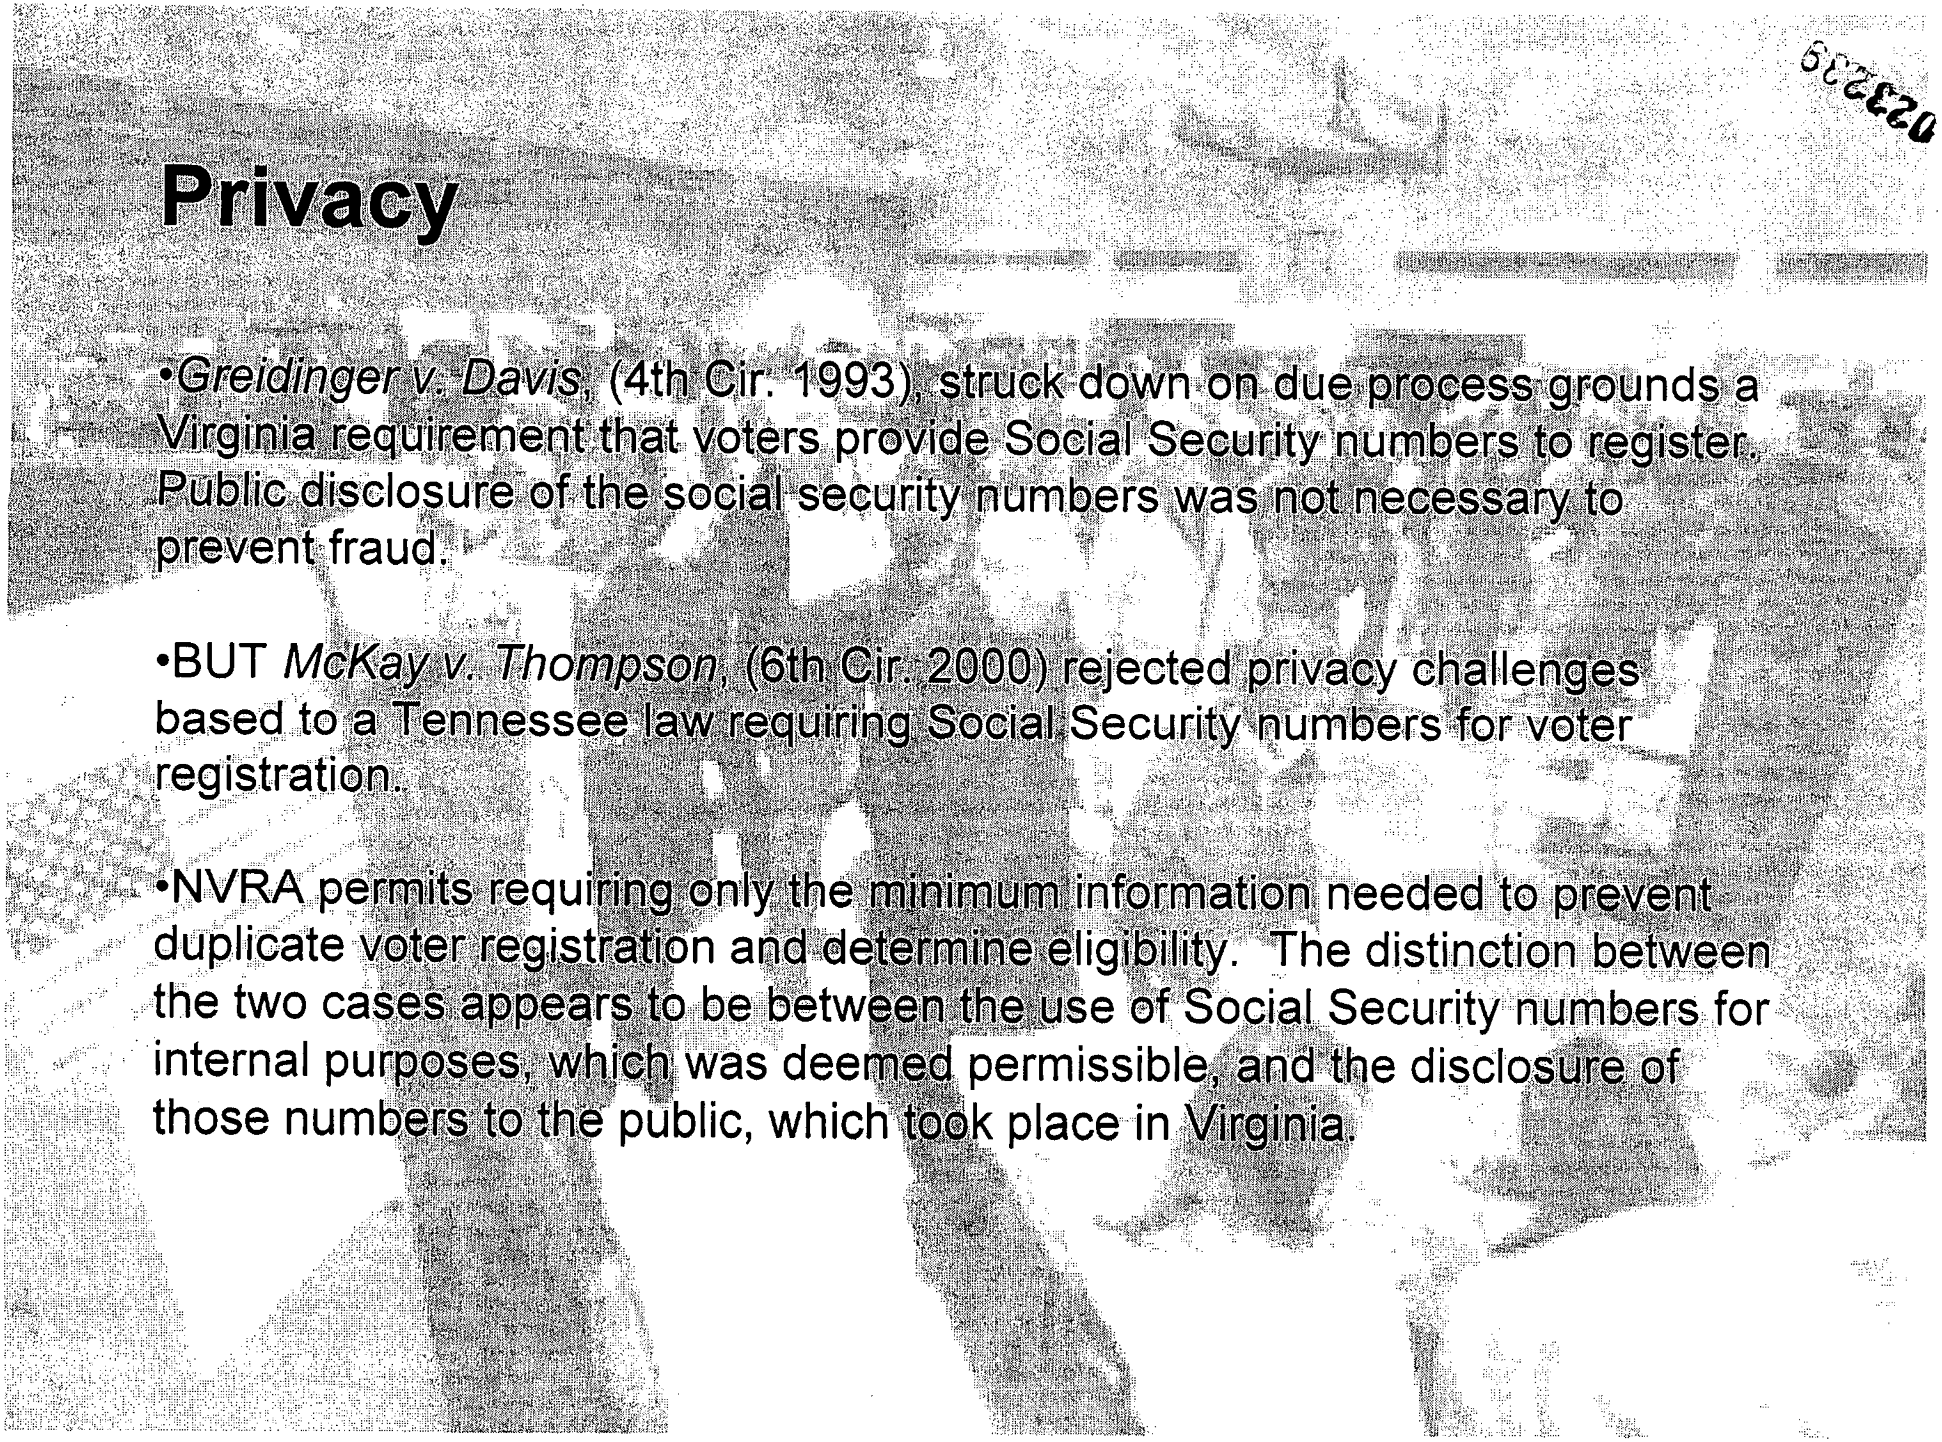


- *Greidinger v. Davis*, (4th Cir. 1993), struck down on due process grounds a Virginia requirement that voters provide Social Security numbers to register. Public disclosure of the social security numbers was not necessary to prevent fraud.

- BUT *McKay v. Thompson*, (6th Cir. 2000) rejected privacy challenges based to a Tennessee law requiring Social Security numbers for voter registration.

- NVRA permits requiring only the minimum information needed to prevent duplicate voter registration and determine eligibility. The distinction between the two cases appears to be between the use of Social Security numbers for internal purposes, which was deemed permissible, and the disclosure of those numbers to the public, which took place in Virginia.

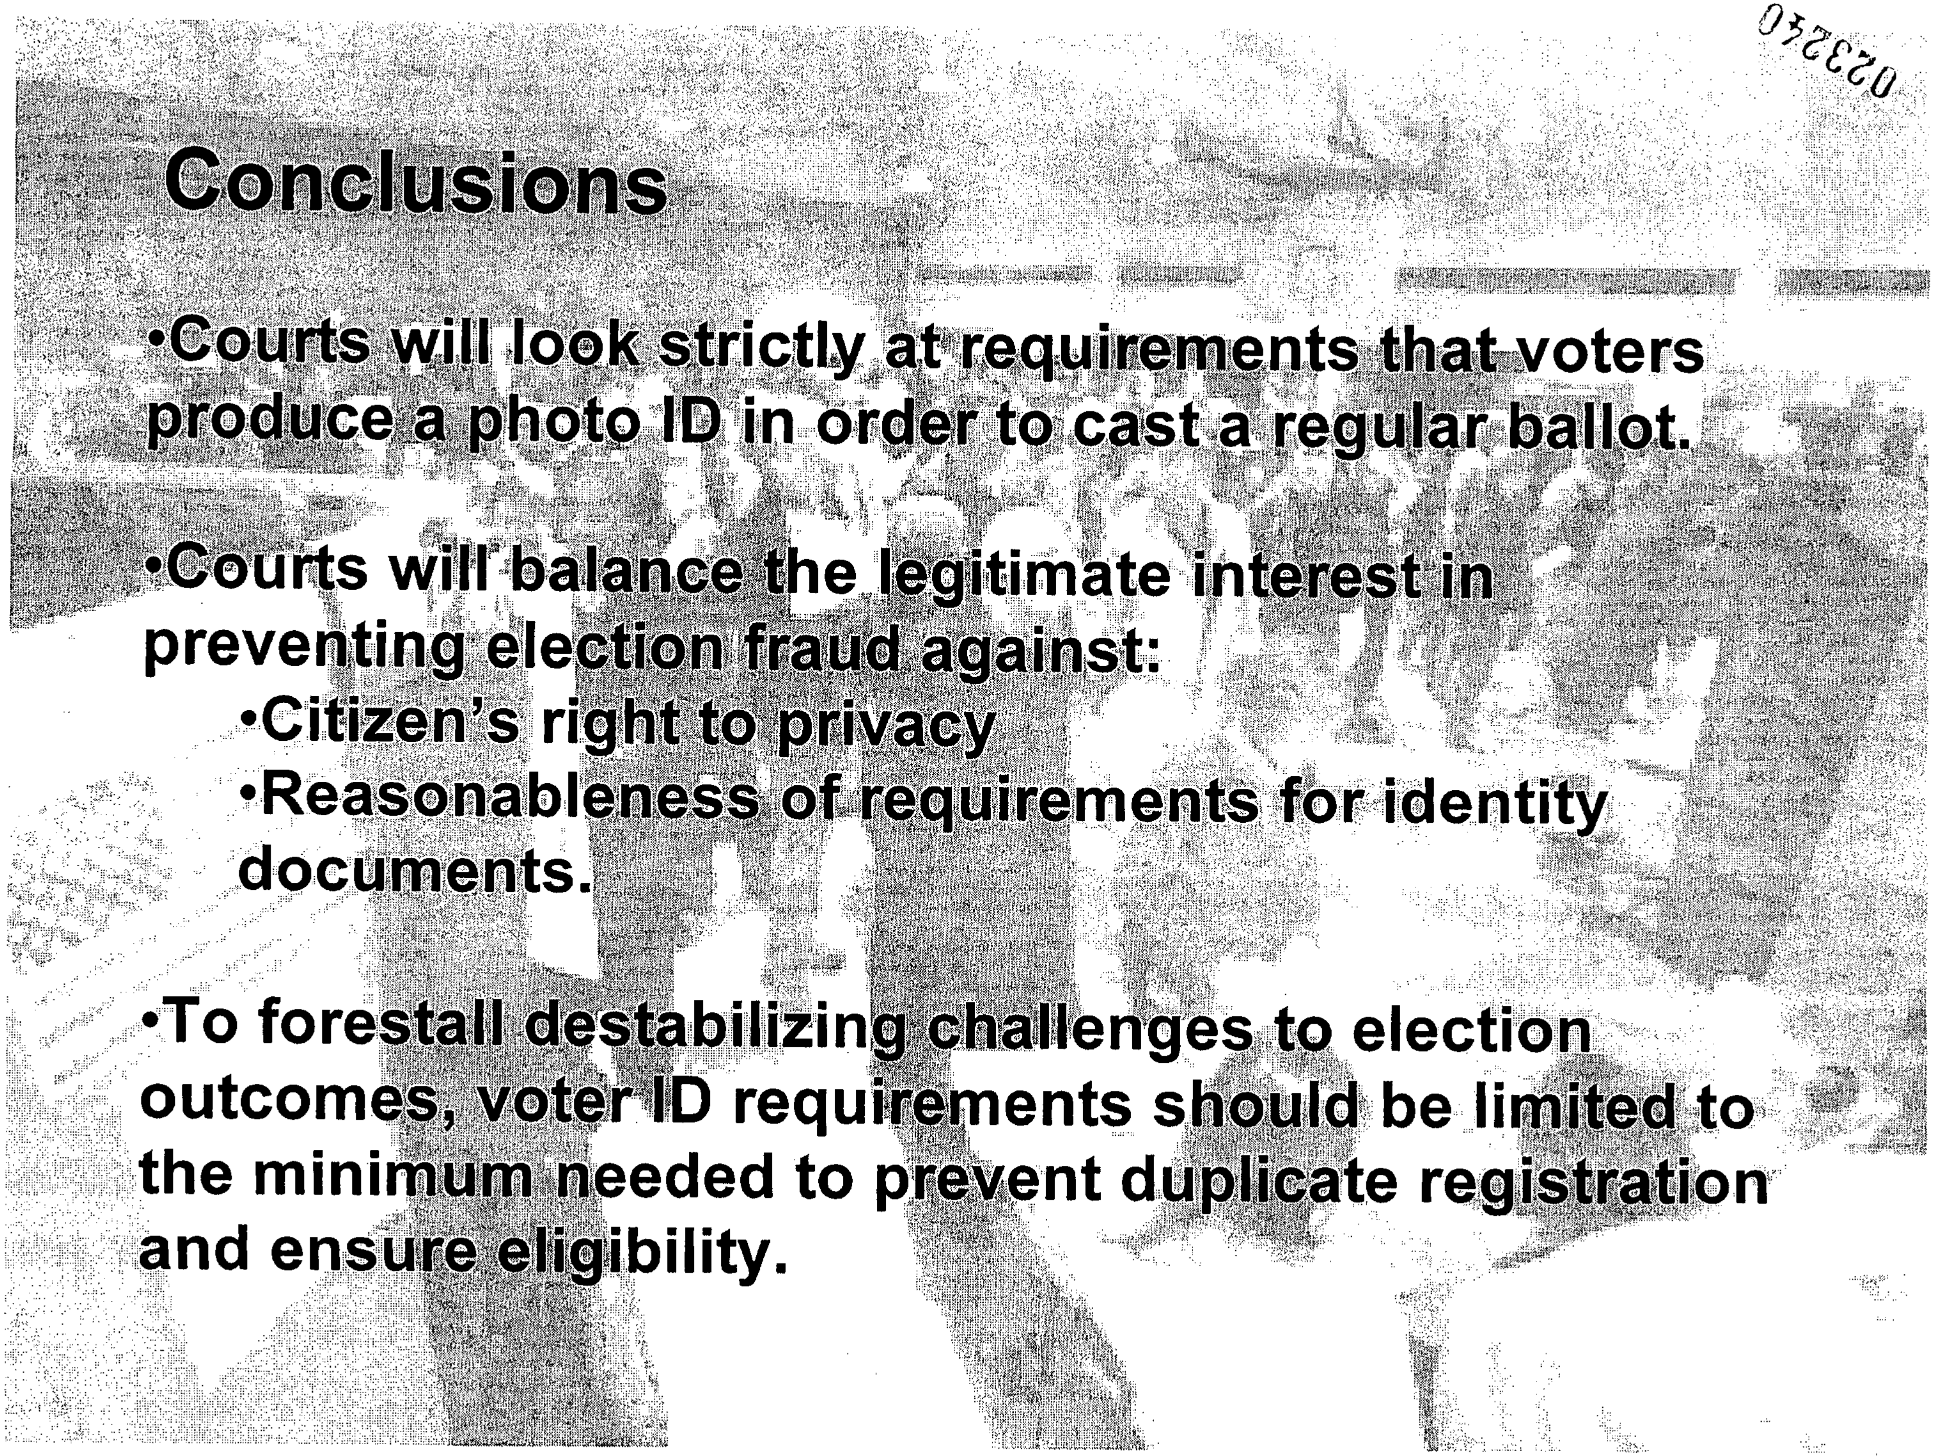
Privacy



- *Greidinger v. Davis*, (4th Cir. 1993), struck down on due process grounds a Virginia requirement that voters provide Social Security numbers to register. Public disclosure of the social security numbers was not necessary to prevent fraud.

- BUT *McKay v. Thompson*, (6th Cir. 2000) rejected privacy challenges based to a Tennessee law requiring Social Security numbers for voter registration.

- NVRA permits requiring only the minimum information needed to prevent duplicate voter registration and determine eligibility. The distinction between the two cases appears to be between the use of Social Security numbers for internal purposes, which was deemed permissible, and the disclosure of those numbers to the public, which took place in Virginia.

