Test Plan for EAC 2005 VVSG Certification Testing Dominion Voting Systems Democracy Suite (D-Suite) Version 5.5 Voting System

EAC Project Number: DVS1702

Version: As-Run, Rev. B

Date: 9/17/2018

U.S. Election Assistance Commission

VSTL

EAC Lab Code 1501

The logo for NVLAP (National Voluntary Laboratory Accreditation Program) is rendered in a stylized, outlined font. The letters 'N', 'V', 'L', 'A', and 'P' are connected, with the 'P' having a distinctive shape. A registered trademark symbol (®) is located at the top right of the 'P'.

NVLAP LAB CODE 200908-0

REVISIONS

Revision	Description	Date
NR	Initial Release	10/18/17
A	Updates per EAC comments and revised System Change Notes	12/6/17
B	Updates per EAC comments and revised System Change Notes	1/5/2018
C	Updates per EAC comments	1/31/2018
C	All highlights removed from document	1/31/2018
As-Run	Final version based on test performance	8/20/2018
As-Run, Rev.A	Revised final version based on EAC comments	8/31/2018
As-Run, Rev.B	Revised final version with all highlights removed	9/17/2018

1.0 INTRODUCTION

The purpose of this Test Plan is to document the procedures that Pro V&V, Inc. will follow to perform certification testing during a system modification campaign for the Dominion Voting Systems Democracy Suite (D-Suite) 5.5 Voting System to the requirements set forth for voting systems in the U.S. Election Assistance Commission (EAC) 2005 Voluntary Voting System Guidelines (VVSG), Version 1.0. Prior to submitting the voting system for testing, Dominion Voting Systems submitted an application package to the EAC for certification of the D-Suite 5.5 Voting System. The application was accepted by the EAC and the project was assigned the unique Project Number of DVS1702.

At test conclusion, the results of all testing performed as part of this test campaign will be submitted to the EAC in the form of a national certification test report.

1.1 Description and Overview of EAC Certified System Being Modified

The D-Suite 5.5 Voting System is a paper-based optical scan voting system with a hybrid paper/DRE option consisting of the following major components: The Election Management System (EMS), the ImageCast Central (ICC), the ImageCast Precinct (ICP), the ImageCast X (ICX) DRE w/ Reports Printer, ImageCast X (ICX) DRE w/VVPAT, and the ImageCast X (ICX) BMD. The D-Suite 5.5 Voting System configuration is a modification from the EAC approved D-Suite 5.0 system configuration.

The following subsections describe the baselined D-Suite 5.0 Voting System.

The EAC Certified System that is the baseline for the submitted modification is described in the following subsections. All information presented was derived from the previous Certification Test Report, the EAC Certificate of Conformance and/or the System Overview.

Election Management System (EMS)

The D-Suite 5.0 EMS consists of various components running as either a front-end/client application or as a back-end/server application. A listing of the applications and a brief description of each is presented below.

Front-end/Client applications:

- **EMS Adjudication:** Represents the client component responsible for adjudication, including reporting and generation of adjudicated result files from ImageCast Central tabulators and adjudication of write-in selections from ImageCast Precinct and ImageCast Central tabulators. This client component is installed on both the server and the client machines.
- **EMS Audio Studio:** A client application that represents an end-user helper application used to record audio files for a given election project. As such, it is utilized during the pre-voting phase of the election cycle.

- EMS Election Data Translator: End-user application used to export election data from election project and import election data into election project.
- EMS Election Event Designer: A client application that integrates election definition functionality together with ballot styling capabilities and represents a main pre-voting phase end-user application
- ImageCast Voter Activation: An application, installed on a workstation or laptop at the polling place, which allows the poll workers to program smart cards for voters. The smart cards are used to activate voting sessions on ImageCast X.
- EMS Results Tally and Reporting: A client application that integrates election results acquisition, validation, tabulation, reporting, and publishing capabilities and represents the main post-voting phase end-user application.

Back-end/Server applications:

- EMS Adjudication Service: Represents a server side application which provides ballot information such as contests, candidates and their coordinates from EMS to the Adjudication application.
- EMS Application Server: Represents a server side application responsible for executing long running processes, such as rendering ballots, generating audio files and election files, etc.
- EMS Database Server: Represents a server side RDBMS repository of the election project database which holds all the election project data, including pre-voting and post-voting data.
- EMS Data Center Manager: A server application that represents a system level configuration application used in EMS back-end data center configuration.
- EMS Election Device Manager: Application used for production and programming of election files, and other accompanying files, for ImageCast X terminals.
- EMS File System Service: A back-end application that acts as a stand-alone service that runs on client machines, enabling access to low level operating system API for partitioning CF cards, reading raw partition on ICP CF card, etc.
- EMS NAS Server: Represents a server side file repository of the election project file based artifacts, such as ballots, audio files, reports, log files, election files, etc.
- Smart Card Helper Service: A service that is installed on a workstation or laptop at the polling place, and provides required data format for programming smart cards for ImageCast devices, or, for jurisdiction's voting registration system in case of integration.

ImageCast Precinct (ICP)

The ICP device is a hybrid precinct optical scan paper/DRE ballot counter designed to provide six major functionalities: ballot scanning, second chance voting, accessible voting, ballot review, tabulation, and poll worker functions.

For ballot scanning functionality the ICP scans marked paper ballots, interprets voter marks on the paper ballots and stores the ballots for tabulation when the polls are closed.

Second Chance voting refers to scenarios in which an error has been detected on the voter's paper ballot (e.g., blank ballot, undervoted ballot, overvoted ballot, misread ballot, cross-over voted ballot), and the ICP notifies the voter by displaying a message or providing an audio visual cue, that one of these situations has been detected, and offers the voter an opportunity to reject and fix their ballot, or to cast the ballot as-is.

Accessible voting allows voters with disabilities to listen to an audio representation of a ballot and use a hand held controller called an Audio Tactile Interface (ATI) to make vote selections, which are then saved directly to the ICP when the voter casts their Accessible Voting ballot.

The Ballot Review feature allows a voter to review their vote selections using an audio or visual representation, which displays or presents the voter with a complete listing of all contests contained on the ballot and an indication of the results which will be recorded for each contest once the voter's ballot is cast.

The Tabulation of paper ballots and Accessible Voting ballots cast by voters is performed when the polls are closed on the ICP unit and the unit tabulates the results, generates results files for aggregation into RTR, and prints a results report containing the results of the ballots cast.

For poll worker functions the ICP contains a small touch-screen LCD to allow the poll worker to initiate polling place activities, diagnostics and reports.

ImageCast Central (ICC) Count Scanner

The ICC is a high-speed, central ballot scan tabulator based on Commercial off the Shelf (COTS) hardware, coupled with the custom-made ballot processing application software. It is used for high speed scanning and counting of paper ballots.

ImageCast X (ICX) Ballot Marking Device (BMD)

The Democracy Suite ImageCast X ballot marking platform is a solution that is used for creation of paper cast vote records. These ballots can be scanned, reviewed, cast and tabulated at the polling location on an ImageCast Precinct device or later scanned and tabulated by the ImageCast Central optical ballot scanner. The ImageCast X also supports enhanced accessibility voting through optional accessories connected to the ImageCast X unit.

The ICX is a proprietary application which runs on any of the tablets listed in Table 1-21.

1.1.1 Baseline Certified System

The baseline system for this modification is the D-Suite 5.0 Voting System. The tables below describe the certified equipment and firmware versions. Detailed descriptions of the D-Suite 5.0 test campaign are contained in Pro V&V Report No.TR-01-01-DVS-2016-01.01 Rev. D, which is available for viewing on the EAC’s website at www.eac.gov.

This subsection lists the proprietary and COTS software to be provided by the manufacturer as part of the test campaign.