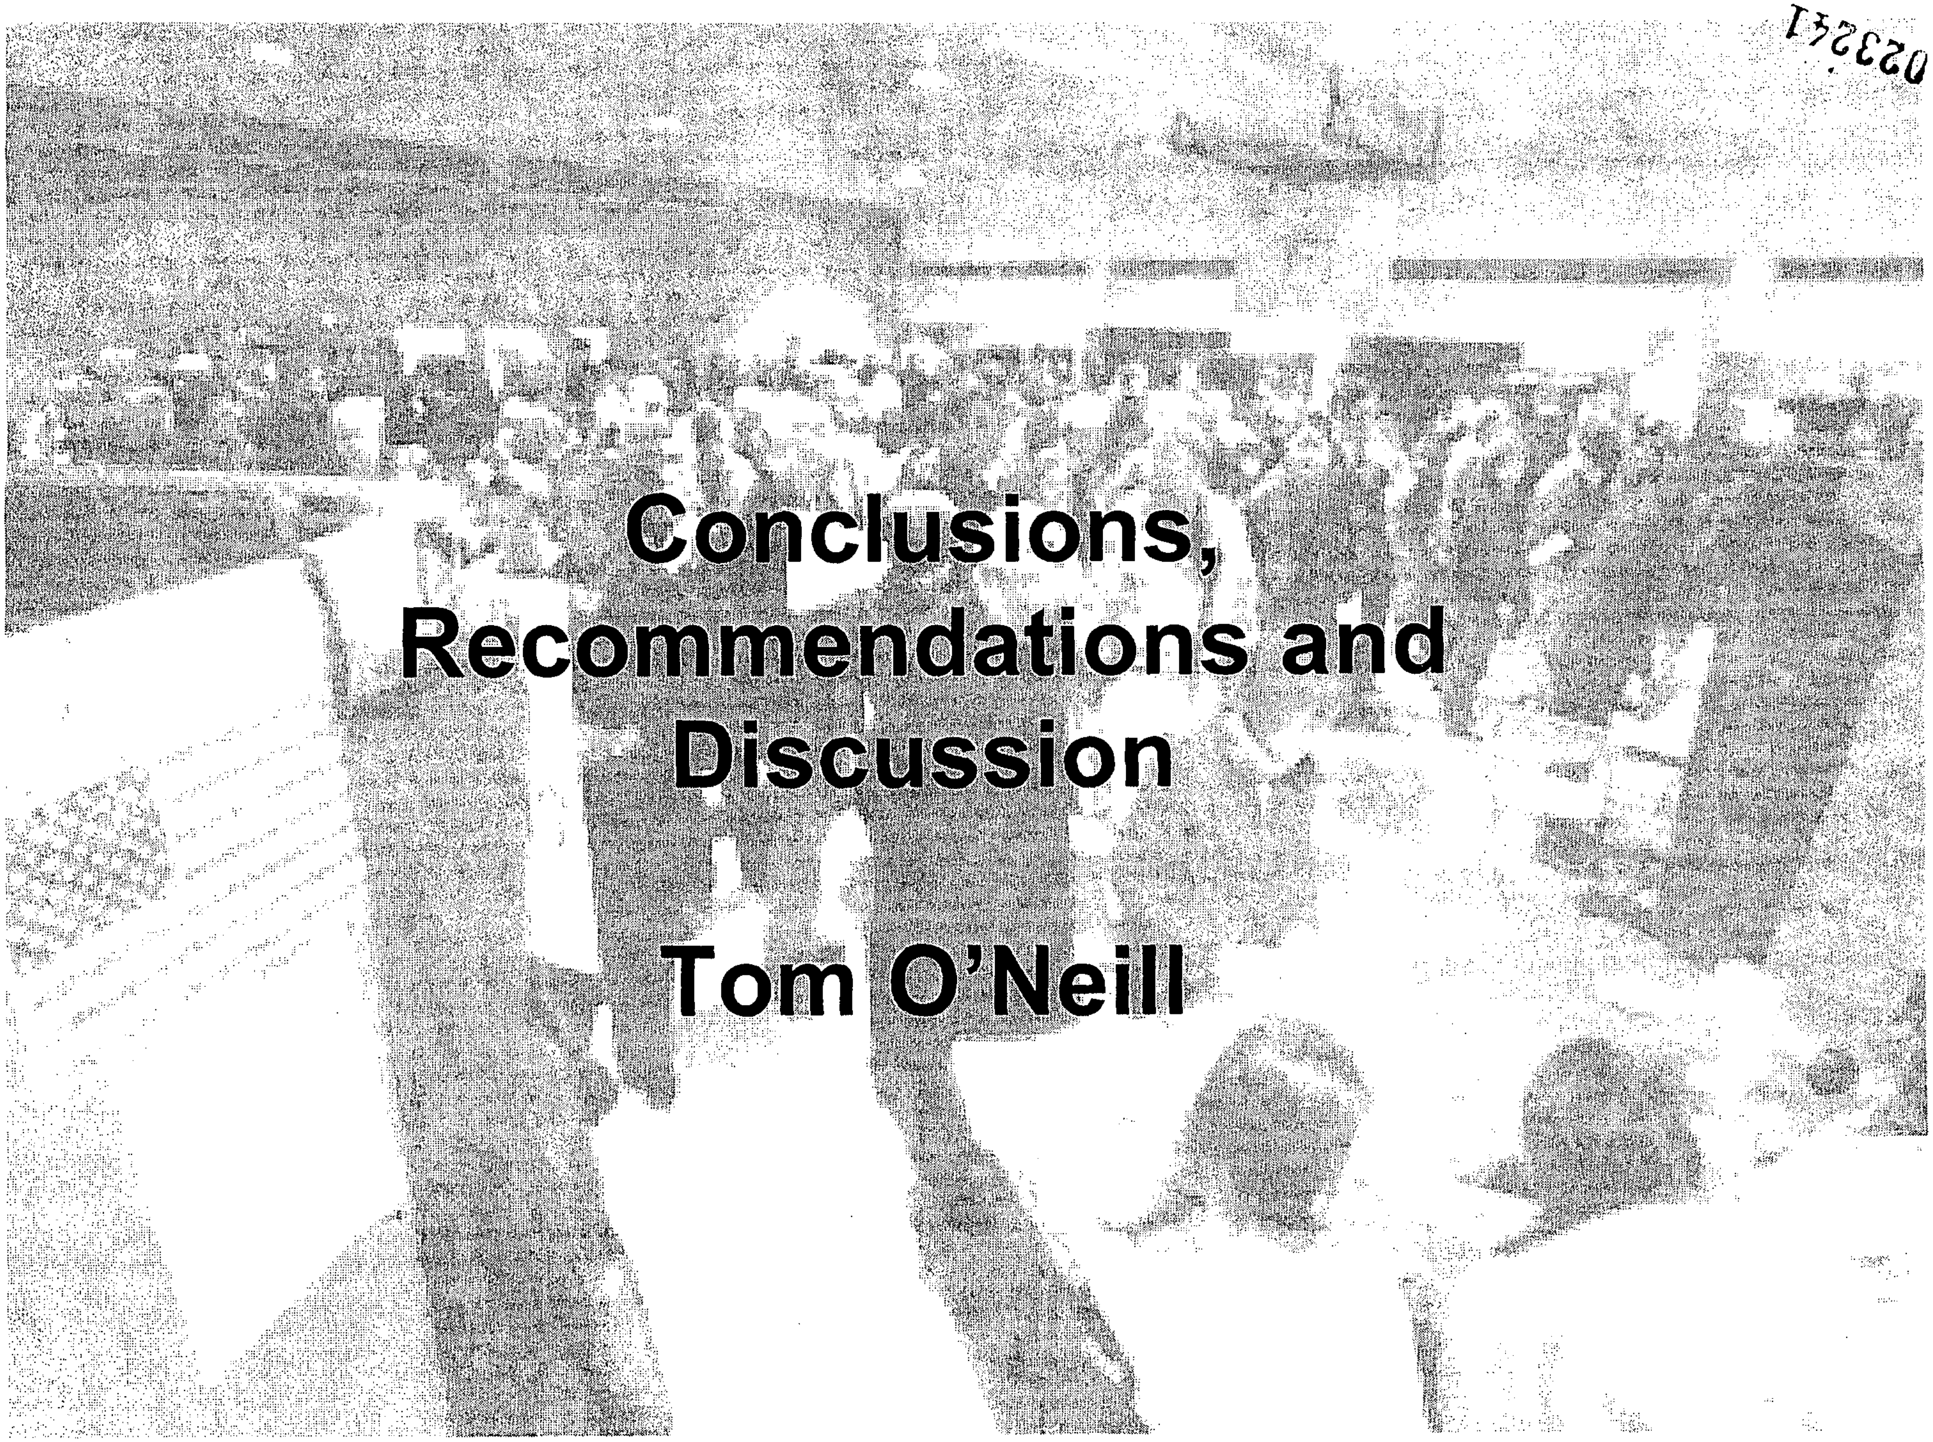


Conclusions

- Courts will look strictly at requirements that voters produce a photo ID in order to cast a regular ballot.

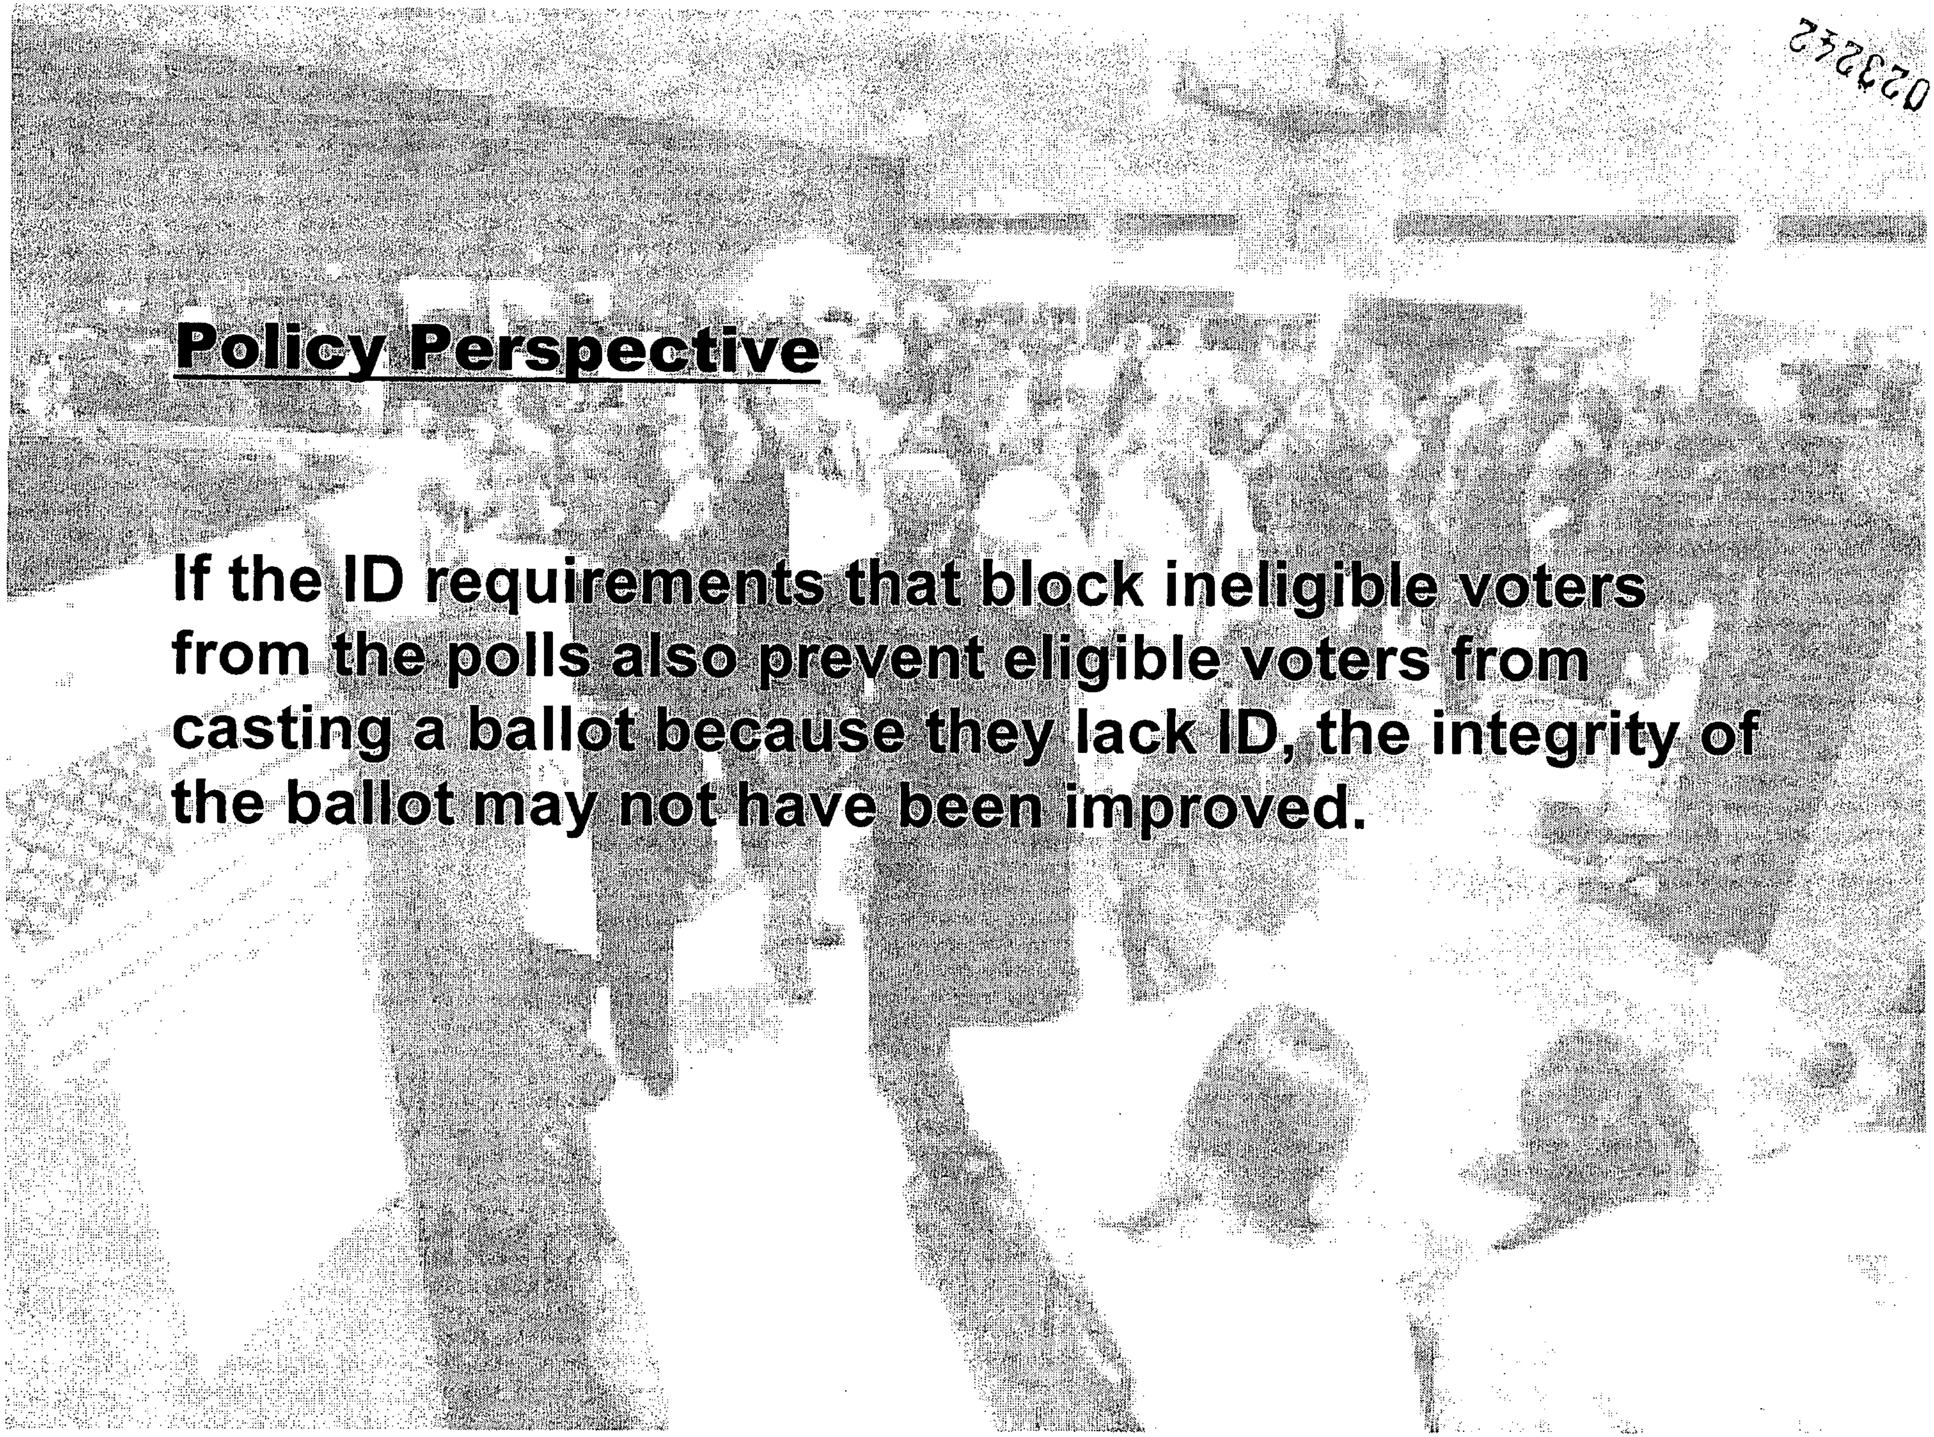
- Courts will balance the legitimate interest in preventing election fraud against:
  - Citizen's right to privacy
  - Reasonableness of requirements for identity documents.

- To forestall destabilizing challenges to election outcomes, voter ID requirements should be limited to the minimum needed to prevent duplicate registration and ensure eligibility.



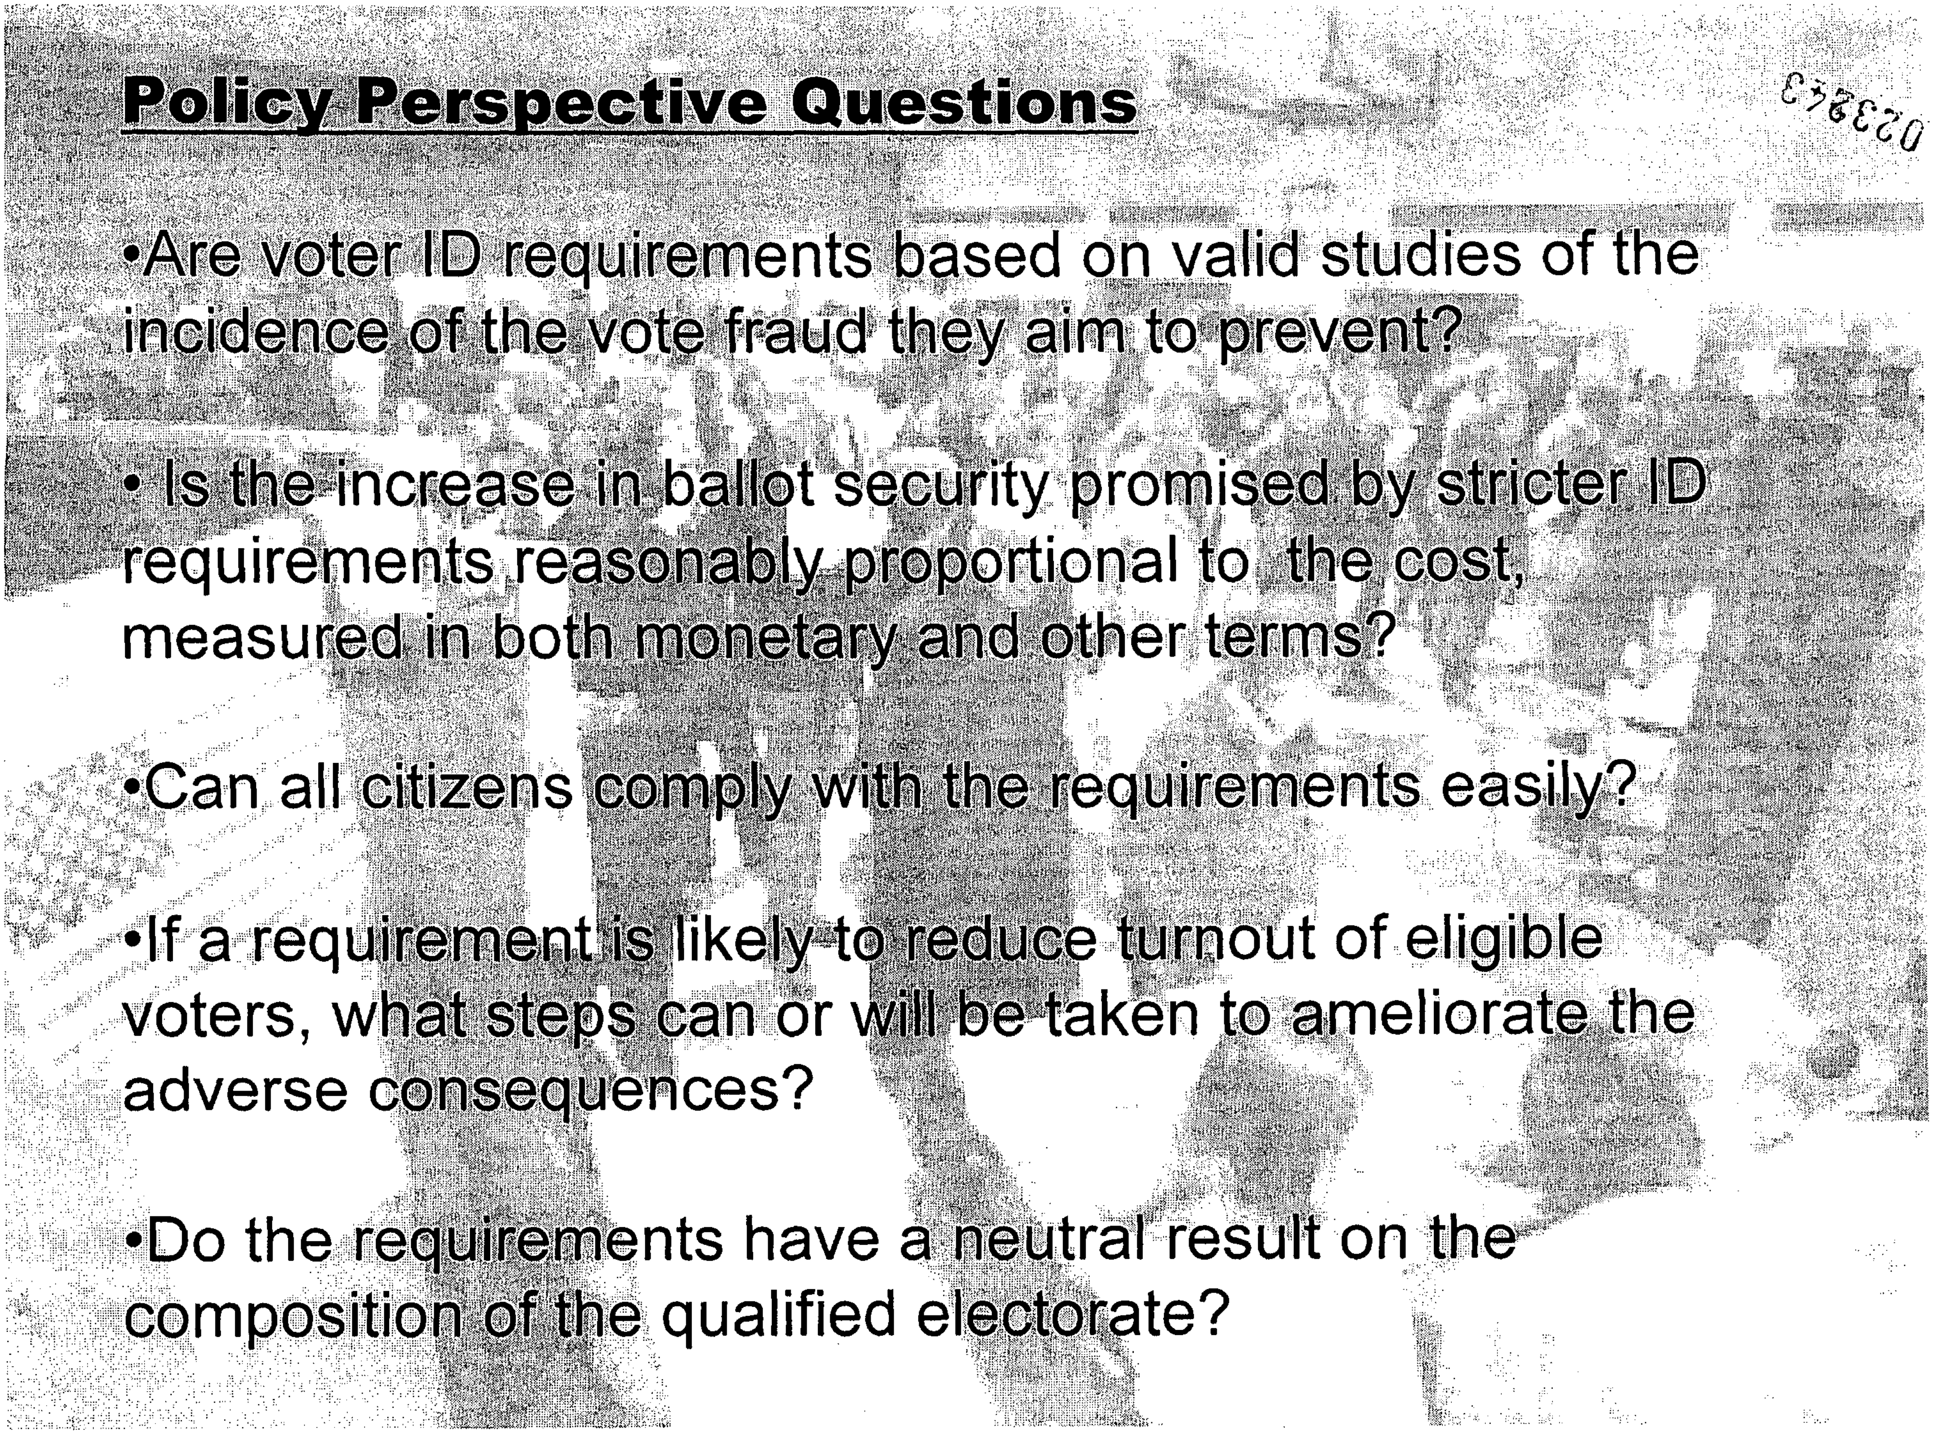
Conclusions, Recommendations and Discussion

Tom O'Neill



Policy Perspective

If the ID requirements that block ineligible voters from the polls also prevent eligible voters from casting a ballot because they lack ID, the integrity of the ballot may not have been improved.



Policy Perspective Questions

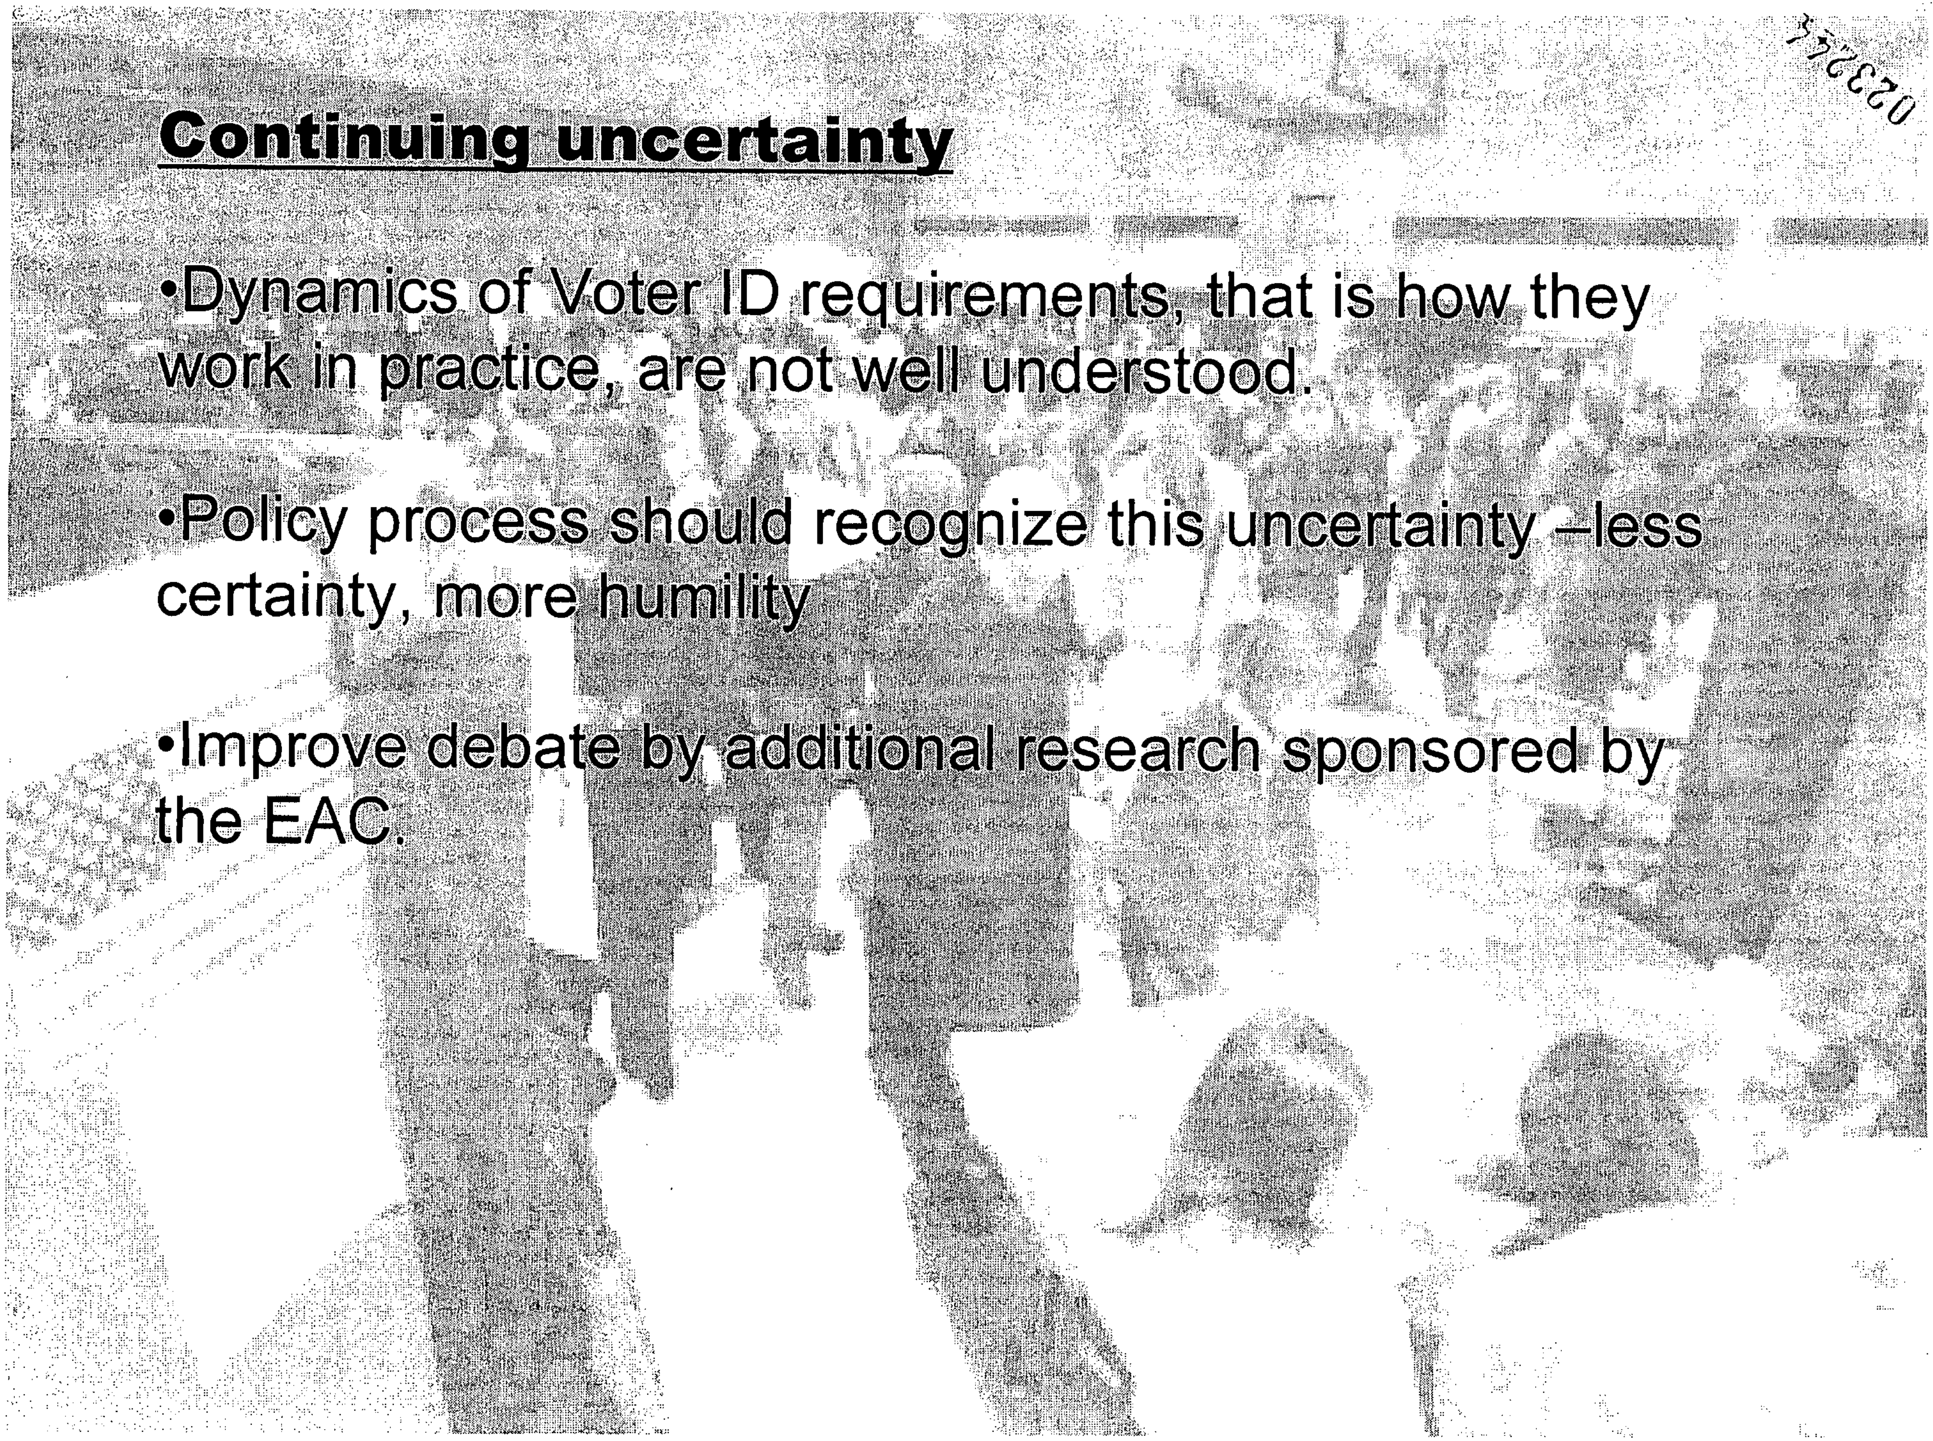
- Are voter ID requirements based on valid studies of the incidence of the vote fraud they aim to prevent?

- Is the increase in ballot security promised by stricter ID requirements reasonably proportional to the cost, measured in both monetary and other terms?

- Can all citizens comply with the requirements easily?

- If a requirement is likely to reduce turnout of eligible voters, what steps can or will be taken to ameliorate the adverse consequences?

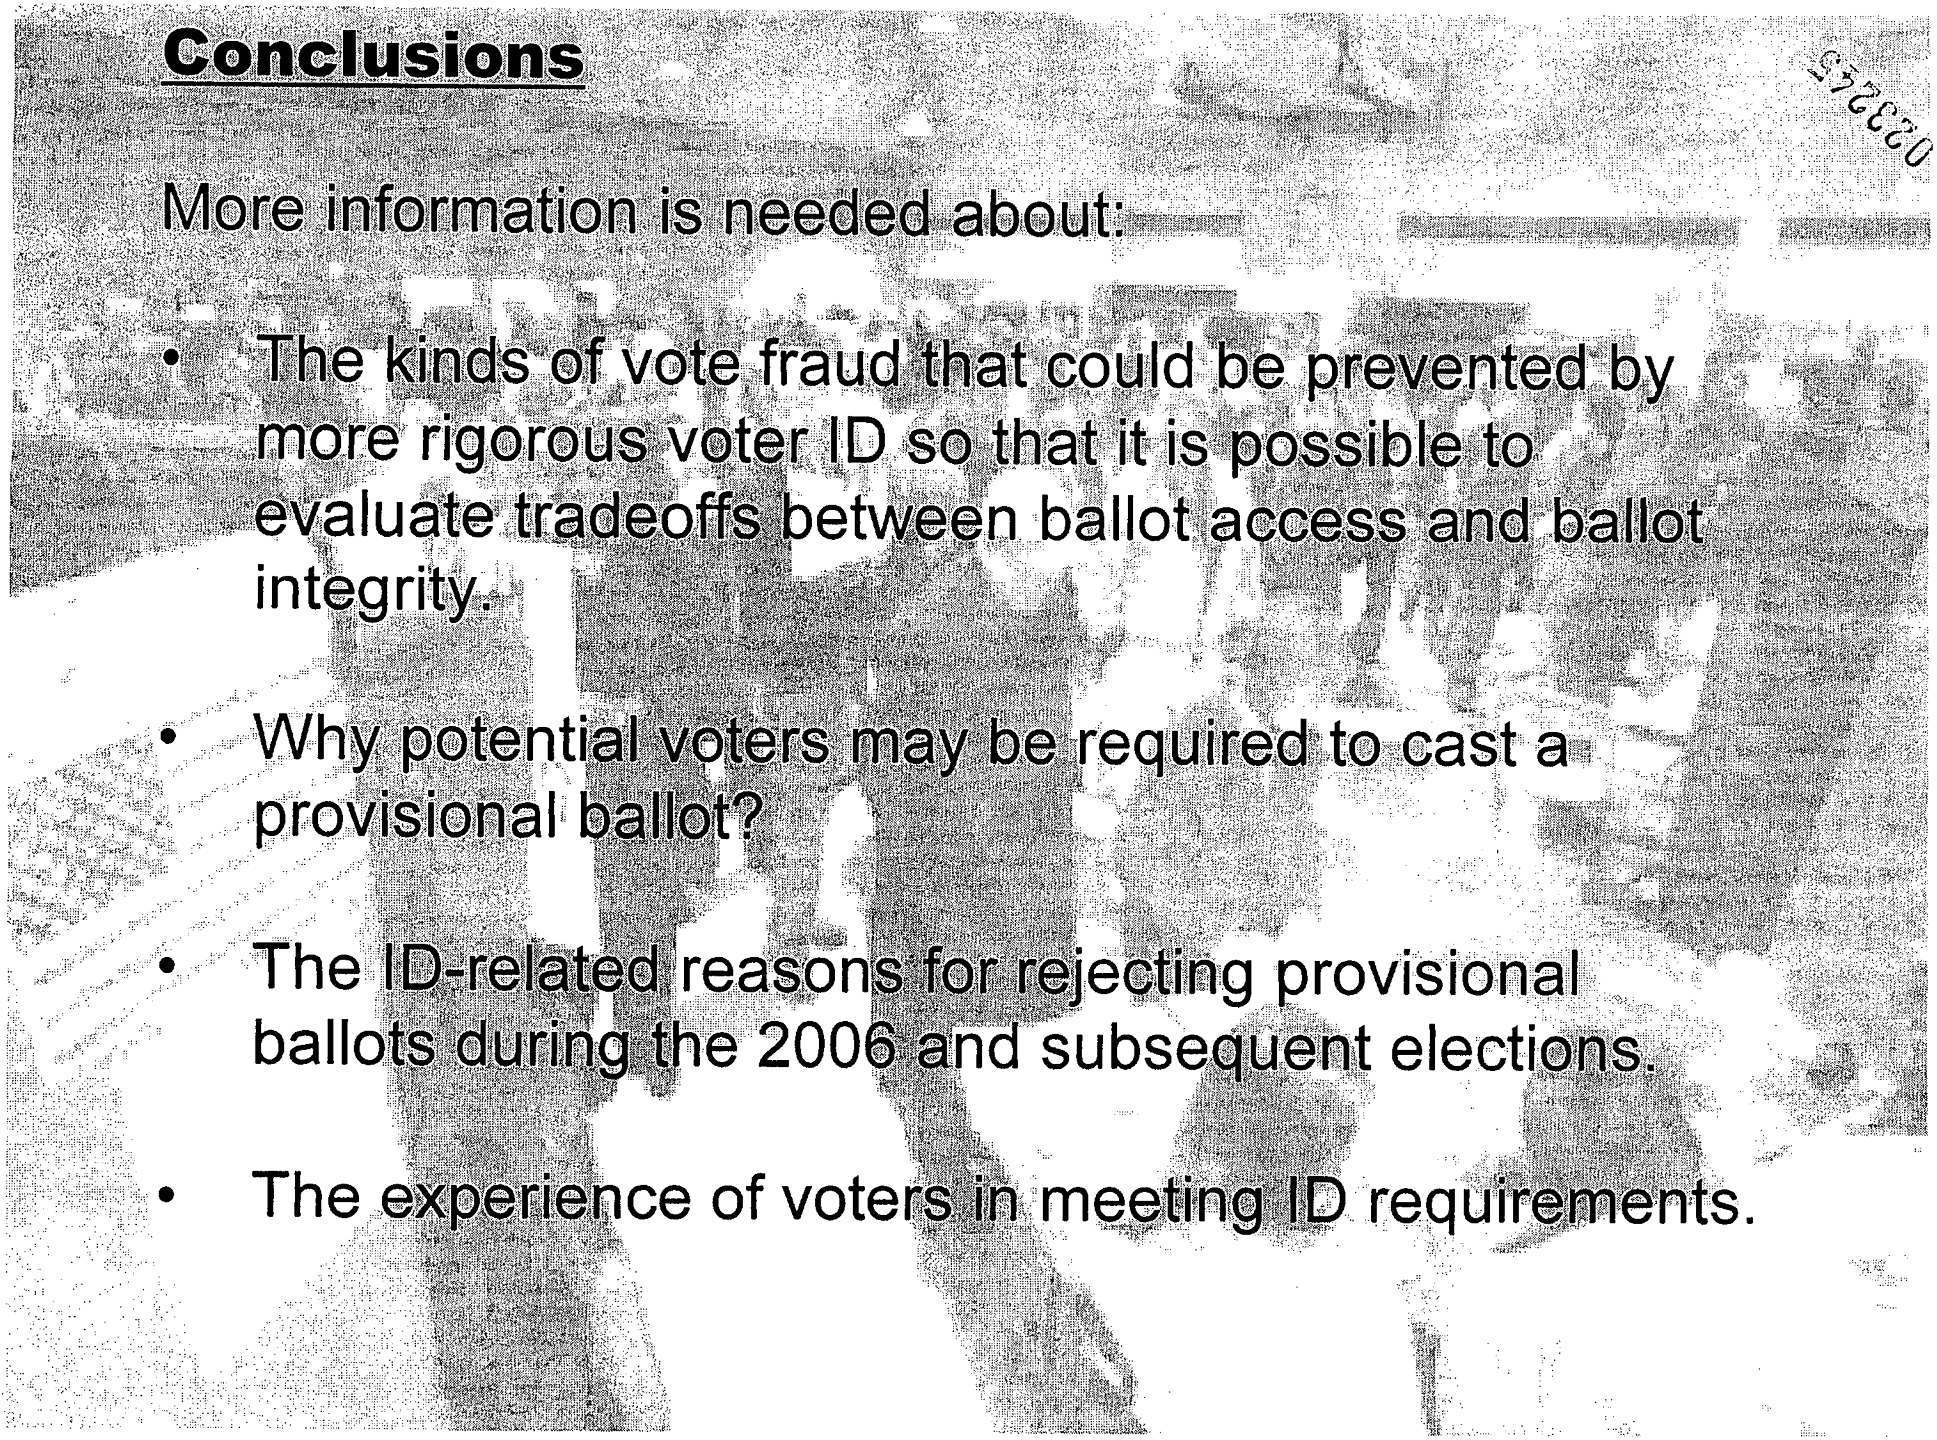
- Do the requirements have a neutral result on the composition of the qualified electorate?