1.1.2 Description of Modification

The Dominion Democracy Suite 5.5 Voting System is a modified voting system configuration that includes upgrades to the components of the D-Suite 5.0 Voting System. The list below includes changes between this system and the baseline of the Democracy Suite 5.0 Voting System:

GENERAL MODIFICATIONS

- EMS components to utilize Windows Authentication instead of SQL Server Authentication
- Ability for system to utilize self-encrypting drives as an additional security feature
- All components now running on combination of Windows 10, Windows Server 2012R2, with SQL Server 2016 (also included are scripts for security hardening procedures)
- Ability to automatically install and configure Windows-based software components used by the security hardening scripts without user interaction. The security hardening scripts and their associated software are located on the EMS Install disc. In the Democracy Suite 5.0 voting system the user was required to install these software components manually.
- Ability to gather all required logs from system and applications and store them in one zip file.
- Updated hardening scripts for windows 10 to remove preinstalled applications that exist on the system
- Add UnifiedInstaller to code build.
- Updated OpenSSL FIPS 140-2 validated modules to each of the Democracy Suite products that use these cryptographic modules
- Updated expired certificates for build environments (Windows-based and ICX components)

EMS

- Upgraded EMS Election Event Designer as follows:
 - Ability to configure how common cards are consolidated
 - Ability to create a naming convention for the ballot ID, artwork filename and description
 - Ability to generate one or more ballots without generating all ballots in the election project
 - Application produces election definition in final form for the ImageCast X voting application (DRE VVPAT/DRE Reports Printer/BMD)
 - Ability to produce and modify a configuration file for ImageCast X (DRE VVPAT/DRE Reports Printer/BMD)
 - Ability for the application to program the USB Flash Device with necessary resources used for setting up an ImageCast X voting device. (DRE VVPAT/DRE Reports Printer/BMD)
 - Extended styling capabilities for ICX (DRE VVPAT/DRE Reports Printer/BMD)
 - Added support for utilizing Legal size paper when printing ballots on an ICX BMD.
 - Modified the specification of available area for Write-in detection, which is passed through the election files to the optical scan tabulators

- Ability to generate distinct ballot ID's for Precinct Portions with Identical Ballot Content
- Extending Paragraph Alignment Attributes to allow for more flexibility
- Contest Headings now have a Global Order Field
- Ability to indicate which District Types can appear on Print Tape
- Support for ICX VVPAT Printer (DRE VVPAT)
- Ability to add "strike through" text on ballots
- Ability to specify how many columns the candidates within a contest should occupy when shown on screen, up to a maximum of 6 columns
- Report which displays how contests appear on the ICX platform for use when troubleshooting ballot layouts during the election design process. (DRE VVPAT/DRE Reports Printer/BMD)
- Ability for candidate with multi-party affiliation to be displayed on ballot or screen with single voting box
- Ability to print samples of all touchscreen ballots.
- Ability to set watermark picture for: ballot header, ballot footer and ballot stubs
- Ability to pass the MCF configuration settings to the connected ICX so that those settings that can affect the display/layout of the ballot are presented on the ICX during the ICX preview mode. (DRE VVPAT/DRE Reports Printer/BMD)
- Straight party tickets now include only the parties that are actually used in affiliations on the ballot.
- Ability for ICP/ICC tabulator platform to implement the straight party logic which takes into account multi-party affiliated voting box
- Ability for ICX tabulator platform to implement the straight party logic which takes into account multi-party affiliated voting box (DRE VVPAT/DRE Reports Printer/BMD)
- Ability for a column on the Ballot Cards screen in EED to show the paper size for each ballot is added in order to determine which ballots are larger or smaller than the allowed size for the election (letter/legal)
- Upgraded EMS Results Tally & Reporting as follows:
 - Ability to break-down results per precinct for consolidated ballots, when reviewing the contents of Results Files
 - New report export, Batches Containing Precincts, provides information on what precincts each batch of results contains

- Ability to select multiple precincts for the Summary Report
- Ability to indicate in a project whether disabled contests and candidates should appear in the Election Summary and Statement of Votes Cast reports
- Ability to track precinct information for consolidated cards, and view the information when reviewing the contents of Results Files
- Ability to bypass adjudication for early voting results. This ability allows an authorized user to choose to skip Adjudication of election results when importing Early Voting election results into the RTR application. This is accomplished by selecting the option to skip adjudication of these results during the results import process. When this option is selected the Early Voting results cannot be adjudicated as the adjudication process is skipped entirely. If the user later wishes to adjudicate the early voting results, the existing results which were not adjudicated must be purged from the database. The user can then import the early voting results from their original sources, choosing not to skip adjudication. At this point the Early Voting results can then be adjudicated.
- Refactoring of CVR Service to allow for improved performance and reliability during loading, adjudicating and publishing of results
- Extended Service to allow Adjudication to retrieve list of Qualified Write-ins, and add new Qualified Write-ins to the master list
- Refactoring of SQL Server Reporting Service based reports to allow for improved performance and more flexibility in extending reporting capabilities.
- Ability to generate Statement of Votes Cast report by Ballot Type
- The existing CVR export can now be generated in Excel format
- The Batches Loaded Report export indicates the date and time when each results batch was loaded into the EMS database.
- Ability to remove provisional votes into a separate results batch in order to allow for adjudication of standard results in a batch
- Ability to export audit images sorted by Candidate
- User is informed if there are pending provisional ballots before pushing results to Adjudication
- Ability to choose whether the system automatically deletes any exported files when clearing all results in the database before the election starts to ensure a zero result state.
- Ability to load results which come from the same logical Tabulator ID definition (i.e., two physically separate ICX machines that were assigned with the same logical Tabulator ID number), and to be sure that results from a single ICX machine are not loaded into the EMS

more than once. The results files from the individual ICX machines are assigned unique Batch ID's when they are uploaded to the EMS. Using the Results Files screen and/or the Tabulator screen, instances of more than one results file for the same Tabulator ID can be seen with the unique Batch ID's displayed. The EMS user can procedurally examine the results batches to trace the results files to the original ICX machines which generated them. (DRE VVPAT/DRE Reports Printer)

- When a report is too large to be generated, the system provides a message that filters need to be applied before generating the report.
- The SOVC report has the ability to suppress the vote results from the report where there is low turnout in order to protect voter privacy. The threshold for suppressing the results is configurable.
- Straight party voting rules now take into account multi-party affiliated voting boxes
- Two new fields added to CVR session object: Ballot Type name and Precinct Portion name, in order to support ADJ Hovering on the ballot header black colored
- Evaluation of RTR Cards Cast report when ballots were cast on ICX (DRE VVPAT/DRE Reports Printer)
- Upgraded EMS Election Data Translator as follows:
 - Ability to import subsets of data using the application: New languages and translations, template assignment, and tabulators
 - Modifications to Contest and Contest Heading tables to allow enhance styling capabilities for ICX (DRE VVPAT/DRE Reports Printer/BMD)
 - Ability to export/import data related to composite parties.
 - References to party logo images can either be made through an absolute file or through a file name
 - On import, the EDT updates the Election Event info using the data in the Election worksheet of the EDT spreadsheet.
- Upgraded EMS Audio Studio as follows:
 - Modifications to application to handle the newly required audio resources for the ICX (DRE VVPAT/DRE Reports Printer/BMD)
- Upgraded EMS Adjudication as follows:
 - The resume function has been made more robust
 - Adjudication Administrator can now perform tasks on a remote client machine, rather than the server

- Master list of qualified write-ins is now managed by EED
- Admin can add a new write-in "on the fly" after the project has been created. Write-ins will be added to master list and will be synchronized for all adjudicators
- Ability to prevent a ballot from being completed until all write-ins are resolved
- The Adjudicator can now see the AuditMark alongside the image of the ballot being adjudicated
- Adjudicator can now skip a ballot and continue adjudicating remainder of batch
- When **Continue** is selected in the ballot load error dialog, new ballots with load errors are given a Quarantined status, with the note "Automatically Quarantined due to Load Error"
- Upgraded EMS ICVA as follows:
 - Improved workflow for programming voter cards to allow for faster processing at polling location
 - Added ability to indicate if a card was voted or not
 - Modified the SmartCard timestamp format to exclude the timezone.