Continuing uncertainty

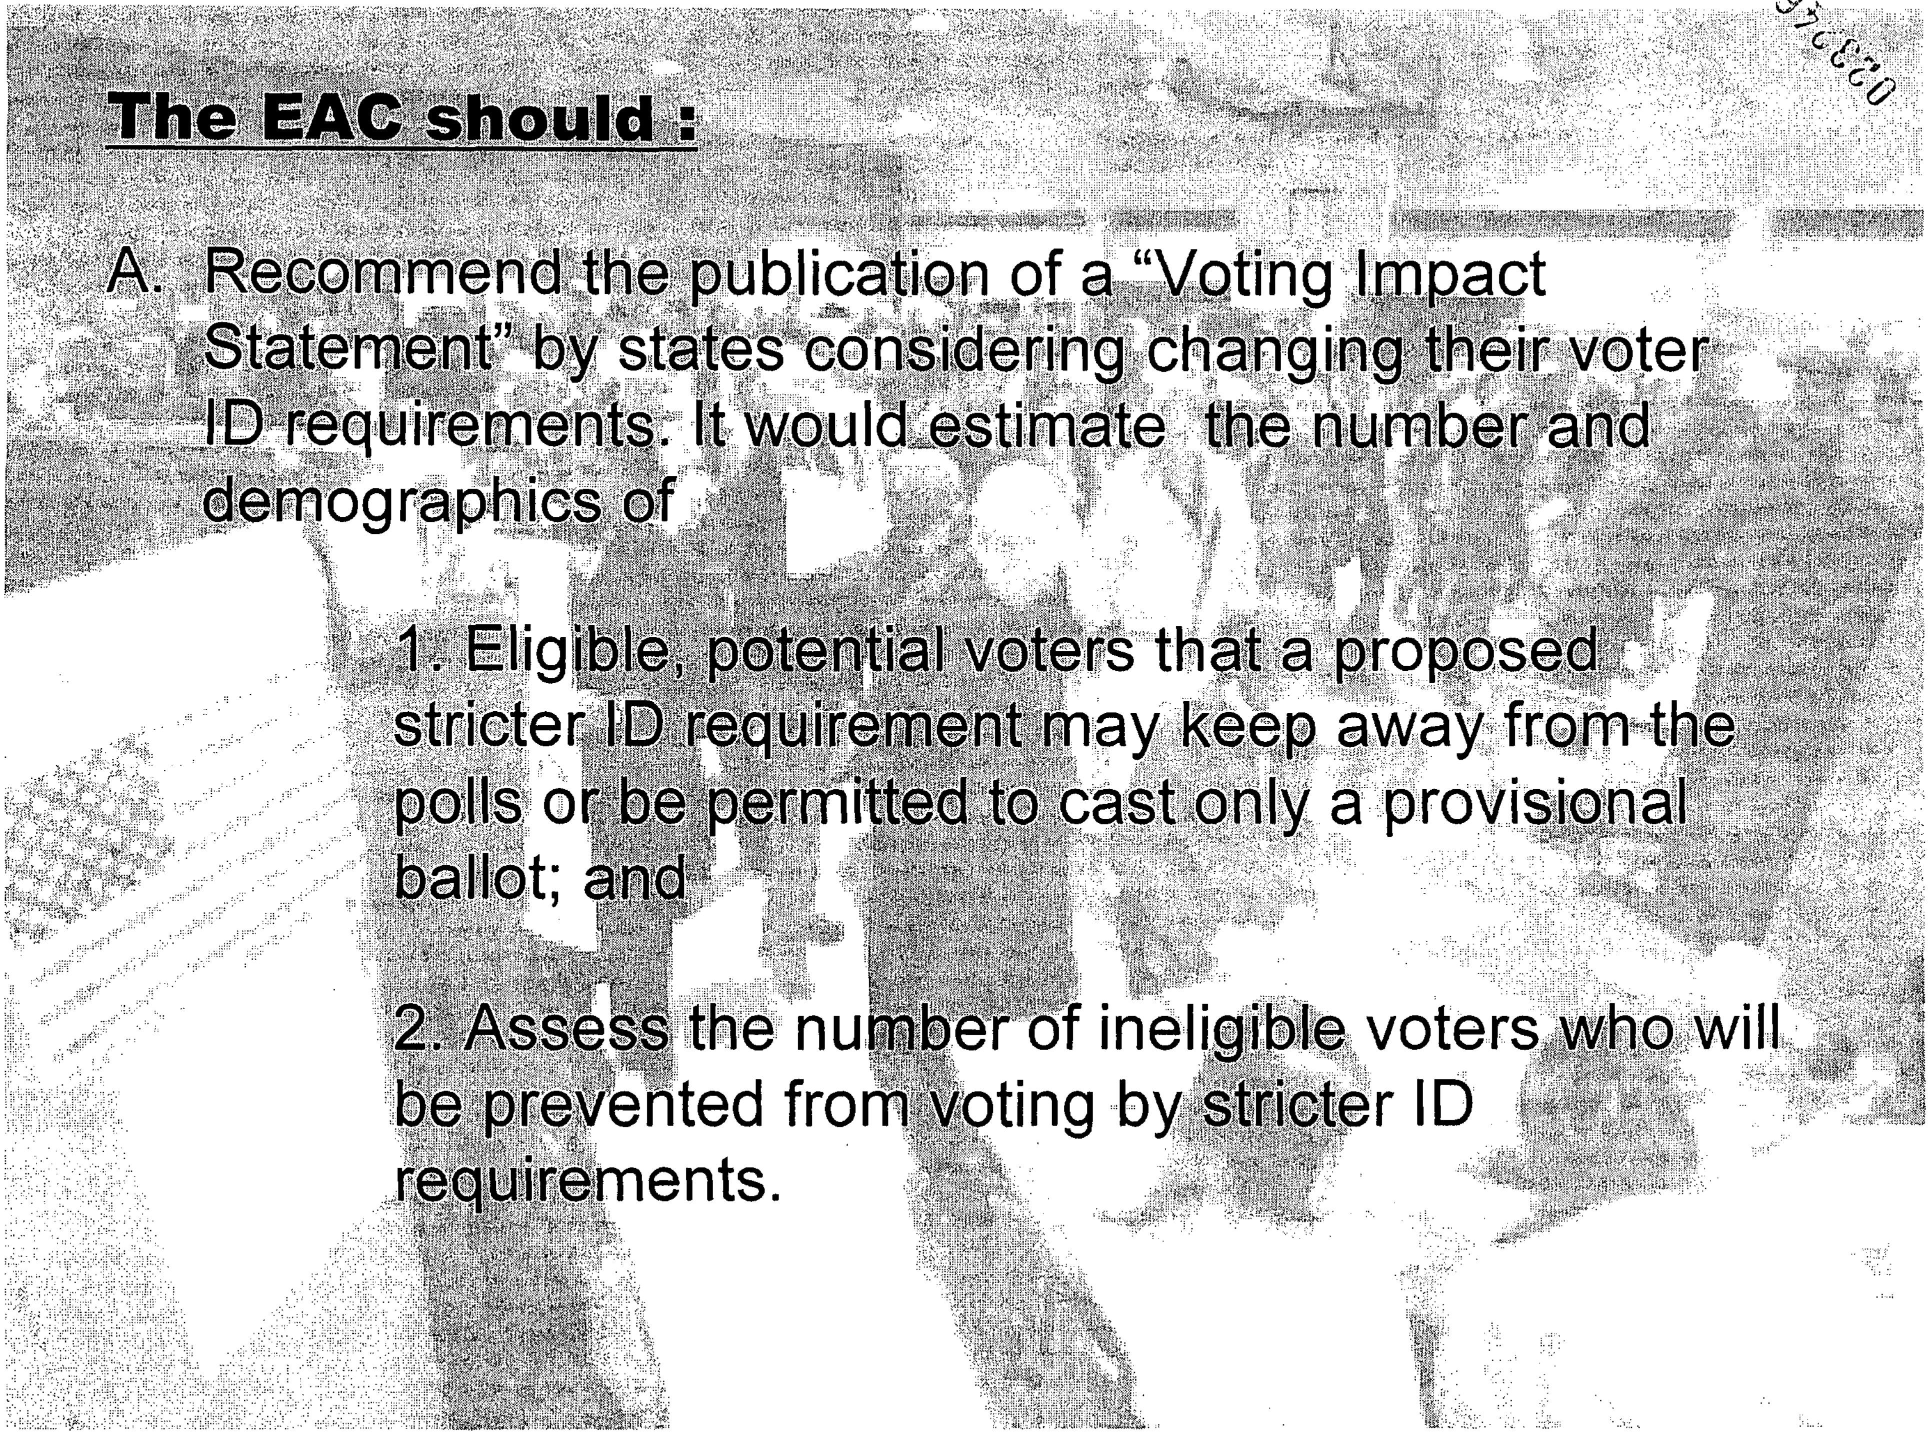
- Dynamics of Voter ID requirements, that is how they work in practice, are not well understood.
- Policy process should recognize this uncertainty –less certainty, more humility
- Improve debate by additional research sponsored by the EAC.

Conclusions



More information is needed about:

- The kinds of vote fraud that could be prevented by more rigorous voter ID so that it is possible to evaluate tradeoffs between ballot access and ballot integrity.
- Why potential voters may be required to cast a provisional ballot?
- The ID-related reasons for rejecting provisional ballots during the 2006 and subsequent elections.
- The experience of voters in meeting ID requirements.

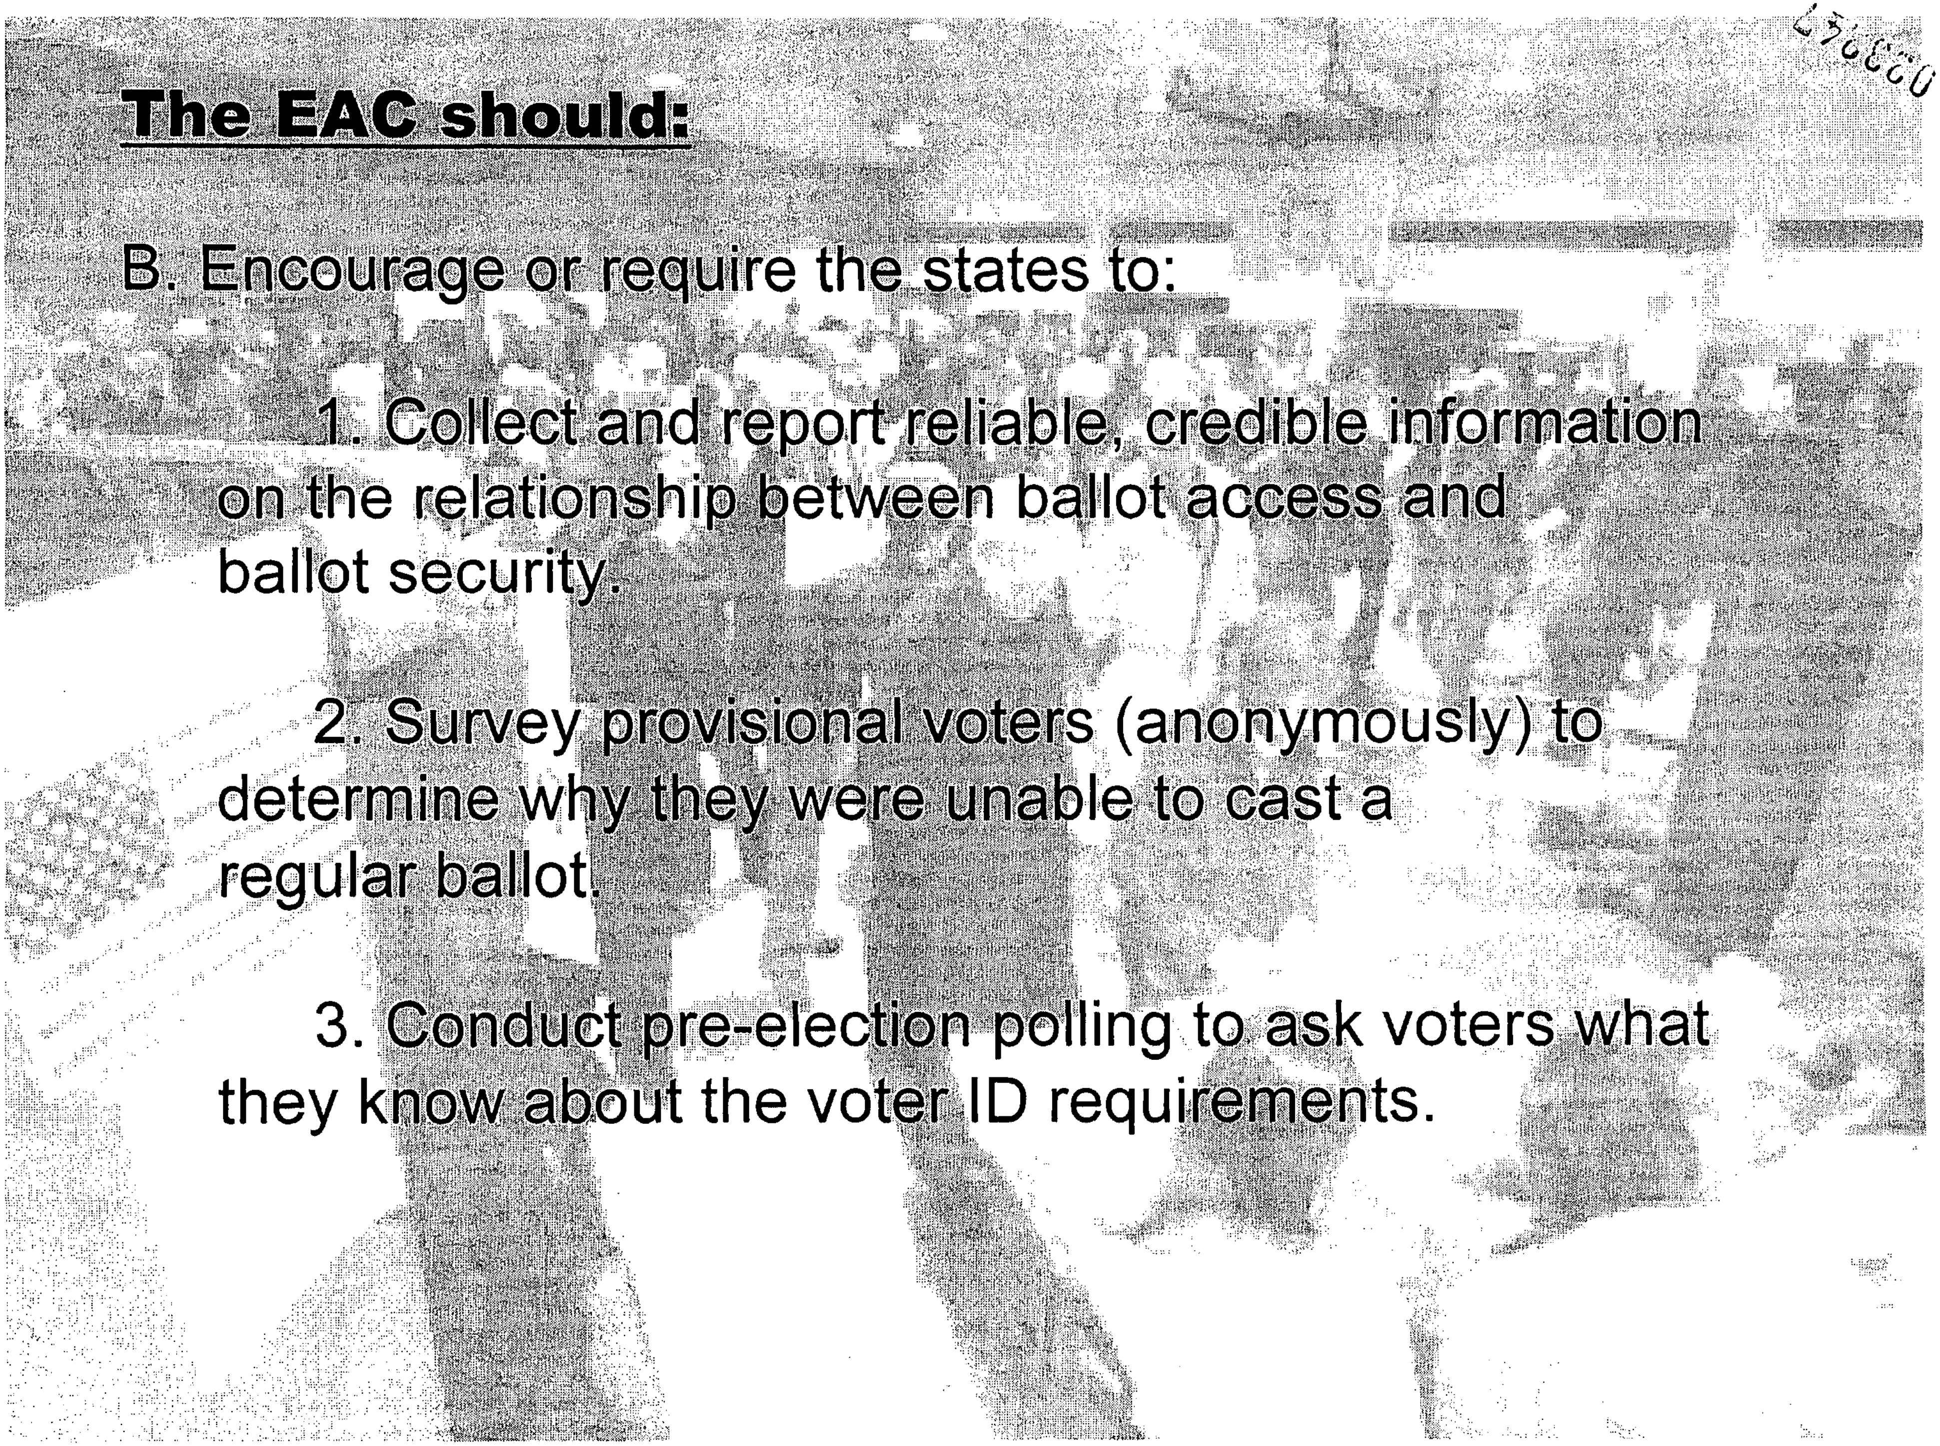


The EAC should :

A. Recommend the publication of a “Voting Impact Statement” by states considering changing their voter ID requirements. It would estimate the number and demographics of

1. Eligible, potential voters that a proposed stricter ID requirement may keep away from the polls or be permitted to cast only a provisional ballot; and

2. Assess the number of ineligible voters who will be prevented from voting by stricter ID requirements.



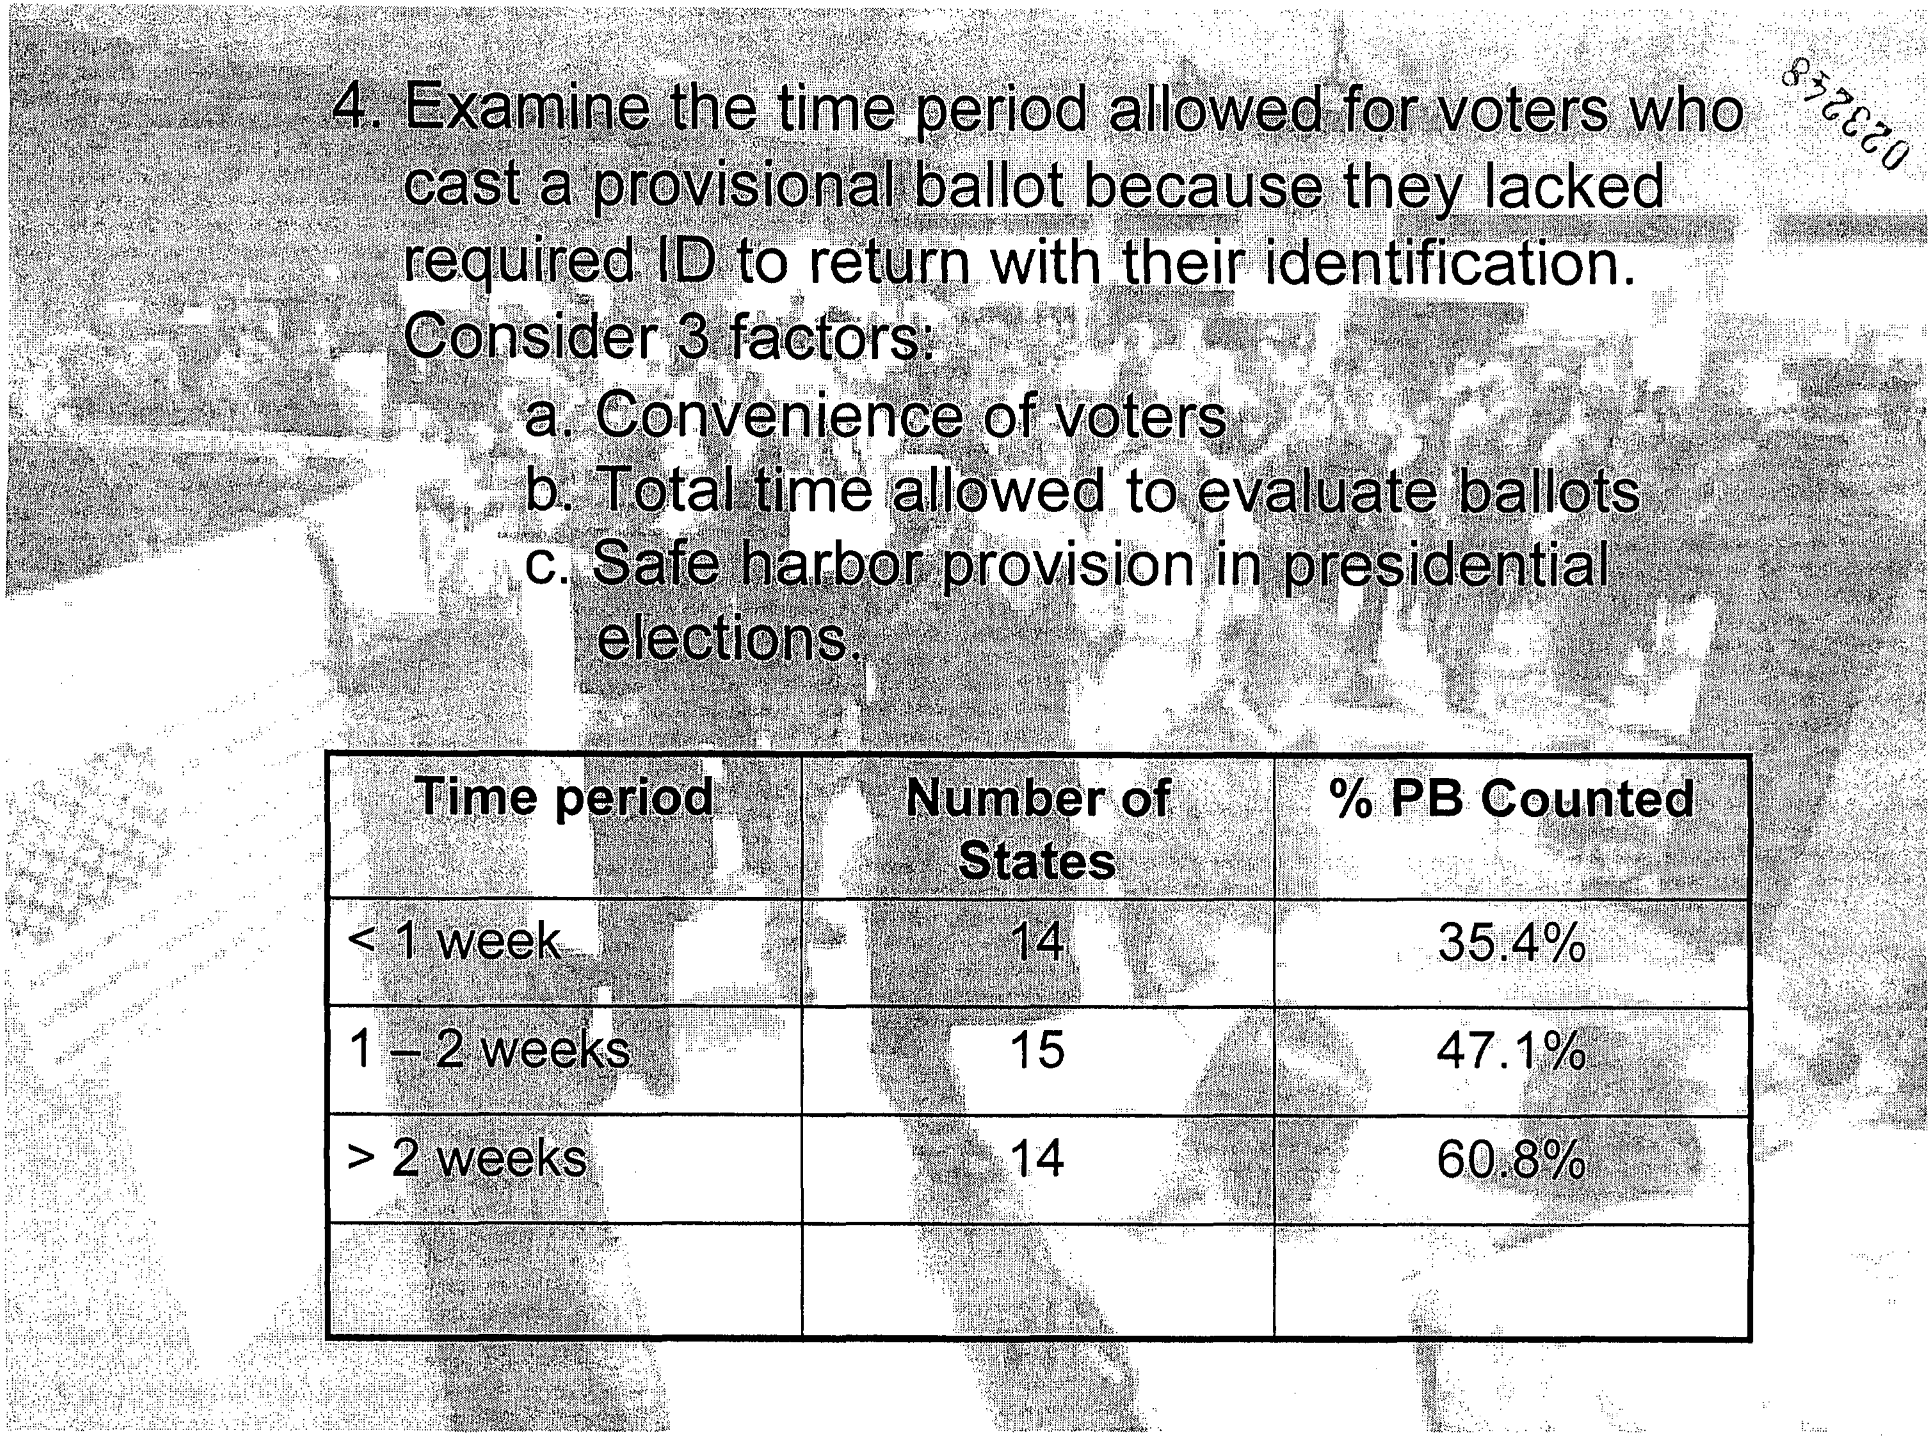
The EAC should:

B. Encourage or require the states to:

1. Collect and report reliable, credible information on the relationship between ballot access and ballot security.

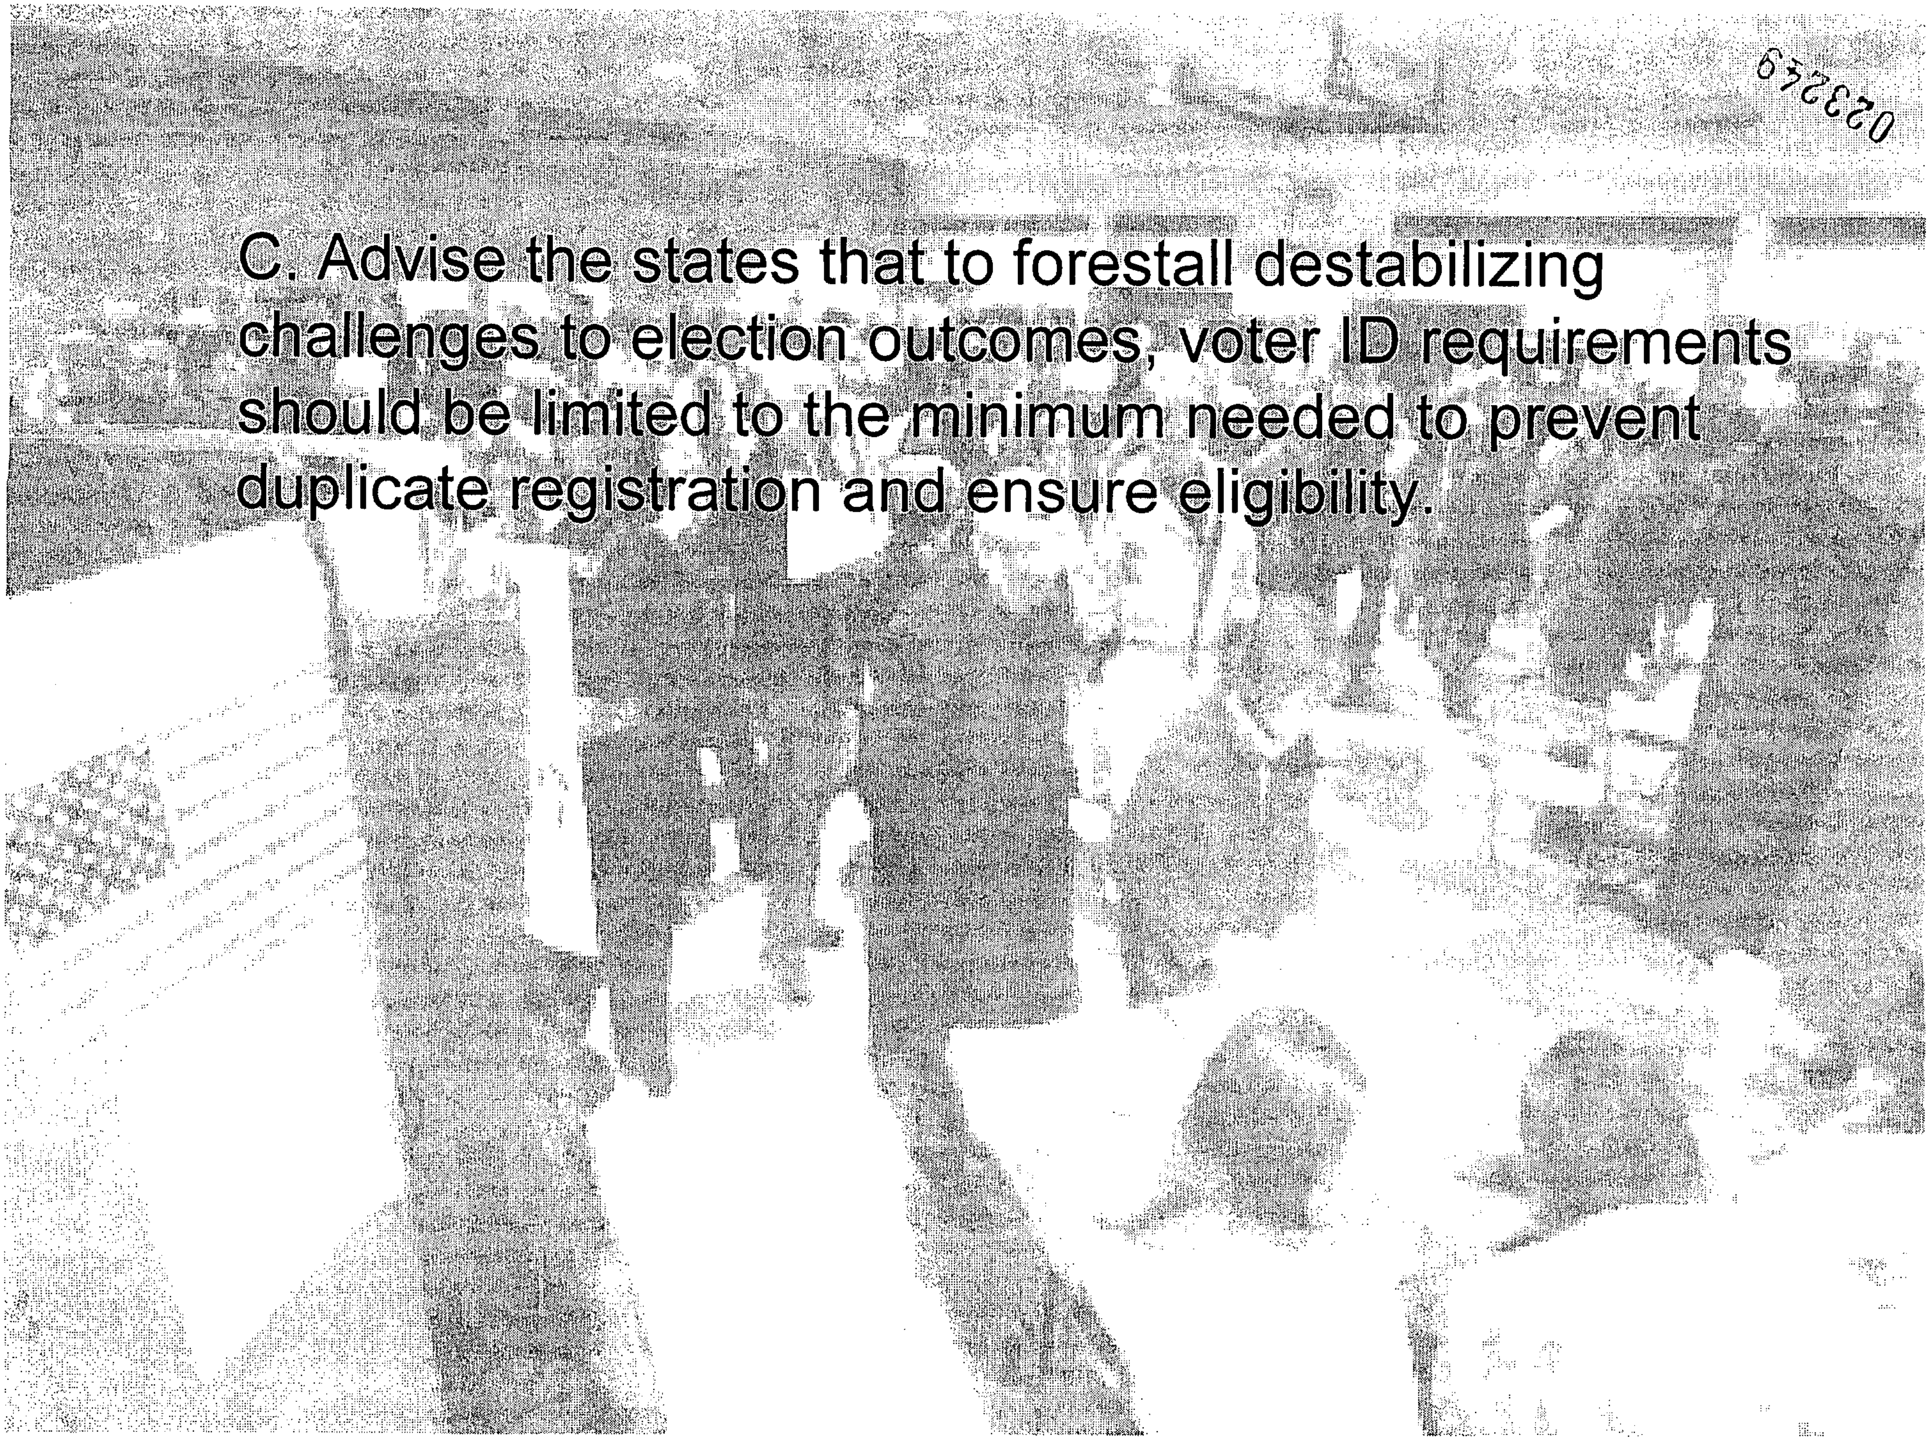
2. Survey provisional voters (anonymously) to determine why they were unable to cast a regular ballot.

3. Conduct pre-election polling to ask voters what they know about the voter ID requirements.



4. Examine the time period allowed for voters who cast a provisional ballot because they lacked required ID to return with their identification. Consider 3 factors:
   - a. Convenience of voters
   - b. Total time allowed to evaluate ballots
   - c. Safe harbor provision in presidential elections.

Time period	Number of States	% PB Counted
< 1 week	14	35.4%
1 – 2 weeks	15	47.1%
> 2 weeks	14	60.8%



C. Advise the states that to forestall destabilizing challenges to election outcomes, voter ID requirements should be limited to the minimum needed to prevent duplicate registration and ensure eligibility.

Subject Revised Voter ID Paper

Karen,

Attached is a new draft of the Voter ID paper, revised to take into account the comments you gave us on Tuesday as well as some points raised recently by other reviewers. We'll be bringing hard copies of this draft with us to Monday's briefing. If you could distribute the new "Executive Summary" (pages 1 – 5) in advance to those who will take part in the meeting on Monday, I think the discussion would be improved.

Our train is scheduled to get into Union Station at 10:30 on Monday. Barring Amtrak delays, we should arrive at your offices shortly before 11.

FINAL DRAFT REPORT AND RECOMMENDATIONS TO THE EAC VOTER IDENTIFICATION ISSUES

Report Background

This report to the United States Election Assistance Commission (EAC) presents an analysis of voter identification requirements across the country and makes recommendations for best practices to improve implementation of voter ID requirements at the polls. It is based on research conducted by the Eagleton Institute of Politics at Rutgers, the State University of New Jersey, and the Moritz College of Law at Ohio State University under a contract to the EAC, dated May 24, 2005. The research included a review and legal analysis of state statutes, regulations and litigation concerning voter identification and provisional voting, a sample survey of local election officials, and a statistical analysis of the effects of various requirements for voter identification on turnout in the 2004 election. This report is a companion to a report on Provisional Voting submitted to the EAC on November 28, 2005 under the same contract.

The Help America Vote Act of 2002 (HAVA) (Public Law 107-252) authorizes the EAC (Sec. 241, 42 USC 15381) to conduct periodic studies of election administration issues. The purpose of these studies is to promote methods for voting and administering elections, including provisional voting, that are convenient, accessible and easy to use; that yield accurate, secure and expeditious voting systems; that afford each registered and eligible voter an equal opportunity to vote and to have that vote counted; and that are efficient.

Executive Summary

Methods

To explore the effects of voter ID requirements on electoral participation in 2004, as measured by turnout, we gathered information on the requirements in effect in the 50 states and the District of Columbia in that year. We assigned each state to one of five categories based on its ID requirements. The five categories are progressively more rigorous based on the demands they make on both voters[1] (and, to some extent) on election workers. The categories range from "Stating Name" which we judge to be somewhat less demanding than "Signing Name." "Signature Match" requires poll workers to examine the signature and compare it to a sample,

---

[1] Even the most relaxed provisions for identification at the polls — anything stricter than the honor system used in North Dakota — will impose some burden on particular voters. *Harvard Law Review* 119:1146

which is slightly more demanding that the voter simply signing. "Present ID" requires voters to offer some documentary evidence of their identity, ranging from a utility bill to a passport. It is more demanding than the previous three categories because it requires that the voter remember to bring this documentation to the polls. (Even a simple ID, such as a utility bill, may not be available to some renters or, say, those in group housing.) We regard a government "Photo ID" as the most rigorous requirement. Such identity documents are not uniformly and conveniently available to all voters.

We collected data on turnout in all counties to permit an estimate of the relationship between the rigor of the ID requirements and the level of turnout. This aggregate analysis is useful, but does not provide valid estimates on the effects of different kinds of ID requirements on particular demographic groups (e.g., the old, the young, African-Americans, the poor, or high school graduates.) To allow that analysis, we used the Census Bureau's Current Population Survey from November 2004, which asked a large sample of Americans about their experience in the election. It has the disadvantage of relying on self reports by respondents about their registration status, citizenship, and experience in the polling place, but it provides the demographic data needed to supplement the aggregate analysis.

To understand the legal issues raised by voter ID requirements, we collected and analyzed the few major cases that have been decided on this issue. The decisions so far suggest the constitutional and other constraints to policies on voter ID requirements.

Findings

The form of Voter ID required of voters affects turnout. Lack of ID can keep voters from the polls. Or, when they go to the polls, it is reasonable to conclude that stricter Voter ID requirements will divert more voters into the line for provisional ballots. (This conclusion is a conjecture because we lack precise information on why voters must cast their ballots provisionally.) The result can be longer lines at the polls and confusion, without a clear demonstration that the security of the ballot is correspondingly increased.

Voter turnout at the state level in 2004 was lower in states where voter identification requirements were more demanding. While the trend is not perfectly linear, the data show a general movement toward lower turnout as requirements tend toward requiring greater levels of proof. An average of 63.1 percent of the voting age population turned out in states that required voters to state their names, compared to 57.3 percent in states that required photo identification. Those figures, however, probably overstate the effect since the inclusion of other factors beyond voter ID requirements in the analysis diminishes the extent of influence of voter ID on turnout. After taking account of the other factors, the analysis still offers some support for the hypothesis that as the burden of voter identification requirements increases, turnout declines. The effect is particularly noticeable in counties with concentrations of Hispanic residents orf people living below the poverty line.

Our analysis of litigation suggests that the courts will look strictly at requirements that voters produce a photo ID in order to cast a regular ballot. The courts have used a balancing test to weigh the legitimate interest in preventing election fraud against the citizen's right to privacy (protecting social security numbers from public disclosure, for example) and the reasonableness of requirements for identity documents. To provide both the clarity and certainty in administration of elections needed to forestall destabilizing challenges to outcomes, best practice for the states may be to limit requirements for voter identification to the minimum needed to prevent duplicate registration and ensure eligibility.

Evidence on the incidence of vote fraud, especially on the kind of vote fraud that could be reduced by requiring more rigorous voter identification is not now sufficient to evaluate the tradeoffs between ensuring ballot access and ensuring ballot integrity. The lack of full understanding of the dynamics of voter ID requirements on political participation can be remedied by requiring the collection and reporting of data on the reasons potential voters are required to cast a provisional ballot and the reasons for rejecting provisional ballots during the 2006 and subsequent elections. Also useful would be the results of exit polling of voters on their experiences in meeting voter ID requirements and on what type of ballot they cast.[2] And, of course, more information is needed on the incidence and varieties of vote fraud, but that inquiry is outside the scope of this report.

A voting system that requires voters to produce an identify document or documents may indeed prevent the ineligible from voting. It may also prevent eligible voters from casting a ballot. If the

---

[2] Arizona held its first election with new, stricter ID requirements on March 14, 2006. In at least one county (Maricopa) election officials handed a survey to voters that asked if they knew about the voter identification law and if they did, how they found out about it. Edythe Jensen, "New Voter ID Law Goes Smoothly in Chandler," *Arizona Republic*, March 15, 2006. More surveys of this kind can illuminate the dynamics of voter ID and voting in ways not possible with the current lack of information on this subject.

ID requirement of a ballot protection system blocks ineligible voters from the polls at the cost of preventing eligible voters who lack the required forms of identification, the integrity of the ballot may not have been improved; the harm may be as great as the benefit.

Recommendations for consideration and action by the EAC

The dynamics of Voter ID requirements –how more rigorous Voter ID requirements affect the decision by potential voters to go or stay away from the polls– are not well understood. This lack of understanding should be recognized in the policy process in the states. The debate over voter ID in the states would be improved by additional research sponsored by the EAC.

The EAC should consider the following actions to improve understanding of the relationship between voter ID requirements, broadly defined, and the two important goals of ensuring ballot access and ensuring ballot integrity.

- Encourage or sponsor further research to clarify the connection between Voter ID requirements and the number of potential voters actually able to cast a ballot.
- Recommend as a best practice the publication of a "Voting Impact Statement" by states considering changing their voter ID requirements to protect the integrity of the ballot. The analysis will help ensure that efforts to increase ballot security have a neutral effect on electoral participation by eligible voters. The Voter Impact Statement would estimate the number and demographics of 1) eligible, potential voters that a proposed stricter ID requirement may keep away from the polls or be permitted to cast only a provisional ballot; and 2) and assess the number of ineligible voters who will be prevented from voting by the stricter ID requirements.
- Encourage or require the states in the 2006 election and beyond, to collect and report reliable, credible information on the relationship between ballot access and ballot security. EAC should analyze this publish an analysis of this information to provide a sound estimate of the incidence of the kinds of vote fraud that more stringent ID requirements may prevent. The analysis should describe the dynamics of the voter ID process in preserving the security of the ballot. The states should also be encouraged to use this information to increase the effectiveness of programs to ensure that all eligible voters have required ID and are permitted to vote in future elections.
    - Useful information could be supplied by exit polling or surveys of voters by local election officials. It would make clear why those who cast a provisional ballot

were found ineligible to cast a regular ballot. The answers would illuminate the frequency with which ID issues divert voters into the provisional ballot line.

  - Polling to ask voters what they know about the voter id requirements would also provide useful context for evaluating the effect of various voter ID requirements on electoral participation.

- Encourage states to examine the time period allowed for voters who cast a provisional ballot because they lacked required ID to return with their identification. In eleven states, voters who had to cast a provisional ballot because they lacked the ID required for a regular ballot were permitted to return later with their ID. Their provision of this ID is the critical step in evaluating the ballots. The length of the period in which the voter may return with ID is important. In setting the time period for return, which now varies among the states from the same day to about two weeks, states should consider three factors: the convenience of the voter, the total time allowed to evaluate ballots[3], and the safe harbor provision in presidential elections.
- Recommendations to the states from EAC should reflect current judicial trends. Requirements that voters provide some identifying documentation have been upheld, where photo ID is *not* the only acceptable form. Whether laws requiring photo ID will be upheld is more doubtful. To date, only one court has considered a law requiring voters to show photo ID (*Common Cause v. Billups*), and that court concluded that this requirement is likely unconstitutional.

Background and Approach of the Study

Establishing the eligibility of a person to vote has long been part of the electoral process. Voters may have to identify themselves twice in the electoral process: when registering to vote and then when casting a ballot. The stress on voters to provide required ID documents may be greater at the polls on Election Day than when registering. The pressures arising from the need to check ID, even so simple a check as a signature match, can be greater at the polls on Election Day than at the time of registration. Poll workers may be faced with long lines and limited time.

---

[3] Our research on provisional voting reveals that states that provide more than week to evaluate provisional ballots end up counting substantially more of those ballots than states that provide less than a week.

This analysis focuses on ID requirements on Election Day, but with an appreciation that the ID requirements at time of registration and on Election Day are inter-related. [4] The emphasis in this report is on Voter ID requirements on Election Day and afterwards as election judges evaluate provisional ballots. This is the critical period for the electoral system, the time when ballot access and ballot security are in the most sensitive balance.

The report looks broadly at voter ID issues and goes beyond the rather narrow identification requirements in HAVA. Much of the current debate in state legislatures on voter ID goes ranges beyond HAVA to require more rigorous documentation of identity for all would-be voters, not just those who had not registered in person and are casting a ballot for the first time. The controversy in the states over voter ID seems to have been sparked in part by the HAVA requirements, but goes beyond those requirements, and sets the context for the analysis here.[5]

We recognize that the previously technical, rather dull subject of voter ID requirements has become fiercely partisan and divisive in many states. The polarization of the debate has raised the stakes over this issue, making dispassionate analysis both more valuable and more rare.[6] Voter ID is often described as the critical step in protecting the integrity of the ballot, the process to ensure that the potential voter is eligible and , if eligible, is permitted to cast one ballot and one ballot only. Truly protecting the integrity of the ballot, however, requires a perspective that takes in the entire voting process. It demands more than preventing the ineligible from voting, and should also ensure that all those who are eligible and want to vote can cast a ballot that counts. The protection effort must embrace all forms of voting, including absentee ballots, and consider each step in the process from registration through vote counting.

---

[4] As the Carter-Baker Commission noted, photo ID requirements for in-person voting do little to address the problem of fraudulent registration by mail, especially in states that do not require third-party organizations that register voters to verify ID. Commission on Federal Election Reform, pp 46-47.

[5] Harvard Law Review 119:1127: "Legislators hoping to stiffen their state antifraud laws have taken their cue from identification provisions buried in HAVA."