ICC

- Added support for a TWAIN interface
- Added option to force to ICC to overrun a preset number of ballots every time scanning stops mid-batch
- Switching election projects in ICC has been simplified
- Improvements to Write-in Area detection
- Application now runs on Windows 10
- Cross-endorsed candidates rule implemented

ICX (General)

- Ability to conduct a vote simulation for use during Logic & Accuracy Testing
- Ability to display more than one contest on the screen
- Ability to display a heading for a single or a group of contests on the screen
- Ability to align the contest cell left, right or center, along with support for font size, bold, italic and underline text

- Ability to playback audio for screen contents for languages that do not have Text-to- Speech support
- Ability to display and record votes for a choice which enables the voter to indicate they do not wish to cast a vote for any of the available choices
- Ability to display a Straight Party ticket and have remaining partisan contests influenced
- Ability to indicate status information using a USB LED poll worker light
- Added manual activation of ballot with alphanumeric codes
- Added option to search for tabulator number
- Added support for changing the background color (contest, choice)
- Added ability for technician to modify brightness for Prime tablet. This functionality is required during the initial setup of the ICX Prime units to establish the default brightness level of the screen based upon brightness values described in the technical documentation used to setup and configure the ICX Prime units. This ability does not preclude a voter from adjusting the contrast ratio of the screen during a voting session.
- Add support for Sunzone SUZCR-R59 smart card reader in ICX
- Ability to display contests in multiple columns, up to a maximum of 6 columns.
- Ability to limit the number of spoiled ballots
- Corrected condition that produced an error message when viewing the lifetime counter in the PollWorker menu.
- Corrected behavior to limit selections in an endorsed partisan contest to the maximum allowed if that partisan contest was on the same screen as the Straight Party selection contest.
- Corrected behavior in AVS sessions to not have text-to-speech read out punctuation characters at the end of contest descriptions.
- Added full support for a Voter Flee situation: warning, alarm sound, LED light ash, timeout, possibility to continue voting or to be re-set by a poll worker for new voter.
- Replaced Android OS accessibility service with custom service in the application to prevent application memory leak (due to Android service) when the Vote Simulator utility uses a navigation bar for administrative tasks during testing.
- Added parameters in the MCF configuration file (Audible Tone group) to allow the duration of the audio tone for error tones to be set (default=15 sec)
- Added scroll bars for when choice font is very large and consumes all of the screen space, to ensure all choices are accessible regardless of font size.

- Added a parameter (AVS > Message Repeat Count) in the MCF configuration file to set the number of times an audio message will repeat in an AVS session.
- Corrected ICX review screen to remove message “Your ballot is blank.” in a single contest ballot when a choice is selected, then deselected, another choice is selected.
- Straight party voting now supported
- Corrected smart card access to Pollworker functions when the USB Memory Device is not inserted or for Pollworker smart cards with invalid election codes.
- Corrected ICX application behavior when voter smart card is removed and re-inserted several times in succession.
- Corrected AVS audio to include all ballot information on the review screen.
- Added support for Pennsylvania straight party voting rules
- Corrected missing text in report when printed per contest or per precinct, and when the project contains instructional contests in multiple languages, and at least one ballot in each language is cast.
- Updated MCF to set “Report per Contest” as the default, and to remove the “Report by Activation Code” option.
- Modified label text in the hardware information screen to USB Device ID to identify the contents of the relevant data fields

ICX (DRE Mode Specific)

- Ability to save results in cast vote record format (Applies to both the DRE VVPAT and DRE Reports Printer Configurations)
- Addition of new VVPAT Printer for the ImageCast X voting application
- Addition of new thermal Report Printer for the ImageCast X voting application
- Ability to verify the VVPAT for an accessible voter
- Added MCF option to specify number of copies of zero and results tapes to print (Applies to both the DRE VVPAT and DRE Reports Printer Configurations)
- Modified the application detection of the Report Printer door position so that when the printer door is unlocked or open, the application stops sending data to the printer and resumes once the door is closed and locked

- Corrected behavior of “Reprint Report” and “Cancel Report” when printing a report with a large header and a large precinct/ballot list (Applies to the DRE Report Printer configuration)
- Corrected behavior of Pollworker LED and audio alarm when an error occurs on the info activity screen and is cleared (Applies to the DRE VVPAT configuration)
- Corrected intermittent printing errors that halted the VVPAT printing and displayed the error “There was an error on printing selection on VVPAT printer” (Applies to the DRE VVPAT configuration)
- Corrected communications with printer to more quickly service low paper error messages to prevent issues with displaying that error message to the user and with printing the balance of the current voting session information.
- Improved integrity of USB communication between the ICX and VVPAT printer, modified the ICX application to ping the VVPAT scanner at most every 10 sec. and used new VVPAT printer firmware to enable an existing watchdog timer to reset the scanner controller if there is no data input/output from the scanner in more than 10 sec.
- Adjusted the Warning message in the PollWorker menu to show the Printer status when printer is overheated instead of showing “N/A.”
- Added the Tabulator ID to the end barcode to match the text on the VVPAT record.
- Updated MCF to default Start and End barcodes to false.

ICX (BMD Mode Specific)

- Printed QR Ballot now has human readable part printed in an OCR-friendly font
- Ability to have a QR ballot printed on Legal sized paper
- The delay before printing pages printed after the first page is less than 2 seconds

ICP

- Improvements to Write-in Area detection
- ICP is no longer restricted to 10 pre-defined languages
- Now able to print list of admin areas as part of the tape header
- Added Tabulator name to footer section of the tape
- Cross-endorsed candidates rule implemented

1.1.3 Initial Assessment

Testing from the previous test campaign was used to establish the baseline. The focus of this test campaign is the introduction of the ICX Prime hardware, the addition of a DRE mode to the ICX application which can be configured to generate a paper backup by utilizing a VVPAT printer or operate in a paperless mode using a Report Printer to print Election Reports (DRE mode is only available on the ICX Prime hardware), the removal of the ICX Samsung configuration from the system, the introduction of a new ICC hardware configuration utilizing the Canon DR-M160II document scanner, the introduction of the updated OpenSSL FIPS 140-2 validated modules, and the updated functionality of the D-Suite 5.5 System components as described in section 1.1.2 of this document. It was determined the following tasks would be required to verify compliance of the modifications:

- Source Code Review, Compliance Build, Trusted Build, and Build Document Review
- System Integration Testing
- Technical Documentation Package (TDP) Review
- Functional Configuration Audit (FCA)
- System Loads & Hardening
- Physical Configuration Audit (PCA)
- Security Testing
- Hardware Testing
- Usability & Accessibility Testing
- Volume & Stress Testing
- Accuracy Testing

1.1.4 Regression Test

Regression testing for this test campaign will consist of the execution of the System Integration Testing.

1.1.5 System Modification Evaluation

To verify the submitted modifications are successfully addressed throughout the test campaign, each modification will be tracked and verified to be addressed during the execution of the relevant test area. For example, source code changes will be verified during the source code review. Modifications requiring functional test verification will be evaluated by executing the standard Accuracy Test, the System Integration Test, or during performance of the FCA. Modifications that are not adequately evaluated during the performance of these tests will be subjected to specifically designed test cases.

1.3 Terms and Abbreviations

This subsection lists terms and abbreviations relevant to the hardware, the software, or this Test Plan.

“ADA” – Americans with Disabilities Act 1990

“BMD” – Ballot Marking Device

“CM” – Configuration Management

“COTS” – Commercial Off-The-Shelf

“DRE” – Direct Record Electronic
“EAC” – United States Election Assistance Commission
“EMS” – Election Management System
“FCA” – Functional Configuration Audit
“HAVA” – Help America Vote Act
“ICC” – ImageCast Central
“ICP” – ImageCast Precinct
“ICX” – ImageCast X
“ISO” – International Organization for Standardization
“NOC” – Notice of Clarification
“PCA” – Physical Configuration Audit
“QA” – Quality Assurance
“RFI” – Request for Interpretation
“TDP” – Technical Data Package
“UPS” – Uninterruptible Power Supply
“VSTL” – Voting System Test Laboratory
“VVPAT” – Voter Verifiable Paper Audit Trail
“VVSG” – Voluntary Voting System Guidelines

1.4 Project Schedule

The Project Schedule for the test campaign is located in Appendix A. The dates on the schedule are not firm dates but planned estimates based on the anticipated project work flow.

1.5 Scope of Testing

The scope of testing focused on the introduction of the ICX Prime hardware, the addition of a DRE mode to the ICX application which can be configured to generate a paper backup by utilizing a VVPAT printer or operate in a paperless mode using a Report Printer to print Election Reports (DRE mode is only available on the ICX Prime hardware), the removal of the ICX Samsung configuration from the system, the introduction of the Canon DR-M160II document scanner for use with the ICC, the introduction of the updated OpenSSL FIPS 140-2 validated modules, as well as the updated functionality of the D-Suite 5.5 System components as described in section 1.1.2 of this document. To evaluate the D-Suite 5.5 test requirements, the submitted

modifications were evaluated against each section of the EAC 2005 VVSG to determine the applicable tests to be performed.

Based on this assessment, it was determined that multiple areas within the EAC 2005 VVSG would be evaluated to encompass the required tests. A breakdown of the areas and associated tests is listed below:

- EAC 2005 VVSG Volume 1, Section 2: Functional Requirements
 - System Integration Testing
 - Functional Configuration Audit (FCA)
 - Physical Configuration Audit (PCA), including System Loads & Hardening
 - Technical Documentation Package (TDP) Review
 - Volume & Stress Testing
 - Accuracy Testing
- EAC 2005 VVSG Volume 1, Section 3: Usability & Accessibility
 - Usability & Accessibility Testing
 - Technical Documentation Package (TDP) Review
- EAC 2005 VVSG Volume 1, Section 4: Hardware Requirements
 - Hardware Testing
 - Technical Documentation Package (TDP) Review
- EAC 2005 VVSG Volume 1, Section 5: Software Requirements
 - Source Code Review, Compliance Build, Trusted Build, and Build Document Review
 - Technical Documentation Package (TDP) Review
 - Functional Configuration Audit (FCA)
- EAC 2005 VVSG Volume 1, Section 7: Security Requirements
 - Security Testing
 - Technical Documentation Package (TDP) Review
 - Functional Configuration Audit (FCA)

1.5.1 Block Diagram

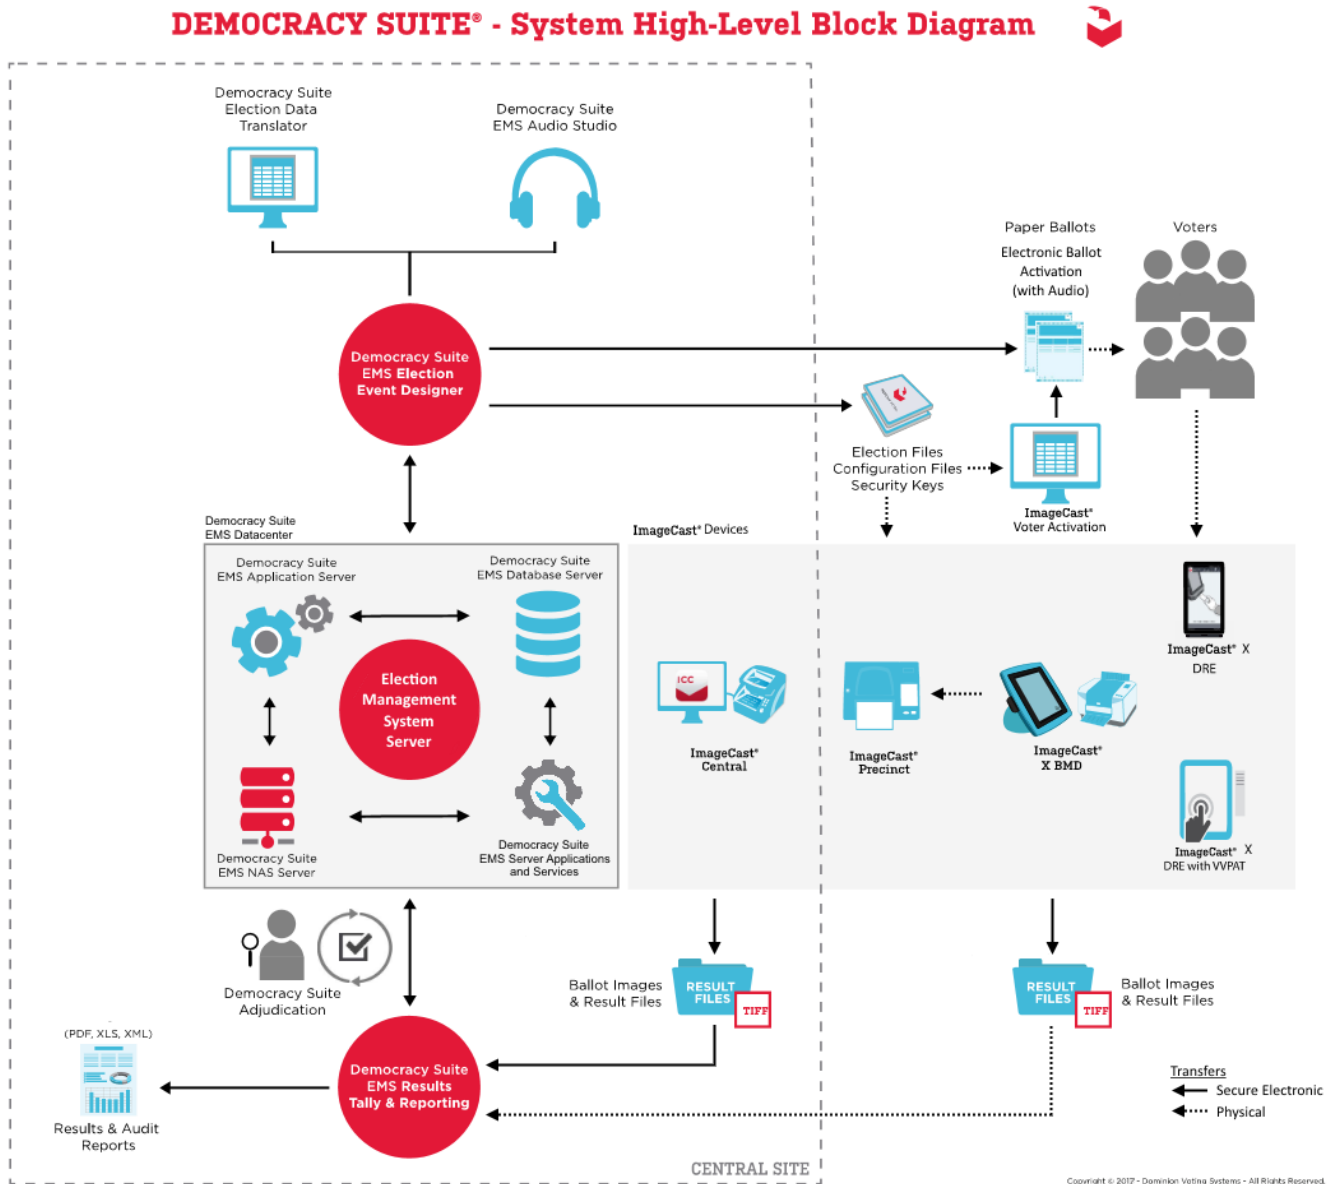

Figure 1-1. D-Suite 5.5 System Overview

1.5.2 System Limits

The system limits that Dominion Voting Systems has stated to be supported by the D-Suite 5.5 are provided in the table below.