[6] "Of the various electoral procedure laws passed in the fifty states since the 2000 and 2004 presidential elections and those still being debated in state legislatures and local media, few arouse more potent partisan feelings than voter identification laws." *Harvard Law Review* 119:1144. John Fund's 2004 book, *Stealing Elections: How Voter Fraud Threaten Our Democracy*, cites (pages 16 – 17) a Rasmussen Research poll that asked respondents if they were more concerned with voting by ineligible participants or with disenfranchisement of eligible voters. Sixty-two percent of Kerry supporters, but only 18 percent of Bush supporters, worried more about *disenfranchisement*; 58 percent of Bush supporters, but only 19 percent of Kerry supporters were more concerned with *voter fraud*.

A voting system that requires voters to produce an identity document or documents may prevent the ineligible from voting. It may also prevent the eligible from casting a ballot. If the ID requirements block ineligible voters from the polls at the cost of preventing eligible voters who cannot obtain or have left at home the required forms of identification, the integrity of the ballot may not have been improved; the harm may be as great as the benefit.

Assessing the effectiveness of voter ID as a way to protect the integrity of the ballot should logically include an estimate of the nature and frequency of vote fraud. The EAC has informed us that it has commissioned a separate analysis of the incidence of vote fraud. Consequently, this research does not include consideration of vote fraud nor the possible effectiveness of various voter ID regimes to counter attempts at vote fraud. As a result, our analysis of the effects of voter ID requirements on turnout cannot take into account how many potential voters who did not turn out under comparatively stricter voter ID requirements might have been ineligible or eligible to vote.

In some states, voters lacking required ID, or who have ID that does not reflect their current address, are able to vote only by casting a provisional ballot.[7] Voter ID requirements that require voters to bring a document to the polls --rather than simply sign their names-- can divert more voters to the provisional ballot. Requiring poll workers to request and check ID, can put stress on the already demanding environment of the polling place. Scrutiny of ID can create lines at the polling places. Further delays can result when voters cast a provisional ballot and fill out the ballot envelope. Voters who cast a provisional ballot because they lack their ID on Election Day, and who then fail to return with the needed document or documents, will have their ballot rejected.[8] And, of course, the cost of processing provisional ballots is greater than the cost of regular ballots.

Each of these potential consequences of more elaborate voter identification processes can increase the chance of litigation. Long lines will, at best, discourage voters and at worst make voting seem a hassle, an impression that could keep more citizens (even those with ID) from the

---

[7] For example, the Florida voter ID law adopted after the 2004 election and pre-cleared by the Department of Justice, permits voters who cannot meet the ID requirements to sign an affidavit on the envelope of a provisional ballot, which will be counted if the signature matches that on the voter's registration form.

[8] The EAC's Election Day Study found "improper ID," to be the third most common reason for a provisional ballot to be rejected. "Improper ID" was cited by 7 states responding to the survey, compared to 14 mentions for voting in the wrong precinct. *Election Day Study*, Chapter 6, p. 5.

polls. In conducting this analysis, we were sensitive to the observation that the problem with American elections may well be that too many people do not vote rather than that a few people may vote more than once.

An evaluation of the effect of different Voter ID regimes can be more effective if based on clear standards --legal, equitable, practical. The standards suggested here can best be described as the set of questions to be asked about Voter ID requirements. We suggest 7 questions that try to measure the most important dimensions of the problem.

1. Is the Voter ID system designed on the basis of valid and reliable, empirical studies of the incidence of the sorts of vote fraud it is designed to prevent?[9]
2. How effective is the ID requirement in increasing the security of the ballot? How well can it be coordinated with a statewide voter database?[10]
3. How practical is the requirement? Can it be administered smoothly by the staff and budget likely to be made available? How much additional training of polling place workers might be required? Is it simple enough or can it be defined with sufficient clarity that poll workers throughout the state can administer it uniformly and with a minimum of local interpretation made on the fly under the pressure of Election Day?[11]
4. How cost-effective is the system? Does it demonstrably increase the security of the ballot affordably, measured in both monetary and other costs? To improve understanding of the non-monetary component of the costs, conducting a voter impact study might be appropriate. The voter impact study would examine, before the adoption of the regulation, the cost of compliance by the voter (such as the cost in time and money of acquiring a photo ID card), any offsetting benefits to voters, and the possible disparate effects of the regulation on various groups of voters.[12] A thorough, objective

---

[9] "Often where the battle over voter identification is most heated, real evidence of voter fraud proves scarce: in Georgia, for example, the Secretary of State averred that she had never encountered a single instance of voter impersonation at the polls. State laws might sometimes impose tighter restrictions on in-person voting than on absentee ballots, which yield the greatest incidence of, and provide the easiest avenue for, voter fraud. . ." Harvard Law Review 127:1144 (2006)

[10] See the final section of this report for a brief overview of possible effects of a statewide voter database on voter identification issues.

[11] In New York, in 2004, disparities in training and voting information were made apparent in a study finding elections officials had wildly varying interpretations of what the state's voter identification requirement actually was. Tova Wang, "Warning Bell in Ohio," December 5, 2005. Website, the Foundation for National Progress.

[12] "Absent clear empirical evidence demonstrating widespread individual voter fraud, legislatures need to fashion narrowly tailored voter identification provisions with an eye toward the inevitable and well-grounded constitutional challenges that will arise in the courts. Only as states grow more adept at

impact statement that demonstrated the nexus between the identification regime and the integrity of the ballot could provide protection against inevitable legal challenges.

5. If a side effect of the Voter ID regulation is likely to reduce turnout, generally or among particular groups, is it possible to take other steps to ameliorate the adverse consequences?[13]
6. Does it comply with the letter and spirit of Voting Rights Act?
7. The seventh question is the most difficult to answer. Does the Voter ID requirement have a neutral result on the composition of the qualified and eligible electorate? ID requirements should not be designed to, or unintentionally, reduce the turnout of particular groups of voters or supporters of one party or another. Whatever the requirement may be, can all citizens comply with it easily and at no or minimal cost?

Voter ID and Turnout

As of the 2004 election, the states and the District of Columbia could be divided into 5 different Voter ID regimes. These are shown in Table 1, *Voter ID Requirements*. Nine states required that voters give their names; 14 that they sign their names; 8 match the signature to a sample in the registration book; 15 require some form of ID (ranging from a utility bill to a government-issued photo ID), and 5 states in 2004 required a photo ID, although in all those states voters without that credential could cast a regular ballot after signing an affidavit concerning their identity and eligibility or provide other forms of ID.

This neat assignment in the following table and map of each state to one category no doubt fails to reflect actual practice at many polling places. Like any system run by fallible people, the voter ID process is subject to wide variation in practice. Voters may be confronted with demands for identification different from the directives in state statutes or regulation. Some voters may be waved through the process without a look at any document, no matter what the regulations say. Under the press of long lines and unfamiliar requirements, there is, in short, no sure way to report the wide variety of conditions voters actually encounter.

---

administering elections will courts likely demonstrate greater willingness to uphold strict identification requirements." Harvard Law Review 127:1144 (2006)

[13] For example, the Carter-Baker Commission coupled its recommendation for a national voter ID card to a call for an affirmative effort by the states to reach out and register the unregistered, that is, to use the new Voter ID regime as a means to enroll more voters. Similarly, Richard Hasen Hasen's has suggested combining a national voter ID with universal registration. See his "Beyond the Margin of Litigation: Reforming U.S. Election Administration to Avoid Electoral Meltdown," 62 Washington and Lee Law Review 937 (2005).

TABLE 1 -- Voter ID Requirements

State	Forms of ID Required 2004	Current ID Requirement for First-Time Voters	Current ID Requirements for All Other Voters	Verification Method for Provisional Ballots
Alabama	Provide ID	Provide ID	Provide ID	Address & Registration

Wyoming	Give Name	HAVA	Give Name	Affidavit

^In Florida and Louisiana, states that required a photo id in 2004, voters without that credential could sign an affidavit concerning their identity and eligibility and cast a regular ballot.

^^In these states in 2004, voters lacking a photo ID could vote by providing other ID.

*Arizona voters who lack a photo ID may present 2 forms of ID with no photograph, such as 2 utility bills.

**State only requires ID for first-time voters who register by mail without providing ID. They accept all forms of ID listed in the statute.

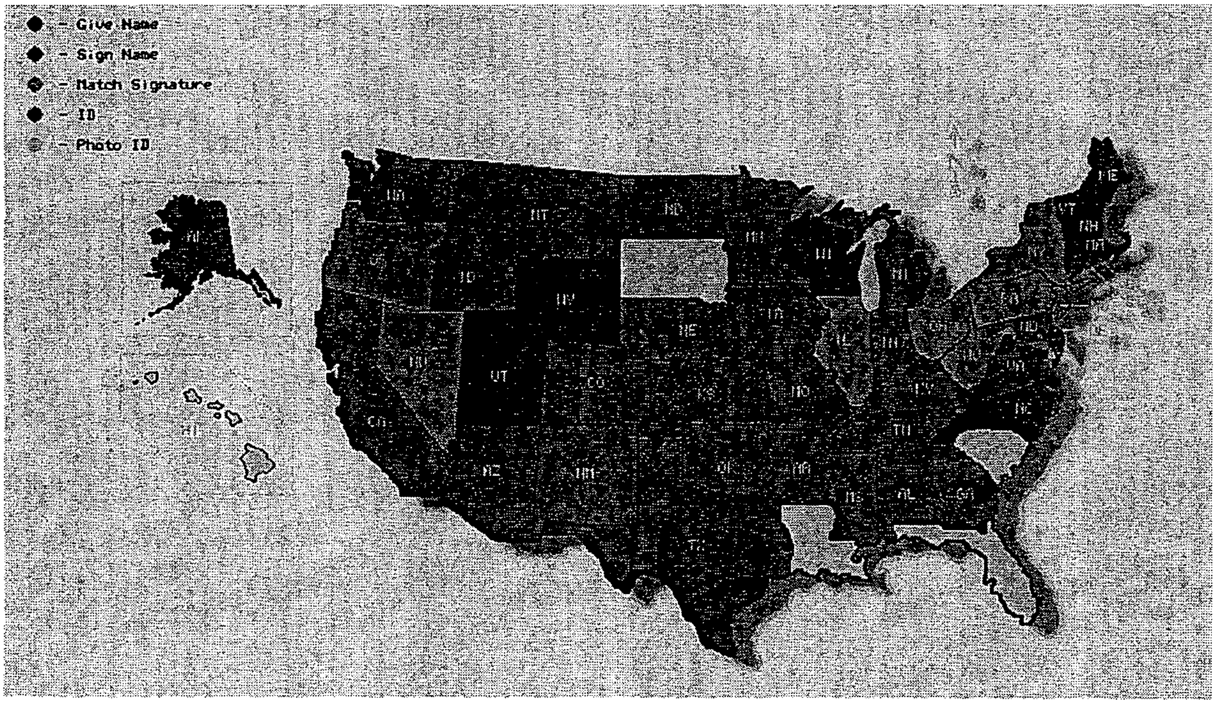
***Georgia is currently enjoined from implementing this law, returning them for the time being to their 2004 requirement of provide ID.

****Pennsylvania requires ID of all first-time voters, whether they registered by mail or in-person.

*****Tennessee voters must provide signature and address. In counties without computerized lists, the signature is compare to the registration card. In counties with computerized lists, the signature is compared to a signature on ID presented with registration.

******Texas voters must present a current registration certificate. Those without a certificate can vote provisionally after completing an affidavit.

Figure 1



Voter ID Requirements 2004

023262

Since it is not practical to attempt to capture the wide variety of how voter ID requirements are actually implemented across the nation's tens of thousands of polling places, the analysis of the effect of state requirements on county-level turnout must be viewed with some caution.

Effect of Voter ID requirements on Turnout

We categorized each state according to its voter ID requirements in 2004, as shown in Table 1 and analyzed turnout data for each county according to the voter identification requirements of its state. We also assessed self-reported turnout by the sample interviewed in the November 2004 Current Population Survey of the Census Bureau. [14]

Voter turnout at the state level in 2004 varied based on voter identification requirements. An average of 63.1 percent of the voting age population turned out in states that required voters to state their names, compared to 57.3 percent in states that required photo identification. Other factors, of course, also influence turnout. Taking those other factors into account in the county-level analysis makes the effect of the voter ID requirement less dramatic. But the analysis still offers some support for the hypothesis that as the burden of voter identification requirements increases, turnout declines. The effect is particularly noticeable in counties with concentrations of Hispanic residents or of people living below the poverty line.

The individual-level analysis, based on the CPS, produced a similar result. Voter identification requirements exert a statistically significant, negative effect on whether survey respondents said they had voted in 2004. The probability that a respondent to the survey voted dropped with each level of voter identification requirement, with a total drop of 2.5 percent across the five types of identification.

Future policy decisions should consider the tradeoffs between the incidence of vote fraud that can be prevented by stricter voter ID requirements and the number of eligible voters who will be kept from the polls by those stricter ID requirements. Continuing research is needed to provide the information to inform this calculation of benefits and costs.

---

[14] See Appendix ___ for the full report on voter ID and turnout.

Methods and Findings

We classified each state as having one of five types of identification requirements in place on Election Day 2004. Upon arrival at polling places, voters had to either: state their names (9 states); sign their names (13 states and the District of Columbia); match their signature to a signature on file with the local election board (8 states); provide a form of identification that did not necessarily include a photo (15 states); or provide a photo identification (5 states). We then tested the assumption that voter identification requirements would prove to be increasingly demanding on the voter, with providing photo ID the most rigorous.

The analysis recognized that election laws in numerous states offer exceptions to these requirements if a prospective voter lacked the ID. Laws in those states set a minimum standard that a voter must meet in order to vote using a regular ballot. We therefore also categorized states based on the minimum requirement for voting with a regular ballot. None of the states required photo identification as a minimum standard for voting with a regular ballot. Four states, however, required voters to swear an affidavit as to their identity (Florida, Indiana, Louisiana, and North Dakota). The five categories for minimum requirements were: state name (12 states), sign name (14 states and the District of Columbia), match one's signature to a signature on file (six states), provide a non-photo identification (14 states), or swear an affidavit (four states). This analysis treats the array of minimum identification requirements also in terms of increasing demand on the voter: state name, sign name, match signature, provide non-photo identification, and, given the potential legal consequences for providing false information, swearing an affidavit is regarded as the most rigorous.

Voter turnout at the state level in 2004 declined as voter identification requirements became more demanding, as shown in Table 2. While the trend is not perfectly linear, there is a general movement toward lower turnout as requirements tend toward requiring greater levels of proof. Using the maximum requirements as the independent variable, an average of 63.1 percent of the voting age population turned out in states that required voters to state their names, compared to 57.3 percent in states that required photo identification. A similar trend emerged when using the minimum requirements as the independent variable. Sixty-one percent of the voting age population turned out in states requiring voters to state their names, compared to 58.7 percent in states that required an affidavit from voters.

Table 2 – Variation in 2004 State Turnout Based on Voter Identification Requirements

Maximum Requirement		Minimum Requirement	
Voter Identification Required in the States	Mean Voter Turnout for States in that Category	Voter Identification Required in the States	Mean Voter Turnout for States in that Category
State Name	**63.1 %**	State Name	**61.3 %**
Sign Name	**58.6 %**	Sign Name	**60.4 %**
Match Signature	**62.1 %**	Match Signature	**59.2 %**
Provide Non-Photo ID	**57.8 %**	Provide Non-Photo ID	**57.6 %**
Provide Photo ID	**57.3 %**	Swear Affidavit	**58.7 %**
Average Turnout (All States)	**59.6 %**		

Voter identification requirements alone do not determine voter turnout. Other influences – demographic or political-- also affect voter participation. Multivariate models that take into account other predictors can place the effects of voter identification in a more accurate context. The multivariate analysis included whether the county was in a presidential battleground state or a state with a competitive race for governor or the U.S. Senate. Demographic variables included the percentage of the voting-age population in each county that was Hispanic or African-American, the percentage of county residents age 65 and older, and the percentage of the county population living below the poverty line. The dependent variable in each model was voter turnout at the county level, with turnout calculated as the percentage of the voting-age population that voted in the 2004 election.

The aggregate analysis for the maximum identification requirements revealed a small and negative effect on turnout in 2004 controlling for electoral context and demographic factors. If the state was a battleground voter turnout increased. As the percentage of senior citizens in the county increased, so did turnout. The percentage of African-Americans in the county had no effect, but the percentage of Hispanic adults reduced voter turnout, as did the percentage of individuals living below the poverty line. In general, analysis of the aggregate data at the county level provides some support for the hypothesis that as the burden of voter identification requirements increases, turnout declines, at least in the case of the maximum requirements. The decline in turnout is particularly noticeable in counties with concentrations of Hispanic residents or individuals who live below the poverty line. Determining if the reduction in turnout is, in fact, among the Hispanic or poor residents of those counties requires further research at the individual level.

Information collected for the Census Bureau Current Population Survey in November 2004 makes it possible to examine the influence of voter ID requirements at the individual level. Self-identified registered voters reported their experience at the polls in the survey. Note that the voter turnout rate for the CPS sample, an average of 89%, is much higher than the turnout rates presented in the aggregate data analysis, which average 58%. The difference is a result of several factors, including different denominators in calculating the turnout rate – self-reported registered voters in the CPS versus the much larger voting-age population for the aggregate data. Also some survey respondents overstate their incidence of voting. Nevertheless, the CPS serves as a widely accepted source of data on voting behavior.

The dependent variable in the individual analyses is whether respondents said they voted in the 2004 election. As in the aggregate analysis the contextual variables consist of whether the state was a battleground state or had competitive state-level races. The analysis also controlled for gender, age, education, household income, race or ethnicity, and employment status, marital status, and residential mobility.

The analysis revealed that voter identification requirements exerted a statistically significant, negative effect on whether survey respondents said they had voted in 2004. Of the other state factors, only the competitiveness of the presidential race had a significant effect on turnout. In terms of demographic influences, consistent with previous research, age, education, income, and marital status all were positive predictors of voting. Women also were more likely to say they voted than men. Those who had moved within six months before the interview were less likely to say they had voted.

Allowing the voter identification requirement to vary while holding constant all other variables in the model showed that the predicted probability of turnout ranged from 91.2 percent if all voters had to state their names to 88.7 percent if all voters had to provide photo identification. (Note that these turnout figures are higher than actual because of the factors involved in the CPS's self-reported survey, but that the difference in effect is reasonably related to the results obtained in the aggregate analysis.) In other words, the probability of voting dropped with each level of the maximum voter identification requirement, with a total drop of 2.5 percent across the five types of identification. When taking into account the minimum requirement for identification, the probability showed a similar decline, with a slightly larger total drop of 3.3 percent.

Both the maximum and minimum identification requirements had negative and statistically significant effects for white voters. Allowing the requirements to vary from stating one's name to providing photo identification or an affidavit showed drops of 2.5 percent and 3.3 percent respectively in the predicted probability of voting. The identification requirements had no effect on the probability of African-Americans voting, but the minimum identification requirements had a comparatively sizable effect on voter turnout among Hispanics. The predicted probability of Hispanics voting ranged from 87 percent if stating one's name would be the required form of identification to 77.3 percent if a voter would have to provide an affidavit in order to vote, a difference of 9.7 percent. Variation also emerged along the lines of income, with the effects of voter identification requirements varying to a greater extent for voters in households below the poverty line compared to those living above the poverty line.

Registered voters who had less than a high school education had a 77.5 percent probability of voting if the maximum requirement would be stating one's name, and a 70.8 percent probability if they would have to provide photo identification under the maximum requirement, a difference of 6.7 percent. The range of effects of voter identification requirements was smaller among those with higher levels of education (and non-existent for one category – voters with some college education).

Discussion and Conclusions of the Analysis

The results give evidence that tougher voter identification requirements are associated with a decline in voter participation. The overall effect for all registered voters was fairly small, but even a slight decline in turnout has the potential to alter the outcome of a close election. The decline is apparent in both the aggregate data and the individual-level data, although not always for both the maximum and minimum sets of requirements.

- Hispanic voters and the poor appear to be less likely to vote if the level of required identification becomes more demanding, according to both the aggregate and the individual-level data. In the individual-level data, for Hispanic voters, the probability of voting dropped by 9.7 percent across the various levels of minimum identification requirements. Survey respondents living in poor households would be 5.3 percent less likely to vote as the requirements vary from stating one's name to attesting to one's identity in an affidavit.

- Self-reported registered voters who had not graduated from high school would be 6.7 percent less likely to vote if the maximum requirement is photo identification as opposed to stating one's name. When considering the minimum requirements, those with less than a high school education would be 7.4 percent less likely to say they voted if the requirement was an affidavit as opposed to stating one's name.

- Age was also a key factor, with voters ages 18 to 24 being 7.7 percent to 8.9 percent less likely to vote as the requirements ranged from stating one's name to providing a photo identification or affidavit.

- Two concerns aired by critics of voter identification requirements were not borne out by the results. African-American voters did not appear to be affected by voter identification requirements, according to both the aggregate data and individual-level data analyses. Also, the self-reports of elderly voters, while indicating that they would be slightly less likely to vote as ID requirements become stricter, do not show a dramatic effect.

The data examined in this analysis could not capture the dynamics of how identification requirements lower turnout. Do know the voter ID and stay away from the polls because they cannot or do not want to meet them? Or, do the requirements result in some voters being turned away when they cannot meet the requirements on Election Day? The CPS data do not include measures that can answer these questions, pointing up the need for collection of additional data. Knowing more about the "on the ground" experiences of voters concerning identification requirements could guide policy-makers at the state and local level in determining whether and at what point in the electoral cycle a concerted public information campaign might be most effective in helping voters to meet identification requirements. Such knowledge also could help in designing training for poll workers to handle questions about, and potential disputes over, voter identification requirements.

It is important to note that the 2004 data do not allow us to draw conclusions about the effect of laws such as those recently passed in Georgia and Indiana, which require government-issued photo ID. No such laws were in place in 2004, and the five states that then required photo ID at the time allowed voters who signed an affidavit or provided another form of identification to cast a regular ballot.

Litigation Over Voter ID Requirements

A handful of cases have challenged identification requirements in court in recent years. In general, requirements that voters provide some identifying documentation have been upheld, where photo ID is *not* the only acceptable form. Whether laws requiring photo ID will be upheld is more doubtful. To date, only one court has considered a law requiring voters to show photo ID (*Common Cause v. Billups*), and that court concluded that this requirement is likely unconstitutional. Cases challenging the mandatory disclosure of voters' Social Security numbers on privacy grounds have yielded mixed results.