Table 1-22. D-Suite 5.5 System Limits by Configuration (Landscape Ballot Orientation)

Characteristic	Configuration Values		Limiting Component
	Standard	Express	
Ballot positions	292	292	*22-inch Landscape Ballot (240 candidates + 24 write-ins + 28 Yes/No choices)
Precincts in an election	250	1000	Memory
Contests in an election	250	1000	Memory
Candidates/Counters in an election	2500	10000	Memory
Candidates/Counters in a precinct	240	240	*22-inch Landscape Ballot
Candidates/Counters in a tabulator	2500	10000	Memory
Ballot Styles in an election	750	3000	Memory
Contests in a ballot style	38	38	*22-inch Landscape Ballot (24 candidacy contests + 14 Propositions)
Candidates in a contest	240	240	*22-inch Landscape Ballot
Ballot styles in a precinct	5	5	Memory
Number of political parties	30	30	Memory
“Vote for” in a contest	24	24	*22-inch Landscape Ballot
Supported languages in an election	5	5	Memory
Number of write-ins	24	24	*22-inch Landscape Ballot

*The 22-inch Ballot length applies only to hand-marked paper ballots

Table 1-23. D-Suite 5.5 System Limits by Configuration (Portrait Ballot Orientation)

Characteristic	Configuration Values		Limiting Component
	Standard	Express	
Ballot positions	462	462	*22-inch Portrait Ballot
Precincts in an election	250	1000	Memory
Contests in an election	250	1000	Memory
Candidates/Counters in an election	2500	10000	Memory
Candidates/Counters in a precinct	462	462	*22-inch Portrait Ballot
Candidates/Counters in a tabulator	2500	10000	Memory
Ballot Styles in an election	750	3000	Memory
Contests in a ballot style	156	156	*22-inch Portrait Ballot
Candidates in a contest	231	231	*22-inch Portrait Ballot (Column Span 3)
Ballot styles in a precinct	5	5	Memory
Number of political parties	30	30	No Limitation
“Vote for” in a contest	30	30	No Limitation
Supported languages in an election	5	5	Memory
Number of write-ins	462	462	*22-inch Portrait Ballot

*The 22-inch ballot length applies only to hand-marked paper ballots.

1.5.3 Supported Languages

The following languages are supported by the D-Suite 5.5 System:

- Alaska Native
- Apache
- Bengali
- Chinese
- English
- Eskimo
- Filipino
- French
- Hindi
- Japanese
- Jicarilla
- Keres

- Khmer
- Korean
- Navajo
- Seminole
- Spanish
- Thai
- Towa
- Ute
- Vietnamese
- Yuman

Support for all stated languages will be verified; however, only English and Spanish language ballots will be cast during the performance of functional testing. Additionally, one character based language (Chinese) will be tested during System Integration Testing.

For the character based language, the ballot will be created by Pro V&V and voted utilizing both paper ballots and ADA voting devices along with all applicable peripherals. The Chinese Language for the ballot will be created using a readily available online translation tool. The translated language text will be entered into the Election Event Designer Application. A ballot preview will be generated in the EED application. The Chinese characters displayed in the ballot preview will be compared to the characters generated by the online translation tool, to ensure that the characters match. The ballots will then be generated and printed, and the election loaded onto the tabulators and the BMD units. The Chinese characters displayed on both the printed ballots and displayed on the BMD units will be compared to the original Chinese Characters generated by the online translation tool to verify that the characters match.

1.5.4 Supported Functionality

The D-Suite 5.5 is designed to support the following voting variations:

- General Election
- Closed Primary
- Open Primary
- Early Voting
- Partisan/Non-Partisan Offices
- Write-In Voting
- Primary Presidential Delegation Nominations
- Split Precincts
- Vote for N of M
- Ballot Rotation

- Provisional or Challenged Ballots

1.5.5 VVSG

The D-Suite 5.5 Voting System shall be evaluated against the relevant requirements contained in the EAC 2005 VVSG, Version 1.0.

1.5.6 RFIs

There are no RFIs released by the EAC as of the date of this Test Plan that pertain to this test campaign that were not in effect at the time of the baseline system certification.

1.5.7 NOCs

There are no NOCs released by the EAC as of the date of this Test Plan that pertain to this test campaign that were not in effect at the time of the baseline system certification.

2.0 PRE-CERTIFICATION TESTING AND ISSUES

This section describes previous testing performed prior to submitting the voting system to the EAC.

2.1 Evaluation of Prior VSTL Testing

Pro V&V evaluated to the published Final Test Report for the D-Suite 5.0 System in order to baseline the current system under test.

2.2 Evaluation of Prior Non-VSTL Testing

No prior non-VSTL testing of the D-Suite 5.5 modifications were considered for this test campaign.

2.3 Known Field Issues

D-Suite 5.5 is a modification to a previously certified system and has not been fielded.

3.0 MATERIALS REQUIRED FOR TESTING

The following sections list all materials needed to enable the test engagement to occur.

The materials required for testing of the D-Suite 5.5 System include all materials to enable the test campaign to occur. This includes the applicable hardware and software as well as the TDP, test support materials, and deliverable materials, as described in the following subsections.

3.1 Software

This subsection lists the proprietary and COTS software to be provided by the manufacturer as part of the test campaign.

All software required for testing is identified in Section 1.1 of this test plan.

Pro V&V will perform a comparison on the submitted source code against the previously certified versions.

3.2 Equipment

This subsection lists the proprietary and COTS equipment to be provided by the manufacturer as part of the test campaign.

For COTS equipment, every effort will be made to verify that the COTS equipment has not been modified for use. This will be accomplished by performing research using the COTS equipment manufacturer’s websites based on the serial numbers and service tag numbers for each piece of equipment. Assigned test personnel will evaluate COTS hardware, system software and communications components for proven performance in commercial applications other than voting. For PCs, laptops, and servers, the service tag information will be compared to the system information found on each machine. Physical external and internal examination will also be performed when the equipment is easily accessible without the possibility of damage. Hard drives, RAM memory, and other components will be examined to verify that the components match the information found on the COTS equipment manufacturer’s websites.

All hardware required for testing is identified in Section 1.1 of this test plan.

3.3 Test Materials

This subsection lists the test materials required to execute the required tests throughout the test campaign.

Table 3-2. Required Test Materials

Material	Description(s)
Tamper Proof Security Seals	Adhesive tamper proof security seal, Novavision Part# XSG21-08RESN
Printer Cartridges	Brother TN-630, HP LaserJet CF226X
Smart Cards	Programmable Smart Cards
ImageCast Precinct Cleaning Sheets	Cleaning Sheets for ImageCast Precinct tabulator Part# CSHT-100B
Stereo Breakout Cable	3.5mm stereo male plug to dual 3.5mm mono female plugs
3.5mm Stereo Cable	3.5mm stereo male plug to 3.5mm stereo female plug
Compact Flash Cards	SanDisk Ultra 4Gb Compact Flash cards
iButton Security Tokens	iButton Security Token with lanyards
Permanent Markers	Fine Tip Sharpie Permanent Markers
Ethernet Cables	Cat5e Ethernet Cables
ICP Paper Rolls	Replacement Thermal Paper Rolls for the ImageCast Precinct tabulator
Sip & Puff Disposable Straws	Disposable straws for use with the Sip & Puff input device

Table 3-2. Required Test Materials *(continued)*

Material	Description(s)
Ballot Stock	Ballot Paper Stock for printing ballots
A/C Power Cables	3-Prong A/C Power Cables
USB Thumb drives	4.0 GB USB Thumb drives

3.4 Proprietary Data

All data and documentation considered by the manufacturer to be proprietary will be identified and documented in an independent submission along with a Notice of Protected Information.

4.0 TEST SPECIFICATIONS

Certification testing of the Dominion D-Suite 5.5 Voting System submitted for evaluation will be performed to ensure the applicable requirements of the EAC 2005 VVSG and the EAC Testing and Certification Program Manual, Version 2.0 are met. Additionally, all EAC Request for Interpretations (RFI) and Notices of Clarification (NOC) relevant to the system under test will be incorporated in the test campaign. A complete listing of the EAC RFIs and NOCs is available on the EAC website.

4.1 Requirements (Strategy of Evaluation)

To evaluate the D-Suite 5.5 test requirements, the submitted modifications were evaluated against each section of the EAC 2005 VVSG to determine the applicable tests to be performed. Based on this assessment, it was determined the following evaluations would be required to verify compliance of the modifications:

Technical Documentation Package (TDP) Review

A TDP Review will be performed to ensure that all submitted modifications are accurately documented and that the documents meet the requirements of the EAC 2005 VVSG. The preliminary TDP is performed to gather information concerning the system under test and its capabilities or design intentions. Additionally, a TDP review will be performed throughout the test campaign. The TDP Review includes the Initial Review, the Regulatory/Compliance Review, and the Final Review. This review is conducted to determine if the submitted technical documentation meets the regulatory, customer-stated, or end-user requirements and includes reviewing the documents for stated functionality review and verification.