Non-photo identification. For the most part, courts have looked favorably on requirements that voters present some form of identifying documents if the photo identification is not the only form accepted. In *Colorado Common Cause v. Davidson,* No. 04CV7709, 2004 WL 2360485, at *1 (Colo. Dist. Ct. Oct. 18, 2004), plaintiffs challenged a law requiring all in-person voters to show identification (not just first-time registrants). The court upheld this requirement against a constitutional challenge. Similarly, in *League of Women Voters v. Blackwell,* 340 F. Supp. 2d 823 (N.D. Ohio 2004), the court rejected a challenge to an Ohio directive requiring first-time voters who registered by mail to provide one of the HAVA-permitted forms of identification, in order to have their provisional ballots counted. Specifically, the directive provided that their provisional ballots would be counted if the voter (a) orally recited his driver's license number or the last four digits of his social security number or (b) returned to the polling place before it closed with some acceptable identification (including reciting those identification numbers). *Id.* This was found to be consistent with HAVA.

Photo ID. Since the 2004 election, two states have adopted laws requiring photo identification in order to have one's vote counted, without an affidavit exception: Georgia and Indiana. Both these requirements were enacted in 2005 and both have been challenged in court. The Georgia law required voters attempting to cast a ballot in person present a valid form of photographic identification. O.C.G.A. § 21-2-417. On October 18, 2005, the District Court granted the Plaintiff's motion for a preliminary injunction, enjoining the application of the new identification requirements on constitutional grounds. In granting the injunction, the court held that plaintiffs' claims under both the Fourteenth Amendment (equal protection) and Twenty-Fourth Amendment (poll tax) had a substantial likelihood of succeeding on the merits at trial (*Common Cause v. Billups,*

Prelim. Inj. 96, 104). In January 2006, Georgia enacted a modified version of its photo ID law, which the court has not yet ruled on. In the other state that has enacted a photo ID requirement without an affidavit exception (Indiana), legal challenges have also been filed. (*Indiana Democratic Party v. Rokita* and *Crawford v. Marion County Election Board*). Cross-motions for summary judgment are currently pending. Another case of significance, for purposes of photo ID requirements, is *American Civil Liberties Union of Minnesota v. Kiffmeyer,* No. 04-CV-4653, 2004 WL 2428690, at *1 (D. Minn. Oct. 28, 2004). In that case, the court enjoined a Minnesota law that allowed the use of tribal photo ID cards, only for an Indian who lived on the reservation. 2004 WL 2428690, at *1. The Court found no rational basis for distinguishing based on whether or not the cardholder lives on the reservation. *Id.* at *1, 3. The court's decision in this case indicates that courts are likely to look strictly on photo ID requirements.

Privacy. In *Greidinger v. Davis*, 988 F.2d 1344 (4th Cir. 1993), the court struck down on due process grounds a Virginia law requiring disclosure of voters' social security numbers for voter registration. The social security numbers recorded in voter registration lists had been disclosed to the public and political parties that had requested the lists. The court found that the requirement to give the social security number effectively conditioned rights on the consent to an invasion of privacy. It concluded that this public disclosure of the social security numbers was not necessary to achieve the government's interest in preventing fraud. On the other hand, in *McKay v. Thompson*, 226 F.3d 752 (6th Cir. 2000), the court rejected privacy challenges based on both the Constitution and federal statutes, to a Tennessee law requiring social security numbers for voter registration since 1972. 226 F.3d at 755. Second, the NVRA only permits requiring the minimum amount of information necessary to prevent duplicate voter registration and to determine eligibility. The distinction appears to be between the use of Social Security numbers for internal purposes only, which was deemed permissible, and the disclosure of those numbers to the public which was not.

These decisions suggest that the courts will look strictly at requirements that voters produce a photo ID in order to cast a regular ballot. The courts have used a balancing test to weigh the legitimate interest in preventing election fraud against the citizen's right to privacy (protecting social security numbers from public disclosure, for example) and the reasonableness of requirements for identity documents. To provide both the clarity and certainty in administration of elections needed to forestall destabilizing challenges to outcomes, these early decisions

suggest that best practice may be to limit requirements for voter identification to the minimum needed to prevent duplicate registration and ensure eligibility.

Developments since 2004

Since the passage of HAVA, with its limited requirements for voter identification, and following the 2004 election, debate over voter ID has taken place in state legislatures across the country. That debate has not been characterized by solid information on the consequences of tightening requirements for voters to identify themselves before being permitted to cast a regular, rather than a provisional, ballot.

Better information might improve the quality of the debate. Answers to the following key questions are not available in a form that might satisfy those on both sides of the argument.

- What is the overall incidence of vote fraud?
- How does fraud take place in the various stage of the process: registration, voting at the polls, absentee voting, or ballot counting?
- What contribution can tighter requirements for voter ID make to reducing vote fraud?
- What would be the other consequences of increasingly demanding requirements for voters to identify themselves? This is the question addressed, within the limits of the available data, in the analysis in this report.

Answering these questions would provide the information needed for more informed judgment in the states as they consider the tradeoffs among the competing goals of ballot integrity, ballot access, and administrative efficiency. The Carter-Baker Commission recognized the tradeoffs when it tied recommendation for national ID to an affirmative effort by government to identify unregistered voters and make it easy for them to register.

State Voter Databases and Voter ID

With the implementation of the HAVA Computerized Statewide Voter Registration List, an application for voter registration for an election for Federal office may not be accepted or processed unless the application includes a driver's license number or last four digits of the Social Security number on the voter registration form. This information can be used to verify the identity of the registrant through interfacing with lists maintained by the Motor Vehicle office and Social Security office. If registrants do not have either a driver's license or Social Security number, the State will assign a unique identifier number to that person.

HAVA does not require that the states notify registrants to remedy any failure to provide either of these numbers or to confirm that they have provided a verifiable number. Verification at the time of registration could forestall difficulties at the polling place. HAVA is silent on how the ID might be required at the polling place for new voters whose driving license or Social Security number could not be verified. Errors in recording those numbers are sure to occur.

Some states are wrestling now with these unresolved issues. In New Jersey, for example, pending legislation would require that voters must be able to confirm their registration through a secure access to the SVRL. It also requires voters to present ID at the polls in order to cast a regular ballot if the numbers recorded on the registration have not been verified (or if no verifiable number appears on the registration). It recognizes the HAVA requirement that if the number provided by the voter has not been verified and if the voter does not present ID at the polls, that voter may cast a provisional ballot. The bill does not specify they have to provide ID within 48 hours in order for their vote to count, as is the case with first-time mail-in registrants.

As some states gain experience in this area, the EAC would perform a useful service by making timely recommendations of best practices for all states to consider.

6. Conclusions

The form of Voter ID required of voters affects turnout. Lack of ID can keep voters from the polls. Or, when they go to the polls, it is reasonable to conclude that stricter Voter ID requirements will divert more voters into the line for provisional ballots. (This conclusion is a conjecture because we lack good data on why voters must cast their ballots provisionally.) The result can be longer lines at the polls and confusion, without a clear demonstration that the security of the ballot is correspondingly increased. [15]

The dynamics of Voter ID requirements –how the more rigorous Voter ID requirements—affect the decision by potential voters to go or stay away from the polls are not well understood. This lack of understanding should be recognized in the policy process. The debate over voter ID in

---

[15] In this connection, the Brennan Center's response to the Carter-Baker Commission report observes that, "while it might be true that in a close election "a small amount of fraud could make the margin of difference," it is equally true that the rejection of a much larger number of eligible voters could make a much bigger difference in the outcome." *Response to the Report of the 2005 Commission on Federal Election Reform*, The Brennan Center for Justice at NYU School of Law and Spencer Overton, On Behalf Of The National Network on State Election Reform, September 19, 2005

the states would be improved by additional research sponsored by the EAC. So far as it may be necessary to reduce vote fraud made possible by inadequate voter ID, the research could identify methods to eliminate the need for voters to bring specific identity documents with them to the polls while assuring that each voter who casts a ballot is eligible and votes only once. One way to break the connection between the benefits of photo ID and the need for the voter to bring identification to the polling place, as recommended elsewhere by one of the authors of this report, Edward Foley: keep the information to verify a voter's identity in the records at the polling place. Other approaches could be developed. [16]

---

[16] "A potential solution to this problem is to break the connection with the photo requirement and the obligation to produce identification at the polls. Eligible citizens could be required to provide a photograph at the time they *register* to vote, and poll workers would match this photograph with the image of the person standing in front of them. Given the availability of digital photography, the photos of registered voters could be stored in electronic poll books and easily "pulled up" with a click of a computer mouse when voters sign in to vote. . . Of course, to satisfy the concerns of liberals, a requirement to provide a digital photograph at time of registration would have to address the cost and accessibility issues identified earlier. "

APPENDIX –Court Decisions and Literature on Voter Identification and Related Issues

Court Decisions

Summary of Relevant Cases:

Challenges Prevailed:

American Civil Liberties Union of Minnesota v. Kiffmeyer, 2004

- Action for temporary restraining order – granted
- Statute: allowed use of tribal identification cards w/ name, address & photo as a valid identification to register to vote only if the voter lives on the reservation to "complete" a mail-in application (which only affected about 600 voters w/ incomplete applications)
- Claim -14th Amendment EPC: likely to prevail, no rational basis for a distinction between Indians residing on reservations and those not
- Statute: may use certain forms of photo identification lacking address together with a utility bill but not tribal identification cards
- Claim -14th Amendment EPC: likely to prevail

Greidinger v. Davis, 1993

- Statute: mandated disclosure of SS # as a precondition to voter registration (rationale was voter identification, but the numbers were rarely used to verify identity & were disclosed in voter lists to both political parties and the public upon request)
- Claims:
  - 14th Amendment EPC: no classification (applied strict scrutiny)
  - Substantive due process: law invalid; found that the statute conditioned the fundamental right to vote on the consent to an invasion of privacy; this was found to be a substantial burden (applied strict scrutiny)
    - Compelling interests: preventing voter fraud (deemed compelling)
    - Necessary: fails, preventing voter fraud when allowing names for inspection could be achieved by supplying addresses and DOBs or use of voter registration numbers
    - HOWEVER: Court also made it clear that if the registration scheme kept the SS# for internal use only – it would be valid

Challenges Rejected:

League of Women Voters v. Blackwell, 2004.

- Sec. of State Directive: provisional ballots issued if first-time voter, who registered by mail and did not provide ID, cannot produce proper ID at the polls AND that the provisional ballot will only be counted if the voter returns to the poll before it closes w/ ID or can recite SS# or DL#
- Claims – Supremacy Clause & HAVA: ruled that HAVA did not specify how the first-time voters' identifications should be verified and this method was not unreasonable or too burdensome

Colorado Common Clause v. Davidson, 2004

- Statute: required all voters to show ID (most types permitted) before voting
- Claims:
  - HAVA: ruled that HAVA did not preempt more strict state laws & allowed States to be more strict as long as consistent with the purpose of HAVA (both HAVA & CO provisions' purposes were to prevent voter fraud)
  - Substantive due process and equal protection
    - No improper discrimination

    - Preventing voter fraud is a compelling interest since it is irreversible once vote is cast
    - Only marginally more intrusive than HAVA, many types of identification permitted – thus, valid

McKay v. Thompson, 2000

- Statute: mandated disclosure of SS # as a precondition to voter registration
- Claims:
    - Privacy Act, Section 7: ruled that Tennessee voter system exempt from Privacy Act because it is pre-75
    - NVRA, permitting only min. amt. of info. necessary to prevent duplicate registration and determine eligibility: ruled that NVRA does not specifically forbid the use of SS#s & the Privacy Act specifically permits them pre-75
    - Substantive due process: ruled that internal use of SS# not a burden
    - Free Exercise, based on Bible's supposed prohibition on use of universal identifiers: ruled that law is generally applicable and thus valid
    - P&I, Article IV: does not protect in-state citizens
    - P&I, 14th Amend.: no protection for privilege where Congress authorized its infringement

Kemp v. Tucker, 1975

- Statute: required name, occupation, address, sex, race, height, hair color, eye color, and date of birth be listed on voter registration card for identification purposes
- Claims:
    - VRA: ruled that race was not made a "qualification" for voting
    - 15th Amendment: ruled that it did not abridge right to vote on account of race because rejection of application was due to failure to provide information, not race; race only one factor in identification
    - 14th Amendment EPC: ruled there was no distinction among voters

Perez v. Rhiddlehoover, 1966

- Statute: date of birth, place of birth, mother's first or maiden name, color of eyes, sex, race, occupation, and whether owner, tenant or boarder must appear on the registration for identification
- Claims:
    - VRA: ruled that it was not a "test or device" because it applied equally
    - 15th Amendment: same reasons

Cases in Which the Plaintiffs Have Prevailed in Challenging the Statute Requiring Voter Identification:

American Civil Liberties Union of Minnesota v. Kiffmeyer, **No. 04-CV-4653, 2004 WL 2428690, at *1 (D. Minn. Oct. 28, 2004).**

This was an action just before the November 2004 election for a temporary restraining order, which was granted. The ACLU challenged a Minnesota law allowing the use of tribal identification cards with the name, address, and photograph as a valid identification (equal to a driver's license) for use in "completing" an incomplete mail-in voter registration only if the Indian lives on the reservation. 2004 WL 2428690, at *1. The Court ruled that this distinction would likely violate the Equal Protection Clause because there was no rational basis for differentiating

between the validity of the identification based on whether or not the cardholder lives on the reservation. *Id.* at *1, 3.

Secondly, the ACLU challenged a second statute which allowed the use of certain photo identification lacking the voter's address to be used together with a utility bill or bank statement as valid identification for registration. *Id.* at *3. The statute did not, however, permit using a tribal identification for this same purpose. *Id.* The Court ruled that this likely violated the equal protection clause as well. *Id.*

***Greidinger v. Davis*, 988 F.2d 1344 (4th Cir. 1993).**

This case challenged a Virginia law requiring the social security number for voter registration, which the State subsequently disclosed to the public and political parties upon request in voter registration lists, which included the social security numbers. Failure to provide the social security number resulted in the denial of the registration application. The law was challenged under the Equal Protection Clause and under substantive due process. The Court quickly rejected the equal protection challenge because the law made no classification. 988 F.2d at 1350.

The law was invalidated under substantive due process. *Id.* at 1355. The Court found that the statutory scheme conditioned the fundamental right to vote on the consent to an invasion of privacy, based on concerns of identity theft. *Id.* at 1353-54. The Court found this to be a substantial burden on the right to vote. *Id.* at 1354. The Court recognized that the government's interest in preventing voter fraud was compelling. *Id.* However, the Court found that disclosure of the information to the public and political parties was not necessary to achieve that interest. *Id.* Disclosure of addresses or dates of birth would be sufficient to aid the public in distinguishing between two voters with the same name. *Id.* at 1355. The Court did state that required disclosure of the social security number for internal use only would be valid. *Id.* at 1354 n.10.

Cases in Which the Statute or Practice of Voter Identification Has Been Upheld:

***League of Women Voters v. Blackwell*, 340 F. Supp. 2d 823 (N.D. Ohio 2004).**

The League of Women Voters challenged the Secretary of State's directive that provisional ballots should be issued to all first-time voters who registered by mail without providing identification who cannot show proper identification at the polls. 340 F. Supp. 2d at 828. The Directive also stated that the provisional ballots would only be counted if the voter orally recited his driver's license number or the last four digits of his social security number or returned to the polling place before it closed with some acceptable identification, including reciting those identification numbers. *Id.* The Court stated that HAVA only requires verification of eligibility of first time voters registering by mail; it does not say how that should be done. *Id.* at 831. The Court found the burden on the right to vote to be slight. *Id.* The Directive was found valid under HAVA and the Supremacy Clause because the number of uncounted votes would be small, the requirement was reasonable, and there was adequate notice of the requirement on the registration forms. *Id.* at 829-30.

***Colorado Common Cause v. Davidson*, No. 04CV7709, 2004 WL 2360485, at *1 (Colo. Dist. Ct. Oct. 18, 2004).**

In this case, the validity of three Colorado statutory provisions was challenged. The laws (1) required all in-person voters to show identification (not just first-time registrants); (2) provided that votes cast in the wrong precinct would not be counted; and (3) provided that

provisional ballots would not be counted if the voter applied for an absentee ballot. 2004 WL 2360485, at *1. The plaintiffs also challenged the provisions under HAVA. The identification provision allowed nearly all forms of acceptable identification under HAVA. *Id.* at *6.

The challenge to the identification requirement failed under both challenges. The Court interpreted HAVA as not intended to preempt state laws and as permitting states to be more strict than, but not inconsistent with, HAVA. *Id.* at *10. The Court felt that the purpose of both laws was the same, to reduce voter fraud, and thus, both laws could coexist. As to the Constitutional claim, both equal protection and substantive due process, the Court felt that preventing voter fraud, which is impossible to remedy once a vote is cast, is a compelling interest, and the Court also felt that a voter identification requirement for all voters, with many types of acceptable identification, was only marginally more intrusive than HAVA. *Id.* at 12. The Court also found no improper discrimination between voters. *Id.* Thus, the provision was upheld.

***McKay v. Thompson*, 226 F.3d 752 (6th Cir. 2000).**

The Sixth Circuit ruled that the Privacy Act, the National Voter Registration Act, Substantive Due Process, the Privileges and Immunities Clauses (Fourteenth Amendment & Article IV), and the First Amendment right to free exercise do not prohibit requiring disclosure of social security numbers as a precondition to voter registration.

The Privacy Act, Section 7, mandates that it is unlawful for a government to deny a right or privilege because of a citizen's refusal to disclose his social security number, unless the disclosure was required for a system established prior to 1975. 226 F.3d at 755 (citing Privacy Act of 1974, Pub. L. No. 93-579 (1974)). Since Tennessee required social security numbers for voter registration since 1972, his challenge was rejected. 226 F.3d at 755. Second, the NVRA only permits requiring the minimum amount of information necessary to prevent duplicate voter registration and to determine eligibility. *Id.* at 755-56 (citing 42 U.S.C. §1973gg-3(c)(2)(B)). The Court rejected this challenge because the NVRA does not specifically forbid the use of social security numbers, and the Privacy Act, a more specific statute, grandfathered their use if prior to 1975. 226 F.3d at 756.

Finally, the plaintiff's constitutional claims were all rejected. His substantive due process claim was rejected because internal receipt and use of social security numbers does not burden the fundamental right to vote. *Id.* The free exercise challenge, based on the Bible's supposed prohibition of universal identifiers, was rejected because the law was generally applicable and not directed at particular religious practices. *Id.* The Privileges and Immunities Clause claim was rejected because the Clause does not apply to citizens of the state. *Id.* The Fourteenth Amendment Privileges and Immunities claim, based on the right to vote as unique to U.S. citizenship, was rejected because the Clause provides no protection where Congress has authorized the infringement. *Id.*

***Kemp v. Tucker*, 396 F. Supp. 737 (M.D. Pa. 1975), *aff'd*, 423 U.S. 803.**

A statute was upheld, which required name, occupation, address, sex, race, height, hair color, eye color, and date of birth to be recorded on the voter registration card and allowed registration officials to reject an incomplete application. 396 F. Supp. at 738. Claims were alleged under the Fourteenth Amendment's Equal Protection Clause, the Fifteenth Amendment, and the Voting Rights Act.

As to the Fourteenth and Fifteenth Amendment claims, the Court reasoned that preventing voter fraud is a compelling goal, and identification provisions are "an essential means of achieving the goal." *Id.* at 739. The Court also rejected the equal protection claim because the statutes did not create a distinction at all. *Id.* at 740 n.3. Since race is just one of

several characteristics required, the Court found that it was intended for preventing voter fraud, not some other motive. *Id.* at 740. As to the VRA, the Court rejected the claim that it added race as a qualification for voting as frivolous. *Id.* As to a Fifteenth Amendment claim that it abridged the right to vote on account of race, the Court also made a distinction between rejecting a voter application because of race and rejecting an application because of failure to answer all relevant questions to assist in preventing voter fraud. *Id.* The statute was upheld.

***Perez v. Rhiddlehoover,* 186 So. 2d 686 (La. Ct. App. 1966).**

A voter registration requirement was challenged and upheld. The statute stated that date of birth, place of birth, mother's first or maiden name, color of eyes, sex, race, occupation, and whether owner, tenant or boarder must appear on the registration. 186 So.2d at 690. This information was required for identification of voters, especially when voters had the same name, to prevent duplicate voting. It was challenged under the Voting Rights Act of 1965 Section 4(a) which prohibits denying the right to vote for failure to comply with a "test or device." The Court felt that this requirement was not a test or device for discrimination because it applied equally. *Id.* at 691. The Court also determined that it was not in conflict with the Fifteenth Amendment either. *Id.*

***Friendly House, et al. v. Janet Napolitano et al.,* CV 04-649 TUC DCB**

On November 30, 2004, the Mexican American Legal Defense and Educational Fund (MALDEF) filed suit seeking to halt the implementation of Proposition 200. . Proposition 200 created a number of legal requirements to ensure that public benefits are not available to illegal immigrants. In particular, Proposition 200 requires that a person attempting to register to vote provide one of six specific forms of proof of United States citizenship. Compl. 12-13. Also, any person attempting to vote must present either one form of photo identification or two forms of non-photo identification. *Id.* at 13.

The lawsuit alleges two violations that directly relate to the voting identification restrictions. First, the lawsuit alleges a violation of the Twenty-Fourth and Fourteenth amendments in that a voter must pay a poll tax by spending money to purchase the required identification. *Id.* at 20. Second, the lawsuit alleges violation of the Voting Rights Act. *Id.* at 21. The lawsuit was recently dismissed by the 9th Circuit Court of Appeals for a lack of standing. The Circuit Court found that there was no injury-in-fact, meaning that once an injury occurs the suit will likely be refiled. Additionally, it should be noted that the voter identification issue is only a part of the lawsuit, and much of the focus has been on other aspects of Proposition 200.

Current Litigation Concerning Voter ID Issues[17]

Litigation is filled with uncertainty. Litigation stemming from newly passed voter identification requirements will continue into the foreseeable future. Lawsuits are currently pending over voter identification requirements in Georgia and Indiana. Other states, such as Ohio, are considering new identification requirements that could lead to further litigation. The Georgia lawsuit has already succeeded in getting a preliminary injunction against the law in question, which will likely galvanize interested parties in other states to pursue similar litigation. Of course, if the injunction is eventually overturned at the appellate level it could have a similar chilling affect on future litigation.