Section 2: Functional Requirements

The requirements in this section shall be tested during the FCA and System Integration Test. This evaluation will utilize baseline test cases as well as specifically designed test cases and will include predefined election definitions for the input data.

The FCA targets the specific functionality claimed by the manufacturer to ensure the product functions as documented. This testing uses both positive and negative test data to test the robustness of the system. The FCA encompasses an examination of manufacturer tests, and the conduct of additional tests, to verify that the system hardware and software perform all the functions described in the manufacturer's documentation submitted in the TDP (such as system operations, voter manual, maintenance, and diagnostic testing manuals). It includes a test of system operations in the sequence in which they would normally be performed. These system operations and functional capabilities are categorized as follows by the phase of election activity in which they are required:

- Overall System Capabilities: These functional capabilities apply throughout the election process. They include security, accuracy, integrity, system audit ability, election management system, vote tabulation, ballot counters, telecommunications, and data retention.
- Pre-voting Capabilities: These functional capabilities are used to prepare the voting system for voting. They include ballot preparation, the preparation of election-specific software (including firmware), the production of ballots, the installation of ballots and ballot counting software (including firmware), and system and equipment tests.
- Voting System Capabilities: These functional capabilities include all operations conducted at the polling place by voters and officials including the generation of status messages.
- Post-voting Capabilities: These functional capabilities apply after all votes have been cast. They include closing the polling place; obtaining reports by voting machine, polling place, and precinct; obtaining consolidated reports; and obtaining reports of audit trails.
- Maintenance, Transportation and Storage Capabilities: These capabilities are necessary to maintain, transport, and store voting system equipment.

The system integration testing addresses the integration of the hardware and software. This testing focuses on the compatibility of the voting system software components and subsystems with one another and with other components of the voting system. During test performance, the system is configured as would be for normal field use.

Section 3: Usability and Accessibility Requirements

The requirements in this section shall be tested during the Usability and Accessibility Testing. This evaluation will utilize baseline test cases as well as specifically designed test cases and will include predefined election definitions for the input data.

The usability testing focuses on the usability of the system being tested. Usability is defined generally as a measure of the effectiveness, efficiency, and satisfaction achieved by a specified set of users with a given product in the performance of specified tasks. In the context of voting, the primary user is the voter, the product is the voting system, and the task is the correct recording of the voter ballot selections. Additional requirements for task performance are independence and privacy: the voter should normally be able to complete the voting task without assistance from

others, and the voter selections should be private. Accessibility evaluates the requirements for accessibility. These requirements are intended to address HAVA 301 (a) (3) (B).

Section 4: Hardware Requirements

The hardware tests specified in the VVSG are divided into two categories: non-operating and operating. The non-operating tests apply to the elements of the system that are intended for use at poll site locations and are intended to simulate the storage and transport of equipment between the storage facility and the polling location. The Operating tests apply to the entire system, including hardware components that are used as part of the voting system telecommunications capability, and are intended to simulate conditions that the voting system may encounter during operation. Prior to and immediately following each required non-operating and operating test, the system shall be subjected to an operational status check.

The requirements in this section shall be tested and/or evaluated by personnel verified by Pro V&V to be qualified to perform the testing.

Section 5: Software Requirements

The requirements in this section shall be tested utilizing a combination of review and functional testing during the source code review, TDP review, and FCA.

To perform the source code review, Pro V&V will review the submitted source code to the EAC 2005 VVSG and the manufacturer-submitted coding standards. Prior to initiating the software review, Pro V&V shall verify that the submitted documentation is sufficient to enable: (1) a review of the source code and (2) Pro V&V to design and conduct tests at every level of the software structure to verify that design specifications and performance guidelines are met. The source code review includes a compliance build and a trusted build of the submitted source code.

Section 7: Security Requirements

The requirements in this section shall be tested during the source code review, security tests, and FCA.

To evaluate the integrity of the system, Pro V&V will develop specifically designed test cases in an attempt to defeat the access controls and security measures documented in the system TDP as well verifying compliance to EAC RFI 2012-05. A threat matrix will be created to determine the risks and vulnerabilities. An evaluation of the system will be accomplished by utilizing a combination of functional testing, source code review, and static code analyzers.

During the security testing, the system shall be inspected for various controls and measure that are in place to meet the objectives of the security standards which include: protection of the critical elements of the voting system; establishing and maintaining controls to minimize errors; protection from intentional manipulation, fraud and malicious mischief; identifying fraudulent or erroneous changes to the voting system; and protecting the secrecy in the voting process.

Additional review will be performed on the implementation of the FIPS cryptographic module in order to:

- Confirm the module (model and version) that is used and implemented is present on the NIST CMVP validated products list.
- Confirm the module in all five instances is configured and used per the NIST published security policy for that module.

4.1.1 Rationale for ‘Not Applicable’ Requirements

All requirements that were excluded from the previous test campaign (D-Suite 5.0) were also deemed not applicable to this test campaign due to the submitted modifications not impacting the specific requirements. These requirements are identified below:

- Volume I, Section 6.2.6 (Telecommunications Requirements: Integrity)
- Volume I, Section 7.5.2-7.5.4 (Security: Protection Against External Threats, Monitoring and Responding to External Threats, and Shared Operating Environment)
- Volume I, Section 7.6 (Use of Public Communications Networks)
- Volume I, Section 7.7 (Wireless Communications)

The rationale for not evaluating the D-Suite 5.5 to the indicated sections is described in following table. Specific requirements that are excluded from this test campaign are identified in the EAC spreadsheet.

Table 4-1. Not Applicable Requirements

EAC 2005 VVSG Version 1 Volume I, Section	Rationale for ‘Not Applicable’
6.2.6	These requirements are written for use of public networks. The D-Suite 5.5 does not utilize public networks.
7.5.2-7.5.4	These requirements are written for use of public networks. The D-Suite 5.5 does not utilize public networks.
7.6	D-Suite 5.5 does not support transmission over public networks.
7.7	No wireless technology is utilized in this system.

4.2 Hardware Configuration and Design

The hardware configuration and design for the modification has changed from the baseline system. The D-Suite 5.5 Voting System is hybrid paper-based optical scan/DRE voting system which consists of the following major components: the EMS, the ImageCast Central (ICC), the ImageCast Precinct (ICP), and the ImageCast X (ICX). The Democracy Suite is comprised of one proprietary hardware component (ICP), two COTS hardware components (ICC and ICX). All EMS functions are managed by proprietary software running on COTS PCs/servers. The ICX Prime aValue is a new ICX hardware model which has been introduced in this modification. The ICX Prime aValue can be configured as either a BMD or as a DRE. In DRE mode, the ICX Prime aValue can be configured with either a VVPAT printer or a Reports Printer. The ICX

Samsung is not included in this modification. The Canon DR-M160II is a newly introduced COTS document scanner for use with the ICC.

4.3 Software System Functions

The software system functions for the previously certified voting system (D-Suite 5.0) remain unchanged for the submitted modifications. The Democracy Suite Election Management System (EMS) consists of a set of applications responsible for all pre-voting and post-voting activities used in election definition and management process. The Democracy Suite EMS applications are as follows:

- EMS Election Event Designer
- EMS Results Tally and Reporting
- EMS Audio Studio
- EMS Adjudication Application
- EMS Adjudication Service
- EMS File System Service
- EMS Election Data Translator
- Smart Card Helper Service
- ImageCast Voter Activation
- EMS Data Center Manager
- EMS Application Server
- EMS Database Server
- EMS NAS Server

The D-Suite 5.5 voting system consists of one software application for all central count tabulator hardware, one software application to run the ICX ballot marking and DRE devices, and a firmware application to run the hybrid precinct tabulator/DRE.

4.4 Test Case Design

Test cases are designed based on the manufacturer's design specifications and the relevant technical requirements set forth by the VVSG. Test cases shall be based on the following aspects of the voting system:

- Hardware qualitative examination design
- Hardware environmental test case design

- Software module test case design and data
- Software functional test case design
- System level test case design

Test cases shall provide information regarding the sequence of actions to be performed for the execution of a test, the requirements being met, the test objective, test configuration, equipment needed, special requirements, assumptions, and pass/fail criteria. Once the test cases are finalized, they will be validated and published for use in the test campaign. The validation of the test case will be accomplished by technical review and approval. This validation will include the following: confirmation of adequate test coverage of all requirements; confirmation that test case results are not ambiguous and gave objective pass/fail criteria; and confirmation that any automated test suites will produce valid results.

4.4.1 Hardware Qualitative Design

Previous hardware examinations were performed on the certified baseline system (D-Suite 5.0). The updates to the modified system (D-Suite 5.5) will require the full suite of hardware and electrical testing as detailed in the 2005 VVSG. These tests are listed below:

Electrical Tests:

- Electrical Power Disturbance
- Electromagnetic Radiation
- Electrostatic Disruption
- Electromagnetic Susceptibility
- Electrical Fast Transient
- Lightning Surge
- Conducted RF Immunity
- Magnetic Fields Immunity
- Electrical Supply

Environmental Tests:

- Bench Handling
- Vibration
- Low Temperature
- High Temperature
- Humidity
- Temperature Power Variation

- Acoustic

4.4.2 Hardware Environmental Test Case Design

The voting system hardware shall be subjected to the tests specified in Section 4.4.1. Testing will be performed by personnel verified by Pro V&V to be qualified to perform the test. Pro V&V will utilize third-party test facilities for performance of the electrical and environmental tests. Environmental Testing for the ICX Prime aValue BMD configuration and the ICC Canon DR-M160II Scanner will be performed at the NTS Huntsville facility located in Huntsville, Alabama. Environmental Testing for the ICX Prime aValue DRE configurations will be performed at the NTS Huntsville facility located in Huntsville, Alabama; with the exception of the Temperature Power Variation Test which will be performed at the NTS Longmont facility located in Longmont, Colorado. Electrical Testing for the ICX Prime aValue BMD and DRE configurations will be performed at the TUV SUD Canada facility located in Gormley, Ontario, Canada. All pre and post operational status checks shall be conducted by Pro V&V personnel.

4.4.3 Software Module Test Case Design and Data

Pro V&V shall review the manufacturer's program analysis, documentation, and module test case design and shall evaluate the test cases for each module with respect to flow control parameters and entry/exit data. As needed, Pro V&V shall design additional test cases to satisfy the coverage criteria specified in Volume II, Section 7.2.1.

Component Level Testing will be implemented during the FCA for each component and subcomponent. During the Source Code Review, Compliance Builds, and Security Testing, Pro V&V will utilize limited structural-based techniques (white-box testing). Additionally, specification-based techniques (black-box testing) will be utilized for the individual software components.

Pro V&V shall define the expected result for each test and the ACCEPT/REJECT criteria for certification. If the system performs as expected, the results will be accepted. If the system does not perform as expected, an analysis will be performed to determine the cause. The test will be repeated in an attempt to reproduce the results. If the failure can be reproduced and the expected results are not met, the system will have failed the test. If the results cannot be reproduced, the test will continue. All errors encountered will be documented and tracked through resolution.

4.4.4 Software Functional Test Case Design and Data

Pro V&V shall review the manufacturer-submitted test plans and data to verify that the individual performance requirements specified in the EAC 2005 VVSG and the TDP are reflected in the software. As part of this process, Pro V&V shall review the manufacturer's test case design and prepare a detailed matrix of system functions and the test cases that exercise them. Pro V&V shall also prepare a test procedure describing all test ballots, operator procedures, and the data content of output reports. Pro V&V shall define abnormal input data and operator actions and then design test cases to verify that the system is able to handle and recover from these abnormal conditions. During this review, emphasis shall be placed on those functions where the manufacturer data on

module development, such as the system release notes and comments within the source code, reflects significant debugging problems, and on functional tests that resulted in high error rates.

Pro V&V shall define the expected result for each test and the ACCEPT/REJECT criteria for certification. If the system performs as expected, the results will be accepted.

If the system does not perform as expected, an analysis will be performed to determine the cause. The test will be repeated in an attempt to reproduce the results. If the failure can be reproduced and the expected results are not met, the system will have failed the test. If the results cannot be reproduced, the test will continue. All errors encountered will be documented and tracked through resolution.

4.4.5 System-Level Test Case Design

System Level testing will be implemented to evaluate the complete system. This testing will include all proprietary components and COTS components (software, hardware, and peripherals) in a configuration of the system's intended use.

For software system tests, the tests shall be designed according to the stated design objective without consideration of its functional specification. The system level hardware and software test cases shall be prepared independently to assess the response of the hardware and software to a range of conditions.

4.5 Security Functions

The objective of the Security Testing is to evaluate the effectiveness of the voting system in detecting, preventing, recording, reporting, and recovering from security threats. To evaluate the integrity of the system, Pro V&V shall develop specifically designed test cases in an attempt to defeat the access controls and security measures documented in the system TDP. The submitted threat matrix identifying the system's risks and vulnerabilities shall be evaluated for completeness and to determine that mitigating controls are adequately implemented. An evaluation of the system shall be accomplished by utilizing a combination of functional testing and source code review. All findings will be reported to the EAC and DVS.

The test methods for performing the Security Testing are execution and review. Prior to performance of Security testing, the examiner will verify that security hardening scripts have been properly applied to system components per the system documentation. The examiner will review the submitted TDP to verify that documented access and physical controls are in place. Following the documented procedures, the examiner will configure the voting system for use and functionality to verify that the documented controls are in place and adequate and meet the stated requirements.

Physical Security will be tested by setting up the system as described in the TDP and then examining the effectiveness and comprehensiveness of physical security measures.

Administrative Security will be tested by examining the system's documented security instructions and procedures for effectiveness and breadth.

Logical security will be tested as part of FCA testing by a recognized security expert who not only will review the physical and administrative testing outcomes, but will perform the following tests on system components: Vulnerability Scans, SCAP Scans, and Physical Bypass Attempts. Logical security testing will assess the effectiveness of the security hardening scripts applied during the system setup and install process.

4.6 TDP Evaluation

In order to determine compliance of the modified TDP documents with the EAC 2005 VVSG, a limited TDP review shall be conducted. This review will focus on TDP documents that have been modified since the certification of the baseline system. The review will consist of a compliance review to determine if each regulatory, state, or manufacturer-stated requirement has been met based on the context of each requirement. Results of the review of each document will be entered on the TDP Review Checklist and reported to the manufacturer for disposition of any anomalies. This process will be ongoing until all anomalies are resolved.

Any revised documents during the TDP review process will be compared with the previous document revision to determine changes made, and the document will be re-reviewed to determine whether subject requirements have been met.

A listing of all documents contained in the D-Suite 5.5 TDP is provided in Table 4-2.

4.7 Source Code Review

Pro V&V will review the submitted source code to the EAC 2005 VVSG and the manufacturer-submitted coding standards. Prior to initiating the software review, Pro V&V shall verify that the submitted documentation is sufficient to enable: (1) a review of the source code and (2) Pro V&V to design and conduct tests at every level of the software structure to verify that design specifications and performance guidelines are met.

A combination of Automated Source Code Review and Manual Source Code Review methods will be used to review the changes in the source code from the previously certified Democracy Suite 5.0 voting system. In addition, 10% of the source code comments will be manually reviewed.

4.8 QA and CM System Review

The Dominion Voting Systems Quality and Configuration Management Manuals shall be reviewed for their fulfillment of Volume I, Sections 8 and 9, and the requirements specified in Volume II, Section 2. The requirements for these sections establish the quality assurance and configuration standards for voting systems to which manufacturers must conform and require voting system manufacturers to implement a quality assurance and configuration management

program that is conformant with recognized ISO standards. As part of the review process, the Dominion TDP documents will be reviewed to determine if the stated policies are being followed.