This summary major litigation pending in Georgia and Indiana includes a brief assessment of the likelihood of success:

---

[17] As of January 2, 2006

Georgia (*Common Cause/Georgia v. Billups*):

On September 19, 2005, Common Cause of Georgia, in conjunction with several other non-profit organizations, filed suit in Federal District Court against the Georgia Secretary of State and other election officials, challenging the constitutionality of Georgia's new voter identification requirements. The new law requires all voters attempting to cast a ballot in person to present a valid form of photographic identification. O.C.G.A. § 21-2-417. A voter that is unable to provide proper identification is given a provisional ballot. However, that provisional ballot will be counted only if the voter is able to subsequently present valid identification within two days of the election. *Id.*

The lawsuit alleges five separate violations of state and federal law. First, the complaint alleges that the identification requirements infringe on the right to vote guaranteed in the Georgia constitution (Compl. 32)[18]. In addition, the Plaintiffs claim violations of the Federal Civil Rights Act and Voting Rights Act. (Compl. 36,38). Finally, the lawsuit alleges violations of the Fourteenth and Twenty-Fourth amendments to the U.S. Constitution. The complaint claims that the ID requirements constitute an "undue burden" on the right to vote, in violation of the Equal Protection Clause of the Fourteenth Amendment (Compl. 34). The ID requirement does not apply to most absentee voters, and thus the requirement is also over-broad and not narrowly tailored to address the stated purpose of preventing voter fraud (Compl. 34). The complaint further alleges that the cost of obtaining a photo ID constitutes a poll tax, in violation of the Twenty-Fourth Amendment, and that the cost is also a violation of the Fourteenth Amendment because it applies to voters who choose to vote in person, and not to those who vote absentee (Compl. 34,35).

On October 18, 2005, the District Court granted the Plaintiff's motion for a preliminary injunction, enjoining the application of the new identification requirements. In granting the injunction, the court held that both federal constitutional claims had a substantial likelihood of succeeding on the merits at trial (Prelim. Inj. 96, 104). The court also held that, while the two federal statutory claims were plausible, they both lacked sufficient evidence at the time to have a substantial likelihood of success. (Prelim. Inj. 109,111,116). Finally, the court held that the Georgia constitutional claim would be barred by the Eleventh Amendment to the U.S. Constitution. (Prelim. Inj. 77).

The Defendants appealed the motion for preliminary injunction to the Eleventh Circuit, and oral argument is scheduled for March 1, 2006. In addition, some news reports have claimed that the Georgia legislature is considering re-visiting the ID requirements in light of the on-going litigation.[19] As for the merits, in granting the preliminary injunction the District Court has already signaled its belief that the federal constitutional claims are likely meritorious. The Eleventh Circuit may have a different view, but for now the case looks to have a reasonable chance of success.

Indiana (*Indiana Democratic Party v. Rokita* and *Crawford v. Marion County Election Board*):

The Indiana lawsuit is similar to its Georgia counterpart in content, though not in status. In Indiana separate lawsuits, now joined, were filed by the state Democratic Party and the

[19] GA Legislature May Revisit Voter ID Law, State Net Capitol Journal, Dec. 19, 2005.

Indiana Civil Liberties Union (ICLU). The Democratic Party's lawsuit is directed against the Indiana Secretary of State, while the ICLU's lawsuit involves the Marion County Board of Elections and the State of Indiana. Like Georgia, Indiana law also requires citizens voting in person to present some form of official photo identification. IC § 3-11-8-25.1. Voters unable to present identification are given a provisional ballot, which is counted if they are able to provide the required identification by Noon on the second Monday following the election. IC § 3-11.7-5-1. Unlike Georgia, Indiana provides state issued identification at no charge. However, there are costs involved in the process, including transportation to the Bureau of Motor Vehicles, and payment for documents such as birth certificates, which are needed to obtain the ID. (Second Am. Compl. 6).

The Democratic Party's complaint raises Fourteenth Amendment claims similar to those in the Georgia lawsuit, including concerns about substantially burdening the right to vote, the enactment of a de-facto poll tax from the costs indirectly associated with obtaining ID, and the lack of applicability to voters who cast an absentee ballot. (Second Am. Compl. 6-9). In addition, the complaint alleges that the substantial burden placed on the right to vote violates the First Amendment protection of expressive or symbolic speech, as well as the freedom of association as applied to Democratic primary elections. (Second Am. Compl. 9-10). Finally, the complaint alleges violations of the Voting Rights Act, National Voter Registration Act, and the Help America Vote Act (Second Am. Compl. 10-11). The ICLU's complaint alleges many of the same violations, but also includes claims of a violation of Indiana's constitutional guarantee of a free and equal election system. (Compl. 15)

The case is currently in the pre-trial phase, with both sides awaiting decisions on their respective motions for summary judgment.[20] The likelihood of success is bolstered by the fact that the Fourteenth amendment constitutional claims have already been found persuasive by at least one other Federal District Court. However, the Indiana law is notably different than its Georgia counterpart in that it provides free identification. While the plaintiffs make a solid argument that related costs still amount to a poll-tax, it is possible that the court could distinguish on this matter.

Unlike the Georgia case, the Indiana lawsuit also claims a violation of the Help America Vote Act. Although the claim is not completely clear, it seems as though the Plaintiffs are arguing that the Indiana statute requires more stringent identification than what is required by HAVA. 42 U.S.C. § 15483(b)(1)-(2). While this is true, it is unclear how this violates the statute. HAVA merely states that certain voters unable to produce HAVA required identification be given a provisional ballot. *Id.* Indiana law meets this requirement. IC § 3-11-8-25.1. Although Indiana law requires more stringent identification for counting the provisional ballot, HAVA leaves theses decisions to state law. 42 U.S.C. § 15482(a).

---

[20] According to an AP article, the Plaintiffs filed some type of brief on December 21—however it is not yet up on the Moritz website and I am unsure how to access it otherwise.

Subject Voter ID Paper --Final Draft

Karen,

Attached is the final draft of the Voter ID paper, with recommendations for the EAC to consider promulgating as best practices. Two appendices are included as part of the draft and a third, the statistical analysis of the effects of different voter ID requirements on turnout, is attached separately to this email.

We look forward to discussing this final draft with you and with the commissioners on April 3. I'll be preparing a Powerpoint presentation for that meeting. Any guidance you can give me later this month on particular questions that briefing should address would be appreciated.

The Moritz-Eagleton team will be meeting next Tuesday at 9:30 a.m.. If you have preliminary comments you would like us to consider, that meeting would be a most convenient occasion to discuss them.

Tom O'Neill

REPORT AND RECOMMENDATIONS TO THE EAC VOTER IDENTIFICATION ISSUES

1. Introduction and Report Background

This report to the United States Election Assistance Commission (EAC) presents recommendations for best practices to improve implementation of the requirements for voters to show identification pursuant to [statute or regulation citation] It is based on research conducted by the Eagleton Institute of Politics at Rutgers, the State University of New Jersey, and the Moritz College of Law at Ohio State University under contract to the EAC, dated May 24, 2005. The research included a review and legal analysis of state statutes, regulations and litigation concerning voter identification and provisional voting, a sample survey of local election officials, and a statistical analysis of the effects of various requirements for voter identification on turnout in the 2004 election. This report is a companion to a report on Provisional Voting submitted to the EAC on November 28, 2005 under the same contract.

The Help America Vote Act of 2002 (HAVA) (Public Law 107-252) authorizes the EAC (SEC. 241, 42 USC 15381) to conduct periodic studies of election administration issues. The purpose of these studies is to promote methods for voting and administering elections, including provisional voting, that are convenient, accessible and easy to use; that yield accurate, secure and expeditious voting systems; that afford each registered and eligible voter an equal opportunity to vote and to have that vote counted; and that are efficient.

2. Voter Identification –Background and Approach of the Study

Voters may have to identify themselves twice in the electoral process: when registering to vote and then when casting a ballot. The burden of providing required ID documents on the voter may be greater at the polls on Election Day than at the time of registration. The burden of checking ID, even as simple as a signature match, can be much greater on election workers at the polls than on those registering voters. Poll workers may be faced with long lines and limited time. This analysis focuses on ID requirements on Election Day, but with an appreciation that the ID requirements at time of registration and on Election Day are inter-related. [1] The emphasis here is on Voter ID on Election Day and afterwards as election judges evaluate provisional

---

[1] As the Carter-Baker Commission noted, photographic ID requirements for in-person voting do little to address the problem of fraudulent registration by mail, especially in states that do not require third-party organizations that register voters to verify identification. Commission on Federal Election Reform, pp 46-47.

ballots. This is the critical period for the electoral system, the time when ballot access and ballot security are in the most sensitive balance.

This analysis takes a view of voter ID issues broader than the rather narrow identification requirements in HAVA. Much of the national ferment over voter ID goes beyond HAVA to require more rigorous documentation of identity for all would-be voters, not just those casting a ballot for the first time who had not registered in person. The controversy in the states over voter ID stems from the HAVA requirements, goes beyond those requirements, and sets the context for the analysis here.[2]

Identification is often described as the critical step in protecting the integrity of the ballot, the process that ensures that the potential voter is eligible and permitted to cast a ballot and one ballot only. In fact, ensuring ballot integrity requires a perspective that takes in the entire voting process. Protecting the integrity of the ballot requires more than preventing the ineligible from voting. It also should ensure that all those who are eligible and want to vote can cast a ballot that counts, and that they can effectively cast a ballot for the candidate of their choice. The protection effort must take into account all forms of voting, including absentee ballots, and embrace each step in the process. A voting system that establishes onerous requirements for voters to identify themselves may prevent the ineligible from voting, but it may also prevent the eligible from casting a ballot. If the ID requirements of a ballot protection system block ineligible voters from the polls at the cost of preventing eligible voters who cannot obtain or forget to bring to the polls the required forms of identification, the integrity of the ballot may not have been improved; the harm may be as great as the benefit.

Assessing the effectiveness of voter ID as a way to protect the integrity of the ballot should logically include an estimate of the nature and frequency of vote fraud. This analysis does not include consideration of the incidence of vote fraud, the forms that it takes, nor the possible effectiveness of various voter ID regimes to counter attempts at vote fraud. The EAC has commissioned a separate study of vote fraud and instructed us not to address that issue in this research.

---

[2] Harvard Law Review 119:1127. "Legislators hoping to stiffen their state antifraud laws have taken their cue from identification provisions buried in HAVA. . . . HAVA makes explicit that it shall not 'be construed to prevent a State from establishing election technology and administration requirements that are more strict than' HAVA itself provides. The states have accepted the invitation. "

Nonetheless, a broad view of ballot integrity is needed to appreciate the background and context of this narrower study. We explore the inter-relationships between Voter ID requirements and Provisional Voting and estimate the effects of various voter id requirements on turnout and on the casting of provisional ballots.

Voters lacking required ID, or who have ID that does not reflect their current address, may be able to vote only by casting a provisional ballot.[3] To the extent that stricter voter ID requirements divert more voters to the provisional ballot, voter ID requirements can put stress on the already pressured management of the polling place. Administering provisional ballots is more expensive than the normal ballot. Scrutiny of ID can create lines at the polling places, lines made longer as voters are diverted to the provisional voting line. Each of these potential consequences of more elaborate voter identification processes can increase the chance of litigation. Long lines will, at best, discourage voters and at worst make voting seem a hassle that will keep more citizens from the polls. A review of voter identification practices should keep in mind that America's problem may well be that too many people do not vote rather than that a few people may vote more than once.

An evaluation of the effect of different Voter ID regimes will be more effective if based on clear standards –legal, equitable, practical. The standards suggested here can best be described as the set of questions to be asked about Voter ID requirements. We suggest 7 questions that try to measure the most important dimensions of the problem.

- Is the Voter ID system designed on the basis of valid and reliable, empirical studies of the incidence of the sorts of vote fraud it is designed to prevent?
- How effective is the ID requirement in increasing the security of the ballot? How well can it be coordinated with a statewide voter database?[4]
- How practical is the requirement? Can it be administered smoothly by the staff and budget likely to be made available? How much additional training of polling place workers might be required? Is it simple enough or can it be defined with sufficient clarity

---

[3] For example, the Florida voter ID law adopted after the 2004 election and pre-cleared by the Department of Justice, permits voters who cannot meet the ID requirements to sign an affidavit on the envelope of a provisional ballot, which will be counted if the signature matches that on the voter's registration form.

[4] See the final section of this report for a brief overview of possible effects of a statewide voter database on voter identification issues.

that poll workers throughout the state can administer it uniformly and with a minimum of local interpretation made on the fly under the pressure of Election Day?[5]

- How cost-effective is the system? Does it increase the security of the ballot at an affordable cost, measured in both monetary and other costs? To improve understanding of the non-monetary component of the costs, conducting a voter impact study might be appropriate. The voter impact study would examine, before the adoption of the regulation, the cost of compliance by the voter (such as the cost in time and money of acquiring a photo ID card), any offsetting benefits to voters, and the possible disparate effects of the regulation on various groups of voters.
- If a side effect of the Voter ID regulation is likely to reduce turnout, generally or among particular groups, is it possible to take other steps to ameliorate the adverse consequences?[6]
- Does it comply with the letter and spirit of Voting Rights Act?
- The seventh question is more difficult to measure than those described in the 6 questions outlined above. The Voter ID requirements should have a neutral result on the composition of the qualified electorate. That is, those requirements should not be designed to reduce the turnout of particular groups of voters who may have a propensity to support one party over another. Whatever the requirement may be, all citizens should be able to comply with it easily and at no or minimal cost.

Summary of findings and conclusions

Voter turnout at the state level in 2004 declined where voter identification requirements were more demanding. While the trend is not perfectly linear, the data show a general movement toward lower turnout as requirements tend toward requiring greater levels of proof. An average of 63.1 percent of the voting age population turned out in states that required voters to state their names, compared to 57.3 percent in states that required photo identification. Including other factors beyond voter id requirements diminishes the influence of voter ID on turnout. But the analysis still offers some support for the hypothesis that as the burden of voter identification

---

[5] In New York, in 2004, disparities in training and voting information were made all too apparent in a study finding elections officials had wildly varying interpretations of what the state's voter identification requirement was. Tova Wang, "Warning Bell in Ohio," December 5, 2005. Website, the Foundation for National Progress.

[6] For example, the Carter-Baker Commission accompanied its recommendation for a national voter ID card with a recommendations for an affirmative effort by the states to reach out and register the unregistered, to use the new Voter ID regime as a means to enroll more voters.

requirements increases, turnout declines. The effect is particularly noticeable in counties with concentrations of Hispanic residents or of people living below the poverty line.

Evidence on the incidence of vote fraud, especially on the kind of vote fraud that could be reduced by requiring more rigorous voter identification is not sufficient to evaluate the tradeoffs between ensuring ballot access and ensuring ballot integrity. The lack of full understanding of the dynamics of voter ID requirements on political participation can be remedied by requiring the collection and reporting of data on the reasons potential voters are required to cast a provisional ballot and the reasons for rejecting provisional ballots. Also useful would be the results of exit polling of voters on their experiences in meeting voter ID requirements and on what type of ballot they cast.[7] And, of course, more information is needed on the incidence and varieties of vote fraud, but that inquiry is outside the scope of this report.

Recommendations for consideration and action by the EAC

The EAC should consider the following actions to improve understanding of the relationship between voter ID requirements, broadly defined, and the two important goals of ensuring ballot access and ensuring ballot integrity.

- Encourage or sponsor further research to clarify the connection between Voter ID requirements and the number of potential voters actually able to cast a ballot.
- Recommend as a best practice that before states adopt a change described as increasing ballot security, states should publish an analysis of the number of eligible, potential voters that the new requirement may keep away from the polls or be permitted to cast only a provisional ballot as well as an estimate of the number of ineligible voters who will be prevented from voting.
- Encourage or require the states in the 2006 election and beyond, to collect and report reliable, credible information on the relationship between ballot access and ballot security. The data should be analyzed to provide a sound estimate of the incidence of the kinds of vote fraud that more stringent ID requirements may prevent and should describe the dynamics of voter ID in preserving the security of the ballot?

---

[7] Arizona held its first election with new, stricter ID requirements on March 14, 2006. In at least one county (Maricopa) election officials handed a survey to voters that asked if they knew about the voter identification law and if they did, how they found out about it. Edythe Jensen, "New Voter ID Law Goes Smoothly in Chandler," *Arizona Republic*, March 15, 2006. More surveys of this kind can illuminate the dynamics of voter ID and voting in ways not possible with the current lack of information on this subject.

  - Useful information could be supplied by exit polling. It would identify those who had cast a provisional ballot and ask why they were unable to cast a regular ballot. Answers would illuminate the frequency with which ID issues divert voters into the provisional ballot line.
  - Polling to ask voters what they know about the voter id requirements would also provide useful context for evaluating the effect of various voter id requirements on electoral participation.
- Encourage states to examine the time period allowed for voters who cast a provisional ballot because they lacked required ID to return with their identification. In eleven states, voters who had to cast a provisional ballot because they lacked the ID required for a regular ballot were permitted to return later with their ID. Their provision of this ID is the critical step in evaluating the ballots. The length of the period in which the voter may return with ID is important. In setting the time period for return, which now varies among the states from the same day to about two weeks, states should consider three criteria: the convenience of the voter, the total time allowed to evaluate ballots[8], and the safe harbor provision in presidential elections.

---

[8] Our research on provisional voting reveals that states that provide more than week to evaluate provisional ballots end up counting substantially more of those ballots than states that provide less than a week.

3. Voter ID and Turnout

As of the 2004 election, the states and the District of Columbia could be divided into 5 different Voter ID regimes. These are shown in Table 1, *Voter ID Requirements.* Nine states required that voters give their names; 14 that they sign their names; 8 match the signature to a sample in the registration book; 15 require some form of ID (ranging from a utility bill to a government-issued photo ID), and 5 states in 2004 required a photo ID, although in all those states voters without that credential could cast a regular ballot after signing an affidavit concerning their identity and eligibility.

TABLE 1 -- Voter ID Requirements

State	Forms of ID Required 2004	Current ID Requirement for First-Time Voters	Current ID Requirements for All Other Voters	Verification Method for Provisional Ballots

^In Florida and Louisiana, states that required a photo id in 2004, voters without that credential could sign an affidavit concerning their identity and eligibility and cast a regular ballot.

^^In these states in 2004, voters lacking a photo ID could vote by providing other ID.

*Arizona voters who lack a photo ID may present 2 forms of ID with no photograph, such as 2 utility bills.

**State only requires ID for first-time voters who register by mail without providing ID. They accept all forms of ID listed in the statute.

***Georgia is currently enjoined from implementing this law, returning them for the time being to their 2004 requirement of provide ID.

****Pennsylvania requires ID of all first-time voters, whether they registered by mail or in-person.

*****Tennessee voters must provide signature and address. In counties without computerized lists, the signature is compare to the registration card. In counties with computerized lists, the signature is compared to a signature on ID presented with registration.

******Texas voters must present a current registration certificate. Those without a certificate can vote provisionally after completing an affidavit.

In 9 states, voters were required merely to state their names so that poll workers could locate them in the registration book. In 14 states, voters signed their names. In 8 states, voters' signatures were matched with a specimen signature. In 15 states voters had to show some form of ID, not necessarily an official picture ID. And in 5 states, voters were required to show an official photo ID, although in 2004 voters who lacked a picture ID could execute an affidavit and vote a regular ballot.

This neat assignment of each state to one of a few categories may fail to reflect actual practice at a polling place. Like any system run by fallible people it is subject to wide variation in practice. Voters may be confronted with demands for identification at variance with state statutes or legislation. Other voters may be waved through the process without a look at any document, no matter what the regulations may say. Under the press of long lines and unfamiliar requirements, there is, in short, no sure way to report the wide variety of conditions voters may encounter.

It is not practical to attempt to capture the wide variety of how voter ID requirements may be actually implemented across the nation's tens of thousands of polling places. Recognizing that means that the analysis of the effect of state requirements on county-level turnout must be viewed with some caution.

Effect of Voter ID requirements on Turnout

Summary of Findings and Conclusions

We categorized each state according to its voter ID requirements in 2004, as shown in Table 1 and analyzed turnout data for each county according to the voter identification requirements of its state. We also assessed self-reported turnout by the sample interviewed in the November 2004 Current Population Survey of the Census Bureau. [9]

Voter turnout at the state level in 2004 varied based on voter identification requirements. An average of 63.1 percent of the voting age population turned out in states that required voters to state their names, compared to 57.3 percent in states that required photo identification. Other factors, of course, also influence turnout. Taking those other factors into account in the county-level analysis makes the effect of the voter ID requirement less dramatic. But the analysis still offers some support for the hypothesis that as the burden of voter identification requirements increases, turnout declines. The effect is particularly noticeable in counties with concentrations of Hispanic residents or of people living below the poverty line.

The individual-level analysis, based on the CPS, produced a similar result. Voter identification requirements exert a statistically significant, negative effect on whether survey respondents said they had voted in 2004. The probability that a respondent to the survey voted dropped with each

---

[9] See Appendix ___ for the full report on voter ID and turnout.

level of voter identification requirement, with a total drop of 2.5 percent across the five types of identification.

Future policy decisions should consider the tradeoffs between the incidence of vote fraud that can be prevented by stricter voter ID requirements and the number of eligible voters who will be kept from the polls by those stricter ID requirements. Continuing research is needed to provide the information to inform this calculation of benefits and costs.

Methods and Findings

We classified each state as having one of five types of identification requirements in place on Election Day 2004. Upon arrival at polling places, voters had to either: state their names (9 states); sign their names (13 states and the District of Columbia); match their signature to a signature on file with the local election board (8 states); provide a form of identification that did not necessarily include a photo (15 states); or provide a photo identification (5 states). We then tested the assumption that voter identification requirements would prove to be increasingly demanding on the voter, with providing photo ID the most rigorous. a form of identification, and providing a form of photo identification.

The analysis recognized that election laws in numerous states offer exceptions to these requirements if a prospective voter lacked the ID. Laws in those states set a minimum standard that a voter must meet in order to vote using a regular ballot. We therefore also categorized states based on the minimum requirement for voting with a regular ballot. None of the states required photo identification as a minimum standard for voting with a regular ballot. Four states, however, required voters to swear an affidavit as to their identity (Florida, Indiana, Louisiana, and North Dakota). The five categories for minimum requirements were: state name (12 states), sign name (14 states and the District of Columbia), match one's signature to a signature on file (six states), provide a non-photo identification (14 states), or swear an affidavit (four states). This analysis treats the array of minimum identification requirements also in terms of increasing demand on the voter: state name, sign name, match signature, provide non-photo identification, and, given the potential legal consequences for providing false information, swearing an affidavit.