4.9 Physical Configuration Audit (PCA)

The Physical Configuration Audit (PCA) compares the voting system components submitted for qualification to the manufacturer's technical documentation, and shall include the following activities:

- Establish a configuration baseline of software and hardware to be tested; confirm whether manufacturer's documentation is sufficient for the user to install, validate, operate, and maintain the voting system
- Verify software conforms to the manufacturer's specifications; inspect all records of manufacturer's release control system; if changes have been made to the baseline version, verify manufacturer's engineering and test data are for the software version submitted for certification
- If the hardware is non-COTS, Pro V&V shall review drawings, specifications, technical data, and test data associated with system hardware to establish system hardware baseline associated with software baseline
- Review manufacturer's documents of user acceptance test procedures and data against system's functional specifications; resolve any discrepancy or inadequacy in manufacturer's plan or data prior to beginning system integration functional and performance tests
- Subsequent changes to baseline software configuration made during testing, as well as system hardware changes that may produce a change in software operation are subject to re-examination

4.10 Functional Configuration Audit (FCA)

The Functional Configuration Audit (FCA) encompasses an examination of manufacturer's tests, and the conduct of additional tests, to verify that the system hardware and software perform all the functions described in the manufacturer's documentation submitted in the TDP.

In addition to functioning according to the manufacturer's documentation tests will be conducted to ensure all applicable EAC 2005 VVSG requirements are met.

4.11 Accuracy

The accuracy test ensures that each component of the voting system can each process 1,549,703 consecutive ballot positions correctly within the allowable target error rate. The Accuracy test is designed to test the ability of the system to "capture, record, store, consolidate and report" specific selections and absences of a selection. The required accuracy is defined as an error rate. This rate is the maximum number of errors allowed while processing a specified volume of data.

In an effort to achieve this and to verify the proper functionality of the units under test, the following methods will be used to test components of the voting system:

For paper-based voting systems the ballot positions on a paper ballot must be scanned to detect selections for individual candidates and contests and the conversion of those selections detected on the paper ballot converted into digital data. The accuracy requirements for the ICP and the ICC units will be met by the execution of the standard accuracy test utilizing pre-marked and hand-marked ballots of each ballot length supported by the system, and ballots produced by the ICX BMD. For DRE-based voting systems the system must correctly capture, store, and report the specific ballot selections, and absence of selections, for each ballot position. DRE configurations which include a VVPAT must also correctly print the ballot selections made by the voter. The accuracy requirements for the ICX DRE will be met by loading elections for each ballot length supported by the system onto DRE units, and using the built-in vote simulation tool, cast votes on the device using predetermined marking patterns. Accuracy testing will be performed on both DRE configurations, one of which includes a connected VVPAT and the other which includes a connected Reports printer. Barcodes printed on VVPAT receipts will be scanned to ensure that the information included within the barcodes correctly matches vote selections.

The Vote Simulation tool votes each ballot using the same process that a voter would with the exception that the ballot is activated using values included in the XML file which defines the ballot to be activated and the vote choices to be selected on the ballot. The Vote Simulation tool offers multiple options to the user such as Printing Votes on the VVPAT and the ability to view the ballots being marked on the ICX screen while the simulation is running. The available options will be selected as applicable to ensure that the simulator runs as similar as possible to normal operation of the ICX unit based upon the selected configuration. The Vote Simulation tool is described in Appendix B of the ICX User Guide.

The ICP and ICC units will be tested by utilizing a combination of hand marked (70%) and pre-marked (30%) ballots to achieve an accuracy rate greater than 1,549,703 correct ballot positions. The ICX DRE units will be tested by using the built-in vote simulation tool to cast a sufficient number of ballots to achieve an accuracy rate greater than 1,549,703 correct ballot positions.

4.12 Volume & Stress

Tests to investigate the system's response to conditions that tend to overload the system's capacity to process, store, and report data. The test parameters will focus on the system's stated limits and the ballot logic for areas such as the maximum number of active voting positions, maximum number of ballot styles, maximum candidates, maximum contests, and stated limits within the EMS. This test will be utilized to ensure the system can achieve the manufacturer's TDP claims of what the system can support. Testing will be performed by exercising an election definition and test cases developed specifically to test for volume and stress conditions of the system being tested.

4.13 System Integration

System Level test for the integrated operation of both hardware and software.

Compatibility of the voting system software components or subsystems with one another, and with other components of the voting system environment, shall be determined through functional tests integrating the voting system software with the remainder of the system.

Additionally, the system shall be configured exactly as it would for normal field use. This includes connecting all supporting equipment and peripherals including ballot boxes, voting booths (regular and accessible), and any physical security equipment such as locks and ties.

Pro V&V personnel shall properly configure and test the system by following the procedures detailed in the D-Suite 5.5 voting system technical documentation.

5.0 TEST DATA

The following subsections provide information concerning test data recording, criteria, and reduction.

5.1 Test Data Recording

All equipment utilized for test data recording shall be identified in the test data package. The output test data shall be recorded in an appropriate manner as to allow for data analysis. For source code and TDP reviews, results shall be compiled in reports and submitted to Dominion for resolution.

5.2 Test Data Criteria

The D-Suite 5.5 Voting System shall be evaluated against all applicable requirements contained in the EAC 2005 VVSG. The acceptable range for system performance and the expected results for each test case shall be derived from the manufacturer-submitted technical documentation and the EAC 2005 VVSG.

6.0 TEST PROCEDURE AND CONDITIONS

The following subsections detail the facility requirements, test setup conditions, and sequence of testing.

6.1 Facility Requirements

Unless otherwise annotated, all testing shall be conducted at the Pro V&V test facility located in Huntsville, AL, by personnel verified by Pro V&V to be qualified to perform the test.

Unless otherwise specified herein, testing shall be performed at the following standard ambient conditions and tolerances:

- Temperature: 68-75° F ($\pm 3.6^\circ\text{F}$)
- Relative Humidity: Local Site Humidity
- Atmospheric Pressure: Local Site Pressure
- Time Allowable Tolerance: $\pm 5\%$

Testing performed at third-party laboratories will be subjected to the test parameters and tolerances defined by the test facility and will be reported in the final Test Report.

6.2 Test Set-up

All voting system equipment shall be received and documented using Pro V&V proper QA procedures. Upon receipt of all hardware, an inspection will be performed to verify that the equipment received is free from obvious signs of damage and/or degradation that may have occurred during transit. If present, this damage shall be recorded, photographed, and reported to the Dominion Representative. Additionally, a comparison shall be made between the recorded serial numbers/part numbers and those listed on shipper's manifest and any discrepancies shall be reported to the Dominion Representative. TDP items and all source code received shall be inventoried and maintained by Pro V&V during the test campaign.

During test performance, the system shall be configured as it would be for normal field use. This includes connecting all supporting equipment and peripherals.

6.3 Test Sequence

The D-Suite 5.5 Voting System will be evaluated against all applicable requirements in the EAC 2005 VVSG. There is no required sequence for test performance.

6.4 Test Operations Procedure

Pro V&V will identify PASS/FAIL criteria for each executed test case. The PASS/FAIL criteria will be based on the specific expected results of the system. In the case of an unexpected result that deviates from what is considered standard, normal, or expected, a root cause analysis will be performed.

Pro V&V will evaluate every EAC 2005 VVSG requirement applicable to the Democracy Suite 5.5 voting system. Any deficiencies noted will be reported to the EAC and the manufacturer. If it is determined that there is insufficient data to determine compliance, this test plan will be altered and additional testing will be performed.

APPENDIX A
PROJECT SCHEDULE

Task Name	Start Date	End Date	Status	Duration
TDP	06/20/17	08/17/18		296d
Initial Review	06/20/17	06/26/17	Full	5d
Compliance Review	09/11/17	11/29/17	Full	56d
Final review	11/30/17	08/17/18	Three Quarter	181d
Test Plan	09/18/17	12/21/17		67d
Test Plan Creation	09/18/17	10/05/17	Full	14d
Vendor Review & Comments	10/06/17	10/09/17	Full	2d
